The primary objective of the SMARA is for each jurisdiction to develop policies that will conserve important mineral resources, where feasible, that might otherwise be unavailable when needed. The SMARA requires that once policies are adopted, local agency land use decisions must be in accordance with its mineral resource management policies. These decisions must also balance the mineral value of the resource to the market region as a whole, not just their importance to the local jurisdiction. Under SMARA, areas are categorized into four MRZs as follows:

MRZ-1 Areas where adequate information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their production.

MRZ-2 Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.

MRZ-3 Areas containing mineral deposits, the significance of which cannot be evaluated from available data.

MRZ-4 Areas where available information is inadequate for assignment to any other MRZ zone.

4.11.2.2 City of Moreno Valley General Plan Policies

No policies related to mineral resources are identified within the City's General Plan.

4.11.3 Methodology

The California Geological Survey (CGS) provides objective geologic information about California's diverse non-fuel mineral resources. Maps, reports, and other data products developed by CGS were used to locate mineral extraction areas in the project area. In addition, the City of Moreno Valley's General Plan was used to determine the location of possible mineral extraction areas in the project area.

4.11.4 Thresholds of Significance

Appendix G of the *State CEQA Guidelines* recognizes the following thresholds related to mineral resources. Based on these significance thresholds, potential impacts to mineral resources could be considered significant if the proposed project:

- Resulted in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State;
- Resulted in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plans.

4.11.5 Less than Significant Impacts

The following potential impacts were determined to be less than significant. In both of the following issues, either no impact would occur or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level. In both instances, no mitigation is required.

4.11.5.1 Loss of Statewide, Regional, or Locally Important Mineral Resources

Thresholds	Would the proposed project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State? Would the proposed project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plans?
------------	---

Lands within the City of Moreno Valley and its Sphere of Influence are designated MRZ-3 and MRZ-4, which are not defined as significant mineral resource areas. No sites have been designated as locally-important mineral resource recovery sites on any local plan.¹ In addition, Figure OS-5 of the Riverside County General Plan shows that the proposed project area is also located within MRZ-3. The development of the project site would not result in the loss of identified regional or local mineral resources, conversion of an identified mineral resource use, or conflict with existing mineral resource extraction activities. Therefore, the development of the project site would not result in a loss of statewide, regional, or locally important mineral resources. No impacts associated with this issue would occur and no mitigation is required.

4.11.6 Significant Impacts

Based on the analysis in Section 4.11.5, the project will have no significant impacts related to mineral resources, and no mitigation is required.

4.11.7 Cumulative Impacts

CEQA requires that an EIR discuss the project's incremental effects to determine if they are cumulatively considerable. The discussion of cumulative impacts must reflect the severity of the impacts and the likelihood of their occurrence; however, the discussion need not be as detailed as the

¹ Section 6.10 Mineral Resources, Section 6.0 Issues Found Not To Be Significant, Draft Environmental Impact Report for City of Moreno Valley General Plan 2030, State Clearinghouse #2004031135, City of Moreno Valley, October 2004.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

discussion of environmental impacts attributable to the project alone. The discussion must demonstrate practicality and reasonableness.

The cumulative area for mineral resources is the City of Moreno Valley and this part of western Riverside County. As population levels increase in the region, greater demand for aggregate and other mineral materials will be placed on mineral resources, especially sand and gravel. Similarly, development pressures in areas where these materials are known or expected to occur would result in the loss of availability of these mineral resources. However, because the project site is not identified as a significant source of sand/gravel deposits and development subsequent to the adoption of the proposed land use actions on any of the sites would not decrease the local or regional availability of mineral resources, potential future development of any of the sites would have no significant cumulative mineral resources impact.

NOTE TO READERS. *This section has been revised due to the following changes from the project characteristics analyzed in the original DEIR:*

- *Loss of 100 acres from the Specific Plan (in the southwest corner);*
- *Changes to the Traffic Impact Assessment (TIA, see Section 4.15); and*
- *Change in project construction phasing (from 10 to 15 years).*

These changes also resulted in updates to the traffic impact assessment and proposed mitigation measures. In addition, this section has been revised in response to public comments received on the Programmatic DEIR.

The original DEIR determined that 14 road or freeway segments would result in a significant noise increase attributable to the project, resulting in a significant cumulative impact requiring mitigation. These 14 segments were included in the original noise study, and all other impacts identified in the original noise study are unchanged except as noted below.

Revisions have been made to this section to address changes in the Specific Plan, revisions to the project noise study (assessment tables), and in responses to comments mainly regarding mitigation.¹ Three street names have changed (Street C, D, and E) and may still be referenced in the section. For correct street names see Circulation Master Plan Figure 3.10. Due to a reduction in size of the Specific Plan, some impacts in this section have been reduced to less than significant levels.

4.12 NOISE

Changes from January 24, 2013, Noise Analysis

The Noise Assessment report included in the Programmatic Draft EIR was issued in January 2013. Comments have been received from various public and private groups and individuals. The Noise Assessment report has been modified in response to these comments and to clarify the description of the analysis. In addition, the Traffic Impact Analysis contained in the Draft EIR has been revised to reflect a downsizing of the project and other factors, resulting in a reduction in associated traffic volumes for the “with project scenarios.” The updated traffic volumes were used in the revised Noise Assessment report. The noise analysis procedures and significance thresholds have not been changed from the January 2013 noise assessment.

In the Noise Assessment report included in the Draft EIR, 33 roadway segments were identified where a significant noise impact would occur for at least one of the impact scenarios. In the revised Noise Assessment report for the Final EIR, 21 roadway segments have been identified as having a significant noise impact. The reduction in noise impact areas is a direct result of the revised traffic analysis which reflects a downsizing of the project and associated traffic volumes for the “plus project” traffic scenarios.

The roadway links that were previously identified as being impacted in the January 2013 noise analysis contained in the Draft EIR and are not directly affected in the revised noise analysis for the Final EIR are listed below:

- *Day Street between Cottonwood Avenue and Alessandro Boulevard (#109);*
- *Fir Avenue between Quincy Drive and Redlands Boulevard (#62);*
- *Moreno Beach Drive between Locust Avenue and Ironwood Avenue (#56);*

¹ *Mainly Comments C-4-2 and F-13-9 and F-13-84.*

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- *Perris Boulevard between John F. Kennedy Drive and Iris Avenue (#303);*
- *Placentia Avenue from El Nido Avenue to Evans Road and on to Water Avenue (#431, #432);*
- *Quincy Drive from Cactus Avenue to Alessandro Boulevard and to Cottonwood Avenue (#502, #503);*
- *Reche Canyon Road from Keissel Road to Reche Vista Drive and on to High Country Drive (#205, #206);*
- *Redlands Boulevard from Eucalyptus Avenue to Dracaea Avenue (#12); and*
- *State Route 60 from Perris Boulevard to Nason Street (#31).*

There are five roadway segments that were previously identified in the January 2013 noise analysis contained in the Draft EIR that had a direct and cumulative impact. In the revised noise analysis for the Final EIR, these five roadway segments do not have a direct impact but have a cumulative impact only. These roadways are as follows:

- *Fir Avenue between Quincy Drive and Redlands Boulevard (#62);*
- *Gilman Springs Road between Eucalyptus Avenue and Street C (#31); and between Jack Rabbit Trail and Bridge Street (#191);*
- *Moreno Beach Drive between Locust Avenue and Ironwood Avenue (#56); and*
- *State Route 60 from Perris Boulevard to Nason Street (#31).*

The roadway link that was previously identified in the January 2013 noise analysis contained in the Draft EIR as being impacted and mitigation was considered infeasible is mitigated below a level of significance with feasible mitigation as shown in the revised noise analysis for the Final EIR:

- *Cactus Avenue west of Redlands Boulevard.*

This section of the EIR is intended to satisfy the City's requirements for a project-specific noise impact analysis by examining the short-term and long-term noise impacts of the proposed project on sensitive uses adjacent to the proposed project area and by evaluating the effectiveness of mitigation measures. This includes the potential for the proposed project to result in impacts associated with a substantial temporary and/or permanent increase in ambient noise levels in the vicinity of the project area; exposure of people to excessive noise levels, groundborne vibration, or groundborne noise levels.

CEQA requires an analysis of the proposed project's impacts on the existing environment; not an analysis on the existing environment's impacts on the proposed project. The occasional blow downs that occur at the Southern California Gas Company (SCGC) are part of the existing conditions and have been part of the existing conditions for years. Thus, for purposes of clarity, it should be noted that the impact analysis below goes beyond the requirements of CEQA and provided as part of an analysis to ensure worker safety. All mitigation measures imposed in this analysis are the responsibility of future developers and not SCGC.

Note: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The analysis contained in this section is based on the following technical study prepared for the proposed project:

- *Noise Assessment for the World Logistic Center Specific Plan*, Mestre Greve Associates, original dated January 24, 2013, revised dated September 2014 (Appendix K of this Revised DEIR).

In addition to these project-specific technical studies, the analysis contained in this section is also based on the following reference documents:

- *California Noise Insulation Standards*, California Code of Regulations, Title 24, Part 2, §3501;
- *Highway Traffic Noise Prediction Model (FHWA-RD-77-108)*, Federal Highway Administration (FHWA);
- *City of Moreno Valley General Plan*, City of Moreno Valley, July 2006;
- *Moreno Valley Municipal Code*, City of Moreno Valley, current through Ordinance 836 and the February 2012 code supplement; and
- *State of California General Plan Guidelines*, Governor's Office of Planning and Research, October 2003, pages 249 and 250.

4.12.1 Existing Setting

4.12.1.1 Background

Characteristics of Noise. To the human ear, sound is technically described in terms of its loudness (amplitude) and pitch (frequency). Pitch is generally an annoyance, while loudness can affect our ability to hear. Noise is usually defined as unwanted sound; it consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Measurement of Noise. The standard unit of measurement of the loudness of sound is the decibel (dB). Decibels are based on a logarithmic scale. The logarithmic scale compresses the wide range in sound levels resulting in a more usable range of sound level values, similar to the Richter scale used to measure earthquakes. To humans, a sound 10 dB higher than another is considered to be twice as loud; a sound 20 dB higher than another is considered four times as loud; etc. Typical daily sounds in the environmental range from 30 dB (very quiet) to 100 dB (very loud).

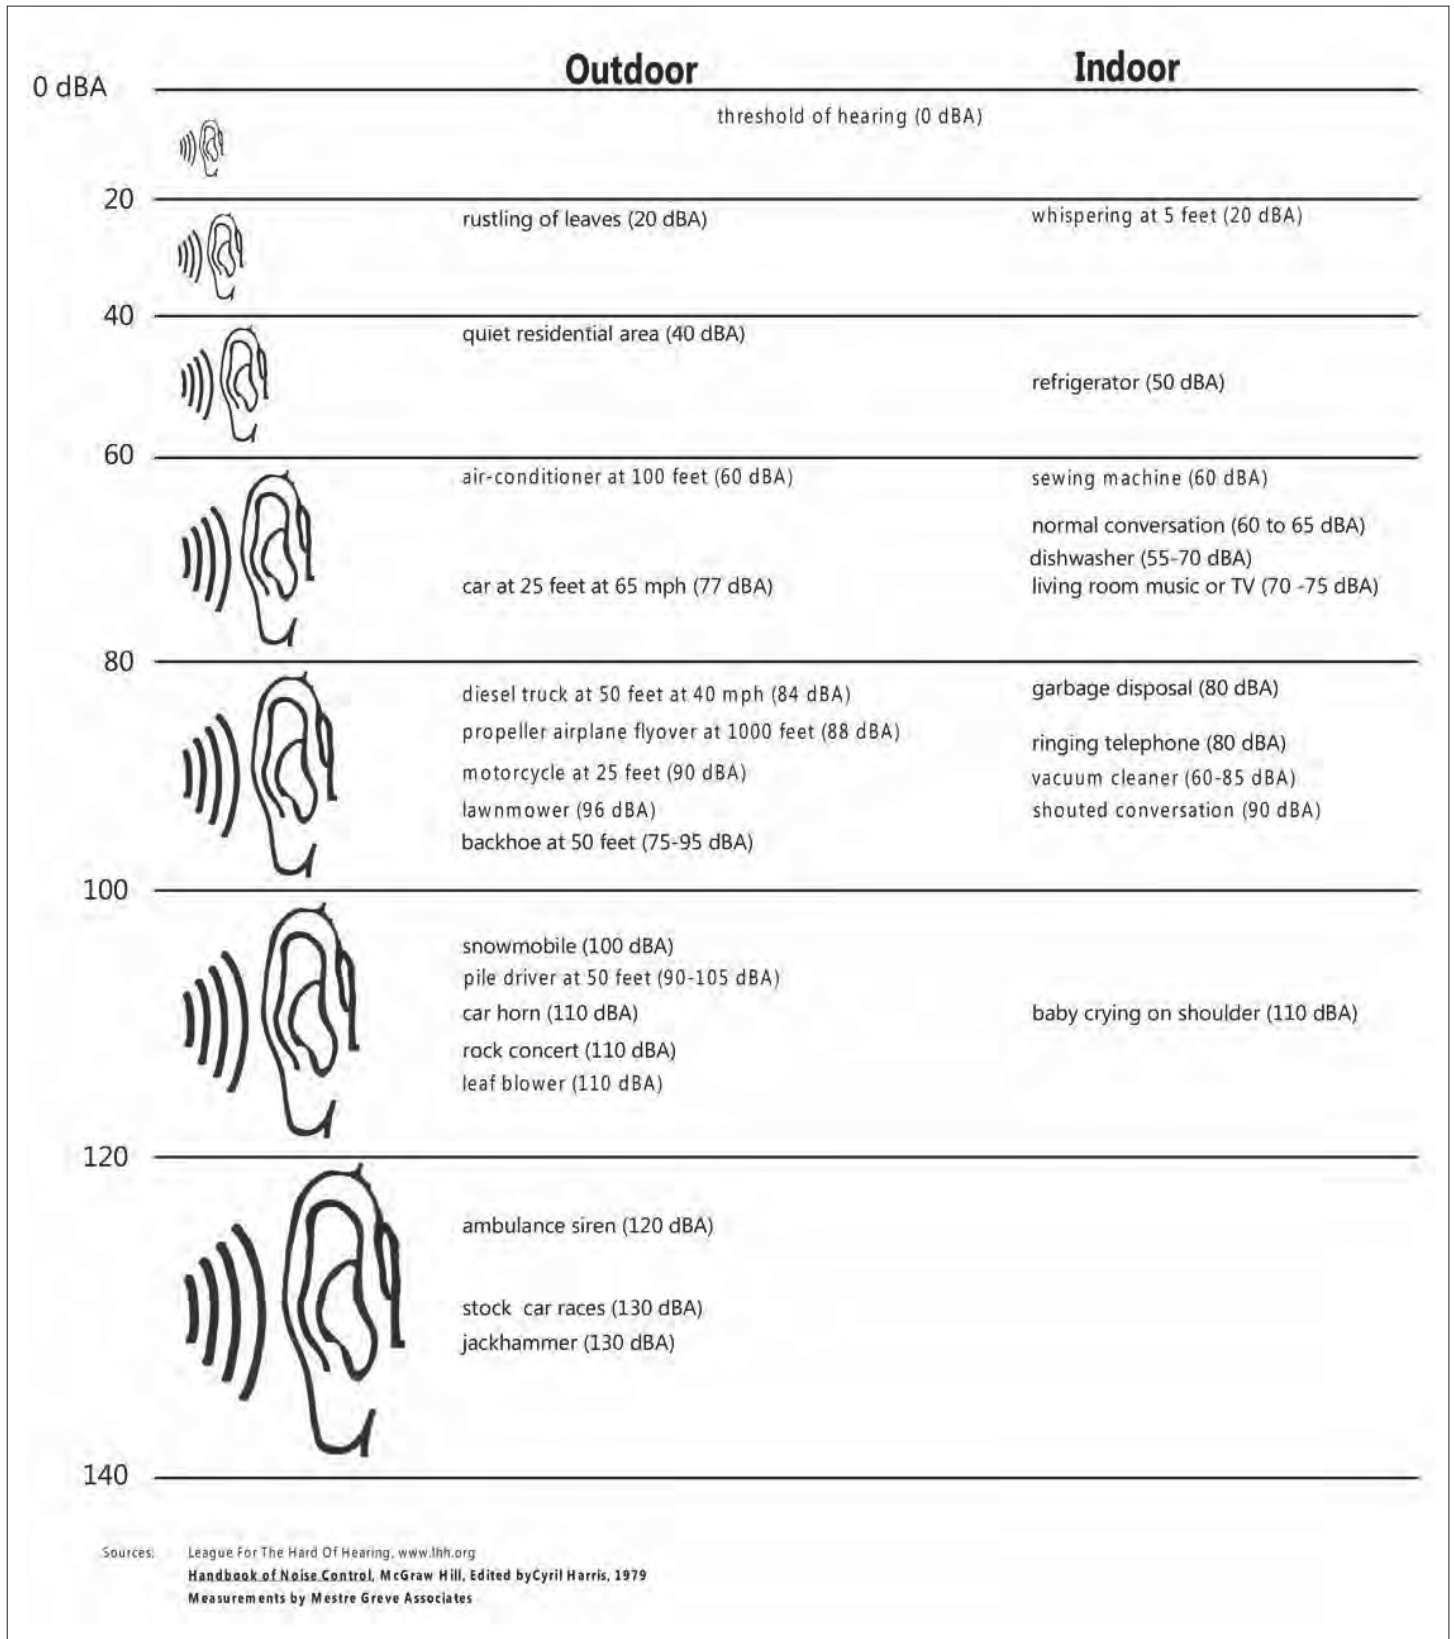

Since the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel (dBA) scale performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear. Community noise levels are measured in terms of the dBA. Figure 4.12.1 shows examples of various noises sources and their typical dBA noise level.

There are two categories of noise that are measured to characterize noise conditions: single event noise and community or cumulative noise. Single event measurements describe the noise levels from an individual event such as a passing airplane or a heavy-duty truck. Cumulative measurements average the total noise in a community over a specific time period, which is typically 1 or 24 hours.

The noise impact analysis performed for this EIR is based on assessment of both single event noise and community or cumulative noise. Several rating scales have been developed for measurement of community noise. These account for: (1) the parameters of noise that have been shown to contribute to the effects of noise on humans; (2) the variety of noises found in the environment; (3) the variations in noise levels that occur as a person moves through the environment; and (4) the variations associated with the time of day. They are designed to account for the known health effects of noise on people described previously. Based on these effects, the observation has been made that the potential for a noise to affect people is dependent on the total acoustical energy content of the noise. A number of noise scales have been developed to account for this observation. Two of the predominant noise scales are the Equivalent Noise Level (L_{eq}) and the Community Noise Equivalent Level (CNEL). L_{eq} is the sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. L_{eq} is the “energy” average noise level during the time period of the sample. L_{eq} can be measured for any time period, but is typically measured for 1 hour. This 1-hour noise level can also be referred to as the Hourly Noise Level (HNL). It is the energy sum of all the events and background noise levels that occur during that time period.

CNEL is the predominant rating scale now in use in California for land use noise compatibility assessment. The CNEL scale represents a time weighted 24-hour average noise level based on the dBA. Time weighted refers to the inclusion of penalties for noise that occurs during certain noise-sensitive time periods. The evening time period (7 p.m. to 10 p.m.) penalizes noises by 5 dBA, while nighttime (10 p.m. to 7 a.m.) noises are penalized by 10 dBA, reflecting people’s increased sensitivity to noise during these time periods. A CNEL noise level may be reported as a CNEL of 60 dBA, 60 dBA CNEL, or simply 60 CNEL.

$L(\%)$ is a statistical method of describing noise which accounts for variance in noise levels throughout a given measurement period. $L(\%)$ is a way of expressing the noise level exceeded for a percentage of time in a given measurement period. For example, since 5 minutes is 25 percent of 20 minutes, $L(25)$ is the noise level that is equal to or exceeded for five minutes in a twenty-minute measurement period. It is $L(\%)$ that is used for most Noise Ordinance standards. For example most daytime County, State and City noise ordinances use a standard of 55 dBA for 30 minutes per hour, or an $L(50)$ level of 55 dBA. In other words, the noise ordinance may state that no noise level should exceed 55 dBA for more than fifty percent of a given period.

LSA

FIGURE 4.12.1

World Logistics Center Specific Plan Project
Environmental Impact Report
Typical A-Weighted Noise Levels

THIS PAGE INTENTIONALLY LEFT BLANK

The maximum noise level (L_{max}) is the highest exponential time averaged sound level that occurs during a stated time period. The noise levels discussed in this analysis for short-term noise impacts are specified in terms of maximum levels denoted by L_{max} , which reflects peak noise conditions and addresses the annoying aspects of intermittent noise. It is often used together with another noise scale, or noise standards in terms of percentile noise levels, in noise ordinances for enforcement purposes. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

Fundamentals of Groundborne Vibration. Vibration refers to groundborne noise and perceptible motion of the earth. Similar to noise, vibration is transmitted in noise-like waves through the earth and solid objects.

There are several ways to categorize vibration sources. One way is to divide vibration into natural sources (e.g., earthquakes, volcanic eruptions, sea waves, and landslides) and human sources (e.g., explosions, machinery, traffic, trains, and construction equipment). Similar to noise sources, vibration sources can also be described as continuous (e.g., operating factory machinery) or transient (e.g., explosions).

As with noise, ground vibrations can be described by amplitude and frequency. Vibration amplitude is characterized by its displacement, velocity, and acceleration. Displacement is the distance that soil particles travel from their original location as a result of vibration, as measured in inches or millimeters. Velocity is the speed of the soil particles measured in inches per second or millimeters per second. Acceleration is the acceleration of the soil particles measured in inches per second per second or millimeters per second per second. Particle velocity is the most commonly used vibration attribute used to describe vibration. Table 4.12.A presents the human reaction to various levels of peak particle velocity. Vibrations also vary in frequency. Traffic vibrations generally range in frequencies from 10 to 30 hertz (Hz), and tend to average around 15 Hz. As a point of reference, city buses often generate frequencies around 3 Hz at high vehicle speeds, due to their suspension systems.

Table 4.12.A: Human Reaction to Typical Vibration Levels

Vibration Level Peak Particle Velocity (inches/second)	Human Reaction
0.0059–0.0188	Threshold of perception, possibility of intrusion.
0.0787	Vibrations readily perceptible.
0.0984	Level at which continuous vibrations begin to annoy people.
0.1968	Vibrations annoying to people in buildings.
0.3937–0.5905	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges.

Source: Caltrans 1992.

Groundborne vibration is almost exclusively a concern inside buildings and is rarely perceived as a problem outdoors, where the motion may be discernable. However, without the effects associated with the shaking of a building, there is less adverse reaction. Building vibration may be perceived by the occupants as motion of building surfaces, rattling of items on shelves or hanging on walls, or as a low-frequency rumbling noise. Building damage is not a factor for normal projects, with the occasional exception of blasting and pile driving during construction or mining. Annoyance from vibration often occurs when the vibration exceeds the threshold of perception by up to 10 decibels. This is an order of magnitude below the damage threshold for normal buildings.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Typical sources of groundborne vibration are construction activities (e.g., blasting, pile driving, and operating heavy-duty earthmoving equipment), steel-wheeled trains, and occasional traffic on rough roads. Problems with groundborne vibration and noise from these sources are usually localized to within about 100 feet of the vibration source, although there are examples of groundborne vibration causing interference out to distances greater than 200 feet, as described in the FTA Transit Noise and Vibration Impact Assessment (FTA, May 2006). When roadways are smooth, vibration from traffic, even heavy trucks, is rarely perceptible.

Factors that influence groundborne vibration and noise include the following:

- *Vibration Source:* Vehicle suspension, wheel types and condition, track/roadway surface, track support system, speed, transit structure, and depth of vibration source.
- *Vibration Path:* Soil type, rock layers, soil layering, depth to water table, and frost depth.
- *Vibration Receiver:* Foundation type, building construction, and acoustical absorption.

Among the factors listed above, there are significant differences in the vibration characteristics when the source is underground versus at ground surface. In addition, soil conditions are known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil and the depth to bedrock. Vibration propagation is more efficient in stiff clay soils than in loose sandy soils, and shallow rock seems to concentrate the vibration energy close to the surface and can result in groundborne vibration problems at a great distance from the track. Factors such as layering of the soil and depth to water table can have significant effects on the propagation of groundborne vibration. Soft, loose, sandy soils tend to attenuate more vibration energy than hard, rocky materials. Vibration propagation through groundwater is more efficient than through sandy soils.

4.12.1.2 Sensitive Land Uses in the Project Vicinity

Certain land uses are considered more sensitive to noise than others. Examples include residential areas, educational facilities, hospitals, childcare facilities, and senior housing. The project vicinity and Specific Plan area are characterized by a mix of developed and undeveloped properties. Developed properties in the vicinity include an industrial/warehouse building in Moreno Valley to the northwest (Skechers) and several residential neighborhoods along Redlands Boulevard along the western boundary of the project site. An area of the City known as “Old Moreno” is situated near the southwest portion of the project site, around the intersection of Redlands and Alessandro Boulevards. The homes along Merwin Street, east of Redlands Boulevard, constitute the closest sensitive receptors to the project site (i.e., they are adjacent to the property).

4.12.1.3 Existing Noise Measurements

Existing noise levels in the vicinity of the proposed project are used to establish baseline noise levels in key areas. Noise measurements within the project site and in the surrounding area were taken. The noise measurement locations were selected to provide coverage of the project’s potential noise impact area. The noise measurement locations are shown in Figure 4.12.2.

Noise measurements were taken at sixteen sites in the project vicinity during the daytime hours (between 7 a.m. and 10 p.m.) and during nighttime hours (between 10 p.m. and 7 a.m.). For each measurement site and time period, noise levels were measured for 15 minutes and calibrated to ensure that the measured sound level readings were accurate. The measurements were used to calculate existing L_{eq} , L_{min} , L_{max} , $L_{1.7}$, $L_{8.3}$, L_{25} and L_{50} values for the measurement locations. Table 4.12.B shows the results for the daytime measurements, and Table 4.12.C shows the nighttime measurements.

4.12.1.4 Existing Traffic Noise Environment

The primary existing noise sources in the project area are transportation facilities. Traffic on SR-60, Redlands Boulevard, Theodore Street, Gilman Springs Road, and other local streets is the dominant source contributing to the ambient noise levels in the project vicinity. Noise from motor vehicles is generated by engine vibrations, the interaction between the tires and the road, and the exhaust system. Table 4.12.D identifies the existing (2012) traffic noise levels adjacent to roadway segments in the project vicinity.

4.12.1.5 Existing SDG&E and SCGC Facilities

The proposed World Logistics Center Specific Plan area is currently occupied by one San Diego Gas and Electric Company (SDG&E) compressor station and two Southern California Gas Company (SCGC) facilities. These facilities are located within the boundaries of the Specific Plan as shown in previously referenced Figure 4.12.2. The SDG&E compressor station recompresses natural gas received from interstate gas pipelines and delivers the gas to Southern California via transmission pipelines. The two SCGC facilities contain flow valve and metering equipment facilities. The southern SCGC facility contains a maintenance functions as well. All of these facilities contain gas pipeline blow-down equipment. This equipment includes exhaust stacks that vent the high pressure gas into the atmosphere occur during emergencies, scheduled maintenance, and annual testing of the blow-down systems.

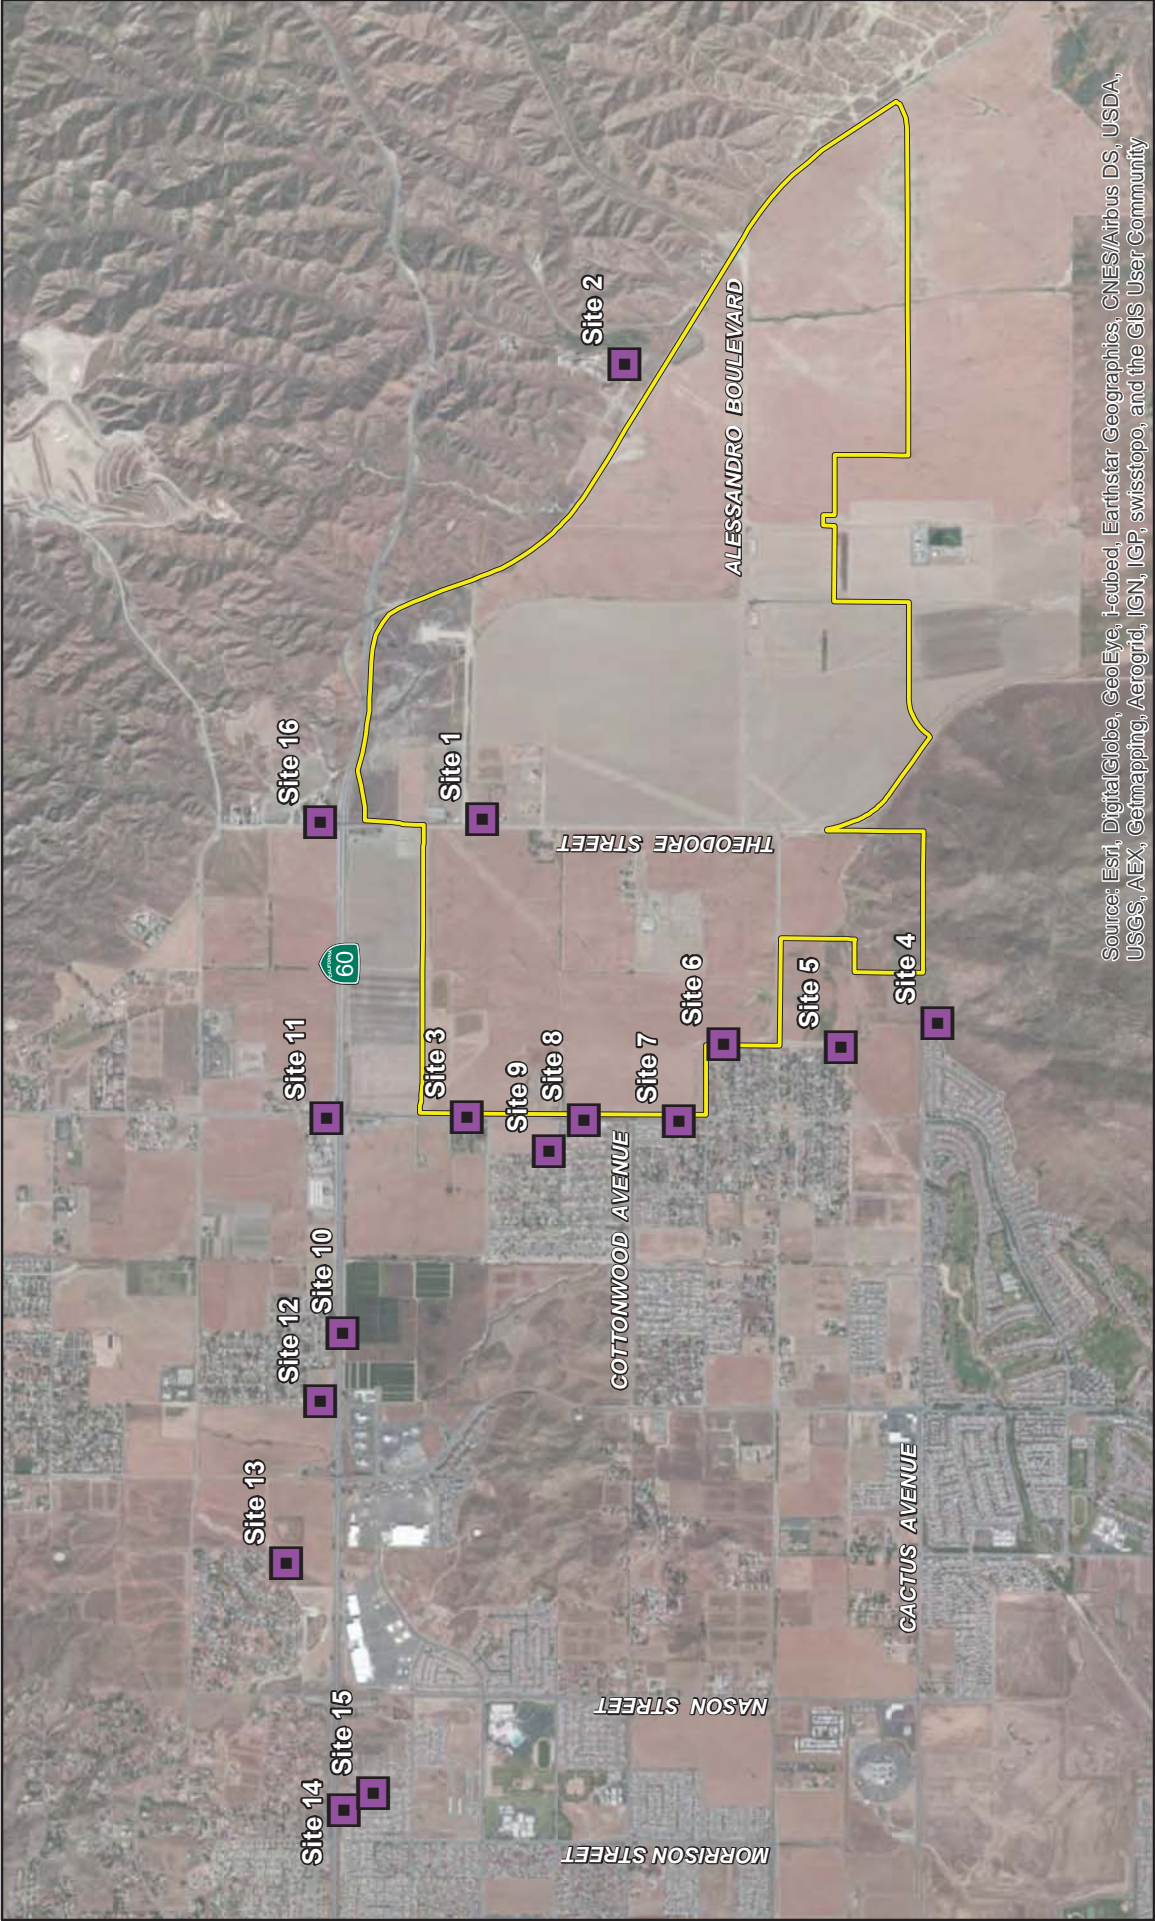

The SDG&E and SCGC facilities produce noise from three different sources that could affect future development within the proposed project: 1) the operation of the compressor station; 2) blow-down events at the compressor station; and 3) blow-down events at the SCGC facilities. The blow-down events generate infrequent high noise levels for relatively short periods. The compressor station generates a relatively constant noise level, although noise levels vary slightly when the compressors are turned on and off when the gas is conveyed to the transmission pipelines.

The SDG&E compressors are the primary source of operational noise generated by the compressor station. The facility contains two sets of three reciprocating natural gas combustion engines and one set of four natural gas-fired turbines, for a total of ten compressors with power ranging from 995 to 3,400 horsepower. The compressors are located within noise attenuation structures and are equipped with intake and exhaust silencers. The facility routinely operates at maximum capacity 24 hours per day. It is anticipated that demand on the compressor station will increase in the future to the point where the facility operates 24 hours a day, year round.

The CNEL levels for the SDG&E compressor station presented in Figure 4.12.3 are based on a worst-case assumption that the compressor station is in full operation 24 hours a day. Figure 4.12.4 presents the average (L_{eq}) noise levels generated by the compressor station during full operation. Both the CNEL and L_{eq} metrics are used to assess the noise impacts from the facility.

There are several blow-down points within the SDG&E compressor station. As stated previously, these blow-down points allow for the release of pressurized gas during emergencies, scheduled maintenance, and annual testing. Blow-down events at the compressor station vent gas and last between 30 and 90 seconds. The maximum sound levels (L_{max} dBA) generated by the blow-down events is presented in Figure 4.12.5.

THIS PAGE INTENTIONALLY LEFT BLANK

There are blow-down points in the SCGC facilities. Blow-down events at the SCGC facilities vent gas from miles of pipeline and are much longer than those at the compressor station, and can last up to 90 minutes. Approximately four blow-down events occur annually at the SCGC facilities. L_{max} noise levels (dBA) are shown in Figure 4.12.6. The noise level will be at or near the L_{max} level during the entire blow-down event. It should also be noted that blow-down events generate ground vibrations and natural gas odors in the vicinity in the surrounding area when events occur. Again, it must be noted that these blow-down events are part of the existing conditions of the project site, and any impacts caused by development of new warehousing near these facilities, and any mitigation necessary, are not the responsibility of SCGC or SDG&E.

4.12.2 Existing Policies and Regulations

The applicable noise standards governing the project site are the criteria in the City of Moreno Valley General Plan Safety Element (Environmental Safety, Noise) and Municipal Code (Noise Ordinance). The City's Safety Element of the General Plan does not contain specific noise standards or significance thresholds. However, the General Plan does cite applicable State standards including the California Administrative Code, Section 1092 of Title 25, Chapter 1, Subchapter 1, Article 4 and Section 5014 of Title 21, Subchapter 6, Article 2. In addition, other applicable standards identified in the *California Noise Insulation Standards*¹ and the *State of California Vehicular Code*² are included below. The following sections list the General Plan policies, Municipal Code, and State standards relevant to noise for the proposed project.

4.12.2.1 City of Moreno Valley General Plan Policies

Chapter 9 of the *City of Moreno Valley General Plan*³ defines goals, objectives, policies, and action items related to noise conditions in the City. The specific policies related to noise that are relevant to the proposed project are as follows:

- Objective 6.3** Provide noise compatible land use relationships by establishing noise standards utilized for design and siting purposes.
- Policy 6.3.5** Enforce the California Administrative Code, Title 24 noise insulation standards for new multi-family housing developments, motels and hotels.
- Policy 6.3.6** Building shall be limited in areas of sensitive receptors.
- Objective 6.4** Review noise issues during the planning process and require noise attenuation measures to minimize acoustic impacts to existing and future surrounding land uses.
- Policy 6.4.1** Site, landscape and architectural design features shall be encouraged to mitigate noise impacts for new developments, with a preference for noise barriers that avoid freeway sound barrier walls.
- Objective 6.5** Minimize noise impacts from significant noise generators such as, but not limited to, motor vehicles, trains, aircraft, commercial, industrial, construction, and other activities.
- Policy 6.5.1** New commercial and industrial activities (including the placement of mechanical equipment) shall be evaluated and designed to mitigate noise impacts on adjacent uses.
- Policy 6.5.2** Construction activities shall be operated in a manner that limits noise impacts on surrounding uses.

FIGURE 4.12.6

THIS PAGE INTENTIONALLY LEFT BLANK

4.12.2.2 City of Moreno Valley Municipal Code

The *Moreno Valley Municipal Code*¹ establishes a Noise Ordinance that describes the noise standards within the City. Chapter 11.80.030 (Title 11) lists specific prohibited acts.

The City's residential site development standards, as identified in Chapter 9.03.040 of the City's Planning and Zoning Code, state that in all residential districts, air conditioners, heating, cooling, and ventilating equipment and all other mechanical lighting or electrical devices shall be operated so that noise levels do not exceed 60 dBA (L_{dn}) at the property line.

The City's Municipal Code, Section 6.04.030.J states that "to create, allow or maintain any loud or unusual noise or operate or maintain any device, instrument, vehicle, or machinery in such a manner as to create loud or unusual noise, cause vibrations, or unreasonable light spillage or glare which causes discomfort or annoyance to reasonable persons of normal sensitivity, or which endangers the comfort, repose, health or peace of the public or of any person using or occupying other property in the vicinity" is prohibited.

The City's Municipal Code, Section 9.10.140, specifies that all commercial and industrial uses shall be operated so that noise created by any loudspeaker, bells, gongs, buzzers, or other noise attenuation or attracting devices shall not exceed 55 dBA at any one time beyond the boundaries of the property.

Chapter 11.80.030 of the City's Municipal Code also states:

Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 and Table 1-A specify sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the sound levels are being exceeded. No sound shall be permitted within the City which exceeds the parameters set forth in Table 11.80.030-1 [Table 4.12.E] and 11.80.030-1-A [Table 4.12.F] of this chapter.

No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimpulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 [Table 4.12.F] when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.

The following uses and activities shall be exempt from the sound level regulations except the maximum sound levels provided in Tables 11.80.030-1 [Table 4.12.E] and 11.80.030-1A [Table 4.12.F]:

- 1. Sounds resulting from any authorized emergency vehicle when responding to an emergency call or acting in time of an emergency.*
- 2. Sounds resulting from emergency work as defined in Section 11.80.020.*
- 3. Any aircraft operated in conformity with, or pursuant to, federal law, federal air regulations and air traffic control instruction used pursuant to and within the duly adopted federal air regulations; and any aircraft operating under technical difficulties in any kind of distress, under emergency orders or air traffic control, or being operated pursuant to and subsequent to the declaration of an emergency under federal air regulations.*

¹ *Moreno Valley Municipal Code*, City of Moreno Valley, current through Ordinance 836 and the November 2012 code supplement.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4. All sounds coming from the normal operations of interstate motor and rail carriers, to the extent that local regulation of sound levels of such vehicles has been preempted by the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.) or other applicable federal laws or regulations.
5. Sounds from the operation of motor vehicles, to the extent they are regulated by the California Vehicle Code.
6. Any constitutionally protected noncommercial speech or expression conducted within or upon any public right-of-way, public space or other publicly owned property constituting an open or a designated public forum in compliance with any applicable reasonable time, place and manner restriction on such speech or expression or otherwise pursuant to legal authority.
7. Sounds produced at otherwise lawful and permitted city-sponsored events, organized sporting events, school assemblies, school playground activities, by permitted fireworks, and by permitted parades on public right-of-way, public space, or other publicly owned property.
8. An event for which a temporary use permit or special event permit has been issued under other provisions of this code, where the provision of Section 11.80.010 are met, the permit granted expressly grants an exemption from specific standards contained in this chapter, and the permittee and all persons under the permittee's reasonable control actually comply with all conditions of such permit. Violation of any condition of such permit related to sound or sound equipment shall be in violation of this chapter and punishable as such.

Table 4.12.E and Table 4.12.F show the maximum sound levels that are permitted in the City for continuous and impulsive sounds, respectively.

Table 4.12.E: Maximum Continuous Sound Levels*

Duration Per Day Continuous Hours	Sound Level (dBA)
8	90
6	92
4	95
3	97
2	100
1.5	102
1	105
0.5	110
0.25	115

* When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percentage of allowed period of sound exposure at each level exceeds 100 percent.

Source: Chapter 11.80.030 Table 11.80.030-1, City of Moreno Valley Municipal Code, City of Moreno Valley.

Table 4.12.F: Maximum Impulsive Sound Levels

Number of Repetitions Per 24-Hour Period	Sound Level (dBA)

10	135
100	125

Source: Chapter 11.80.030 Table 11.80.030-1A, City of Moreno Valley Municipal Code, City of Moreno Valley.

The City also restricts the sound levels for non-impulsive sound on lands designated for residential and commercial land uses during the daytime and nighttime time periods. These levels are shown in

Table 4.12.G. Section 11.80.050 (3) clearly identifies the measurement as an “average” noise level, and therefore, the noise limits shown in Table 4.12.G are interpreted as the L_{eq} noise level.

Table 4.12.G: Maximum Sound Levels (in dBA) for Source Land Uses

Residential		Commercial	
Daytime	Nighttime	Daytime	Nighttime
60	55	65	60

Source: Chapter 11.80.030 Table 11.80.030-2, City of Moreno Valley Municipal Code, City of Moreno Valley.

The City prohibits all construction and demolition activities between the hours of 8:00 p.m. and 7:00 a.m. the day following a noise disturbance. A noise disturbance is defined as any sound which that disturbs a reasonable person of normal sensitivities, exceeds the sound level limits set forth in the Noise Ordinance, or is plainly audible. A noise disturbance is defined as plainly audible measured at a distance of 200 feet from the real property line of the source of the sound if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property.

4.12.2.3 State of California Vehicle Code

Recent studies have shown that the most objectionable feature of traffic noise is the sound produced by vehicles equipped with illegal or faulty exhaust systems. In addition, such vehicles are often operated in a manner that causes tire squeal and excessively loud exhaust noise. A number of California State vehicle noise regulations can be enforced by local authorities as well as the California Highway Patrol. These include § 27150 (mufflers) of the California Vehicle Code (CVC), as well as excessive speed laws, which may be applied to curtail traffic noise. The California Highway Patrol and the Department of Health Services (through local health departments) are available to aid local authorities in code enforcement and training pursuant to proper vehicle sound level measurements.

4.12.2.4 State of California Noise Compatibility Guidelines

The State of California Noise Compatibility Guidelines, published by the Department of Health, Services provides guidance for use when siting land uses. The compatibility guidelines are shown in Figure 4.12.7. The guidelines will be used to evaluate the compatibility of the proposed land uses with the noise environment. The guidelines show compatibility of various land uses with different noise environments. The guidelines show that industrial uses are normally acceptable in noise environments up to 75 CNEL.

4.12.3 Methodology

Evaluation of noise impacts associated with the proposed project includes the following:

- Determination of the short-term construction noise impacts on off-site noise-sensitive uses;
- Determination of the long-term noise impacts, including vehicular traffic and stationary noise sources, on on-site and off-site noise-sensitive uses; and
- Determination of the required mitigation measures to reduce long-term noise impacts from all sources.

Because of the location of noise-sensitive receptors, the noise analysis evaluates the noise effects of the industrial development on the existing residential development (sensitive receptors) near the southwest portion of the proposed project area.

THIS PAGE INTENTIONALLY LEFT BLANK

Land Use/Noise Compatibility Guidelines

- 
Normally Acceptable Specified land use is satisfactory based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements
- 
Conditionally Acceptable - New construction or development shall be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply system of air conditioning, will normally suffice.
- 
Normally Unacceptable New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design
- 
Clearly Unacceptable New construction or development should generally not be undertaken

LSA

FIGURE 4.12.7

*World Logistics Center Specific Plan Project
Environmental Impact Report*

California Noise Compatibility Guidelines

THIS PAGE INTENTIONALLY LEFT BLANK

There are no Federal Highway Administration (FHWA), State, or local standards for vibration. According to the FHWA, highway traffic and construction vibrations pose no threat to buildings and structures; and annoyance to people is not considered any worse than other discomforts experienced from living near highways. However, a substantial amount of research has been completed to compare vibrations from single events such as dynamite blasts with architectural and structural damage. The U.S. Bureau of Mines has set a safe limit of 0.5 inch per second peak particle velocity to avoid structure damage in residential structures (U.S. Bureau of Mines 1980). Below this level, there is virtually no risk of building damage.

4.12.4 Thresholds of Significance

A project would have a significant effect on the environment related to noise if it would substantially increase the ambient noise levels for adjoining areas or if it would conflict with adopted environmental plans and goals of the community in which it is located.

The applicable noise standards and guidelines governing the project are those specified previously in Sections 4.12.2.1 through 4.12.2.4. In summary, these criteria are contained within the Safety Element of the General Plan, the Municipal Code, the California Vehicle Code, and the State Noise Compatibility Guidelines.

For this project, a noise impact is considered significant if the project would result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the *City of Moreno Valley General Plan*, *Moreno Valley Municipal Code*, or applicable standards of other agencies;
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- A substantial temporary, periodic, and/or permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels; and/or
- For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.

The standards within the *City of Moreno Valley General Plan* and *Moreno Valley Municipal Code* determine the acceptable noise environment for proposed project and its vicinity. The standards are as follows:

- To the extent feasible, ensure through the design review process that exterior noise levels at commercial and industrial areas do not exceed 75 dBA CNEL.
- Consider the following uses noise-sensitive and discourage them in areas where exterior noise levels exceed 65 dBA CNEL unless measures are implemented that reduce the noise exposure below this level: single-family and multiple-family residential uses, group homes, hospitals, schools and other learning institutions, and parks and open space areas where quiet is a basis for use.

Long-term impacts from the project's traffic noise that affect existing sensitive land uses are considered to be substantial and, therefore, constitute a significant noise impact if the project would:

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

The project’s incremental contribution to a cumulative noise increase would be considered cumulatively considerable and significant when ambient noise levels affect noise-sensitive land uses and when the project increases noise levels by 1 dB or more over pre-project conditions and the predicted future cumulative with project noise levels cause the following cumulative increases:

- Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;
- Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.

4.12.5 No Impact/Less than Significant Impacts

The following impacts were identified as having a less than significant impact or no impact on the environment with implementation of the proposed project.

4.12.5.1 Groundborne Vibration Impacts

Threshold	Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?
-----------	--

Roadways in the vicinity of the project area are either paved or would be paved as the area develops, and would not result in project traffic driving over rough or dirt roads. Well maintained roads typically do not result in substantial vibration levels. Even roads with irregularities typically only generate substantial levels of vibration very near, less than 50 feet from the irregularity. Construction activities that would occur within the WLCSP area are not anticipated to require blasting or pile driving. Roadway vibrations are typically not perceptible more than 50 feet from the roadway except in very unusual circumstances. Generally, the interface between the soft tire of a truck or automobile will not generate significant vibration unless the road is in poor shape (e.g., potholes or pavement joints) Therefore, impacts associated with this issue are anticipated to be less than significant, and no mitigation is required.

4.12.5.2 Airport Noise Impacts

Threshold	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, results in exposure of people residing or working in the project area to excessive noise levels. For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.
-----------	---

The project area is located approximately 5.5 miles northeast of the March Airfield (MAF) and is not located within two miles of a private airstrip. The MAF is a joint-use airport, used for both military and civilian purposes. The March Air Reserve Base (MARB) is the military operator of the MAF and March Inland Port (MIP) is the civilian operator of the airport. This facility is anticipated to play an increasingly important role in the transportation of goods and cargo for the Southern California region. Existing flight patterns affect a large portion of the City of Moreno Valley, along a path that affects the

western portion of the City in a northwest/southeast alignment. Aircraft operations from the airport currently contribute intermittent single-event noise.

There is potential for single-event noise exposure levels from MAF activity to affect the proposed project. The exposure levels will vary dependent upon the type of aircraft and flight track flown for each operation at MAF. However, the proposed project is not identified as being within the noise or safety contours delineated for the MARB Airport.¹ In addition, the proposed project is not considered to contain sensitive receivers and, therefore, the impacts from these single-event noise levels are considered to be below the level of significance. The City's exterior noise standard for industrial uses is 70 dBA CNEL. MAF noise levels are less than 60 dB CNEL within the project area. Therefore, the proposed project would not have the potential to expose people to excessive noise levels from airport operations. Therefore, no significant noise impacts would occur regarding these issues from implementation of the proposed project, and no mitigation is required.

4.12.6 Significant Impacts

4.12.6.1 Short-Term Construction Noise Impacts

Threshold	Would the project result in a substantial temporary, periodic, and/or permanent increase in ambient noise levels in the project vicinity above levels existing without the project?
-----------	---

Short-term noise would occur during the construction of the WLCSP. First, construction crew commutes and the transport of construction equipment and materials to the site for the proposed WLC project would incrementally increase noise levels on access roads in the WLC planning area. In addition, noise would be generated during excavation, grading, and building construction on various portions of the Specific Plan site. Construction is completed in discrete steps, each of which has its own mix of equipment, and consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. The site preparation phase, which includes excavation and grading of the site, tends to generate the highest noise levels, because the noisiest construction equipment is earthmoving equipment, which includes excavating machinery such as backfillers, bulldozers, draglines, and front loaders. Earthmoving and compacting equipment includes compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Implementation of the Specific Plan would result in construction activities that would require the use of scrapers, bulldozers, and water and pickup trucks within the WLCSP area.

Figure 4.12.8 presents construction noise levels measured at 50 feet. The peak noise level for the majority of the equipment that will be used during construction of the proposed project will range from 70 to 95 dBA. Based on the fact that noise levels dissipate with increases in distance from the noise source due to noise divergence, noise levels at greater distances are less than those presented in Figure 4.12.8. Noise measurements made by Mestre Greve Associates demonstrate that the noise levels generated by commonly used grading equipment (e.g., loaders, graders, and trucks) generate noise levels that typically do not exceed the middle of the range shown in Figure 4.12.8.² However, the noise levels shown in Figure 4.12.8 have been used as the basis for the noise analysis estimates presented in this EIR.

¹ Figure 5.4-1 March Reserve Air Base Noise Impact Area, City of Moreno Valley General Plan EIR, July 2006.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Construction activities that are associated with the proposed WLCSP project would occur in two general areas: on-site and off-site. Some phases of the on-site construction would occur for 24 hours a day for 7 days a week. It is anticipated that on-site construction would occur periodically over a nine-year period with a potential start year of 2015 and ending in 2030. Off-site construction (which would involve minor grading, drainage, interchange, utility, and roadway improvements) is anticipated to only during the daytime weekday hours and would have a shorter construction duration.

On-site Construction. Sensitive receptors that would be potentially affected by on-site construction activities would include residences located within and adjacent to the WLCSP area as well as residences located on the north side of SR-60. For residences on the opposite side of SR-60, existing daytime and nighttime freeway noise is anticipated to be greater than the noise generated by the construction activities that would occur within the WLCSP area. Although certain conditions at night, such as low inversions and very calm conditions, can increase the ability of construction noise to travel to the residences north of the freeway, these same conditions would also amplify the noise generated on the freeway. Since freeway noise would continue to be the dominant noise source in the area for these residences along SR-60, construction noise impacts on the residents north of the freeway will be less than significant and no mitigation is required.

Existing residences within the WLCSP area or adjacent to the Specific Plan area may be located within 50 feet or less from areas where intense construction (24 hours a day, 7 days a week) would occur. Although residential properties located within the WLCSP would be rezoned as Light Logistics, the existing residences are considered to be noise-sensitive uses that would be affected by intense construction activities. Similarly, residences located adjacent to the project site (i.e., along Redlands Boulevard, Merwin Street, Bay Avenue, Cactus Avenue, and Gilman Springs Road) would also be affected by intense construction activities. Based on a 50-foot noise attenuation distance, these residences may experience worst-case unmitigated peak construction noise levels (L_{max}) up to 97 dBA. The average noise levels are typically 5 to 15 dB lower than the peak noise levels. Average noise levels (L_{eq}) at 50 feet could easily be in the range of 82 to 92 dBA during most phases of construction.

The City of Moreno Valley Municipal Code does not include any exemptions for construction noise. Therefore, construction would be subject the limitations of 60 dBA during daytime and 55 dBA at nighttime measured at residential areas. According to Section 3.4.14, *Project Description*, WLC project construction may occur 24 hours a day, 7 days a week for certain activities. Significant noise impacts would be expected, especially if work with high noise levels occurs between 8:00 p.m. and 6:00 a.m.

Based on these projections, anticipated worst-case construction noise levels would regularly be exceeded during daytime and nighttime hours at residences within the Specific Plan area. Based on an L_{eq} noise level of 90 dBA at 50 feet, an observer would need to be 1,580 feet from the construction to experience a noise level of 60 dBA (L_{eq}), or 2,800 feet for a noise level of 55 dBA (L_{eq}). Therefore, a residence within 1,580 feet during active construction during the daytime would be affected. Similarly, a residence within 2,800 feet during the nighttime would be affected by construction noise.

As set forth in Section 3.4.14 and as stated by the project applicant, construction could occur 24 hours per day, 7 days per week for these construction activities. Therefore, noise levels at the nearest residences would exceed the City's exterior noise standard of the 60 dBA¹ CNEL daytime standard and 55 dBA CNEL nighttime standard for residential uses. This is a significant impact requiring mitigation.

¹ Chapter 11.80.030 Table 11.80.030-2, City of Moreno Valley Municipal Code, City of Moreno Valley.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Off-site Construction. Construction activities associated with off-site construction include road improvements along Cactus Avenue and Redlands Boulevard, water and utility improvements, construction of a detention basin, debris basins, and interchange improvements. Roadway and interchange improvements are planned along Cactus Avenue, Redlands Boulevard, State Route 60, and Gilman Springs Road. Often the loudest pieces of equipment associated with this type of construction are the graders/scrapper equipment. Peak noise levels at 50 feet can reach 96 dBA, with average noise levels (L_{eq}) in the 85 dBA range. Noise levels of 60 dBA (L_{eq}) could be exceeded for up to 900 feet from the construction area. Existing residences are located within 900 feet of the off-site construction areas and would be exposed to noise levels that would exceed of the Moreno Valley noise criteria for residential uses.

Other off-site construction improvements such as drainage, sewer, water, and utility features would also generate noise in close proximity to existing sensitive uses. However, these activities typically utilize less construction equipment, which results in lower noise levels. These construction activities may commonly employ a backhoe as the loudest piece of equipment. A backhoe may have a peak noise level that exceeds 90 dBA at 50 feet, but has an average noise level around 80 dBA (L_{eq}) at 50 feet. However, at this noise level one would need to be more than 500 feet away to experience a noise level (L_{eq}) of less than 60 dBA. This noise level would exceed the City's daytime criteria at the nearest existing residences and mitigation measures would be required.

Specific Plan Design Features. The WLCSP does not contain any design features that specifically address noise. Other features, such as perimeter setback requirements, will have the effect of reducing noise to certain residential areas.

Note: The following changes to the mitigation measures were made as a result of the revised project noise assessment (Appendix K in FEIR Volume 2) and in responses to Comments C-4-2 in Letter C-4 from Sempra Energy and Comments F-13-9 and F-13-84 in Letter F-13 from Johnson & Sedlack on behalf of the Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.

Mitigation Measures. Construction of the proposed project would result in noise levels at the closest residences exceeding the maximum noise level allowed under the City's Municipal Code. The following measures¹ would reduce short-term construction-related noise impacts associated with the proposed WLC project:

- 4.12.6.1A** Prior to issuance of any discretionary project approvals, a Noise Reduction Compliance Plan (NRCP) shall be submitted to and approved by the City. The Noise Reduction Compliance Plan shall show the limits of nighttime construction in relation to any then-occupied residential dwellings and shall be in conformance with City standards. Conditions shall be added to any discretionary projects requiring that the limits of nighttime grading be shown on the Noise Reduction Compliance Plan and all grading plans submitted to the City (per Noise Study MM N-2, pg. 51).
- 4.12.6.1B** All construction equipment, fixed or mobile, shall be equipped with operating and maintained mufflers consistent with manufacturers' standards.
- 4.12.6.1C** Construction vehicles shall be prohibited from using Redlands Boulevard south of Eucalyptus Avenue to access on-site construction for all phases of development of the Specific Plan (per Noise Study MM N-1, pg. 51).

¹ Measures 4.12.6.1B-F corresponds to the noise study measures N-1 through N-5.

- 4.12.6.1D** No grading shall occur within 2,800 feet of residences south of State Route-60 between 8 p.m. and 6 a.m. on weekdays and between 8 p.m. and 7 a.m. on weekends. These restrictions shall be included as part of the Noise Reduction Compliance Plan per Mitigation Measure 4.12.6.1A (per Noise Study MM N-2, pg. 51)
- 4.12.6.1E** As an alternative to Mitigation Measure 4.12.6.1D, a 12-foot tall temporary construction sound barrier may be installed for residences within 1,580 feet of active nighttime construction areas. The temporary sound barrier shall be constructed of plywood with a total thickness of 15 inches, or a sound blanket wall may be used. If sound blankets are used, they must have a Sound Transmission Class (STC) rating of 27 or greater. This shall be included as part of the Noise Reduction Compliance Plan required in Mitigation Measure 4.12.6.1A, which shall be reviewed and approved by the City prior to implementation (per Noise Study MM N-2 and N-3, pg. 51 and pg. 52).
- 4.12.6.1F** As an alternative to Mitigation Measure 4.12.6.1D and 4.12.6.1E, on-site noise measurements of construction areas may be taken by qualified personnel and specific buffer distances between construction activities and existing residences may be proposed based on actual noise levels. These measurements will be incorporated into the Noise Reduction Compliance Plan required in Mitigation Measure 4.12.6.1A, which shall be reviewed and approved by the City prior to implementation (per Noise Study MM N-2, pg. 51).
- 4.12.6.1G** Any discretionary approvals for development that proposes grading within 1,580 feet of occupied residential units shall require that all grading equipment be equipped with residential grade mufflers (or better). All stationary construction equipment shall be placed so that emitted noise is directed away from noise-sensitive receptors nearest the site. Additionally, stationary construction equipment shall have all standard acoustic covers in place during operation (per Noise Study MM N-4, pg. 52).
- 4.12.6.1H** All material stockpiles in connection with any grading operations shall be located at least 1,200 feet from existing residences (per Noise Study MM N-5, pg. 52).
- 4.12.6.1I** All project-related off-site construction shall be limited to 6 a.m. and 8 p.m. on weekdays only. Construction during weekends and City holidays shall not be permitted (per Noise Study MM N-6, pg. 53) to the satisfaction of the Land Development Division/Public Works.
- 4.12.6.1J** Prior to issuance/approval of any grading permits, off-site construction activities adjacent to residential uses shall provide for installation of 12-foot temporary sound barriers for construction activities lasting more than one month. The sound barrier will reduce noise levels by approximately 10 dB. The temporary sound barrier may be constructed of plywood with a total thickness of 1.5 inches, or a sound blanket wall may be used. If sound blankets are used, the curtains must have a Sound Transmission Class (STC) rating of 27 or greater. No off-site construction is permitted during weekday nighttime hours (8 p.m. to 6 a.m.) or during weekends and City holidays except for emergencies (per Noise Study MM N-7, pg. 53).

Level of Significance after Mitigation. *On-site Construction.* Elimination of nighttime construction within 2,800 feet of residences would lower the noise levels to 55 dBA (L_{eq}) at the closest residences. The noise levels would just meet the 55 dBA (L_{eq}) nighttime criteria contained in the Moreno Valley Noise Ordinance resulting in a less than significant impact. With the implementation of **Mitigation Measures 4.12.6.1A** through **4.12.6.1J**, the loudest noise level that would be experienced at any developed residential parcel would be less than the 55 dBA (L_{eq}) nighttime threshold and would be consistent with the limits established in the City's Noise Ordinance resulting in a less than significant impact. In addition, implementation of **Mitigation Measure 4.12.6.1H**, would reduce the noise experienced at existing residences, resulting in a less than significant impact.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

As previously stated, construction within 1,580 feet of residential areas south of the freeway has the potential to exceed the daytime Moreno Valley Noise Ordinance criteria of 60 dBA (L_{eq}). With implementation of **Mitigation Measure 4.12.6.1E**, any existing residences within 1,580 feet of a construction area would be shielded from construction noise with a 12-foot temporary sound barrier. A sound barrier will reduce the noise levels by about 10 dB resulting in a reduction of noise below City thresholds at residences 500 feet or further from the construction area. Although the installation of the temporary sound barrier would reduce noise levels experienced at the closest residences, those residences that are located within 500 feet of a construction area would still be exposed to noise levels greater than 60 dBA (L_{eq}). Therefore, impacts associated with this issue would remain significant and unavoidable.

Off-site Construction. With the implementation of **Mitigation Measure 4.12.6.1I**, off-site construction activities would be limited to daytime hours while **Mitigation Measure 4.12.6.1J** would require the installation of a temporary sound barrier. With these mitigation measures in place, residences adjacent to construction activities (depending on the loudness of the construction equipment) could experience noise levels greater than 60 dBA (L_{eq}) for off-site construction projects lasting less than one month. These impacts would only occur during weekday daytime hours. However, even with implementation of these mitigation measures, noise levels experienced at these residences would be above the City’s threshold. Therefore, impacts would remain significant and unavoidable.

4.12.6.2 Long-Term Traffic Noise Impacts

Threshold	Would the project result in a substantial temporary, periodic, and/or permanent increase in ambient noise levels in the project vicinity above levels existing without the project?
-----------	---

The January 2013 noise analysis contained in the Draft EIR identified 33 roadway segments where a significant noise impact would occur for at least one of the impact scenarios. In the revised noise analysis for the Final EIR, 21 roadway segments have been identified as having a significant noise impact. The reduction in noise impact areas is a direct result of the revised traffic analysis which reflects a downsizing of the project and associated traffic volumes for the “plus project” traffic scenarios. The roadway links that were previously identified as being impacted in the January 2013 noise analysis contained in the Draft EIR and are not impacted in the revised noise analysis for the Final EIR are listed below:

- Day Street between Cottonwood Avenue and Alessandro Boulevard (#109);
- Fir Avenue between Quincy Drive and Redlands Boulevard (#62);
- Moreno Beach Drive between Locust Avenue and Ironwood Avenue (#56);
- Perris Boulevard between John F. Kennedy Drive and Iris Avenue (#303);
- Placentia Avenue from El Nido Avenue to Evans Road and on to Water Avenue (#431, #432);
- Quincy Drive from Cactus Avenue to Alessandro Boulevard and to Cottonwood Avenue (#502, #503);
- Reche Canyon Road from Keissel Road to Reche Vista Drive and on to High Country Drive (#205, #206);
- Redlands Boulevard from Eucalyptus Avenue to Dracaea Avenue (#12); and
- State Route 60 from Perris Boulevard to Nason Street (#31).

The noise analysis for the proposed project is based on the traffic volume data contained in the revised Traffic Impact Analysis (TIA) prepared for the project (contained in its entirety as EIR

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Appendix L). The TIA addressed the intersections of surface streets in Moreno Valley of a collector or higher classification street with another collector or higher classification street, at which the proposed project will add 50 or more peak hour trips. The study area also included the main travel routes between the project and the neighboring cities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area extended west to the nearest ramps on SR-91 and as far south as the I-215 ramps at Redlands Avenue in Perris. The study area for freeways was selected to cover the freeway routes radiating from the project site to the north, south, east, and west. The traffic analysis covered SR-60 from SR-62 in the east to SR-71 in the west, SR-91 from I-215 in the east to I-15 in the west, and I-215 from SR-210 in the north to the Scott Road interchange in the south.

Three hundred and thirty nine (339) roadway links and eighty nine (89) freeway segments were analyzed in the noise analysis. The change in noise level was calculated for all 428 roadway and freeway links with and without the project for the existing case (2012), 2022, and 2035 time horizons. Links with noise increases less than 1.5 dB would not have a substantial noise increase and were not presented in the main body of the noise report (i.e., the tables and figures). Similarly, any links that do not have sensitive receptors (e.g., residential uses) were also not presented in the main body of the noise report. Based on this filtering process, of the 428 links analyzed, 44 links have sensitive receptors and an increase of 1.5 dB for at least one time horizon and were therefore addressed in the analysis.

The projected future daily traffic volumes (Parsons Brinckerhoff, Inc., September 2014) for roadway segments in the project vicinity were used in the traffic noise impact analysis. Modeled noise levels represent the worst-case scenario, which assumes that no shielding is provided between the traffic and the location where the noise contours are drawn. As previously identified, the threshold for traffic noise is 65 dBA CNEL for sensitive receptors.

Operation of development that could occur within the proposed project area would generate traffic along roadways in the project vicinity. Table 4.12.H identifies existing with project roadway traffic noise levels with the project.

Note: Table 4.12.H has been replaced in its entirety. Please refer to Final EIR Volume IV for the original Table 4.12.H, which can be found in section 4.12.6.2.

Source: Mestre Greve Associates, September 2014.

As identified in Table 4.12.H, build out of the proposed WLC project would result in relatively minor changes in traffic noise levels in the Existing plus Project scenario case. The largest project-related increase in traffic noise would be along Streets D, E, and F where increases of greater than 65 dBA are predicted. The increase associated with these roadway segments is attributable in part to Streets D, E and F being new roads that will be constructed by the proposed project. A total of 18 road or

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

freeway segments would result in a significant noise increase attributable to the project, resulting in a significant project direct impact requiring mitigation.

Year 2022 (Phase I) with and without project scenarios projected daily traffic volumes on roadway segments in the project vicinity were used to conduct the traffic noise modeling. The projected daily traffic volumes in the area were taken from the TIA prepared for the proposed project. Table 4.12.1 identifies year 2022 without project and with project traffic noise levels.

Note: Table 4.12.1 has been replaced in its entirety. Please refer to Final EIR Volume IV for the original Table 4.12.1, which can be found in section 4.12.6.2.

Source: Mestre Greve Associates, September 2014.

As identified in Table 4.12.I, implementation of the proposed WLC project would result in relatively minor changes in traffic noise levels in Year 2022 (Phase I). The largest project-related increase in traffic noise would be along Street D (Street E to Cactus Avenue) and Street E (north of Alessandro Boulevard), where increases of greater than 65 dBA are predicted for the 2022 With Project scenario over the Year 2022 without project scenario. The increase associated with these roadway segments is attributable in part to Streets D and E being new roads that will be constructed by the proposed project. A total of 7 road segments would result in a significant noise increase attributable to the project, resulting in a significant cumulative impact requiring mitigation.

Note: Table 4.12.J has been deleted in its entirety. Please refer to Final EIR Volume IV for the original Table 4.12.J, which can be found in section 4.12.6.2. Operation of the proposed project would generate traffic along roadways in the surrounding area during the buildout year (2035) scenario. Buildout Year (2035) with and without project scenarios projected daily traffic volumes on roadway segments in the project vicinity were used to conduct the traffic noise modeling. The projected daily traffic volumes in the area were taken from the TIA prepared for the proposed project. Table 4.12.J identifies the Buildout Year (2035) without project and with project traffic noise levels.

Note: Table 4.12.K (now table 4.12.J) has been replaced in its entirety. Please refer to Final EIR Volume IV for the original Table 4.12.K, which can be found in section 4.12.6.2.

Source: Mestre Greve Associates, September 2014.

Increases in noise levels associated with Buildout Year (2035) traffic conditions on area roadways range from 0.1 to 68.0 dBA. As identified in the Table 4.12.J, the greatest increase in noise levels would be along Street D (Street E to Cactus Avenue), Street E (north of Alessandro Boulevard), and Street F west (of Street A), where increases of greater than 65 dBA are predicted for the Buildout Year 2035 With Project scenario over the Buildout Year 2035 Without Project scenario. The increase associated with these roadway segments is attributable in part to Streets D, E, and F being new roads that will be constructed by the proposed project.

Note: A total of 14 road or freeway segments would result in a significant noise increase attributable to the project, resulting in a significant cumulative impact requiring mitigation. These 14 segments were included in the original noise study, and all other impacts identified in the original noise study are unchanged except as noted below.

Tables 4.12.H through 4.12.J identify the noise increases directly caused by the proposed project. These numbers represent the distance from the centerline of the road to the contour value shown. Note that the values given in Tables 4.12.H through 4.12.J do not take into account the effect of any existing noise attenuation in the form of barriers, soundwalls, or topography that may affect ambient noise levels.

For the reader's convenience, the significance threshold for a project-specific roadway noise impact as defined previously is:

- Project induced increase in noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Project induced increase in noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Project induced increase in noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

For the reader's convenience, the significance threshold for a project's incremental contribution to a cumulative noise increase as defined previously is:

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- A project increase of the ambient (cumulative without project) noise level by 1 dB or more, and the predicted future cumulative with project noise levels cause the following cumulative increases:
 - Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;
 - Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or
 - Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.

It should be noted that the same noise increase occurs at all locations along a roadway link. In addition, the noise contours cover a wider area around the local roadways than does the existing condition. State Route 60, however, continues to be the dominant noise source in the area.

In general, the project proposes logistics uses and will not be affected by these noise increases. However, there are a few scattered residences within the project area and adjacent to the WLCSP area that would be affected by the proposed logistics uses.

Within the Specific Plan Area. Existing noise-sensitive uses within the WLCSP area include three groups of residences that may remain with the implementation of the proposed project. The Specific Plan would rezone the properties as Light Logistics, but it is anticipated that the residences may remain for some time. The Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain, must be considered sensitive land uses.

- *Redlands Boulevard (north of Brodiaea Avenue).* The first group of homes is located east of Redlands Boulevard north of the intersection with Brodiaea Avenue. The traffic on Redlands Boulevard will not increase significantly as a result of the project. Future Street E is proposed to be constructed west of these existing residences. However, as stated in the Noise Study conducted for the Specific Plan, it is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways. Therefore, impacts are anticipated to be less than significant and no mitigation is required.
- *Street A/Theodore Street (Street B to Street F).* The second group of residences within the Specific Plan area is located on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are currently two residences in this area. These residences are anticipated to experience noise increases up to 16 dB due to the implementation of the Specific Plan. As a result, existing noise levels at these two residences will be changed significantly. The exact alignment of the roadway is yet to be determined, but the homes may be roughly 100 feet from the centerline on the roadway. As identified in Table 4.12.J, at this distance, the noise level by future year (2035) could be as high as 73.1 CNEL. This level of noise would be above the 65 CNEL threshold and would result in a greater than 1.5 dB noise increase when compared to without project conditions. This is a significant impact requiring mitigation.
- *Street F/Dracaea Avenue (east of Theodore Street).* The third area is a single residence located east of Theodore Street along what is currently Dracaea Avenue (future Street F). Existing conditions identify low levels of traffic noise on Dracaea Avenue. With build out of the project, noise levels would reach as high as 68.1 CNEL. This level of noise would be above the 65 CNEL threshold and result in a greater than 1.5 dB noise increase when compared to without project conditions. Therefore, this is a significant impact requiring mitigation.

Off-Site Areas Adjacent to the Specific Plan Area. For areas adjacent to the Specific Plan area, 18 segments would experience a noise increase that would be greater than significance criteria specified previously. These seven areas are described below.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- *Cactus Avenue (Redlands Boulevard to Street D)*. This area is occupied by a small group of single-family homes along Cactus Avenue between the future Street D and Redlands Boulevard. A significant noise increase is projected for all time horizons. Currently, there is no soundwall along these homes. Therefore, this is a significant impact requiring mitigation.
- *Cactus Avenue (west of Redlands Boulevard)*. As identified in the noise study, this area shows noise increases ranging from 0.7 dB to 4.2 dB depending on the time horizon. Only the 2035 case results in a significant noise increase.

Existing residences are located along Redlands Boulevard with rear yards facing Cactus Avenue. Existing 6-foot high soundwalls are located along the residences and rear yard areas are approximately 60 feet from the centerline of the roadway. In buildout year (2035), the noise levels projected for the yard area including the effects of the soundwall are projected to be 66.2 CNEL. This is above the City criteria of 65 CNEL, resulting in a significant impact and mitigation is required.

- *Gilman Springs Road (between Eucalyptus Avenue and Street C, between Jack Rabbit Trail and Bridge Street, and between Bridge Street and SR-79 SB Ramps)*. There are three single-family homes scattered along these roadway segments. All of the houses are set back from the roadway, but none has soundwalls. A significant noise increase is projected for at least one of these segments in all time horizons. Therefore, this is a significant impact requiring mitigation.
- *Ironwood Avenue (between Redlands Boulevard and Highland Boulevard)*. There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. A significant noise increase is projected for 2012 with full project build out. Therefore, this is a significant impact requiring mitigation.
- *John F. Kennedy Drive (south of Cactus Avenue)*. The residences along John F. Kennedy Drive south of Cactus Avenue will experience significant noise increases in all four time horizons. Similar to the area along Cactus Avenue, this noise increase will be due to cars and light vehicles, and not heavy trucks. The residences along the west side of the roadway are generally depressed with respect to the road and have existing 6-foot soundwalls. Due to the presence of the existing soundwalls and slope conditions, noise levels would be reduced by 6 to 10 dB. This would result in noise levels being below the City threshold of 65 CNEL for residential uses. Therefore, residences on the west side of the street will not be affected. Impacts are considered to be less than significant and no mitigation is required.

The residences on the east side of the roadway are elevated with respect to the roadway and do not have soundwalls. Rear yards areas on both sides of the street are approximately 60 to 90 feet from the centerline of the roadway and are bordered by wrought iron fencing. As identified in Tables 4.12.H through 4.12.J, the greatest noise levels that would be experienced at these residences would range up to 67.5 CNEL, which is above the City threshold of 65 CNEL. This is a significant impact requiring mitigation.

- *Locust Avenue (between Moreno Beach Drive and Smiley Boulevard)*. There are three single-family homes along this roadway and they front onto the roadway. The 2035 time horizon results in a significant noise increase for this area. In 2035, the project will increase noise levels by 1.5 dB, bringing the noise level to 66.9 CNEL. This is a significant impact requiring mitigation.
- *Redlands Boulevard (from Eucalyptus Avenue to State Route 60)*. There are scattered homes in this area that either face Redlands Boulevard (or Shubert Street) or are on Redlands Boulevard. The 2012 and 2035 time horizons result in a significant noise increase for this area. This is a significant impact requiring mitigation.
- *Redlands Boulevard (from Ironwood Avenue to State Route 60 and Ironwood Avenue to San Timoteo Canyon Road)*. There are approximately 28 homes along this roadway that would be affected. The single-family homes are scattered and generally front the roadway. All time horizons result in a significant noise increase for this area. The increases in noise are around 2

dB with a resultant noise level in the 70 to 71 CNEL range. This is a significant impact requiring mitigation.

- *San Timoteo Canyon Road (from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard)*. There are about four scattered residences along this roadway that would be affected. The existing baseline plus project time horizon results in a significant noise increase for this area. The noise increases by up to 3.1 dB with resultant noise levels in the 65 to 66 CNEL range. This is a significant impact requiring mitigation.
- *Theodore Street (State Route 60 to Highland Boulevard)*. There are four existing homes on Theodore Street that front onto the roadway. Implementation of the Specific Plan would result in a 7.1 dB increase over baseline conditions (2012), and a 3.1 dB increase in Opening Year (2022). By Buildout Year (2035), the noise increase associated with the proposed project is anticipated to be 1.2 dB, which would not be significant. These existing residences could experience noise levels of 65.0 CNEL in the baseline and 66.3 CNEL in the Year 2035 time horizons which is above the City threshold of 65 CNEL. This is a significant impact requiring mitigation.
- *Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19)*. There are three groups of homes that may remain within the project area. The analysis shows significant noise increases for all four cases. The proposed Specific Plan designates these properties for Light Logistics uses, but the residences may remain indefinitely. The future Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain as a non-conforming use, must be considered as a sensitive land use. The first group of homes is east of Redlands Boulevard north of the intersection with Brodiaea Avenue. Street E will be constructed west of these homes. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways.

The second group of homes is on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are two homes in this area. Their noise environment will be changed significantly. The exact alignment of the roadway is to be determined, but noise levels could exceed 70 CNEL at the residences. The noise levels at these homes would be unacceptable to the residents, and a significant impact would occur.

The third area is a single home and lies east of Street A and along Street F. Currently there is essentially no traffic on this street. There is one residence in this area. Depending on the alignment for the street noise levels could exceed 70 CNEL. Since this home will experience a substantial noise increase, this is considered a significant impact.

It should be noted these homes were evaluated in the original DEIR and their impacts were disclosed on DEIR page 4.12-47.

- *Cactus Avenue Extension (from Street E to Cactus Avenue)*. Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the project parallel to Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. There would be limited or no heavy trucks using this roadway. The 65 CNEL contour will lie 114 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than 114 feet to the residences, then a significant impact would occur. Outdoor living spaces for homes along Merwin Street would experience noise levels greater than 65 CNEL, and this would not be consistent with City criteria. This is a significant impact requiring mitigation.
- *State Route 60 (from Pigeon Pass Road to Perris Boulevard)*. All residential areas along this stretch of freeway have soundwalls in place. The 2012 time horizon results in a significant noise increase for this area. The noise levels are projected to increase by 1.5 to 1.7 dB in this area with

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

resultant noise levels in the 66.9 to 68.0 CNEL range. This is a significant impact requiring mitigation.

- *State Route 60 (from Moreno Beach Drive to Redlands Boulevard)*. There are soundwalls in place for all residences in this area. The existing 2012 and 2035 time horizons result in a significant noise increase for this area, reaching 67.1 CNEL by 2035. This is a significant impact requiring mitigation.
- *State Route 60 (from Redlands Boulevard to Theodore Street)*. No soundwalls are present in this area. The residential area is set back from the freeway and is clustered along Redlands Boulevard north of the freeway. The existing 2012 time horizon results in a significant noise increase for this area. The resultant noise level will be 63.5 CNEL with an increase due to the project of 3.4 dB. This is a significant impact requiring mitigation.

Specific Plan Design Features. The WLCSP indicates there will be a 250-foot setback from existing housing along Redlands Boulevard. No additional design features to attenuate noise impacts are planned as part of the WLCSP.

Note: Due to changes in the Specific Plan, Project Traffic Impact Assessment, Project Noise Study, and in response to comments in Letter C-4-2 and F-13-9 and F-13-84, the following mitigation measures have been revised.

Mitigation Measures. Construction of the proposed WLC project would result in noise levels at the closest residences within and adjacent to the WLCSP area exceeding the maximum noise level allowed under the City's Municipal Code. The following measures would reduce long-term traffic related noise impacts associated with the proposed project:

4.12.6.2A When processing future individual buildings under the World Logistics Center Specific Plan, as part of the City's approval process, the City shall require the Applicant to take the following three actions for each building prior to approval of discretionary permits for individual plot plans for the requested development:

Action 1: Perform a building-specific noise study to ensure that the assumptions set forth in the FEIR prepared for the programmatic level entitlement remain valid. These procedure used to conduct these noise analyses shall be consistent with the noise analysis conducted in the programmatic FEIR and shall be used to impose building-specific mitigation on the individually-proposed buildings.

Action 2: If the building-specific analyses identify that the proposed development triggers the need for mitigation from the proposed building, including all preceding developments in the specific plan area, the Applicant shall implement the mitigation identified in the WLC FEIR. Prior to implementing the mitigation, the Applicant shall send letters by registered mail to all property owners and non-owner occupants of properties that would benefit from the proposed mitigation asking them to provide a position either in favor of or in opposition to the proposed noise abatement mitigation within 45 days. Each property shall be entitled to one vote on behalf of owners and one vote per dwelling on behalf of non-owner occupants.

If more than 50% of the votes from responding benefited receptors oppose the abatement, the abatement will not be considered reasonable. Additionally, for noise abatement to be located on private property, 100% of owners of property upon which the abatement is to be placed must support the proposed abatement. In the case of proposed noise abatement on private property, no response from a property owner, after three attempts by registered mail, is considered a *no* vote.

At the completion of the vote at the end of the 45 day period, the Applicant shall provide the tentative results of the vote to all property owners by registered mail. During the next 15 calendar days following the date of the mailing, property owners may change their vote. Following the 15-day period, the results of the vote will be finalized and made public.

Action 3: Upon consent from benefited receptors and property owners, the Applicant shall post a bond for the cost of the construction of the necessary mitigation as estimated by the City Engineer to ensure completion of the mitigation. The certificate of occupancy permits shall be issued upon posting of the bond or demonstration that 50% of the votes from responding benefited receptors oppose the abatement or, if the abatement is located on private property, any property owners oppose the abatement (per Noise Study MM N-8, pg.53).

- 4.12.6.2B** Prior to issuance/approval of any building permits, the centerline of Cactus Avenue Extension will be located no closer than 114 feet to the residential property lines along Merwin Street. An alternative is to locate the roadway closer to the residences and provide a soundwall along Cactus Avenue Extension. The soundwall location and height should be determined by a Registered Engineer, and the soundwall shall be designed to reduce noise levels to less than 65 CNEL at the residences. The Engineer shall provide calculations and supporting information in a report that will be required to be submitted to and approved by the City prior to issuing permits to construct the road (per Noise Study, pg. 51, Cactus Avenue Extension, ID #50).
- 4.12.6.2C** Prior to the approval of any discretionary permits, cumulative impact areas shown in the WLC EIR Noise Study shall be included in the soundwall mitigation program outlined in Mitigation Measures 4.12.6.2A and 4.12.6.2D (per Noise Study MM N-9, pg. 62).
- 4.12.6.2D** Prior to issuance of a building permit, the applicant shall demonstrate that the development maintains a buffer with soundwall for noise attenuation at residential/warehousing interface (i.e., western and southwestern boundaries of the project site). To keep the noise levels at nearby residential areas less than typical ambient conditions, the warehousing property line shall be located a minimum of 250 feet from the residential zone boundary, and a 12-foot noise barrier shall be located along the perimeter of the property that faces any residential areas. The 12 foot noise barrier may be a soundwall, berm, or combination of the two. The height shall be measured relative to the pad of the warehouse. This requirement shall be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (Leq) will not be exceeded at the residential zone. This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, "All manufacturing and industrial uses adjacent to residential land uses shall include a buffer zone and/or noise attenuation wall to reduce outside noise levels" (per Noise Study MM N-10, pg.62).

Level of Significance after Mitigation. *Within the WLC Specific Plan Area.* For areas within the WLCSP area, three groups of residences may exceed the noise standard with the implementation of the proposed project. The level of significance after mitigation is provided for each of the two areas for which a significant impact has been identified.

- *Redlands Boulevard (north of Brodiaea Avenue).* A group of homes is located east of Redlands Boulevard north of the intersection with Brodiaea Avenue. The traffic on Redlands Boulevard will not increase significantly as a result of the project. Future Street E is proposed to be constructed west of these existing residences. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

public roadways. Therefore, impacts are anticipated to be less than significant and no mitigation is required.

- *Theodore Street/Street A (Street B to Street F)*. There are two residences in this area. These residences are anticipated to experience noise increases up to 16 dB due to the implementation of the Specific Plan. As a result, existing noise levels at these two residences will be changed significantly. The exact alignment of the roadway is to be determined, but the homes may be roughly 100 feet from the centerline on the roadway. One residence fronts onto Street A (Theodore Street), and the driveway access would make a soundwall ineffective. The other residence is on to Street A. It is difficult to determine where an outdoor living area is for this residence. However, since it is a single residence, a soundwall would have a limited effectiveness. Since mitigation is not feasible, impacts remain significant and unavoidable.
- *Dracaea Avenue/Street F (east of Theodore Street)*. There is one residence in this area fronting onto the future alignment of Street F (currently Dracaea Avenue). Existing conditions identify low levels of traffic noise on Dracaea Avenue. The 65 CNEL contour is projected to lie 84 feet from the centerline of Street F and it is likely that the one residence would lie within this zone. With build out of the project, noise levels would reach as high as 68.1 CNEL, which exceeds the City's 65 CNEL threshold. Installation of a soundwall would not be effective in reducing noise levels due to the opening for the driveway. Since mitigation is not feasible, impacts remain significant and unavoidable.

Off-Site Areas Adjacent to the Specific Plan Area. For areas adjacent to the WLCSP area, seven areas would experience noise increases that would be mitigated to a less than significant level with implementation of **Mitigation Measures 4.12.6.2A** and **4.12.6.2D**. These areas are as follows:

- Cactus Avenue west of Redlands Boulevard;
 - Cactus Avenue from Redlands Boulevard to Street D;
 - John F. Kennedy Drive, south of Cactus Avenue;
 - Moreno Beach Drive between Locust Avenue and Ironwood Avenue (15 of 18 homes);
 - State Route 60 from Redlands Boulevard to Theodore Street;
 - Iris Avenue from Nason Street to Oliver Street; and
 - Street D from Street E to Cactus Avenue (8).
- For the remaining noise impact locations adjacent to the WLCSP area for which significant noise impacts have been identified, mitigation measures are not feasible or will not fully reduce the impact to less than significant levels. Each location that will remain significant and unavoidable with *Gilman Springs Road (between Eucalyptus Avenue and Street C, and between Jack Rabbit Trail and Bridge Street)*. There are three single-family homes scattered along these roadway segments. All of the houses are set back from the roadway, but none has soundwalls. A significant noise increase is projected for at least one of these segments in three of the four case years. Homes that are widely separated from other homes cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.
 - *Ironwood Avenue (between Redlands Boulevard and Highland Boulevard)*. There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. A significant noise increase is projected for the 2012 time horizon. In 2035, the project is projected to increase noise levels by 2.1 dB, bringing the noise level to 60.8 CNEL. Land uses that are widely separated from one another cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- *Locust Avenue (between Moreno Beach Drive and Smiley Boulevard)*. There are three single-family homes along this roadway and they front onto the roadway. The 2035 time horizon results in a significant noise increase for this area. In 2035, the project will increase noise levels by 1.5 dB, bringing the noise level to 66.9 CNEL. As discussed above, homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.
- *Redlands Boulevard (Eucalyptus Avenue to State Route 60)*. There are scattered homes in this area that either face Redlands Boulevard (or Shubert Street) or are on Redlands Boulevard. The 2012 and 2035 time horizons result in a significant noise increase for this area. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.
- *Redlands Boulevard (State Route 60 to San Timoteo Canyon Road)*. There are approximately 28 homes along this roadway that would be affected. The single-family homes are scattered and generally front the roadway. The 2012, 2022, and 2035 time horizons result in a significant noise increase for this area. The increases in noise are around 2 dB with a resultant noise level in the 70 to 71 CNEL range. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.
- *San Timoteo Canyon Road (from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard)*. There are approximately four scattered residences along this roadway that would be affected. The existing baseline plus project time horizon results in a significant noise increase for this area. The noise increases by a little over 3.0 dB with resultant noise levels in the 65 to 66 CNEL range. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.
- *Theodore Street (State Route 60 to Highland Boulevard)*. The noise analysis indicates that the project will cause a 1.2 dB increase in the year 2035 with a resulting noise level of 66.3 CNEL. There are four existing homes on Theodore Street that front onto the roadway. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.
- *Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19)*. There are three groups of homes that may remain within the project area. The analysis shows significant noise increases for all four cases. The project would rezone these residences as Light Logistics, but the residences may remain for some time. The Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain, must be considered as a sensitive land use. The first homes are east of Redlands Boulevard north of the intersection with Brodiaea Avenue. Street E will be constructed west of these homes. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways.

The second group of homes is on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are two homes in this area. Their noise environment will be changed significantly. The exact alignment of the roadway is to be determined. The noise levels at these homes would be unacceptable to the residents, and a significant impact would occur. As discussed above homes, that front onto a street or scattered homes cannot be effectively mitigated with a soundwall. Therefore, there is no feasible mitigation and this impact would remain significant and unavoidable.

The third area is a single home and lies east of Street A and along Street F. Currently there is essentially no traffic on this street. There is one residence in this area. Since this home will experience a substantial noise increase, this is considered a significant impact. All of these homes will either front onto the roadway or are scattered. As discussed above homes, that front

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

onto a street or scattered homes cannot be effectively mitigated with a soundwall. Therefore, there is no feasible mitigation and this impact would remain significant and unavoidable.

- *Cactus Avenue Extension (Street D) from Street E to Cactus Avenue.* Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the project parallel to Merwin Street and roughly 1,250 feet from Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There would be essentially no heavy trucks using this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. The noise forecast shows that the 65 CNEL contour will lie 114 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than 114 feet to the residences, then a significant impact would occur. Outdoor living spaces for homes along Merwin Street would experience noise levels greater than 65 CNEL, and this would not be consistent with City criteria. Due to the distance from the currently envisioned between Merwin Street and Cactus Avenue Extension, it is most likely that no soundwall will be needed. If a soundwall was needed, a preliminary estimate indicates that the soundwall along Cactus Avenue Extension would need to be roughly 2,000 feet.

4.12.6.3 Long-Term Operational Noise Impacts

Threshold	Would the project cause exposure of persons to or generation of noise levels in excess of standards established in the <i>City of Moreno Valley General Plan, Moreno Valley Municipal Code</i> , or applicable standards of other agencies?
-----------	---

Potential long-term stationary noise impacts would primarily be associated with operations at logistics facilities within the WLCSP area. Logistics facility uses would generate noise from truck delivery, loading/unloading activities at the loading areas, heating, ventilation, and air-conditioning (HVAC) equipment and other noise-producing activities within the parking lot (e.g., doors slamming, vehicle engine start-ups, and conversing in the parking lot). These activities are potential point sources of noise that could affect noise-sensitive receptors adjacent to the loading areas and parking lots. As noise spreads from a source, it loses energy; therefore, the farther away the noise receiver is from the noise source, the lower the perceived noise level would be.

Noise levels were measured at similar facilities to determine representative noise levels that might be generated by this type of activity. Noise measurements were made at two facilities; specifically, Lowes Distribution Center (3984 Indian Avenue, Perris, CA) and Ross Distribution Center (3404 Indian Avenue, Perris, CA). Based on these representative noise measurements, Table 4.12.K provides the noise levels for various distances from the warehouse property line with no noise barrier in place and with an assumed 12-foot noise barrier.

Table 4.12.K: Representative Noise Levels for Warehousing Activities

Distance from Facility (feet)	Noise Level (dBA L _{eq})	
	No Barrier	With 12-foot barrier
50	56.9	48.6
100	54.9	47.8
250	50.8	44.7
500	46.6	40.9

Source: Mestre Greve Associates, September 2014.

The City of Moreno Valley Noise Ordinance requires that noise levels remain below 55 dBA (L_{eq}) during nighttime hours. To achieve this noise level, the warehouse property line would only need to be 100 feet from the nearest residential property and no soundwall would need to be present.

Another consideration is whether the proposed activity levels will be substantially higher than current ambient conditions. No matter what is developed in the Specific Plan area, ambient conditions would be higher in future years due to higher levels of traffic and activity. Ambient noise levels were measured at seven sites that could border the World Logistics Center (i.e., Measurement Sites 3 through 9). The nighttime ambient noise levels (L_{eq}) ranged from 35.8 to 61.8 dBA with an average for the sites of 46.6 dBA. To keep the noise levels at nearby residential areas less than typical ambient conditions, the logistics property line should be located a minimum distance of 250 feet and a 12-foot soundwall should be located along the perimeter of the property that faces any residential areas. This would keep the logistic use noise to less than 45 dBA (L_{eq}) at the residences. The implementation of this buffer between logistics uses and noise sensitive uses has been included as **Mitigation Measure 4.1.6.1A**.

Specific Plan Design Features. The WLCSP indicates there will be a 250-foot building setback from residentially zoned property along Redlands Boulevard, Bay Avenue, and Merwin Street.

Level of Significance after Mitigation. Implementation of **Mitigation Measure 4.1.6.1A** would eliminate any noise impacts on residential areas due to the operation of logistic activities. Through the provision of a 250-foot buffer, berms, and/or soundwalls, noise levels at the nearest residences would be reduced to below the City’s thresholds. Therefore, with adherence to the identified mitigation measure, impacts associated with this issue would be less than significant.

4.12.6.4 Long-Term Utility Noise Impacts

Threshold	Would the project cause exposure of persons to or generation of noise levels in excess of standards established in the <i>City of Moreno Valley General Plan</i> , <i>Moreno Valley Municipal Code</i> , or applicable standards of other agencies?
-----------	---

As illustrated in previously referenced Figure 4.12.3 and Figure 4.12.6, there is one existing SDG&E compressor station and two existing SCGC facilities located within the WLC Specific Plan area.

Based on preliminary calculations as illustrated in Figure 4.12.3, the worst-case compressor station operational characteristics will result in a maximum noise level just above 65 CNEL within the project area proposed for development (i.e., not open space). Typical commercial construction results in buildings that achieve at least a 20 dB reduction of outdoor noise levels. Therefore, an office use exposed to the highest noise level from the compressor station will be just above 45 CNEL and below the 50 CNEL limit prescribed by the City’s General Plan, resulting in a less than significant impact and no mitigation is required.

As illustrated in previously referenced Figure 4.12.4, the L_{eq} noise level generated by the compressor station does not exceed 60 dBA L_{eq} beyond the property lines of the facility. Therefore, the compressor station is not considered a noise disturbance based on City criteria. Operation of the compressor station would not result in any interior noise levels exceeding the limits established by the City in the General Plan. Therefore, noise impacts associated with the operation of the compressor station would be less than significant and no mitigation is required.

As identified in previously referenced Figure 4.12.5, the maximum noise level from a blow-down at the SDG&E compressor station within the WLCSP area proposed for development (i.e., the Logistics

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Development land use) is 100 dBA. A person would need to be exposed to this level for more than two hours in a day before permanent hearing loss would be expected. As discussed above, blow-down events at the SDG&E compressor station typically do not last longer than 90 seconds. Therefore, the SDG&E blow-down events will not result in a significant impact to the uses proposed within the WLCSP area, and no mitigation is required.

For SCGC blow-down events, noise generated could reach as high as 130 dBA just outside the fence line of the southern facility and in excess of 135 dB just outside the fence line of the northern facility. People within approximately 250 feet of the blow-down points would be exposed to noise levels greater than 115 dBA, which would likely cause permanent hearing damage regardless of the exposure time. The SCGC blow-downs could last as long as 90 minutes. It is anticipated that people exposed to noise levels greater than 102 dBA, within approximately 1,300 feet from the blow-down point could experience permanent hearing loss based on this event duration. Noise generated by SCGC blow-down events has the potential to cause permanent hearing loss in persons in the developed area of the project. This is a significant impact and mitigation is required.

SCGC blow-down events also have the potential to produce groundborne vibration. However, the effect of the blow-down groundborne vibration would be limited to within 100 feet of the equipment and would not be perceived beyond the facility fenceline, resulting in a less than significant impact and no mitigation is required.

Specific Plan Design Features. The WLCSP provides a setback of open space and a street between the SCGC facility and planned warehouse buildings in the WLCSP. However, the separation may not be sufficient to prevent significant noise impacts during blow-down events. According to the project noise assessment, a 40 dB reduction in existing noise levels from the blow-down facilities would be needed to ensure there would be no significant noise impacts on workers or other persons within 1,300 feet of the blow-down facilities (FEIR Volume 2 Appendix K).

Note: The changes to the following mitigation measure have been made in response to Comment C-4-2 in Letter C-4 from Semper Energy, and the revised noise study.

Mitigation Measures. Operation of the proposed WLC project could result in exposure of people to noise levels as high as 130 dBA or greater during SCGC blow-down events. The following measure would reduce long-term utility related noise impacts associated with the proposed WLC project:

4.12.6.4A Prior to the issuance of building permits for projects within 1,300 feet of the Southern California Gas Company (SCGC) and San Diego Gas and Electric (SDG&E) blow-down facilities, documentation shall be submitted to the City confirming that sound attenuation devices and/or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events are available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund all sound attenuation improvements to the blow-down facilities required by this measure. It shall also be the responsibility of the developer to coordinate with San Diego Gas and Electric and/or Southern California Gas Company regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the San Diego Gas and Electric compressor station or the Southern California Gas Company pipelines. This measure shall be implemented to the satisfaction of the City Land Management Division (per Noise Study MM N-11, pg.65).

Level of Significance after Mitigation. The SCGC blow-down equipment does not currently include a permanent silencer system. A review of the literature of a leading manufacturer of specialty silencer

systems (Industrial Acoustics Company) determined that a specialty silencer system added to the blow-down equipment could reduce noise levels by about 40 dB. With a silencer system providing 40 dB of noise reduction, blow-down noise levels would be less than 102 dBA approximately 30 feet from the blow-down point, which is within the property line of these facilities. 102 dBA is the noise level that could be experienced for up to 90 minutes without causing permanent hearing loss. Therefore, while occupants within the WLCSP in close proximity to the SCGC facilities would be subject to high noise levels during these infrequent noise events, they would not be subject to any permanent hearing damage. With implementation of **Mitigation Measure 4.12.6.4A**, SCGC blow-down events would not result in noise levels that could cause permanent hearing loss and the project would not be significantly affected by noise from the SCGC facilities, resulting in a less than significant impact.

4.12.7 Cumulative Impacts

The cumulative area for noise impacts is the City of Moreno Valley. Implementation of the Specific Plan would result in the introduction of new noise sources and levels from on-site activities and from increased traffic volumes on vicinity roadway and freeways.

Construction crew commutes and the transport of construction equipment, and materials to the WLCSP area would incrementally increase noise levels on access roads leading to the site. Secondary sources of noise would include noise generated during excavation, grading, and building erection on the project site. The net increase in project site noise levels generated by these activities and other sources has been quantitatively estimated and compared to the applicable noise standards and thresholds of significance. Although it is not possible to predict if contiguous properties may be constructed at the same time and create cumulative noise impacts that would be greater than if developed at separate times, it is unlikely that adjacent properties will be developed at the same time as the Specific Plan area. However, in the unlikely event that adjacent properties are developed at the same time as the proposed WLC project, adherence to the City's Municipal Code provisions that regulate construction activities and other development standards would render the cumulative impacts of the proposed project to less than significant levels.

The noise analysis contained in this section also provides an assessment of on-site operational noise level impacts on adjacent sensitive uses, both existing and future. Additionally, on-site operational noises are individual noise occurrences and are not typically additive in nature. It is extremely unlikely that adjacent properties will generate noises that would be additive in nature because of two important reasons. First, the noise sources would have to be adjacent or in close proximity to one another in order for the noises to intermingle. Second, the sensitive receptor or receptors would also have to be adjacent to or in close proximity to the noise generators. Although it is not possible to predict if contiguous or proximate properties may generate noise at the same time that would be additive in nature and thus create a significant cumulative noise impact at sensitive receptors, adherence to the City's Municipal Code provisions that regulate nuisance noise from land uses and other development standards would render the cumulative impacts of the proposed project to less than significant levels.

Cumulative traffic volumes contained in the TIA were developed for the Future Year 2022 and Buildout 2035 analysis time horizons. Traffic volumes for each time horizon were developed utilizing a combination of various future traffic growth methods as follows. For Future Year 2022, traffic volumes were developed by interpolating year 2035 traffic volume projections from the Riverside County Transportation and Analysis Model (RivTAM) to year 2022 plus traffic from a list of past, present, and reasonably foreseeable projects. For Buildout Year 2035, traffic volumes were developed by utilizing the year 2035 traffic volume projections from the RivTAM plus traffic from a list of past, present, and reasonably foreseeable projects.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Cumulative noise impacts associated with roadway noise have been addressed based on the cumulative traffic volumes. Previously referenced Table 4.12.J provides a comparison of Buildout Year (2035) without and with project noise levels, and if a significant impact (project-specific or cumulatively significant) occurs.

The project calls for improvements to several of the roadways around the project area in order to accommodate the projected increase in project traffic volumes. There are no new noise-sensitive land uses proposed to be constructed within the area of analysis. However the presence of residential uses occurs within the WLCSP project and nearby area. These roadway segments are analyzed against the thresholds for determining significant impacts defined previously in Section 4.12.6.2. As described previously in Section 4.12.4, the project's incremental contribution to a cumulative noise increase would be considered cumulatively considerable and significant when ambient noise levels affect noise-sensitive land uses and when the proposed project increases noise levels by 1 dB or more over pre-project conditions and the predicted future cumulative with project noise levels cause the following cumulative increases:

- Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;
- Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.

Cumulative noise impacts associated with roadway noise have been addressed based on the 2022 and 2035 time horizons analyses contained in Section 4.12.6.2. As identified in the preceding analysis, Table 4.12.J shows the Buildout Year 2035 CNEL values without and with the proposed project and if a significant impact would be produced based on the project-specific significance criteria identified in Section 4.12.4 and the cumulatively significant significance criteria identified in Section 4.12.4 and repeated above. Traffic noise level increases from the existing baseline condition and the future (2022 and 2035) time horizons are attributable to the intermingled effects of both the cumulative (i.e., past, present, and reasonably foreseeable projects) development projects in the project vicinity and region as well as the proposed project. As indicated in Section 4.12.6.2, roadway noise impacts have been identified and **Mitigation Measures 4.12.6.2A** and **4.12.6.2D** have been presented to reduce roadway noise impacts to the greatest extent feasible. As disclosed in Section 4.12.6.2, there are numerous instances in which there is no feasible means to reduce roadway noise impacts because of the existing developed nature of the affected roadway segment and/or the scattered nature of the sensitive receptors (i.e., residences), which prohibits the effectiveness of a soundwall. Therefore, no significant cumulative noise impacts would occur after implementation of the proposed mitigation measures. For those segments at which there is a cumulatively considerable impact and there is no feasible means to provide mitigation, the significant cumulative impact will remain significant and unavoidable.

Note to Reader: The following Section 4.13 has been revised based on revisions to the Specific Plan project size. The section has also been revised to provide clarification in response to comments made about data consistency.¹

4.13 POPULATION, HOUSING, AND EMPLOYMENT

This section identifies population and housing conditions within the City of Moreno Valley and addresses potential impacts that may result from the construction and operation of the proposed WLC project. The analysis is based in part on population and housing projections identified by the California Department of Finance (DOF), Southern California Association of Governments (SCAG), as well as information contained in the City's General Plan.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The analysis contained in this section is based in part on the following reference documents:

4.13.1 Existing Setting

4.13.1.1 Population Characteristics

The U.S. Census as reported by the DOF estimates the City’s current (2011) population at 194,451 persons.¹ SCAG projections estimate the population of the City, Riverside County, and southern California (SCAG) regions will continue to grow. The SCAG projects the City’s population will grow to 213,700 persons by the year 2020 and 255,200 persons by the year 2035 (Table 4.13.A).

Table 4.13.A: Population, Housing, and Employment Forecasts

	2011	2020	2035
Population²			
City of Moreno Valley	194,451	213,700	255,200
Riverside County	2,205,731	2,592,000	3,324,000
SCAG	18,163,664	19,663,000	22,091,000
Housing Units²			
City of Moreno Valley	55,635	60,000	72,800
Riverside County	804,913	834,000	1,092,000
SCAG	6,348,741	6,458,000	7,325,000
Employment¹			
City of Moreno Valley	25,120	48,000	64,400
Riverside County	551,492	939,000	1,243,000
SCAG	7,224,670	8,414,000	9,441,000

4.13.1.2 Housing Characteristics

The number of housing units in the City has increased to accommodate the City’s growing population (Table 4.13.B). Currently, the DOF identifies that over three-quarters of the existing housing units in the City are single-family detached units (Table 4.13.C). Multiple-unit dwellings comprise approximately 15 percent of the City’s current housing stock.

4.13.1.3 Employment Characteristics

As identified in Table 4.13.A, approximately 25,120 jobs were located within the City in 2011. Based on available data from 2012 (SCAG 2013), the largest share of Moreno Valley’s jobs were in the education sector (41.5%). The top four employment sectors, education (41.5%), retail trade (17.8%), leisure/hospitality (10.8%), and professional and management (6.0%) accounted for three-fourths of jobs in the City. Table 4.13.D provides a breakdown of the percentage by job type for the most recent available data (2013). The Husing Report presented to the City Council in January 2012 also indicated that medical services and logistics were two of the few employment categories to show significant growth during the economic downturn starting in 2008 (Husing 2012).

NOTE: This table had been updated based upon the updated Profile of the City of Moreno Valley, by the Southern California Association of Governments 2013.

Table 4.13.D: City of Moreno Valley 2012 Employment Percentage by Sector

Job Sector	Percentage of Employees
Education	41.5%
Retail Trade	17.8%

Source: *Profile of the City of Moreno Valley*, Southern California Association of Governments, <http://www.scag.ca.gov/Documents/MorenoValley.pdf>, date accessed February 7, 2014.

The jobs-to-housing ratio measures the extent to which job opportunities in a given geographic area are sufficient to meet the employment needs of area residents. This ratio identifies the number of jobs available in a given region compared to the number of housing units in the same region. For example, a region with a jobs-to-housing factor of 1.5 would indicate that 1.5 jobs exist for every housing unit within that region. The standard used for comparison is the jobs-to-housing ratio of the SCAG region, is currently 1.24 jobs for every household. This standard is used because most residents of the region are employed somewhere in the SCAG region. A City or sub-region with a jobs-to-housing ratio lower than the overall standard would be considered a “jobs poor” area, indicating that many of the residents must commute to places of employment outside the sub-area. Table 4.13.E shows the current and potential jobs/housing ratios for the City, Riverside County, and SCAG.

Table 4.13.E: Existing and Future Jobs/Housing Ratios¹

	2011 Jobs/Housing Ratio	2035 Jobs/Housing Ratio
City	0.45	0.88
Riverside County	0.69	1.14
SCAG	1.14	1.29

¹ Ratios calculated from values listed in Table 4.13.A

The 2011 estimated jobs-to-housing ratios for the City, County, and SCAG region are 0.45, 0.69, and 1.14, respectively. The 2035 future jobs-to-housing ratios for the City, County, and SCAG region are 0.88, 1.14, and 1.29, respectively. These ratios indicate that both Riverside County and the City of Moreno Valley are “jobs poor” because the jobs-to-housing ratios are below the Southern California region (as defined by SCAG). The Husing Report presented to the City Council in January 2012 indicated that the jobs to housing ratio for Southern California had actually declined from 1.25 to 1.04 from 2007 to 2010 as a result of the economic downturn (Slide 7, Husing 2012).

A low jobs/housing ratio results in longer distances that residents of Moreno Valley must drive to and from work. This factor may contribute to the City’s property values which are currently about half of the regional average (Source: *Profile of the City of Moreno Valley*, SCAG, May 2013). For example, the median home sales price in Moreno Valley in 2010 was \$155,000 compared to the regional average of \$291,000. One result of a jobs/housing imbalance is a weaker or lower tax base with which to support public services. The City also experiences a large “leakage” of potential sales tax revenue due to the resident workers’ absence during workdays, as well as the lack of business and industry taxes compared to other jurisdictions of similar size.

4.13.1.4 City Economic Conditions

Moreno Valley is Riverside County’s second largest city with a population of nearly 200,000 people (2012) and a land area of more than 50 square miles. The City incorporated in 1984. The majority of the land in the City was designated for residential development. Over the years, the plan for Moreno

Valley has remained overwhelmingly residential in character. Little of the City's area (approximately 9%) is allocated for job producing land uses today. More than 90 percent of the City is designated for non-commercial land uses such as residential, open space and parks¹ see figure below:

Comparison of Land Zoned for Industrial/Business Park
(Moreno Valley Economic Development Action Plan, 2011)

Moreno Valley has less than one job for every two homes (0.47), which is about one-third of Riverside's rate and about one-fifth of Ontario's, see figure below.²

Comparison of Jobs to Housing Ratios *(SCAG City Profiles, May 2013; Fiscal and Economic Impact Study, David Taussig & Associates, 2014)*

¹ City of Moreno Valley Economic Development Action Plan, 2011

² SCAG City Profiles, May 2013; Fiscal and Economic Impact Study, David Taussig & Associates, September 2014

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

This has created a significant jobs-housing imbalance which resulted in chronically difficult economic and social conditions. As a result, a large majority of Moreno Valley’s workforce commutes to jobs outside the City, with an average daily commute of 76 minutes.¹ The City has a very limited tax base from which to generate tax dollars to fund expensive residential services. In 1996, the City enacted a utility tax to offset operational deficits resulting from the slowdown in residential development and the development fees which they provided.

“The city became burdened with too much residential development, which does not generate enough property tax revenue to pay for the city services such development demands. Every new home constructed drained the city’s coffers over time, and the city needed the more lucrative tax base of commerce and industry—which hasn’t developed—to make up the difference.” *Los Angeles Times*, October 28, 1996

Average household income in Moreno Valley is \$56,000, well below the Riverside County average. Nearly one person in five or 20 percent of Moreno Valley is living below the poverty level.² Fifty percent of the population has a high-school education or less and Moreno Valley has one of the highest high-school drop-out rate in the county.

Unemployment in Moreno Valley remains the highest in the region at 9.7 percent³ and median house prices are among the lowest in the Inland Empire at \$158,000.⁴ See figures below:

Comparison of Unemployment Rates (Monthly Labor Force Data for Cities, California Employment Development Department, April 2014)

¹ SCAG, Profile of the City of Moreno Valley, May 2013
² Husing, Press Enterprise Letter to the Editor, May 15, 2014
³ California Employment Development Department, April 2014
⁴ (SCAG City Profiles, May 2013)

Comparison of Median Home Sale Prices
(SCAG City Profiles, May 2013)

In April of 2011, the City adopted a 2-year Economic Development Action Plan as a short-term and long-term approach to the difficult economic conditions facing the City. The logistics and healthcare industries were identified as the two primary areas of opportunity for the City. The Action Plan focused on five areas of opportunity in the City and established key initiatives for each one. In April 2013 the City conducted additional public hearings and adopted a 3-year Action Plan which established fourteen objections aimed at increasing the City’s overall economic development efforts and expanded these efforts to nine areas in the City. The World Logistics Center project is identified as one of the Action Plan’s goals for eastern Moreno Valley. The World Logistics Center project directly responds to the City’s Action Plan, representing a major shift in the City’s approach to long-range community planning and economic stability.

4.13.1.5 Economic Assessment Factors

The *Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California* (David Taussig & Associates, Inc. (DTA), 2014) prepared for the proposed WLC project evaluates the likely fiscal and economic impacts of the proposed WLC project within the City. The following information is from the Executive Summary of the DTA study:

The purpose of the study is to estimate the net fiscal impacts of the proposed WLC project and construction of the project on the City’s General Fund. The fiscal impacts identified in the study include recurring municipal revenues and costs to the City General Fund that result from the land use scenario analyzed. City General Fund revenues are generated from a variety of sources including property taxes, sales taxes, fees, and fines. Costs to the City’s General Fund are associated with a variety of services, such as police protection, fire protection, public works maintenance, and general government services. While the City also expends revenues from a series of other special funds outside of the General Fund, these revenues include a Moreno Valley Library property tax, Community Services District and Community Facilities District assessments and special taxes, and various enterprise funds. As these revenues are generally equal to the cost of the services that they finance, they are essentially break-even and are not typically included in a fiscal analysis for a municipality. As a result, most fiscal analyses focus on

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

the General Fund, where any shortfalls or surpluses can be easily identified, and such is the case for this Study.

However, in preparing the World Logistics Center's (the Center) fiscal analysis, DTA did notice certain anomalies occurring related to the Moreno Valley Fire property tax, in that the revenues generated by this special fund appear to be greater than the fund's expenditures on fire services to be provided by the City to the Center. While the projected fiscal surplus generated by the Moreno Valley Fire property tax fund was not included in the General Fund analysis, DTA felt that a brief discussion of this revenue source within the text of the Study would better inform the public regarding the entire fiscal impact of the Center on the City.

The fiscal analysis focuses on the impacts of the Center on the General Fund if it were built during fiscal year 2012-13, based on cost and revenue criteria and assumptions existing during that fiscal year. As is the case for most General Fund fiscal analyses, it would be speculative to *Fiscal & Economic Impact Study May 21, 2014 World Logistics Center – City of Moreno Valley Page II* project future cost and revenue factors because there is no certainty regarding what those factors will be. For example, while the City will be increasing its annual costs as it eliminates a furlough program that it established during the Great Recession, the Center itself is expected to generate additional revenues in future fiscal years due to increases in logistics facilities property values above the \$90 per square foot assumed in the Study. Based on a recent appraisal prepared by Coldwell Banker, the Center site's property valuation has already increased by more than 10%. Assumptions made regarding the relative levels of cost and revenue increases for factors such as these in future years would typically create a bias in the fiscal analysis that could in itself invalidate the results of the Study.

The DTA study also identifies the general economic impacts on the City that would occur and quantifies these impacts wherever possible. General economic impacts include additions to the City's employment, economic output, and earnings. The study also distinguishes between one-time impacts and permanent impacts. One-time impacts include benefits to the City that occur on a non-recurring basis as a result of construction activity, while permanent impacts refer to benefits that occur on a continuing basis, year after year. An examination of these conditions relative to potential population, housing and employment impacts is provided in Section 4.13.5.1, *Population Growth*.

4.13.1.6 NOP/Scoping Comments

A representative of a conservation group and several individuals said the EIR should address the loss or transfer of 7,700 housing units from the Moreno Highlands Specific Plan to other locations in the City. Some residents commented that fiscal commitments by the City on other local projects by this developer have resulted in expenditures of funds that could otherwise have been used for City services. It should be noted the analysis of this change was largely addressed in the updated (2011) Housing Element that recognized the Moreno Highlands Specific Plan would probably not be built.

4.13.2 Existing Policies and Regulations

4.13.2.1 Federal Regulations

The Federal Community Development Block Grant (CDBG) monies are part of Federal housing assistance programs at the local level. Housing and Urban Development (HUD) and CDGB monies are a function of the potential change in the jobs and housing mix (<http://www.hud.gov/offices/cpd/about/conplan/>). The HUD's Office of Community and Planning Development's (CPD's) Consolidated Plan is designed to help states and local jurisdictions to assess their affordable housing and community development needs and market conditions, and to make data-driven, place-based investment decisions. The consolidated planning process serves as the framework for a

communitywide dialogue to identify housing and community development priorities that align and focus funding from the four CPD formula block grant programs: the CDBG, the HOME Investment Partnership (HOME), the Emergency Solutions Grant (ESG) program, and the Housing Opportunities for Persons with AIDS (HOPWA) program.

CPD Maps is an online data mapping tool for place-based planning. Grantees and the public can use CPD Maps to analyze and compare housing and economic conditions across their jurisdictions. The CPD Maps tool is publicly available, giving all community stakeholders access to the same data. The Consolidated Plan template allows grantees to insert maps and data tables from CPD Maps with ease, throughout their plans.

4.13.2.2 State Regulations

The Regional Housing Needs Assessment (RHNA) is mandated by State Housing Law as part of the periodic process of updating local housing elements of the General Plan. The RHNA quantifies the need for housing within each jurisdiction during specified planning periods. The most recently completed RHNA planning period is January 1, 2006, to June 30, 2014. Due to the requirements of SB 375, SCAG is preparing the next RHNA planning cycle, which will cover October 1, 2013, to September 30, 2021.

4.13.2.3 Regional and Local Regulations

County of Riverside Housing and Land Use Policies. The Housing Element is one of the seven General Plan elements mandated by the State of California as articulated in Sections 65580 and 65589.8 of the Government Code. Each city and county is required to discuss how it will meet its fair share of the housing need in the State.

The County of Riverside has a relevant policy in the Land Use Element of the County General Plan. To support future growth of the population and housing stock in the County of Riverside, the Land Use Element contains policies to ensure adequate utilities for new development (County of Riverside 2003). Specifically the policy LU 1.6 states...“Coordinate with local agencies, such as the Local Agency Formation Commission (LAFCo), service providers, and utilities to ensure adequate service provision for new development.”

City of Moreno Valley General Plan. The City’s General Plan Chapter 9 (Goals and Objectives) establishes goals and objectives to guide the development, redevelopment, and preservation of a balanced housing inventory within the City. Specific policies relevant to the proposed WLC project include:

Objective 2.5 Promote a mix of industrial uses which provides a sound and diversified economic base and ample employment opportunities for the citizens of Moreno Valley with the establishment of industrial activities that have good access to the regional transportation system, accommodate the personal needs of workers and business visitors; and which meets the service needs of local businesses.

Goal 2.2 An organized, well-designed, high quality, and functional balance of urban and rural land uses that will meet the needs of a diverse population, and promote the optimum degree of health, safety, well-being, and beauty for all areas of the community, while maintaining a sound economic base.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Goal 2.4 A supply of housing in sufficient numbers suitable to meet the diverse needs of future residents and to support healthy economic development without creating an oversupply of any particular type of housing.

4.13.3 Methodology

To determine the potential for impacts related to population and housing, the current uses, overall condition of the project site, historic and current population and housing characteristics, and future projections for population, housing, and employment were identified. This analysis is based on data published by the DOF and SCAG, as well as information presented in the City's General Plan and the County of Riverside General Plan.

As identified in the study prepared by David Taussig & Associates, Inc. (DTA), fiscal impacts arising from a land development project can be broadly categorized as one of two types: one-time and recurring impacts. Each of these broad types can be divided into a revenue component and a cost component. The study assumes that one-time revenues would directly offset one-time costs; therefore, the fiscal impacts considered focus on ongoing, or recurring, fiscal impacts of the proposed WLC project on the City's General Fund. Revenues generated outside of the City's General Fund (e.g., special district revenue) or costs incurred by the City outside of the General Fund (e.g., costs financed through a special district) are not included in this analysis.

This methodology involves calculating the average citywide revenues/costs per Persons Served,¹ utilizing the fiscal year 2012–2013 City budget, and applying these revenue/cost factors to the specific number of Persons Served projected for the proposed WLC project. For analysis purposes, all recurring revenues and costs are stated in constant (uninflated) 2012 dollars based on the assumption that the relative impacts of inflation in future years will be the same for both of these fiscal impact categories.

Direct economic impacts reflect the initial or first-round increases in jobs, earnings, and output, all of which occur directly on site. Indirect/induced economic impacts are the secondary and other additional rounds of economic activity that occur as a consequence of the direct impacts, and can occur elsewhere within the City. The indirect impacts represent the economic activity (buying and selling of goods and services) of suppliers to the proposed land uses. The induced impacts represent the economic activity that results from household spending by employees of all companies directly and indirectly affected by the construction and operation of the proposed WLC project. The study estimated the number of direct employees in the proposed WLC project based upon an average employee per square foot ratio for similar land uses in the region. Additionally, all economic impacts are stated in constant (uninflated) 2012 dollars, based on the assumption that the relative impacts of inflation in future years may be difficult to gauge.

4.13.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts related to population and housing are based on *CEQA Guidelines* (2011). A project would have a significant impact on population and housing if it would:

- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);

¹ A service population comprising all residents and 50% of employees.

- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) that may lead to fiscal or economic impacts;
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere; and/or
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

4.13.5 No Impact/Less than Significant Impacts

4.13.5.1 Population Growth

Threshold	<p>Would the proposed WLC project induce substantial population growth in an area, either directly (e.g., new homes and businesses) or indirectly (e.g., extension of roads and infrastructure)?</p> <p>Would the proposed WLC project induce substantial population growth in an area, either directly (e.g., new homes and businesses) or indirectly (e.g., extension of roads and infrastructure) that may lead to fiscal or economic impacts?</p>
-----------	---

Growth-Related Impacts. CEQA requires a discussion of ways in which the proposed WLC project could be growth inducing (see also Section 5.0, *Other CEQA Topics*). The *CEQA Guidelines* identify a project as growth inducing if it fosters economic or population growth, or the construction of additional housing either directly or indirectly in the surrounding environment (*CEQA Guidelines* Section 15126.2[d]). New employees from commercial or industrial development and new population from residential development represent direct forms of growth. These direct forms of growth have a secondary effect of expanding the size of local markets and inducing additional economic activity in the area.

A project could indirectly induce growth by reducing or removing barriers to growth, or by creating a condition that attracts additional population or new economic activity. However, a project’s potential to induce growth does not automatically result in growth. Growth can only happen through capital investment in new economic opportunities by the private or public sectors. Under CEQA, growth inducement is not considered necessarily detrimental, beneficial, or of little significance to the environment. Typically, the growth-inducing potential of a project would be considered substantial if it fosters growth or a concentration of population in excess of what is assumed in pertinent master plans, land use plans, or in projections made by regional planning agencies (e.g., SCAG). Substantial growth impacts could also occur if a project provides infrastructure or service capacity to accommodate growth beyond the levels currently permitted by local or regional plans and policies. In general, growth induced by a project is considered a significant impact if it directly or indirectly affects the ability of agencies to provide needed public services, or if it can be demonstrated that the potential growth significantly affects the environment in some other way.

A project could indirectly induce growth at the local level by increasing the demand for additional goods and services associated with the increase in project population and thus reducing or removing the barriers to growth. This occurs in suburban or rural areas where population growth results in increased demand for service and commodity markets responding to the new population. This type of growth is, however, a regional phenomenon resulting from introduction of a major employment center or regionally significant housing project. Additional commercial uses may be drawn to the area by the increased number of residents in the area as a result of a project; however, it is expected that any such development would occur consistent with planned growth identified in the General Plan or applicable specific plans.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

As shown in previously referenced Tables 4.13.A and 4.13.B, the City's population has grown steadily over the past decades. Population projections developed by SCAG estimate the City's population will reach approximately 213,700 persons by the year 2020 and approximately 255,200 persons by the year 2035.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

The extent to which the new jobs created by a project are filled by existing residents is a factor that tends to reduce the growth-inducing effect of a project. Construction of the proposed WLC project will create short-term construction jobs. These short-term positions are anticipated to be filled by workers who, for the most part, reside in the project area; therefore, construction of the proposed WLC project will not generate a permanent increase in population within the project area. Development envisioned under the proposed WLCSP consists of approximately 40.6 million square feet of logistics warehouse and general warehouse facilities (WLCSP, September 2014).

An economic study of the project prepared by DTA concluded that the proposed WLC project could directly generate up to 20,300 new jobs within the City.¹ In addition to the projected on-site job creation, the DTA study estimates the proposed WLC project could generate new off-site jobs (i.e., indirect/induced employment) in all industries of the economy. The DTA study also estimated that an additional 7,386 indirect/induced jobs could be created in the County, of which 3,693 jobs were projected to be within the City as a result of project implementation. This estimate is derived from the Impact Analysis for Planning (IMPLAN) Input/Output Modeling System, which is a quantitative economic model that provides an approximate measure of the "multiplier effect" of a firm's spending on payroll and purchase of goods and services. While the specific location of the potential additional indirect/induced jobs created within the County cannot be specifically determined, it is reasonable to assume that some percentage of these jobs will be support service jobs and are likely to be located in the proposed WLC project vicinity, and therefore the City.

The WLC project does not include a residential component. The proposed WLC project is located within an area that is currently largely vacant and planned for mix of residential, commercial, business park, and open space land uses in accordance with the General Plan Community Development Element. The proposed WLC project includes a General Plan Amendment to change the existing mix of land use designations to Logistics Development and Light Logistics.

If approved, the WLCSP would supplant the approved Moreno Highlands Specific Plan (MHSP) project that did have a residential component. The EIR for that project indicated it would have increased the City's population by 17,019 persons over 15 years (7,736 units × 2.2 persons/unit). However, because the City is considered housing rich (and jobs poor) by SCAG, the loss of that projected population growth is not considered a significant impact and, in fact, a number of State policies (e.g., SB 375) encourage the creation and development of jobs-producing development in areas with poor jobs/housing numbers such as that which exists in the City.

Most of the site has been used for dry farming since the early 1900s and much of the proposed WLC project site continues to be used for dry farming at the present time. Currently, there are seven single-family homes in various locations on the property along with associated ranch/farm buildings. Streets, water and sewer utilities, and municipal services would be extended to serve the proposed WLC project. The proposed WLC project may benefit other development projects in the project area by the installation of infrastructure (e.g., roads and utilities), but is not expected to induce substantial population growth into the area since there would be no large areas of vacant land left in the east end of the City (south of SR-60) that could be developed with residential uses.

¹ Table B, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California (David Taussig & Associates, Inc., September 2014).

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Development of high-cube logistics warehouse and general warehouse facilities will create jobs in the local economy. However, it is difficult to predict exactly how many new jobs would be generated by the proposed WLCSP. One concern expressed during the NOP/scoping period was the amount of new employment that would actually be generated by the WLC project. Table 4.13.F provides several sources for estimating potential new direct employment for the proposed project, which could range from 16,240 to 21,315 jobs, depending on what data source is selected to predict future employment within the WLCSP.

NOTE: The following changes to the table have been made due to revision to the Specific Plan project size and to clarify the discussion on projected jobs by the Skechers and HF Corporate Park.

Table 4.13.F: Comparison of Direct Employment Projections for Other High-Cube Logistics Projects

Source/Project (Jurisdiction)	Jobs / 1000 ft ²	Square Feet/ Employee	Square Feet of Building	Projected Direct Jobs
World Logistics Center ¹ Specific Plan (City of Moreno Valley)	0.5:1,000	2,000:1	40,600,000	20,300
Stratford Ranch ³ (City of Perris)	0.4:1,000	2,500:1	1,712,880	685
Skechers Only (City of Moreno Valley)	0.5:1,000	2,000:1	1,820,000	910 ⁴
Husing Logistics Report ⁵ (City of Moreno Valley)	0.525:1,000	1,906:1	NA	NA
Vogel Industrial Project ⁶ (City of Moreno Valley)	0.4:1,000	2,500:1	1,616,133	646

¹ DTA Public Works Database; confirmed by “Employment Density Study,” SCAG (2001), and “Logistics Trends and Specific Industries,” NAIOP Research Foundation (March 20110).

³ Inland Empire Distribution Center Operations Profile, WCL Consulting, June 10, 2008. 2,500 square feet per employee is an average of the Inland Empire rates.

⁴ Total projected direct employment.

⁵ From Husing report to the City Council in January 2012 based on 2003 study by U.S. Energy Information Agency shipping and distribution centers increase by 5% making it 1 employee/ 2,000 square feet.

⁶ Inland Empire Distribution Center Operations Profile, WCL Consulting, June 10, 2008. 2,500 square feet per employee is an average of the Inland Empire rates.

It should be understood that the actual eventual number of employees generated by the project will vary depending on a variety of economic factors (e.g., actual companies that relocate and current hiring conditions). The projected employment estimate also does not take into account relocation of existing employees from other jurisdictions as a result of existing businesses relocating into the WLC project. However, these would be counted as “new” employees for the City of Moreno Valley. For the purposes of this analysis, the EIR will use 20,300 employees working at the WLC or one employee per 2,000 square feet as a conservative estimate (in terms of environmental impacts) for future employment growth from WLCSP development.

The new employment opportunities resulting from development of the proposed high-cube logistics warehouse and general warehouse uses will raise the City’s current jobs-to-housing ratio by providing additional jobs to local residents. While the place of residence of the persons accepting employment provided by the proposed uses is uncertain, due to the City’s projected jobs/housing ratio, it is reasonable to assume and therefore expect that some percentage of these jobs would be filled by persons already living within the City or project area. Therefore, no significant increase in population of the City would result from the development or operation of the proposed WLC project, resulting in a less than significant impact associated with growth inducement and no mitigation is required.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The second threshold for significance is “Would the proposed WLC project induce substantial population growth in an area, either directly (e.g., new homes and businesses) or indirectly (e.g., extension of roads and infrastructure) that may lead to fiscal or economic impacts?” In that regard, the following provides an analysis of the projected fiscal effects of the proposed WLCSP project.

Indirect City Population Impacts Related to Fiscal and Economic Changes. If the MHSP project is not built, it could be argued the City may experience a financial impact from the loss of property tax, sales tax, and other revenues related to growth and development. The following analysis demonstrates that the City will benefit financially by employment and development of logistics warehousing as a result of the WLCSP project.

As detailed in the DTA study, recurring municipal revenues available to the City include those listed in Table 4.13.G. Total recurring revenues available to the City are estimated at approximately \$11,257,466 per year. As shown in Table 4.13.G, the greatest percentage of revenue is attributed to the Property Tax In-Lieu of Vehicle License Fee (40.2%), followed by Secured Property Tax (29.1%), and Business Receipts Tax and Licenses (10.8%).

Table 4.13.G: Recurring Fiscal Revenues City of Moreno Valley (City General Fund)

Source	Amount	Percent ¹
Property Tax In-Lieu of Vehicle License Fee	\$ 4,522,818	40.2%
Secured Property Tax	\$ 3,276,191	29.1%
Business Receipts Tax & Licenses	\$ 1,210,847	10.8%
Tax Revenues	\$ 607,657	5.4%
Indirect Sales Tax	\$ 423,144	3.8%
Charges for Services	\$ 386,032	3.4%
Unsecured Property Tax	\$327,619	2.9%
Franchises	\$ 251,896	2.2%
Property Transfer Tax	\$ 100,495	0.9%
Intergovernmental Revenues	\$ 60,918	0.5%
Licenses/Permits	\$ 57,771	0.5%
Direct Sales Tax	6,000	0.1%

Fines and Forfeitures	\$ 6,498	0.1%
Transfers In	\$ 3,757	0.0%
Use of Money & Property	\$ 2,538	0.0%
Total	\$ 11,257,466	100.0%

¹ Numbers may not sum correctly due to rounding to the nearest hundredth.
Source: Table 3A, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates, September 2014.

Recurring municipal services costs to the City include those listed in Table 4.13.H. Total recurring costs to the City are estimated at approximately \$5,557,674 per year. As shown in Table 4.13.H, the greatest percentage of cost is attributed to the Police Services (35.8%), followed by Infrastructure and Parks Maintenance Costs (34.1%), and Fire Services (13.3%).

Source: Table 3B, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September, 2014.

Table 4.13.I provides an overall summary of the fiscal impact to the City based on projected revenues generated by the proposed WLC project. As shown in Table 4.13.I, project recurring annual fiscal surplus that would be available to the City is estimated at \$5,699,792, which is equal to 2.03 times the project annual City General Fund costs.

Table 4.13.I: Net Fiscal Impact City of Moreno Valley (City General Fund)

Category	Amount
Total Recurring Revenues	\$ 11,257,466
Total Recurring Costs	\$ 5,557,674
Annual Recurring Surplus/(Deficit)	\$ 5,699,792
Total Annual Revenue/Cost Ratio	2.03

Source: Table 3C, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September 2014.

Table 4.13.J presents the project characteristics that are the basis for the fiscal impact assessment. The locations of the additional indirect jobs that will be created within the County cannot be specifically determined; however, some percentage of these jobs will be support service jobs and are likely to be located in the general project vicinity. Based on experience with similar types of projects, DTA estimated that half of these indirect jobs would be located within the City. The study also considers Total Output (i.e., total expenditures including sales or gross receipts, or other operating income) based on the different types of development projected to occur. For gross receipts, the study considers the initial or first-round increase in output (e.g., total spending/gross receipts, including payroll), all of which would occur directly on site. Indirect impacts represent the economic activity of supplier and/or supporting businesses. Induced impacts represent the economic activity that results from household spending by employees that may result from direct and direct employment generation of the proposed WLC project.

NOTE: The following changes to the table have been made due to revision to the Specific Plan project size.

Source: Table 4A, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September 2014.

As previously noted, potential economic impacts that may occur with project implementation include permanent employment (direct on site and indirect/induced), permanent output (gross receipts; total direct output plus output produced by suppliers and employee spending), and one-time construction impacts. Table 4.13.K summarizes the permanent (recurring) employment, wage, and gross receipts values associated with the proposed WLC project.

Table 4.13.K: Project Permanent (Recurring) Employment, Wages ,and Gross Receipts

Recurring Impact	Direct	Indirect/Induced	Total
Employees			
Countywide	20,307	7,387	27,693
Within City	20,307	3,693	24,000
Employee Wages			
Countywide	\$831 Million	\$ 300 Million	\$ 1.13 Billion
Within City	\$ 831 Million	\$150 Million	\$ 981 Million
Overall Output			
Countywide	\$1.5 Billion	\$ 870 Million	\$2.37 Billion
Within City	\$1.5 Billion	\$435 Million	\$1.94 Billion

Source: Tables 4B and 4C, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September 2014.

The DTA study indicates that the creation of new jobs to the City will lead to more consumer spending by employees in existing retail establishments within the City, as well as new retail development that will be attracted to the City as a result of this spending. Job creation also results in increased tax revenues to the City through increased property taxes and sales taxes associated with development of the proposed WLC project. However, it is important to note that because of the difference in timing of the development of the various phases of the proposed WLC project, the number of employees summarized above will not be realized at the same time.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 4.13.L summarizes the construction (one-time) employment, wages, and gross receipts values associated with the proposed WLC project.

Table 4.13.L: Project Construction (One-Time) Employment and Wages and Gross Receipts

Recurring Impact	Direct	Indirect/Induced	Total
Construction Employees			
Countywide	12,807	7,426	20,233
Within City	12,807	3,714	16,521
Construction Wages			
Countywide	\$625 Million	\$301 Million	\$ 927 Million
Within City	\$625 Million	\$151 Million	\$776 Million
Total Output from Construction Jobs			
Countywide	\$ 1.67 Billion	\$ 932 Million	\$ 2.6 Billion
Within City	\$ 1.67 Billion	\$ 466 Million	\$ 2.14 Billion

Source: Tables 4D and 4E Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California, David Taussig and Associates, September 2013.

As summarized in Table 4.13.L, development of the proposed WLC project is projected to create approximately 16,521 construction-related full-time equivalent (FTE) jobs within the City. Similar to recurring employment (i.e., permanent), it is likely that some percentage of these jobs will be associated with support services and are likely to be located in the vicinity of the proposed WLC project and therefore within the City.

The proposed WLC project does not include a residential component, so it would not directly generate additional new housing. Employees of the project that choose to live in the City would likely utilize the existing supply of housing within the City.

Based on the potential increase in jobs (additional 20,307 direct jobs) within the City and no substantial increase in population as a result of the project, the City's jobs-to-housing ratio would improve from the existing (2011) ratio of 0.45 to 0.82, thus achieving a greater jobs-to-housing balance within the City. Similarly, the potential new County employees that may be generated by the proposed WLC project would increase the total County employment to 571,799 from 551,492 resulting in a ratio of 0.71 from 0.69.

As development of the proposed WLC project is expected to occur over the course of many years, the jobs-to-housing ratio will not significantly change immediately. The City's current jobs-to-housing ratio is exceptionally low when compared to SCAG standards; therefore, the need for employment is immediate. A balance between jobs and housing within the City would have a positive impact by decreasing costs associated with commuting and traffic congestion. It also provides savings to consumers in the operation and maintenance of automobiles, and saving to local public agencies in terms of the need to construct and maintain new road improvements.

Summary of Impacts. Based on the foregoing discussion and as evidenced in Tables 4.13.I, 4.13.K, and 4.13.L, implementation of the proposed WLC project would not result in a deficit in the City's General Fund. The estimated surplus is \$5,699,792, which is equal to 2.03 times the projected annual City General Fund costs. Additionally, the proposed WLC project is expected to generate sizeable, substantial, and lasting employment, wages, output, and revenues for the City and region. Therefore, potential fiscal and economic changes that could affect the City's population or housing are considered to be less than significant, and no mitigation is required.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4.13.5.2 Displace Substantial Housing/People

Threshold	Would the proposed WLC project displace substantial numbers of people or existing housing, necessitating the construction of replacement housing elsewhere?
-----------	---

Displace Existing People/Housing. The WLC project site currently contains seven rural residences. At the City Council meeting on May 22, 2012, some of the existing residents stated that they did not want to be included in the Specific Plan. After deliberation, the Council decided to include the rural properties in the Specific Plan in the interest of comprehensive land planning for the WLC property. Upon approval of the Specific Plan, these properties can continue as non-conforming uses, and the WLC Specific Plan designates these properties as “Light Logistics” (LL), which allows for future industrial-related uses (vehicle storage, light assembly, etc.). In this way, the WLCSP will not remove or displace any of the existing residents or residences from the project site. As large warehouse buildings are developed near or adjacent to these residences, it may become less desirable to reside within the WLCSP area; however, the project itself does not cause housing displacement.

Therefore, impacts to the seven on-site residences would not be considered a significant housing impact. For these reasons, the WLCSP will not have significant population or housing impacts related to displacing substantial numbers of people or existing housing.

Displace Potential Future People/Housing. The City of Moreno Valley has been housing “rich” for many years, with much more housing stock than jobs according to data available from the SCAG. In addition, the recent economic downturn and related foreclosure/short sale conditions have left Moreno Valley, as with many housing rich communities, with an overabundance of housing stock. Section 4.10, *Land Use and Planning*, examines the potential environmental impacts related to the “loss” of 388 affordable housing units from the MHSP, as outlined in the City’s 2011 Housing Element. The Element acknowledges that the MHSP property may have to be used for employment-generating uses, and that “land use changes with the Moreno Highlands Specific Plan area will not hinder the City’s ability to meet its RHNA obligations.”¹ The 2011 Housing Element therefore documents that the City has an abundant supply of housing and can meet its RHNA requirements without relying on any units from the MHSP.

During the NOP/scoping process, several residents commented that development of the proposed WLCSP would result in the loss of 7,700 housing units from the project site that would have to be “made up” elsewhere in the City. The 2006 City Housing Element identified a potential for 5,240 units of the potential 7,700 housing units in the Moreno Highlands Specific Plan. However, an updated Housing Element adopted by the City in February 2011 indicated the Moreno Highlands area would be rezoned to support employment-generating uses rather than housing. It also concluded that “pursuing any land use changes with the Moreno Highlands Specific Plan area will not hinder the City’s ability to meet its RHNA obligations.” The term RHNA refers to the Regional Housing Needs Allocation (affordable housing allocations) from the SCAG.

Table 8-19.5 in the 2011 Housing Element states that after removing sites south of SR 60 and east of Redlands Boulevard, the Amended Inventory throughout the City west of Redlands accommodates:

- 4,100 Low and Very Low Income units, which is 1.3 times the RHNA number (3,045) (deleting sites south of SR-60 and east of Redlands Boulevard has no effect on low and very low income housing opportunities);
- 2,600 Moderate Income units, which is 2.1 times the RHNA number (1,239);

¹ Page 41, City of Moreno Valley Housing Element, February 2, 2011.

- 7,828 Above Moderate Income units, which is 2.5 times the RHNA number (3,068); and
- 14,528 total identified units, which is 1.94 times the total RHNA number (7,474).

Therefore, removal of the 388 affordable units originally identified in the MHSP (Table 8-19, page 40 of the Housing Element), including 233 “Very Low” and 155 “Low” units, will not have a significant impact on the City’s Housing Element or its ability to achieve its RHNA allocation.

The State Housing and Community Development Department (HCD) certified the City’s Housing Element as compliant with State law on May 31, 2011. This State HCD certification reinforces the conclusion that approval of the proposed project will not impede the City’s housing goals as set forth in the City’s Housing Element.

In April 2011, the City adopted its Economic Development Action Plan, which also identified the eastern part of the City as a potential area for major job-producing land uses. The *Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California* (“Study”) prepared by DTA in 2014 concluded that the proposed WLC project would generate 20,307 direct jobs/employees to the City. Section 4.10.5.3 determined that the proposed WLC project is consistent with the 2011 Housing Element, and it will not displace substantial numbers of existing housing or necessitate the construction of replacement housing elsewhere. Therefore, no significant displacement impacts relative to people or housing are expected to occur, and no mitigation is required.

4.13.6 Significant Impacts

Based on the analysis in Section 4.13.5, the WLC project will not have any significant impacts relative to population, housing, or employment. Therefore, no mitigation is required. However, in response to Comment F-8-94 and other related comments, the Final EIR Volume 1 recommends the City add the following text to the WLCSP Development Agreement approval with the concurrence of the applicant:

“Highland Fairview will establish a WLC Local Hiring Program to actively encourage the hiring of Moreno Valley residents for job opportunities at the World Logistics Center. Highland Fairview will encourage its contractors, suppliers and tenants to be active participants in a Moreno Valley Employment Resource Center (ERC) job opportunity announcement program.

World Logistics Center employers will be encouraged to submit all job announcements to the Moreno Valley Employment Resource Center at least one week prior to providing such announcements to other agencies or to the general public. Potential employers will be urged to provide information regarding job opportunities to the ERC including details regarding job titles, minimum qualifications, application processes, and employer contact information.”

4.13.7 Cumulative Impacts

The cumulative area for the discussion of population and housing impacts is the City of Moreno Valley. The proposed WLC project would require a General Plan Amendment and Zone Change to re-designate the site from a mix of land uses and zoning designations to Logistics Development and Public Utility land uses and a Specific Plan zoning designation. The project would not contribute to substantial population growth and therefore would not result in an increased demand on the current or future housing in the region. In addition, the Moreno Valley area is considered housing rich and jobs poor by SCAG, so the loss of population (and planned housing) would actually be a regional benefit according to the Regional Transportation Plan. The project may result in an influx of new workers who would need to locate temporarily or permanently in the area, but the City has an overabundance of existing housing stock due to current market conditions. Implementation of the

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

proposed WLC project would actually benefit population and housing conditions relative to employment and jobs/housing ratio and, therefore, not result in cumulatively adverse impacts to population or housing. The WLC project would also not significantly induce growth into areas where growth was not previously anticipated since the WLC project area represents the last largest remaining vacant land in the City of Moreno Valley.

NOTE TO READERS. *No major revisions have been made to this section in response to comments other than changes related to the revised Specific Plan.*

4.14 PUBLIC SERVICES AND FACILITIES

This EIR discussion includes an evaluation of police and fire services, as well as schools and parks. The analysis considers these public services in the proposed project vicinity and evaluates the impacts to service providers that would result from the construction and operation of the proposed uses as described in the Specific Plan. The analysis contained in this section is based on the following reference documents:

- City of Moreno Valley General Plan, City of Moreno Valley, July 11, 2006;
- City of Moreno Valley General Plan Final EIR, City of Moreno Valley, July 2006;
- Letter from Joel Ontiveros, Moreno Valley Police Department Chief, July 10, 2012;
- Letter from City Fire Chief Abdul R. Ahmad dated June 27, 2012;
- Moreno Valley School District website information on Developer Impact School Fees; and
- San Jacinto Unified School District website May 2012.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

This section describes the existing public services within the City of Moreno Valley. The project site consists of the lands within the project boundaries and the project vicinity. The project vicinity consists of areas adjacent to the project site. This section differs slightly from other sections in that it is organized by the public service provider so continuity is maintained. Police Service is found in Section 4.14.1, Fire Protection is found in Section 4.14.2, Schools are found in Section 4.14.3, Parks are found in Section 4.14.4, and Cumulative Impacts are found in Section 4.14.5.

4.14.1 Police Protection

4.14.1.1 Existing Setting

The City of Moreno Valley contracts with the Riverside County Sheriff's Department (RCSD) for police services. Through this contract, the RCSD staffs the Moreno Valley Police Department (MVPD). The MVPD Chief provided a letter on July 10, 2012, that provided the following information on police service in the City. The MVPD has a service area of 51.5 square miles and a service population of 196,495 people. The main police station is located in the City Public Safety Building (PSB) at 22850 Calle San Juan De Los Lagos in Moreno Valley. In addition, the MVPD operates four storefront substations throughout the City. The MVPD occupies 44,800 square feet or 98 percent of the 45,900-square foot PSB with the remainder used by the City Fire Department. The MVPD also utilizes 405 parking spaces in the PSB secured lot. The MVPD Chief has indicated the PSB and parking lot are already at or near full capacity at this time. The MVPD maintains five operational divisions: Patrol, Detective, Special Enforcement, Traffic, and Administrative.

The MVPD handles a service demand of more than 130,000 calls for service (CFS) each year. The MVPD has a current demand of 657 CFS per year per sworn officer, and each deputy on patrol averages 8 CFS per 10-hour shift. There are no set response time goals, but the current response times average 6.15 minutes for Priority 1 calls (emergency), 13.8 minutes for Priority 2 (service need) calls, and 32.4 minutes for Priority 3 (business) calls.

Police services are paid for out of the City of Moreno Valley General Fund. There are currently 255 employees working at the MVPD and 198 of them are sworn peace officers. The MVPD maintains 166 vehicles to support its operations but does not have any commercial vehicle enforcement equipment or personnel at this time.

According to the Federal Bureau of Investigation, Uniform Crime Reporting Program, the national average for police department staffing is 2.3 officers per 1,000 residents. By comparison, the nationwide average for cities of comparable size to Moreno Valley is 1.8 officers per 1,000 residents, while the average for "west coast" area cities of comparable size is 1.2 officers per 1,000 residents. The police service ratio within the City is 1.0 officer per 1,000 citizens, and the City has indicated a commitment to maintain that ratio.

The PSB is approximately 6.5 miles from the project site and would be the closest station to service the proposed project site. The WLC site is located within City Beat 46 (MV46) but there are few calls from the project site at present.

NOP/Scoping Comments. Several residents asked during the scoping process what the impact of the project would be on existing and future public services like police and fire.

4.14.1.2 Existing Policies and Regulations

The City of Moreno Valley has developed policies and regulations in order to direct future activities and decisions in order to achieve the goals and objectives set forth in the City's General Plan and Municipal Code.

Community Design Element Policies

- 2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.
- 2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.

Safety Element Policies

- 6.8.1 Explore the most effective and economical means of providing responsive and adequate law enforcement protection in the future.
- 6.9.2 Require well-lighted entrances, walkways and parking lots, street lighting in all commercial, industrial areas and multiple-family residential areas to facilitate nighttime surveillance and discourage crime.
- 6.9.3 Incorporate "defensible space" concepts into the design of dwellings and nonresidential structures, including, but not limited to configuration of lots, buildings, fences, walls and other features that facilitate surveillance and reinforce a sense of territorial control.
- 6.11.1 Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.
- 6.12.1 Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.

NOTE: The following changes have been made in response to Comment F-13-32 in Letter F-13 from Johnson & Sedlack on Behalf of Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.

Ultimate Goals

- VII Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards.

City of Moreno Valley Municipal Code. Pursuant to Moreno Valley Municipal Code Section 3.42.070, the proposed project is subject to Police Facilities Commercial and Industrial Development Impact Fees. These fees contribute to the police services facilities provided for in the Existing General Plan area and Capital Improvement Projects. The fees provide financing for the acquisition of land for police and fire facilities as well as design, construction, improvements, and maintenance to the extent permitted by law.

4.14.1.3 Methodology

Based on discussion with City staff and previous environmental documents prepared by the City, the evaluation of impacts associated with the proposed project on police services includes the following:

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Determine the existing police response time for the City based on RCSD goals;
- Determine the length of time for police services to arrive at the project site based on average travel time;
- Compare existing police response time and potential police response time; and
- Determine funding mechanism for future police services, staff, and facilities.

Police service funding impacts were evaluated by identifying compliance with local and RCSD goals and policies. Response time impacts were evaluated by comparing existing and anticipated average responses through RCSD response time goals.

4.14.1.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, police protection impacts would be considered significant if the following condition resulted from the construction or operation of the proposed project:

- Substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services.

4.14.1.5 Less than Significant Impacts

Threshold	Would the proposed project result in substantial adverse physical impacts associated with the provision of new or physically altered law enforcement facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police services?
-----------	--

The development and operation of the proposed project would increase demand for police protection services. In addition, the MVPD Chief has indicated the department would not be able to maintain current service levels if the WLC project were built. Initially, crimes of grand theft and malicious mischief during construction would be the potential major crime issue. However, it is anticipated that private security would be utilized during the construction process, similar to other private security services that are utilized for other construction projects in the City. Typical operational police protection services involved with warehouse uses include after-hours patrol. Potential impacts would take the form of a need for expanded police protection services routinely associated with industrial growth, including routine patrols, responding to calls for service such as graffiti or vandalism, robbery, etc. In addition, commercial enforcement will be needed on surrounding streets. The number of additional service calls and call response times would slowly increase, and overall service levels would decrease incrementally as more warehouse buildings were built on the project site. The proposed warehouse uses would generate new employment opportunities. The new jobs that would be created by the proposed project would probably not induce substantial population growth within the City, because most of the new jobs would either be filled by residents of the City and surrounding areas or transfer from existing jobs to the project site for existing warehousing that relocates to the WLC project site.

In his July 10 letter, the City Police Chief concluded that buildout of the WLC project would create a need for 15 full-time sworn officers, 4 classified staff, 2,635 square feet of new police building area, 11 police vehicles, and 24 more secured parking spaces. The Chief also concluded buildout of the WLC project would generate a need for two additional commercial enforcement vehicles and all the

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

related equipment, the addition of two full-time sworn commercial enforcement police officers, and training for those officers.

According to the 2004 City of Moreno Valley Community and Economic Profile, a majority of funding for police protection services is funded through sales tax revenue. In addition, the project will be subject to all applicable impact fees at the time specific development is proposed.

The City collects fees from developers to offset police-related service impacts associated with new development. These development impact fees (DIFs) are one-time charges applied to new development and are imposed to raise revenue for the construction or expansion of capital facilities. DIFs enable the City to collect fair-share fees from new development projects to fund new infrastructure and services. In the City, developers are also required to pay development fees per square foot of development to offset impacts associated with increased demand on law enforcement services. DIFs are collected for specific infrastructure needs and are deposited into different accounts representing these requirements. The proposed project would be designed and operated per applicable standards required by the City for new development in regard to public safety. In addition, the project would be required to pay development fees used to fund capital costs associated with constructing new public safety structures and purchasing equipment for new public safety structures.

The proposed WLCSP project will result in an increased need for police services as the project builds out. Serving the WLCSP project would initially require additional patrol and service time from existing staff, but would require additional personnel and/or equipment as new development is added.

Building security is a critical component of contemporary logistics facility design. Site design features routinely include restricted vehicular and pedestrian access, perimeter fencing and walls, and full-coverage cameras and monitoring systems. Tenants typically employ full-time security personnel and sophisticated internal security and monitoring systems. Facilities that operate as “Free Trade Zones,” as established by the U.S. Customs Service, are required to install and maintain extensive internal and external security facilities and systems.

General Plan and Municipal Code Consistency. Table 4.14.A evaluates whether the proposed project is consistent with the City’s General Plan policies and Municipal Code requirements relative to police service

NOTE: The following analysis was added to the table in response to Comment F-13-32 in Letter F-13 from the Sierra Club et al.

Table 4.14.A: Project Consistency with General Plan Policies and Municipal Code Requirements for Police Service

General Plan Policies	Project Consistency
Ultimate Goals	
<p>VII Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards.</p>	<p>Consistent. The project will be consistent with this goal regarding public services by providing future sites and/or facilities for fire and police facilities as development occurs. The project will also protect onsite and offsite uses from flooding and other hazards. The revised air quality study indicates the project will not result in significant offsite health risks for adjacent land uses based on the SCAQMD ten in one million threshold for cancer risks.</p>

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 4.14.A: Project Consistency with General Plan Policies and Municipal Code Requirements for Police Service

General Plan Policies	Project Consistency
Community Design Element Policies	
2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.	Consistent. Initial project construction can be accommodated by existing police service. As development continues, additional police facilities, equipment, and services will be needed within the project, and the project will provide DIF and property tax revenues to support these future needs.
2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.	Consistent. This EIR provides information on the potential impacts of the project on City services and facilities, including police. As development occurs within the project, additional police facilities, equipment, and services will be needed within the project, and the project will provide DIF and property tax revenues to support these future needs.
Safety Element Policies	
6.8.1 Explore the most effective and economical means of providing responsive and adequate law enforcement protection in the future.	Consistent. This EIR provides information on the potential impacts of the project on City services and facilities, including police. As development occurs within the project, additional police facilities, equipment, and services will be needed within the project, and the project will provide DIF and property tax revenues to support these future needs.
6.9.2 Require well-lighted entrances, walkways and parking lots, street lighting in all commercial, industrial areas and multiple-family residential areas to facilitate nighttime surveillance and discourage crime.	Consistent. The Specific Plan provides site and building lighting guidelines for future development to discourage crime. In addition, many of the on-site uses will have gated access and private security, reducing the need for additional City police services.
6.9.3 Incorporate “defensible space” concepts into the design of dwellings and nonresidential structures, including, but not limited to configuration of lots, buildings, fences, walls and other features that facilitate surveillance and reinforce a sense of territorial control.	Consistent. The Specific Plan provides site and building design guidelines, including fencing and walls, lighting, security cameras, to discourage crime. In addition, many of the uses will have gated access and private security, reducing the need for additional City police services.
6.11.1 Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.	Consistent. Development according to the Specific Plan will allow full emergency access to this portion of the City as new buildings are constructed.
6.12.1 Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.	Consistent. Development according to the Specific Plan will allow regional emergency access to this portion of the City from SR-60 and Gilman Springs Road.

Table 4.14.A: Project Consistency with General Plan Policies and Municipal Code Requirements for Police Service

General Plan Policies	Project Consistency
City of Moreno Valley Municipal Code	
Pursuant to Moreno Valley Municipal Code Section 3.42.070, the proposed project is subject to Police Facilities Commercial and Industrial Development Impact Fees. These fees contribute to the police services facilities provided for in the Existing General Plan area and Capital Improvement Projects. The fees provide financing for the acquisition of land for police and fire facilities as well as design, construction, improvements, and maintenance to the extent permitted by law.	Consistent. All development within the Specific Plan will pay applicable Development Impact Fees to the City.

The proposed project is consistent with the City General Plan policies and Municipal Code requirements relative to police services.

The WLCSP requires building and site design characteristics that specifically support police services by encouraging buildings that are safe and can be secured by design, fencing, security services, etc. The proposed WLCSP design guidelines are consistent with the goals of the General Plan relative to police protection and site design, as outlined in Section 4.14.1.2. In addition, future development within the WLCSP will be required to comply with the City’s Development Impact Fee (DIF) requirements as new development is constructed. It is anticipated that DIF revenues will help fund additional equipment needs and increased property taxes would help fund increased service or staffing needs. Therefore, the project will have less than significant impacts relative to police service, and no mitigation is required.

4.14.1.6 Significant Impacts

Based on the analysis in Section 4.14.1.5, the project will have no significant impacts relative to police protection.

4.14.2 Fire Protection

4.14.2.1 Existing Setting

The following information is based in part on a letter from the City Fire Chief dated June 27, 2012. The City of Moreno Valley Fire Department (MVFD) contracts with the Riverside County Fire Department (RCFD) to provide fire protection, fire prevention, and emergency services. The RCFD is administered and operated by the California Department of Forestry and Fire Protection (CalFire). Within the City, the objective of the MVFD is to have an engine company arrive on the scene of a fire or emergency medical aid situation within four minutes of a notification (i.e., dispatch) 90 percent of the time and a complete first alarm assignment within eight minutes¹ 90 percent of the time. Moreno Valley is served by six fire stations and a one-minute preparation time plus a four-minute travel time to fire incidents and emergency medical aid calls (90% of the time) is considered to be the maximum time standard for serving urban and suburban uses in accordance with the National Fire Protection Association (NFPA) 1710 standard. The City requires any new developments to provide adequate fire suppression water flows. The MVFD responds to medical aid calls with advance life support services.

¹ Station assigned to respond after first responder assesses situation.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

The MVFD participates in the Regionalized Cooperative Fire Protection Delivery System of Riverside County Fire/CalFire. This system ensures that the closest and most appropriate resources are dispatched to all requests for fire department emergency services regardless of jurisdiction.

The MVFD main office is located in the City PSB at 22850 Calle San Juan De Los Lagos in Moreno Valley. The MVFD occupies 1,100 square feet or 2 percent of the 45,900-square foot PSB, plus parking in the PSB secured lot. The City Police Chief has indicated the PSB and parking lot are already at or near full capacity at this time, so it is assumed this conclusion also applies to the Fire Department as well.

The City of Moreno Valley has six existing fire stations and one proposed fire station within the City limits as summarized in Table 4.14.B. Fire Station 58, Moreno Beach Station, is located at 28040 Eucalyptus Avenue and is the closest station to the project site. This station is approximately 1.25 miles northwest of the western limits of project site. The station is staffed on a 24/7 basis by three firefighters, one engine, one reserve aerial ladder truck, and a rescue squad.

Municipal Code Section 3.42.060 provides for the collection of Fire Facilities Commercial and Industrial DIFs and states that these fees shall be paid by applicants for commercial and industrial projects prior to the issuance of applicable building or occupancy permits.

NOP/Scoping Comments. During the NOP period, a comment was made about a future fire station planned at Redlands Boulevard/Brodiaea Avenue. Fire Chief Abdul R. Ahmad’s letter (June 27, 2012) cites potential fire danger from the proposed project being within both a high fire risk category and a non-fire high hazard risk category from building types, from emergency incidents (both fire and non-fire) during construction of the various phases of the proposed project, and from being partially within a State-designated Very High Fire Hazard Severity Zone.

Table 4.14.B: Moreno Valley Fire Stations

Fire Station	Address	Personnel	Equipment
Station 2 (Sunnymead)	24935 Hemlock Avenue	7 Firefighters	1 Engine 1 Aerial Ladder Truck (100 foot) 1 Urban Search and Rescue Trailer
Station 6 (Towngate)	22250 Eucalyptus Avenue	3 Firefighters	1 Engine 1 Reserve Engine
Station 48 (Sunnymead Ranch)	10511 Village Road	3 Firefighters	1 Engine 1 Reserve Engine
Station 65 (Kennedy Park)	15111 Indian Street	3 Firefighters	1 Engine 1 Reserve Engine
Station 58 (Moreno Beach)	28040 Eucalyptus Avenue	3 Firefighters	1 Engine 1 Reserve Aerial Ladder Truck 1 Rescue Squad
Station 91 (College Park)	16110 Lasselle Street	7 Firefighters	1 Engine 1 Rescue Squad 1 Aerial Ladder Truck (75 foot)
Station 99 (Morrison Park) <i>Opened October 2012</i>	13400 Morrison Street	3 Firefighters	1 Engine

Source: Table 5.13-1 City of Moreno Valley General Plan Final EIR, July 2006; Moreno Valley Fire Department, 2012.

4.14.2.2 Existing Policies and Regulations

The City of Moreno Valley has developed policies and regulations in order to direct future activities and decisions in order to achieve the goals and objectives set forth in the City's General Plan and Municipal Code.

Community Design Element Policies

- 2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.
- 2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.

Safety Element Policies

- 6.11.1 Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.
- 6.12.1 Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.
- 6.13.1 Provide fire safety education to residents of appropriate age.
- 6.14.2 Relate the timing of fire station construction to the rise of service demand in surrounding areas.
- 6.15.1 Encourage programs to minimize the fire hazard, including but not limited to the prevention of fuel build-up where wildland areas are adjacent to urban development.
- 6.15.2 Tailor fire prevention measures implemented in wildland areas to both the aesthetic and functional needs of the natural environment.
- 6.16.1 Ensure that ordinances, resolutions and policies relating to urban development are consistent with the requirements of acceptable fire safety, including requirements for smoke detectors, emergency water supply and automatic fire sprinkler systems.
- 6.16.2 Encourage the systematic mitigation of existing fire hazards related to urban land development or patterns of urban development as they are identified and as resources permit.
- 6.16.3 Ensure that adequate emergency ingress and egress is provided for each development.

City of Moreno Valley Municipal Code. Municipal Code Section 3.42.060 provides for the collection of Fire Facilities and Commercial and Industrial Development Impact Fees and states that fees shall be paid by applicants for commercial and industrial projects prior to the issuance of applicable building or occupancy permits.

4.14.2.3 Methodology

Based on discussion with City staff and previous environmental documents prepared by the City, the evaluation of fire service impacts associated with the proposed project includes the following:

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- Determine the existing fire response time for the City based on Moreno Valley Fire Department goals identified in the Moreno Valley Fire Department Strategic Plan 2012–2022;¹
- Determine the length of time for fire services to arrive at the project site based on average travel time;
- Compare existing fire response time and potential fire response time; and
- Determine the funding mechanism for future fire services and facilities.

Fire service funding impacts were evaluated by estimating compliance with local and RCFD goals and policies as indicated in the Moreno Valley Fire Department Strategic Plan 2012–2022. Response time impacts were evaluated by comparing existing and anticipated average responses with MVFD response time goals.

4.14.2.4 Threshold of Significance

Based on Appendix G of the *CEQA Guidelines*, impacts to fire protection services would be considered significant if the following condition resulted from the construction or operation of the proposed project:

- Substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services.

4.14.2.5 Less than Significant Impacts

Threshold	Would the proposed project result in substantial adverse physical impacts associated with the provision of new or physically altered fire-fighting facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire services?
-----------	--

The majority of the project site is currently undeveloped. The development and operation of the proposed project would increase the demand for fire protection, prevention, and emergency medical services. Time is the critical component in fire/medical emergencies. Reductions in the emergency response time or the distance between fire/medical facilities and the site of an emergency would result in improved service and saved lives and property.

Construction materials for the proposed warehouse buildings would likely be reinforced concrete and steel. Although fire occurring during the construction period for such buildings is rare, when they do occur they tend to be catastrophic due to a lack of completed fire protection and detection systems and the presence of considerable amounts of combustible materials that are normally on site during the construction phases. California Fire Code Section 8704 establishes fire safety standards for sites during the construction phase. All on-site construction as well as the use and storage of construction materials is required to conform to fire prevention/protection standards established by the RCFD, MVFD, and/or the City, which mirror standards prescribed in the California Fire Code. Adherence to safety standards required for sites during the construction phase established by the MVFD and/or the City would ensure that potential impacts during construction remain less than significant. Since portions of the project site are located within a State-designated Very High Fire Hazard Severity Zone, development within these zones is required to implement special construction features set forth

¹ *Moreno Valley Fire Department Strategic Plan 2012–2022*, Moreno Valley Fire Department, December 2011.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

in Chapter 7A of the California Building Code (CBC). Adherence to these specific requirements would ensure that potential impacts during construction remain less than significant.

All new development within the proposed project would be required to pay DIFs to the City. These fees are determined by the City Council, in consultation with the Fire Prevention Bureau, based on an assessment of the activity occurring within the City as well as the needs of the City. Such fees would be used to fund capital costs associated with land acquisition, construction, purchasing equipment, and providing for additional staff.

The proposed project will require that fire services be extended to the project site. In consultation with the MVFD through a letter dated June 27, 2012, submitted by Fire Chief Ahmad, the MVFD has identified that the estimated travel time from Fire Station 58 (the closest station to the project site) to the middle of the project site would exceed the NFPA 1710 standard for fire response time in the event of an emergency incident. Additionally, the MVFD identifies that buildings under construction are susceptible to fire and are likely to have a high rate of fire spread due to the absence of fire protection systems, fire detection systems, and fire protection features. Buildings under construction also lack compartmentalization of the interior to slow the rate of fire spread. The MVFD letter also notes that Fire Station 99 is expected to open in October of 2012;¹ however, the opening of an additional fire station would still result in service levels at the project site being below the NFPA 1710 standard.

The proposed project would increase the need for fire services and would potentially affect the MVFD's ability to maintain current service levels within the City. Additional service would be needed in the form of new facilities, personnel, and/or equipment. The City of Moreno Valley does not set a ratio of personnel per population, nor does it set equipment and staffing levels; rather, additional personnel and equipment are based on assessment of the activity occurring in the City, including but not limited to, calls for service and response times in order to meet or exceed the NFPA 1710 standard, the California Fire Code, and City Municipal Code Amendments. According to the 2004 City of Moreno Valley Community and Economic Profile, a majority of funding for fire protection services is from sales tax revenue. The project will be subject to all applicable development impact fees.

In his June 27, 2012, letter, the Fire Chief indicated the Fire Department would require "construction of a fire station during the first phase of this project. The fire station shall be located on 1.5 acres of land and the facility shall be approximately 11,000 square feet in size. This location shall be identified by the Fire Chief prior to the approval of the specific plan for the World Logistics Center. Initially, this station will require the purchase of an aerial ladder truck, which will be staffed daily by four Fire Department personnel for a total of twelve personnel to provide seven-day-a-week, twenty-four-hour-a-day coverage of the aerial ladder truck. During the final phase of construction, the Fire Department will require an additional fire apparatus to be purchased and staffed. This shall consist of a fire engine with a daily staffing of three Fire Department personnel for a total of nine personnel to provide seven-day-a-week, twenty-four-hour-a-day coverage."

As previously described, the proposed project would be designed, constructed, and operated per applicable fire prevention/protection standards established by the City. Such requirements include (but shall not be limited to) provisions for smoke alarms; sprinklers; building and emergency access; adequate emergency notification; and hydrant sizing, pressure, and siting. Due to the size and nature of the project and the potential for increased emergency incidents resulting from increased development and truck traffic will increase as development occurs, but payment of DIF fees and increased property taxes will offset increased service costs for this type of project. In addition, the Section 2.2.6 of the WLC Specific Plan indicates a future 1.5-acre urban fire station site will be dedicated to the City to help offset increased fire service needs. With these provisions, the proposed project will have a less than significant impact on fire services.

¹ Fire Station 99 (Morrison Park) opened in October 2012.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

General Plan and Municipal Code Consistency. Table 4.14.C evaluates whether the proposed project is consistent with the City’s General Plan policies and Municipal Code requirements relative to fire service.

Table 4.14.C: Project Consistency with General Plan Policies and Municipal Code Requirements for Fire Service

General Plan Policies		Project Consistency
Community Design Element Policies		
2.13.1	Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.	Consistent. Initial project construction can be accommodated by existing fire protection service. As development continues, the WLCSP provides a future fire station site, and the project will provide DIF fees and increased property taxes to compensate for future fire service needs.
2.14.3	Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.	Consistent. This EIR provides information on the potential impacts of the project on City services and facilities, including fire protection. As development occurs, the WLCSP provides a future fire station site, and the project will provide DIF fees and increased property taxes to compensate for future fire service needs.
Safety Element Policies		
6.11.1	Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.	Consistent. Development according to the Specific Plan will allow emergency access to this portion of the City as new industrial warehouses are constructed.
6.12.1	Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.	Consistent. Development according to the Specific Plan will allow regional emergency access to this portion of the City from SR-60 and Gilman Springs Road.
6.13.1	Provide fire safety education to residents of appropriate age.	Consistent. The project is for industrial warehouses and this policy generally applies to residential uses; however, warehouse operators will provide fire safety instruction and information to employees as encouraged by the Fire Department.
6.14.2	Relate the timing of fire station construction to the rise of service demand in surrounding areas.	Consistent. Initial project construction can be accommodated by existing fire protection service. As development continues, the WLCSP provides a future fire station site, and the project will provide DIF fees and increased property taxes to compensate for future fire service needs.
6.15.1	Encourage programs to minimize the fire hazard, including but not limited to the prevention of fuel build-up where wildland areas are adjacent to urban development.	Consistent. The Specific Plan provides site and building lighting guidelines for future development to discourage crime. Landscape palettes designed to reflect fuel modification criteria in wildland areas.
6.15.2	Tailor fire prevention measures implemented in wildland areas to both the aesthetic and functional needs of the natural environment.	Consistent. A portion of the project is in a High Fire Hazard Severity Zone and special construction features of the California Building Code will apply.

Table 4.14.C: Project Consistency with General Plan Policies and Municipal Code Requirements for Fire Service

General Plan Policies	Project Consistency
6.16.1 Ensure that ordinances, resolutions and policies relating to urban development are consistent with the requirements of acceptable fire safety, including requirements for smoke detectors, emergency water supply and automatic fire sprinkler systems.	Consistent. Future development will be required to comply with applicable fire protection requirements of the California Building Code.
6.16.2 Encourage the systematic mitigation of existing fire hazards related to urban land development or patterns of urban development as they are identified and as resources permit.	Consistent. Future warehouse development will have fire access lanes, building sprinkler systems and other fire suppression equipment and personnel to minimize fire-related risks.
6.16.3 Ensure that adequate emergency ingress and egress is provided for each development.	Consistent. Development according to the Specific Plan will allow emergency access to this portion of the City as new industrial warehouses and roadways are constructed.
City of Moreno Valley Municipal Code	
Pursuant to Moreno Valley Municipal Code section 3.42.060, Fire Facilities and Commercial and Industrial Development Impact Fees, states that fees shall be paid by applicants for commercial and industrial projects in the amounts adopted by the City Council by resolution from time to time. Neither building permit nor occupancy permit will be issued for any new commercial, industrial, or other non-residential building or structure unless the specified fees are paid.	Consistent. Future development within the Specific Plan will pay applicable Development Impact Fees to the City for fire-related services.

The proposed project is consistent with the City General Plan policies and Municipal Code requirements relative to fire protection services.

NOTE: The following information was added as a result of revisions to the WLC Specific Plan.

The WLCSP will dedicate a new 1.5-acre urban fire station site within its boundaries to allow for expansion of fire protection services as the project develops (see WLCSP Section 2.2.4). The revised WLCSP indicates the new fire station will be at the north end of Planning Area 11, and it is required to be built during Phase I. Placement of the fire station is subject to review and approval by the Fire Chief (WLCSP Section 2.2.4 First Station Site). The WLCSP also requires building and site design characteristics that specifically support fire services by encouraging buildings that are safe and can be secured by design, fencing, security services, etc. The proposed WLCSP design guidelines are consistent with the goals of the General Plan relative to fire protection and site design, as outlined in Section 4.14.2.2. Finally, future development within the WLCSP will be required to comply with the City's DIF requirements as new development is constructed. Therefore, the project will have less than significant impacts relative to fire protection service, and no mitigation is required.

4.14.2.6 Significant Impacts

Based on the analysis in Section 4.14.2.5, the project will have no significant impacts relative to fire protection.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4.14.3 Schools

4.14.3.1 Existing Setting

The project area is served by two school districts, the Moreno Valley Unified School District (MVUSD) and the San Jacinto Unified School District (SJUSD) and is home to the Moreno Valley campus of Riverside Community College (RCC). The MVUSD operates a total of 30 schools; 20 elementary, six middle, and four high schools. The SJUSD encompasses the far southeastern portion of the proposed project site (approximately 30 acres) and operates seven elementary schools, three middle schools, and two high schools.

NOP/Scoping Process. A number of residents were concerned about the WLC project only bringing in a small number of blue collar workers in a limited field (logistics warehousing), and that it would not help diversity or benefit to the workforce of the City (or their level of education) as a whole.

4.14.3.2 Existing Policies and Regulations

The City of Moreno Valley has developed policies and regulations in order to direct future activities and decisions in order to achieve the goals and objectives set forth in the City's General Plan and Municipal Code.

Community Design Element Policies

- 2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.
- 2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.

City of Moreno Valley Municipal Code. The proposed project will be located mainly within the MVUSD with a small part in SJUSD. These school districts currently impose fees of \$0.51 and \$0.47, respectively, per square foot on new industrial construction to offset the cost of providing new school facilities. The proposed project will be subject to these fees at the time of building permit issuance. However, no homes and no significant generation of school-aged children would be developed as part of the proposed project.

4.14.3.3 Methodology

Evaluation of school service impacts associated with the proposed project includes the following:

- Potential for student generation of the project in ways that would have direct or indirect impacts on local school districts;
- Cause other indirect educational impacts; and
- Cause negative impacts on existing or future school facilities or programs.

School impacts were evaluated by estimating compliance with local school district impact fee programs.

4.14.3.4 Thresholds of Significance

According to Appendix G of the *CEQA Guidelines*, a project would have a significant impact to schools if it would result in:

- Substantial adverse physical impacts associated with the provision of new or physically altered school facilities, need for new or physically altered school facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives.

4.14.3.5 Less than Significant Impacts

Threshold	Would the proposed project result in substantial adverse physical impacts associated with the provision of new or physically altered school facilities, need for new or physically altered school facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives?
-----------	--

Section 4.13.5.1 indicates the project is expected to generate from 15,000 to 25,000 new jobs for the City and surrounding areas; however, it is speculative to estimate how many of those workers will actually live within the City and how many will commute from other areas. Although the exact number is speculative, any increase is not expected to be substantial and will not generate significant new demands related to need for new or altered school facilities. The project is an industrial project and not a residential project that would have a direct impact on school services by accommodating additional residents within the City. Construction of the proposed project will create short-term construction jobs. These short-term positions are anticipated to be filled by workers who, for the most part, reside in the project area; therefore, construction of the proposed project will not generate a permanent increase in population within the project area.

California Government Code (§65995[b]) establishes the base amount of allowable developer fees imposed by school districts. These base amounts are commonly referred to as “Level 1 fees” and are subject to inflation adjustment every two years. School districts are placed into a specific “level” based on school impact fee amounts that are imposed on the development.

Unlike residential development, where it is possible to ascertain impacts to a particular school or school district, because employees at a warehouse facility could reside in any number of school districts with their children attending a collection of schools, it is difficult to determine with any level of certainty what the potential impacts to a particular school or school district would be.

The project site is located within the jurisdictional boundaries of the MVUSD and SJUSD. The MVUSD imposes development fees of \$0.51 per square foot of industrial development.¹ The SJUSD imposes development fees of \$0.47 per square foot of industrial development.² These development fees are equal to the minimum fee established by the State (Level 1 fees). Per California Government Code (§ 65995[h]), “The payment or satisfaction of a fee, charge, or other requirement levied or imposed ... are hereby deemed to be full and complete mitigation of the impacts ... on the provision of adequate school facilities.”

It is anticipated that most of the new employment opportunities generated by the proposed project will be filled by persons already residing in the community and surrounding areas. Because employees of the proposed on-site uses would be drawn from the local area, no substantial increase in population

¹ *School Developer Impact Fees*, Moreno Unified School District, 2012. http://www.mvusd.net/apps/pages/index.jsp?uREC_ID=24969&type=d&pREC_ID=55535, accessed April 16, 2012.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

or corresponding increase in students attending local schools will occur. In addition, the project proponent would be required to pay these development fees in accordance with Government Code 65995 and Education Code 17620.

The proposed project contains no residential development, so it would not cause a significant increase in the local population that would increase the number of students attending local schools (see Section 4.13, *Population and Housing*). Since payment of the school impact fees is required of all projects within MVUSD and SJUSD boundaries, impacts to school services and facilities would not occur. The WLC project is also consistent with the applicable General Plan policies in Section 4.13.3.2 as it will assist in the provision of adequate school facilities by providing legally required DIFs. Accordingly, impacts to the environment resulting from new or expanded school facilities would not occur, resulting in a less than significant impact and no mitigation is required.

General Plan and Municipal Code Consistency. Table 4.14.D evaluates whether the proposed project is consistent with the City’s General Plan policies and Municipal Code requirements relative to school services.

Table 4.14.D: Project Consistency with General Plan Policies and Municipal Code Requirements for School Services

General Plan Policies	Project Consistency
Community Design Element Policies	
2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.	Consistent. The proposed project consists of logistics warehousing and supporting uses and does not propose any residential uses that would add housing units or substantial numbers of new students to local schools.
2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.	Consistent. This EIR provides information on the potential impacts of the project on City services and facilities, including schools.
City of Moreno Valley Municipal Code	
The proposed project will be located mainly within the MVUSD with a small part in SJUSD which currently impose fees of \$0.51 and \$0.47, respectively, per square foot on new industrial construction to offset the cost of providing new school facilities. The proposed project will be subject to these fees at the time of building permit issuance. However, no homes and no significant generation of school-aged children would be developed as part of the proposed project.	Consistent. Future development within the Specific Plan will pay applicable School Impact Fees for non-residential uses.

The proposed project is consistent with the City General Plan policies and Municipal Code requirements relative to school services. In addition, future development within the WLCSP will be required to comply with the City’s DIF requirements as new development is constructed. Therefore, the project will have less than significant impacts relative to schools, and no mitigation is required.

4.14.3.6 Significant Impacts

Based on the analysis in Section 4.14.3.5, the proposed project will not produce any significant school-related impacts, so no mitigation is required.

4.14.4 Parks, Recreation, and Trails

4.14.4.1 Existing Setting

The Moreno Valley Parks and Community Services Department (Department) maintains over 358 acres of parks and park facilities, and 10 miles of trails. See Figure 4.14.1 for De Anza Trail in the surrounding area. The Department also maintains and operates 39 parks and facilities; including senior recreation centers and conference centers as well as 20 lighted sports fields and lighted sports fields at three schools. The nearest park to the project site is Ridgecrest Park located on John F. Kennedy Drive less than a mile southwest of the project site.

Open space land can be classified into lands for preservation of natural resources (e.g., wildlife habitat), production of resources (e.g., farming), public health and safety (e.g., floodplains), low-density residential development, and outdoor recreation (e.g., parks). Open space for outdoor recreation includes public and private outdoor recreation facilities. Public recreation facilities in Moreno Valley include State, County, and City parks as well as public golf courses. Private outdoor recreation facilities include private golf courses, driving ranges, and other private outdoor recreation facilities. Two private outdoor recreation facilities are owned and operated by homeowner's associations in Sunnymead Ranch and Moreno Valley Ranch.

A large amount of the City's open space lands is managed for the preservation of natural resources. These areas include the Box Springs Mountain Reserve, the San Timoteo Canyon Park property, the Lake Perris State Recreation Area, and the San Jacinto Wildlife Area. These areas are also used for hiking, horseback riding, fishing, boating, and other uses.

The Box Springs Mountain Reserve and the San Timoteo Canyon Park property are owned and operated by Riverside County Regional Park and Open Space District. They are primarily mountainous natural open space parks. The Box Springs Mountain Reserve is located at the northwest corner of Moreno Valley. The Reserve consists of three noncontiguous land areas, two of which are within the City's Sphere of Influence. San Timoteo Canyon Park property is located east of the City's Sphere of Influence along the north side of SR-60. Approximately 1,100 acres of the property, including the Badlands Landfill is jointly owned by the Regional Park and Open Space District and Riverside County Waste Management District.

Lake Perris State Recreation Area, located south of Moreno Valley, is approximately 8,000 acres. It contains a major reservoir, natural open space and facilities for boating and fishing, picnicking and camping. About 1,600 acres of the property were dedicated to the State of California as mitigation for loss of wildlife habitat due to development of the Moreno Valley Ranch Specific Plan. The Lake Perris State Recreation Area serves as one of several habitat reserves for the endangered Stephens' kangaroo rat (*Dipodomys stephensi*).

The San Jacinto Wildlife Area in the southeastern corner of the study area consists of gently sloping grasslands, sage scrub and natural and man-made wetlands that support migratory birds and resident wildlife. Bird watching and hunting are popular activities. Some of the adjoining property is owned by private organizations dedicated to hunting and wildlife conservation.

Several open space areas are located along soft-bottomed drainage courses within the planned communities of Sunnymead Ranch and Hidden Springs. The City also owns two natural open space areas. One open area is adjacent to the Moreno Valley Equestrian Center, located at the northeast corner of Redlands Boulevard and Locust Avenue. A second natural open space area is located north of Sunnymead Ranch Parkway, on the east side of Perris Boulevard.

THIS PAGE INTENTIONALLY LEFT BLANK

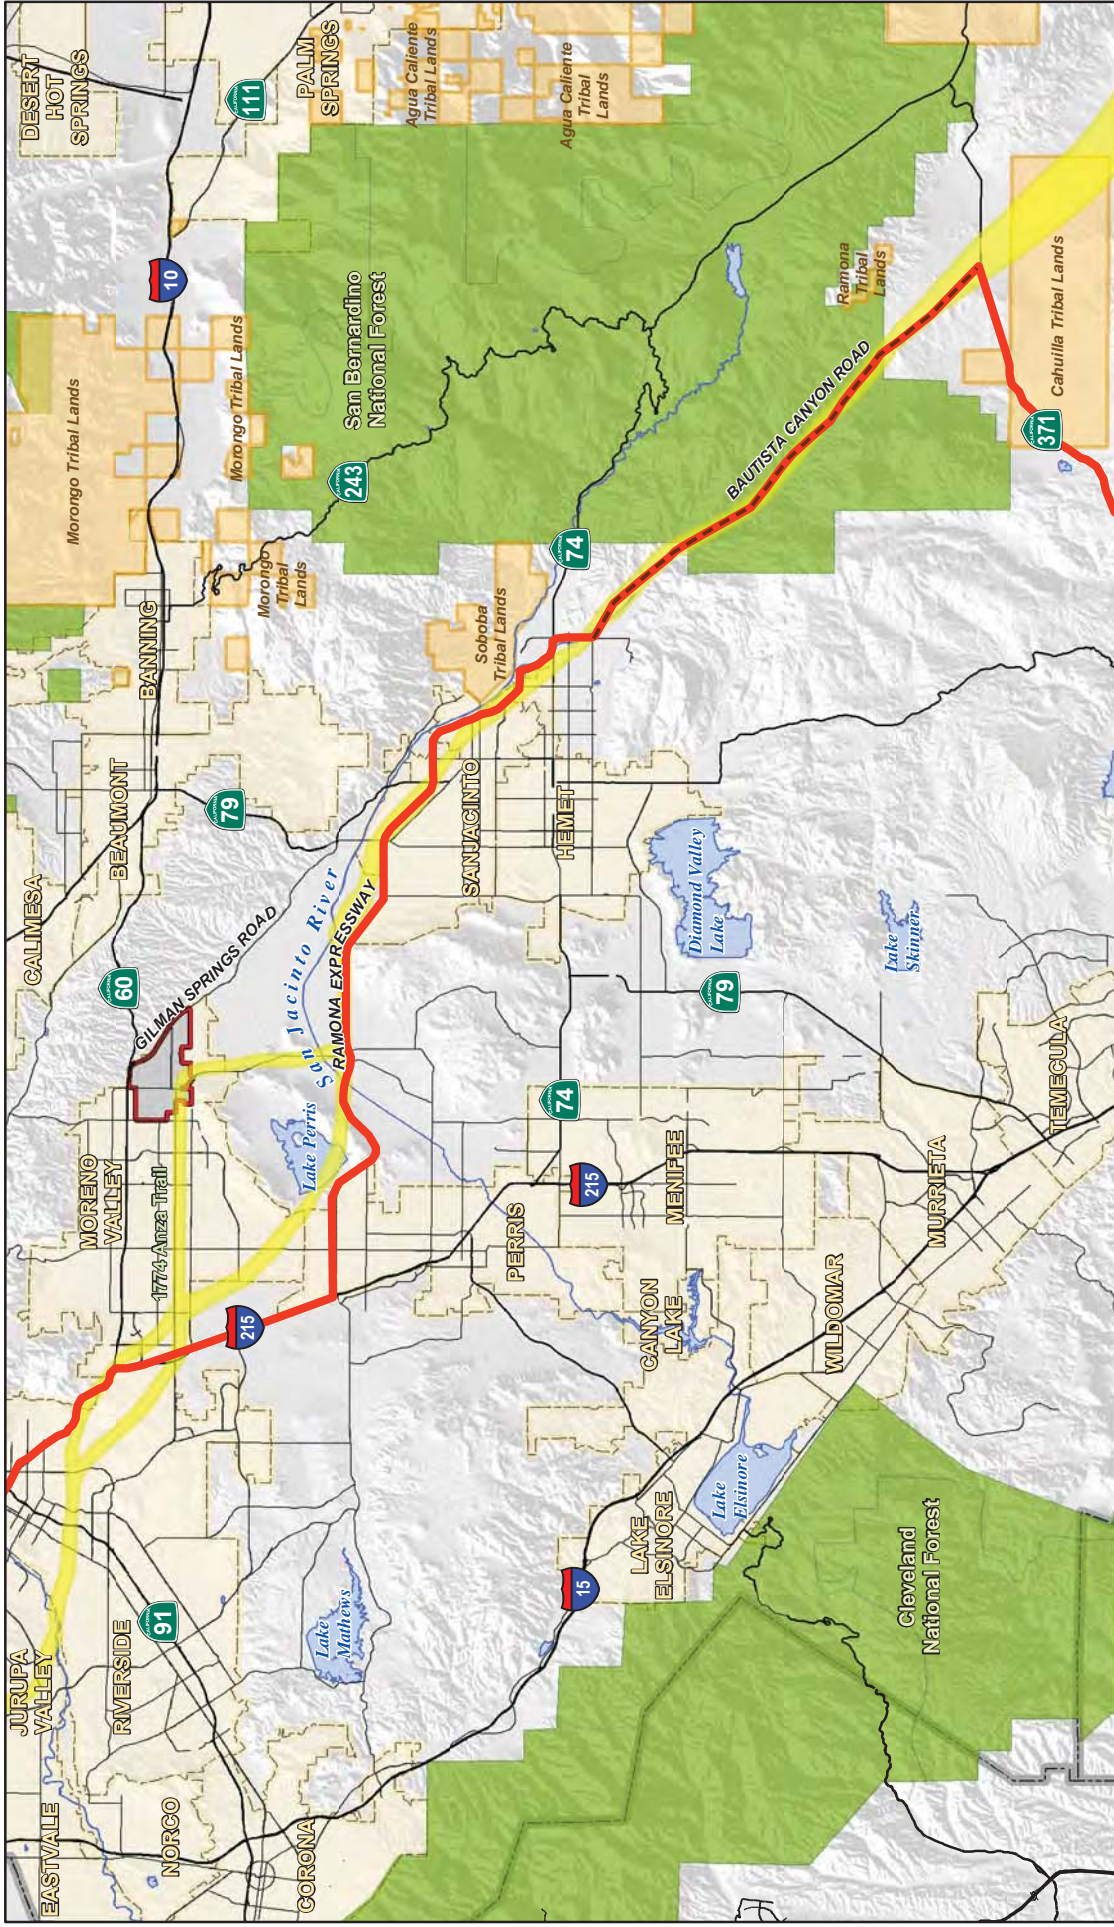

FIGURE 4.14.1

- Historic Trail Corridor

THIS PAGE INTENTIONALLY LEFT BLANK

Natural open space can also be found within the steeply sloping areas designated Rural Residential and Hillside Residential on the General Plan land use map. These areas contain wildlife habitat, watershed benefits and scenic values that can be conserved even as these areas are developed. Natural open space can be conserved because these areas are planned for low-density residential development. Low-density development requires a minimal amount of land disturbance.

The City's General Plan also discusses trail facilities. The City owns and maintains about 10 miles of developed trails. Multiuse trails are popular with the equestrian community. The Moreno Valley Equestrian Center, dedicated in 2003, provides additional facilities of interest to equestrians. This 45-acre park is located at the northeast corner of Redlands Boulevard and Locust Avenue. The park features equestrian facilities, including an arena, with bleachers, a water trough, night lighting and parking for horse trailers.

Multiuse trails should be designed with considerations for safety, accessibility, proper design and construction, signage and relative location. The City's trail network should also connect to the County and State regional trail systems.

There is one existing multiuse trail adjacent to the project limits, located along Redlands Boulevard and Cottonwood Avenue. There are several proposed trails shown on the current General Plan within the project area along Redlands Boulevard, Cottonwood Avenue, Brodiaea Avenue, Dracaea Avenue, Theodore Street, Fir Avenue, Sinclair Street, and Davis Road.

NOP/Scoping Comments. One written comment was received specifically about park impacts. The State requested that the WLCSP project not have any adverse impacts on the Lake Perris Recreational Area. In addition, at least one resident urged the City to provide an integrated network of trails that would connect to other trails planned in the region (e.g., Juan Bautista de Anza trail).

4.14.4.2 Policies and Regulations

a. State Regulations

Quimby Act (California Government Code 66477). This State policy requires the dedication of land and/or imposes a requirement of fees for park and recreational purposes as a condition of approval of tentative map or parcel map.

b. Local Regulations, City of Moreno Valley General Plan

Parks, Recreation and Open Space Element Policies

4.2.7 The City level of service standard is 3 acres of developed parkland for every 1,000 new residents. Exceptions from this ratio may be made in exchange for extraordinary amenities of comparable economic value. Land not suitable for active recreation purposes may not be counted toward fulfilling parkland dedication requirements.

4.2.8 Encourage the development of recreational facilities within private developments, with appropriate mechanisms to ensure that such facilities are properly maintained and that they remain available to residents in perpetuity.

4.2.17 Require new development to contribute to the park needs of the City.

4.3.1 The City's network of multiuse trails, including regional trails, community trails, and local feeder trails, shall (1) be integrated with recreational, residential and commercial areas, schools and equestrian centers; (2) provide access to community resources and facilities,

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- and (3) connect urban populations with passage to hillsides, ridgelines, and other scenic areas.
- 4.3.3 All new development approvals shall be contingent on trail right-of-way dedication and improvement in accordance with the Master Plan of Trails.
- 4.3.4 In conjunction with all development review, the City shall consider multiuse trail access and traditional travel routes through the property.
- 4.3.5 In conjunction with the review and approval of non-residential developments, the City should consider the use of multiuse trail amenities such as hitching posts, benches, rest areas, and drinking facilities.
- 4.3.7 Trail design and construction should take into consideration the safety and convenience of all trail users as the primary concern.
- 4.3.8 The City should facilitate the development of a multiuse regional trail system.
- 4.3.9 Unless otherwise specified due to fire department requirements, access or as established by a specific plan, city trails along roadways shall be ten (10) feet wide and shall be constructed with decomposed granite or equal material and shall provide appropriate fencing or other devices where needed to delineate trails from vehicular rights-of-way.
- 4.3.10 Where firefighting access is required, trails shall be 20' wide to meet the needs of the Fire Department and its equipment. Fire Department requirements shall be met in all conditions where access is required.
- 4.3.11 In unusual situations where legal or topographical barriers exist (e.g., excessive slope, the configuration of right-of-way, existing vegetation, etc.), the City shall have the discretion to amend the trail requirement as needed to accomplish the goals of this General Plan.
- 4.3.14 Where feasible, use drainage courses, utility rights-of-way and other such opportunities to incorporate trail and open space elements in the design of major development projects.

4.14.4.3 Methodology

The potential impacts of the proposed project on recreation and park resources were evaluated based on whether implementation of the proposed project could result in increased use of existing recreation and park resources, or whether implementation of the proposed project could necessitate the construction or expansion of recreation and park facilities.

4.14.4.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts to recreational facilities and resources are based on questions contained in Appendix G of the *CEQA Guidelines*. The proposed project would result in a significant impact on recreation resources if any of the following occurs:

- The project increases the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; and/or
- The project includes recreational facilities or requires the construction or expansion of recreational facilities that have an adverse physical effect on the environment.

4.14.4.5 Less than Significant Impacts

Threshold	Would the project result in increased use of existing neighborhood and regional parks or other recreational facilities (e.g., trails) where substantial physical deterioration would occur or be accelerated?
-----------	---

The WLC project proposes the development of a master-planned logistics center; no residential development is proposed. There is a potential for the proposed project to indirectly generate new residents in the City, although predicting the exact number would be too speculative. Increases in the City's population from future residential development will help fund new parks and trails through dedications of land and the payment of Development Impact Fees.

The WLCSP project proposes a General Plan Amendment to the Master Plan of Trails to reduce the extent of trail systems in the area to reflect the change from a residential neighborhood (Moreno Highlands) to a non-residential neighborhood (World Logistics Center). Trail linkages are provided in the WLC project to extend existing trail routes from the western edge of the project to the east, providing for future linkages to Gilman Springs Road, to the Lake Perris State Recreation Area, and to the San Jacinto Wildlife Area.

Implementation of these new trails and the General Plan Amendment (i.e., revised Master Plan of Trails) will allow the project to be consistent with the General Plan policies relative to trails (4.3.1 and 4.3.8).

General Plan and Municipal Code Consistency. Table 4.14.E evaluates whether the proposed project is consistent with the City's General Plan policies and Municipal Code requirements relative to parks, recreation, and open space:

Table 4.14.E: Project Consistency with General Plan Policies and Municipal Code Requirements for Parks, Recreation and Open Spaces

General Plan Policies	Project Consistency
Parks, Recreation and Open Space Element Policies	
4.2.7 The City level of service standard is 3 acres of developed parkland for every 1,000 new residents. Exceptions from this ratio may be made in exchange for extraordinary amenities of comparable economic value. Land not suitable for active recreation purposes may not be counted toward fulfilling parkland dedication requirements.	Not Applicable. The proposed project consists of logistics warehousing and supporting uses, and does not propose any residential uses that would add new housing units or residents who would use local parks.
4.2.8 Encourage the development of recreational facilities within private developments, with appropriate mechanisms to ensure that such facilities are properly maintained and that they remain available to residents in perpetuity.	<i>The following changes have been made due to revision to the Specific Plan project size.</i> Not Applicable. The proposed project does not generate a need for new active recreational facilities, so no maintenance costs will be involved. However, the project does provide 74.3 acres of Open Space in the southwestern corner of the site adjacent to Mount Russell to be dedicated to the City of Moreno Valley.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 4.14.E: Project Consistency with General Plan Policies and Municipal Code Requirements for Parks, Recreation and Open Spaces

General Plan Policies	Project Consistency
4.2.17 Require new development to contribute to the park needs of the City.	<p><i>The following changes have been made due to revision to the Specific Plan project size.</i></p> <p>Not Applicable. The proposed project consists of logistics warehousing and supporting uses, and does not propose any residential uses that would add new housing units or residents who would use local parks. However, the project does provide 74.3 acres of Open Space in the southwestern corner of the site adjacent to Mount Russell.</p>
4.3.1 The City's network of multiuse trails, including regional trails, community trails, and local feeder trails, shall (1) be integrated with recreational, residential and commercial areas, schools and equestrian centers; (2) provide access to community resources and facilities, and (3) connect urban populations with passage to hillsides, ridgelines, and other scenic areas.	<p>Consistent. The Specific Plan proposes a trail along the southwestern portion of the site to tie into an existing trail along the west side of Redlands Boulevard and an existing trail west along Cactus Avenue. The project will also provide a trail connection from the southwest corner of the project around the Open Space area and a trailhead that will allow a future connection to the SJWA property that would be installed and maintained by the CDFW.</p>
4.3.3 All new development approvals shall be contingent on trail right-of-way dedication and improvement in accordance with the Master Plan of Trails.	<p>Consistent. The new trail and related improvements will be consistent with the City's requirements in this regard. The project entails a General Plan Amendment to modify the Master Plan of Trails consistent with the proposed Specific Plan trails.</p>
4.3.4 In conjunction with all development review, the City shall consider multiuse trail access and traditional travel routes through the property.	<p>Consistent. See discussion under Policy 4.3.1 above.</p>
4.3.5 In conjunction with the review and approval of non-residential developments, the City should consider the use of multiuse trail amenities such as hitching posts, benches, rest areas, and drinking facilities.	<p>Consistent. The new trail and related improvements will be consistent with the City's requirements in this regard.</p>
4.3.7 Trail design and construction should take into consideration the safety and convenience of all trail users as the primary concern.	<p>Consistent. The new trail and related improvements will be consistent with the City's requirements in this regard.</p>
4.3.8 The City should facilitate the development of a multiuse regional trail system.	<p>Consistent. The proposed trail connections within the Specific Plan would connect to existing regional trails to the west and future regional trails to the southeast through the SJWA property.</p>
4.3.9 Unless otherwise specified due to fire department requirements, access or as established by a specific plan, city trails along roadways shall be ten (10) feet wide and shall be constructed with decomposed granite or equal material and shall provide appropriate fencing or other devices where needed to delineate trails from vehicular rights-of-way.	<p>Consistent. The new trail and related improvements will be consistent with the City's requirements in this regard.</p>
4.3.10 Where firefighting access is required, trails shall be 20' wide to meet the needs of the Fire Department and its equipment. Fire Department requirements shall be met in all conditions where access is required.	<p>Consistent. The new trail and related improvements will be consistent with the City's requirements in this regard.</p>

Table 4.14.E: Project Consistency with General Plan Policies and Municipal Code Requirements for Parks, Recreation and Open Spaces

General Plan Policies	Project Consistency
4.3.11 In unusual situations where legal or topographical barriers exist (e.g., excessive slope, the configuration of right-of-way, existing vegetation, etc.), the City shall have the discretion to amend the trail requirement as needed to accomplish the goals of this General Plan.	Consistent. The new trail and related improvements will be consistent with the City's requirements in this regard.
4.3.14 Where feasible, use drainage courses, utility rights-of-way and other such opportunities to incorporate trail and open space elements in the design of major development projects.	Consistent. The proposed trails will allow for connections to existing and future trails as outlined in Policy 4.3.1 above.

The proposed project is consistent with the City General Plan policies relative to parks, recreation, and trails.

The WLCSP will provide connections to existing trails to the west and southwest, and a connection to and trailhead for a future planned trail in the San Jacinto Wildlife Area south of the site, as outlined in Specific Plan Section 3.4.2, *Multi-Use Trails*, and as shown on Figure 3-11 of the Specific Plan. In addition, future development within the WLCSP will pay applicable DIFs to offset any potential impacts to parks or recreational services. Based on this, the proposed project will not create significant impacts on parks, recreation, or trails.

Threshold	Would the project result in construction or expansion of recreational facilities that would have an adverse physical effect on the environment?
-----------	---

NOTE: The following changes have been made due to revision to the Specific Plan project size.

The WLC project proposes development of up to approximately 40.6 million square feet of high-cube logistics warehouse facilities. It does not include the construction or expansion of a recreational facility since it would not create any substantial demands on recreational facilities. Section 4.13.5 concluded that the project would have a less than significant impact on population or housing; therefore, no new demand on existing park facilities would occur, and no expansion of existing parks or the construction of new parks would be required.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

As noted in the Specific Plan, the project includes an Open Space (OS) designation covering 74.3 acres on the lower elevations of Mount Russell in the southwestern portion of the WLCSP project site.

4.14.4.6 Significant Impacts

The analysis in Section 4.14.4.5 determined that all impacts of the WLC project relative to parks and recreation are less than significant, therefore, no mitigation is required.

4.14.5 Cumulative Impacts

The cumulative areas for police and fire protection services are the service areas for the RCSD and RCFD. The need for the public services and associated facilities is measured by service area population, or the number of residents and workers within the City's service area. Service population, as well as the type and density of development, determines the need for new or expanded police and services. Utilizing statistical information, local planning policies, and by interacting with other agencies, fire and police service providers can delineate past patterns, emerging trends, and future issues of concern. Once identified, service providers can redeploy resources to meet future needs.

Sections 4.14.1.6 and 4.14.2.6 identified the possible need for new fire station within the WLC project. Payment of DIFs and provision of a new fire station site within the WLCSP is expected to fully mitigate potential impacts of the WLC project relative to fire services. In addition, payment of DIFs is expected to fully mitigate potential impacts of the WLC project relative to police services.

As additional development occurs in the City of Moreno Valley and region, there may be an overall increase in the demand for law enforcement and fire protection services, including personnel, equipment, and/or facilities. Increases in demand are routinely assessed by these agencies as part of the annual monitoring and budgeting process. New development within the service areas of the RCSD and RCFD would be required to adhere to conditions established by fire and police service providers, and pay applicable DIFs to ensure adequate staffing and equipment levels. Therefore, there would be no cumulative impact on police and fire services in the City. Accordingly, cumulative impacts to the environment resulting from new or expanded police and fire protection facilities would not occur, resulting in a less than significant impact and no mitigation is required.

The cumulative area for school-related issues encompasses the two school district(s) that provide school services/facilities in the project area. While no significant population increase is anticipated to result from the construction and operation of the proposed project, future development (particularly residential development) forecast in the City's General Plan will increase the demand for school facilities and services. New school facilities are currently being constructed to accommodate the growth in the local student population. Additionally, school districts are engaged in planning new facilities in anticipation of future local and regional growth. Each district requires the payment of development fees to provide for new school services and/or facilities. As every new development is mandated to provide the fees applicable to the school district affected, there would be no cumulative impact on school services in the City. Accordingly, cumulative impacts to the environment resulting from new or expanded school facilities would not occur, resulting in a less than significant impact and no mitigation is required.

Implementation of the proposed project will not increase the use of existing parks and recreation facilities. As future residential development is proposed, the City will require developers to provide the appropriate amount of parkland or payment of in-lieu fees, which will contribute to future recreational facilities. Payment of these fees and/or implementation of facilities on a project-by-project basis would offset cumulative parkland impacts by providing funding for new and/or renovated parks equipment and facilities. As such, the cumulative impact of buildout associated with the implementation of the proposed project, when considered with cumulative projects in the area, would be less than significant with implementation of the WLC project.

THIS PAGE INTENTIONALLY LEFT BLANK

NOTE TO READERS. *This section has been revised based on changes to the WLC Specific Plan, the project traffic study, and in response to comments on the original DEIR. Three street names have also changed (Street C now named Alessandro Boulevard, D now named Cactus Avenue, and E a portion of which is now named Alessandro Boulevard) and may still be referenced in the section. For correct street names see Circulation Master Plan Figure 3.10. In addition, Streets E and C have been realigned to follow the historical alignment of Alessandro Boulevard.*

Large amounts of text, tables, and/or graphics were removed or heavily modified from those in the original DEIR. The changed text is shown in underline/strikeout wherever possible. To maintain readability, however, some sections have notes that refer the reader to the original DEIR for the complete text, table, or graphic from the original DEIR.

4.15 TRAFFIC AND CIRCULATION

Revisions to this section have been made due to changes to the revised Traffic Impact Analysis (TIA) Report for the World Logistics Center prepared by Parsons Brinckerhoff and dated September 2014 (FEIR Volume 2, Appendix L-1). The vast majority of the changes to the TIA, and in turn replicated in the following Final EIR traffic section, are associated with:

- 1) Project Reduction. A reduction in the project area in the amount of 100 acres that occurred between the Draft EIR and this Final EIR. The reduced project area would result in a reduction in the proposed quantity of high-cube warehouse development in the WLC by one million square feet and an increase in the quantity of background (i.e., non-project related) development in year 2035 by 220 dwelling units. The area of land that was eliminated is located in the southwest corner of the previous WLC site that was analyzed in the previous TIA and Draft EIR.*
- 2) Baseline Plus Phase 1 Analysis. Added an Existing Plus Phase 1 (only) scenario that was added to the revised TIA and Final EIR, in order to provide a “baseline plus Phase 1 analysis.”*
- 3) Revised Project Schedule. A revision to the WLC implementation schedule so that Phase 1 is scheduled for completion in year 2022 as analyzed in the revised TIA and Final EIR, rather than in Year 2017 as analyzed in the previous TIA and Draft EIR. The scenarios for Year 2017 were revised to Year 2022 and include analysis of Phase 1 only and not full buildout of the WLC in the revised TIA and Final EIR, while the analysis of the previous Year 2022 scenarios were dropped from the revised TIA and Final EIR.*

Additional revisions to this section have been made due to comments received on the Draft EIR and previous TIA. In summary, these changes include:

- 4) Truck Trips to Ports of Los Angeles and Long Beach. Analysis of freeway impacts from WLC trucks was extended to the Ports of Los Angeles and Long Beach. The extended analysis, covering more than 60 additional centerline miles of freeway, did not find any new impacts that were not already identified in the Draft TIA (see TIA Chapter 12, Section F) and replicated in this Final EIR traffic section (see Section 4.15.6.5 of this Final EIR). These changes have been made in response to: Comment F-1-49 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society; Comment F-3-4 in Letter F-3 from the California Clean Energy Committee; Appendix 78 in Letter F-3 from the California Clean Energy Committee; Comment F-9A-22 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comments F-9C-2, 4, 5, 6, and 7 in Letter F-9C from Sustainable Systems Research, LLC; Comment F-11-23 in Letter F-11 from the Sierra Club, San Geronio Chapter; Comment F-*

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

13-11 in Letter F-13 from the Sierra Club and Friends for a Livable Moreno Valley; and Comment G-51-45 in Letter G-51 from Michael McCoy.

- 5) *Rail Analysis.* Analysis of the feasibility of shipping cargos between the WLC and the Ports of Los Angeles and Long Beach by rail instead of by truck was added. The analysis found that this was not feasible for a variety of reasons, including the cost and environmental impacts of a new rail alignment, the high fixed handling costs for rail cargo that makes short hauls uneconomical, and system constraints with the rail system itself. This analysis is provided in the revised TIA (see TIA Chapter 4, Section F) and replicated in this Final EIR traffic section (see end of Section 4.15.3.2 of this Final EIR). These changes have been made in response to: Comments F-3-5, 11, and Appendix 176 in Letter F-3 from the California Clean Energy Committee; Comments F-6-1, 2, and 3 in Letter F-6 from the Endangered Habitats League; Comment F-9A-45 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comment F-9B-45 in Letter F-9B from Tom Brohard and Associates; Comment F-11-29 in Letter F-11 from the Sierra Club, San Geronio Chapter; Comment G-2-7 in Letter G-2 from Perry Johnson; Comment G-17-2 in Letter G-17 from Joanne Lindgren; Comment G-18-1 in Letter G-18 from Sam Zaidy; Comment G-34-5 in Letter G-34 from Lindsay Robinson; Comment G-35-4 in Letter G-35 from Peggy Hadaway and John Neal; Comment G-49-18 in Letter G-49 from Karen Jakpor; Comment G-50-2 in Letter G-50 from Ann McKibben; Comment G-51-5 in Letter G-51 from Michael McCoy; Comments G-52-1 and 2 in Letter G-52 from Steve Jiannino; Comment G-53-4 in Letter G-53 from Deanna Reader and Kenny Bell; Comment G-57-1 in Letter G-57 from Tracy Hodge; Comment G-68-3 in Letter G-68 from Craig and Joan Givens; Comment G-96-3 in Letter G-96 from Margie Breikreuz; and Comment G-97-1 in Letter G-97 from Otana Jakpor.
- 6) *Project Traffic Near Schools.* Analysis of the potential safety impacts of WLC traffic on local schools was added, including the new proposed high school #5 located north of SR-60. The traffic analysis for this proposed school can be found in the Tech Memo on High school # 5 Appendix L. The analysis found that the project would pose little safety risk and that appropriate safety features were already present on roads near local schools. This analysis is provided in the revised TIA (see TIA Chapter 12, Section B) and replicated in this Final EIR traffic section (see Section 4.15.5.2 of this Final EIR). These changes have been made in response to: Comment E-3-13 in Letter E-3 from the Moreno Valley Unified School District; Comment F-11-36 in Letter F-11 from the Sierra Club, San Geronio Chapter; and Comment G-96-4 in Letter G-96 from Margie Breikreuz.
- 7) *Additional Changes.* Additional changes have been made to the revised TIA and replicated in the Final EIR traffic section based on comments received on analytical details contained in the Draft EIR and/or previous TIA. These changes have been made in response to: Comments B-2-2 through B-2-14 in Comment Letter B-2 from the California Department of Transportation District 8; Comment B-5-12 in Letter B-5 from the California Air Resources Board; Comment C-3-17 in Letter C-3 from the South Coast Air Quality Management District; Comments E-2A-2 through E-2A-12 in Comment Letter 2A from the City of Riverside; Comments E-2B-1 through E-2B-23 in Appendix 1 to Comment Letter 2-A from the City of Riverside; Comment E-3-5 in Letter E-3 from the Moreno Valley Unified School District; Comments E-5-1 through E-5-5 in Comment Letter E-5 from the City of Redlands; Comments F-3-3, F-3-4, and F-3-6 to F-3-10 in Letter F-3 from the California Clean Energy Committee; Comments F-8-68 and F-8-69 in Comment Letter F-8 from Shute, Mihaly & Weinberger LLP; Comments F-9A-3 and F-9A-7 through F-9A-22 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comments F-9B-1 and F-9B-2, F-9B-4 through F-9B-47 in Letter F-9B from Tom Brohard and Associates; Comments F-13-9, F-13-26, and F-13-89 through F-13-98 in Letter F-13 from the Sierra Club and Friends for a Livable Moreno Valley; Comment G-17-1 in Letter G-17 from

Joanne Lindgren; Comments G-51-19, G-51-28 through G-51-30, G-51-47, and G-51-61 through G-51-65 in Letter G-51 from Michael McCoy; Comments G-57-5 through G-57-7 in Letter G-57 from Tracy Hodge; and Comments G-90-7 and G-90-14 in Letter G-90 from Mr. and Mrs. H.W. Wolterbeek.

Note: As a result of these various changes, the level of significance of traffic impacts has not changed in comparison to the Draft EIR. However, the following changes to individual roadway, intersection, and/or freeway impacts and the reason for these changes are as follows:

Intersections

Indian Street/Cactus Avenue (IN-64). Although this intersection exceeds the level of service standard in the Year 2035 Cumulative Plus Project analysis, the revised project does not increase the delay in comparison to the No Project condition. Consequently, no mitigation is required.

Ellsworth Street/Alessandro Boulevard (IN-71). Due to the reduction in the project size, this intersection does not exceed the level of service standard and therefore no longer requires mitigation.

Ellsworth Street/Cactus Avenue (IN-74). The Draft EIR TIA identified required mitigation for the Ellsworth Street/Cactus Avenue intersection (IN-74) in Table 69 (page 325). The mitigation included widening the northbound approach to provide three left-turn lanes, one through lane, and one right-turn lane, and adding a westbound left-turn lane and eastbound right-turn lane. This mitigation was inadvertently omitted from the mitigations chapter text and Table 80 in the Draft EIR TIA. This mitigation has been corrected in the Final EIR TIA and added to the mitigation discussion in the Final EIR.

Bridge Street/Ramona Expressway (IN-122). Mitigation for this intersection was included in the Draft EIR for project direct impacts (Existing Plus Project). Upon further review, it was determined that the mitigation was not warranted because the intersection will be eliminated and replaced by a grade separation. A discussion of this has been included in the Revised Draft EIR, however, the impact remains significant and unavoidable.

Roadway Segments

Theodore Street from SR-60 Westbound Ramps to Ironwood Avenue (S-1). Due to the reduction in the project size, this roadway segment does not exceed the level of service standard and therefore no longer requires mitigation.

Freeway Segments

Southbound I-215 from SR-74 to Ellis Avenue (F-71). In the Draft EIR, this freeway segment was listed as “I-215 SR-74/Case Road to Redlands Avenue” and shown as having an impact. In the Final EIR TIA, the segment where the level of service exceedance will occur (between SR-74 and Ellis Avenue) is listed as “I-215 SR-74 to Redlands Ave” in Table 76 for project direct impacts but as “I-215 SR-74 to Ellis Ave” in Table 79 for cumulative impacts. In each table, however, the same identification number (F-71) was used. In summary, this is not a new impact; as it was already identified in the Draft EIR. A footnote has been added to the Revised EIR as follows: “I-215 currently runs unbroken between SR-74 and Redlands Avenue. The RTP includes a project (3M0731) that would split this freeway mainline section by adding a new interchange at Ellis Avenue. For this reason, this freeway section is listed as “I-215 SR-74 to Redlands” on the tables in the TIA and EIR describing conditions prior to construction of the Ellis Avenue interchange.”

Southbound I-215 from Baseline Road to Highland Avenue (F-83). This freeway segment was identified as a significant and unavoidable project direct impact (Existing Plus Project). Upon further review, it was determined that the significant and unavoidable impact will occur in the Year 2035

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Cumulative Plus Project scenario. For this reason, the impact has been moved to the Year 2035 Cumulative Plus Project analysis. Regarding F-83, the WLC would have a direct impact which was identified in the analysis of the Existing Plus Project scenario. However, the identified mitigation for this is already under construction. As a result, the direct impact will never exist. In the Cumulative scenario, F-83 would be deficient with or without WLC, even with the new lane currently under construction. Since the WLC is adding to a deficient condition it would have a cumulative impact on this segment. The solution to this would be to add yet another lane, but this is not feasible given the constraints at the site.

This section of the EIR assesses traffic impacts by examining the proposed project's impacts on Existing Baseline 2012, Opening Year 2022, and Year 2035 Cumulative traffic analysis time horizons. The impact of the entire proposed project has been assessed in the Baseline 2012 and Buildout Year 2035 time horizons, while the Baseline 2012 and Future Year 2022 analyses assess impacts of Phase 1 of the proposed project.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements, which affect several separate, adjacent and related properties. The following information is summarized from Section 3.0, *Project Description*. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes the WLC Specific Plan Area (2,610 acres), the CDFW Conservation Buffer Area (910 acres), the Public Facilities Lands area (194 acres), plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

Note: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The analysis contained in this section is based on the following technical studies prepared for the proposed project:

- *Traffic Impact Analysis Report for the World Logistics Center*, Parsons Brinckerhoff, September 2014 (Appendix L-1 of this EIR).
- *Trip Generation Analysis for High-Cube Warehouse Distribution Center Land Use for the NAIOP Inland Empire*, Kunzman Associates, Inc., December 20, 2011 (Appendix L-2 of this EIR).
- *Assessment of Available High-Cube Trip Generation Rates*, Memorandum from Aric Evatt, Urban Crossroads, Inc., to Ahmad Ansari, City of Moreno Valley, February 1, 2012 (Appendix L-3 of this EIR).
- Letter from George Rhyner, Crain & Associates, to Mr. Robert Evans, NAIOP Inland Empire, regarding Response to the South Coast Air Quality Management District White Paper, dated December 1, 2011 (Appendix L-4 of this EIR).

In addition to these technical studies, the analysis contained in this section is also based on the following reference document:

- Moreno Valley General Plan Circulation Element, adopted July 2006.

The TIA for the proposed project has been prepared in accordance with accepted standards and practices of the traffic engineering industry as summarized in a scoping agreement with the City of Moreno Valley. The TIA analyzes roadway segments, intersections, freeway mainline segments, freeway weaving areas, and freeway ramp merge/diverge locations and complies with the TIA Guidelines of the City and Caltrans. Figures 4.15.1, 4.15.2, 4.15.3, and 4.15.4 illustrate the locations of analysis roadway segments, intersections, freeway mainline segments, freeway weaving segments, and freeway ramp merge/diverge locations.

The study area for roadway segments included the roadways that will be affected by the proposed General Plan Amendment. The study area for intersections in Moreno Valley covered all intersections between streets classified as collector or higher and another collector or higher classification street, at which the proposed project would add 50 or more peak hour trips. This study area criterion was also applied to the main routes between the project and the neighboring cities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area also extended west to the nearest ramps to State Route (SR-91) and as far south as the I-215 ramps at Redlands Avenue in Perris.

The study area for freeways included the freeway routes extending from the project site to the north, south, east, and west. The analysis covered SR-60 from I-10 in the east to SR-71 in the west, SR-91/I-215 from I-210 in the east to I-15 in the west, I-215 from Redlands Avenue (4th Street) in the north to the Scott Road interchange in the south, and I-10 from SR-62 in the east to SR-60 in the west. In addition, the two main routes to the Ports of Los Angeles and Long Beach were assessed.

Any freeway ramp where the project added 100 or more peak-hour trips was also studied. These included:

- All ramps at the SR-60/Theodore Street Interchange;
- All ramps at the SR-60/Gilman Springs Road Interchange;

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- All ramps at the SR-60/Redlands Boulevard Interchange;
- The westbound off- and eastbound on-ramps to the SR-60/Central Avenue Interchange; and
- The westbound off- and eastbound on-ramps to the SR-60/Martin Luther King Boulevard Interchange.

Note: The following figures (3 of which were in the original DEIR) were modified or added in this revised DEIR section - the reader is referred to the original DEIR for the original graphic.

4.15.1 Existing Setting

4.15.1.1 Traffic Level of Service Definitions

Level of Service (LOS) is an expression of a transportation facility's operations and is dictated by the relationship between capacity and traffic volumes. LOS is generally defined using the letter grades A through F (Table 4.15.A). These levels reflect the reality that conditions rapidly deteriorate as traffic approaches the absolute capacity of a thoroughfare.

Table 4.15.A: Traffic Level of Service Definitions

Level of Service	Description
A	No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication. Typically, the approach appears quite open, turns are made easily, and nearly all drivers find freedom of operation.
B	This service level represents stable operation, where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.
C	This level still represents stable operating conditions. Occasionally drivers may have to wait through more than one red signal indication, and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.
D	This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak period; however, enough cycles with lower demand occur to permit periodic clearance of developing queues, thus preventing excessive backups.
E	Capacity occurs at the upper end of this service level. It represents the most vehicles that any particular intersection approach can accommodate. Full utilization of every signal cycle is seldom attained no matter how great the demand.
F	This level describes forced flow operations at low speeds, where volumes exceed capacity. These conditions usually result from queues of vehicles backing up from a restriction downstream. Speeds are reduced substantially and stoppages may occur for short or long periods of time due to the congestion. In the extreme case, both speed and volume can drop to zero.

Roadway Segment Level of Service Methodology. Roadway segment operations have been evaluated using the City of Moreno Valley Daily Roadway Capacity Values provided in the City of Moreno Valley General Plan Circulation Element as shown in Table 4.15.B.

Table 4.15.B: City of Moreno Valley Level of Service Criteria for Roadway Segments

Roadway Classification	Level of Service*				
	A	B	C	D	E
6-Lane Divided Arterial	33,900	39,400	45,000	50,600	56,300
4-Lane Divided Arterial	22,500	26,300	30,000	33,800	37,500
4-Lane Undivided Arterial	15,000	17,500	20,000	22,500	25,000
2-Lane Industrial Collector	7,500	8,800	10,000	11,300	12,500
2-Lane Undivided Residential	N/A	N/A	N/A	N/A	2,000

*Maximum Average Daily Traffic (ADT)

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Riverside County's LOS thresholds for surface streets were used for the assessment of impacts to Gilman Springs Road, as shown in Table 4.15.C.

Table 4.15.C: Riverside County LOS Thresholds for Surface Streets

Type of Roadway	Level of Service ⁽¹⁾		
	LOS C	LOS D	LOS E
8-Lane Urban Arterial	57,400	64,600	71,800
6-Lane Urban Arterial	43,100	48,500	53,900
4-Lane Urban Arterial	28,700	32,300	35,900
2-Lane Collector	10400	11700	13,000

Notes: All capacity figures are based on optimum conditions and are intended as guidelines for planning purpose only.

(1) Maximum two-way ADT values are based on the 1999 Modified Highway Capacity Manual Level of Service Tables as defined in the Riverside County Congestion Management Program.

Source: County of Riverside General Plan, Circulation Element, 2008

Intersection Level of Service Methodologies. LOS criteria for signalized intersections are identified in Table 4.15.D. Levels of service at signalized intersections were calculated using the methodology described in Chapter 16 of the *Highway Capacity Manual (HCM)* and generated by the Synchro analysis software. Signalized intersection LOS are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections, LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 4.15.D.

Table 4.15.D: Level of Service Criteria for Unsignalized and Signalized Intersections

Level of Service	Unsignalized Intersection and Roundabouts Average Delay per Vehicle (sec.)	Signalized Intersection Average Delay per Vehicle (sec.)
A	≤ 10	≤ 10
B	> 10 and ≤ 15	> 10 and ≤ 20
C	> 15 and ≤ 25	> 20 and ≤ 35
D	> 25 and ≤ 35	> 35 and ≤ 55
E	> 35 and ≤ 50	> 55 and ≤ 80
F	> 50	> 80

Source: *Highway Capacity Manual*, Transportation Research Board, Washington, DC, 2000.

LOS criteria for unsignalized intersections are also identified in Table 4.15.D. The City of Moreno Valley requires unsignalized intersection analysis based on the methodology described in Chapter 17 of the HCM.

Freeway Level of Service Methodology. Caltrans LOS criteria for freeway mainline segments, freeway weave segments, and freeway ramp merge/diverge locations are expressed in terms of density (passenger cars/mile/lane). Table 4.15.E shows the correlation between density and LOS for freeway segments and ramps.

Table 4.15.E: Level of Service Criteria for Freeway Segments

Level of Service	Freeway Segment Density (passenger cars/mile/lane)	Freeway Weaving Segment Density (pc/mi/lane)	Freeway Ramp Density (passenger cars/mile/lane)
A	0–11.0	≤ 10.0	≤ 10.0
B	11.0–18.0	> 10.0 and ≤ 20.0	> 10.0 and ≤ 20.0
C	18.0–26.0	> 20.0 and ≤ 28.0	> 20.0 and ≤ 28.0
D	26.0–35.0	> 28.0 and ≤ 35.0	> 28.0 and ≤ 35.0
E	35.0–45.0	>35.0 and ≤ 43.0	>35
F	> 45.0	>43.0	Exceeds Capacity

Source: (Table 11, PB 2013) *Highway Capacity Manual*, Transportation Research Board, Washington, DC, 2000.

4.15.1.2 Baseline Conditions

The project is located within the eastern portion of the City of Moreno Valley. The project site is located south of SR-60 and west of Gilman Springs Road. Tables 4.15.F and 4.15.G show existing intersection control types and roadway through lanes for the study area intersections and roadways, respectively. LOS and volumes are discussed below for existing (2012) without project conditions (otherwise known as the “baseline” condition).

Baseline Levels of Service. Existing (2012) traffic operations have been evaluated for study area intersections. The analysis was performed for the a.m. and p.m. peak hours. Existing traffic volumes at study area intersections are based on peak hour intersection turn movement counts. An intersection level of service analysis was conducted to determine current intersection performance for existing baseline conditions. The levels of service for existing baseline conditions at study area intersections are summarized in Table 4.15.F, which shows the following 12 study intersections currently operate at an unsatisfactory level of service during either the a.m. and p.m. peak hour:

- Redlands Boulevard/Locust Avenue (a.m. and p.m.);
- Redlands Boulevard/SR-60 Westbound ramps (a.m. and p.m.);
- Oliver Street/Alessandro Boulevard (a.m.);
- Moreno Beach Drive/SR-60 Eastbound Ramps (p.m.);
- Lasselle Street/Cactus Avenue (a.m. and p.m.);
- Alessandro Boulevard/Chicago Avenue. (p.m.);
- Gilman Springs Road/Bridge Street (a.m.);
- SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road (a.m. and p.m.);
- SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road (a.m. and p.m.);
- San Timoteo Canyon Road/Alessandro Road (a.m. and p.m.);
- San Timoteo Canyon Road/Live Oak Canyon Road (a.m. and p.m.); and
- Redlands Boulevard/San Timoteo Canyon Road (a.m. and p.m.).

A roadway segment analysis was conducted to determine current roadway system performance for existing baseline conditions for the roadway segments that would be affected by the proposed General Plan Amendment. Roadway segment operations have been evaluated using the City of

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Moreno Valley Daily Roadway Capacity Values provided in the City of Moreno Valley General Plan Circulation Element and summarized in previously referenced Table 4.15.B. The roadway segment levels of service are summarized in Table 4.15.G. The following two roadway segments currently exceed the threshold of significance established in the General Plan.

Gilman Springs Road:

- Between Alessandro Boulevard and Bridge Street; and
- Between SR-60 and Alessandro Boulevard.

A freeway analysis was conducted for existing baseline conditions to determine current freeway performance on SR-60, SR-91, I-215, and I-10 basic freeway segments where the project would add 100 or more peak-hour trips and on the freeway routes to the Ports of Los Angeles and Long Beach. A freeway weaving analysis was conducted on freeway segments where an on-ramp is closely followed by an off-ramp, and the two are joined by an auxiliary lane. Existing baseline freeway mainline and weaving section levels of service are summarized in Tables 4.15.H and 4.15.I, respectively, which show the following 17 freeway mainline segments and six weaving segments are currently operating at an unsatisfactory level of service during either the a.m. or p.m. peak hour:

- SR-60, South Reservoir Street to Ramona Avenue (Westbound a.m.);
- SR-60, Ramona Avenue to Central Avenue (Westbound a.m., Eastbound p.m.);
- SR-60, Central Avenue to Mountain Avenue (Eastbound p.m.);
- SR-60, Euclid Avenue to Grove Avenue (Eastbound p.m.);
- SR-60, Grove Avenue to Vineyard Avenue (Eastbound p.m.);
- SR-60, Vineyard Avenue to Archibald Avenue (Eastbound p.m.);
- SR-60, Market Street to Main Street (Eastbound p.m.);
- SR-60, Martin Luther King Boulevard to Central Avenue (Eastbound p.m.);
- SR-60, I-215 to Day Street (Westbound a.m.);
- SR-91, I-15 to McKinley Street (Eastbound p.m.);
- SR-91, Pierce Street to Magnolia Avenue (Westbound p.m.);
- SR-91, Magnolia Avenue to La Sierra Avenue (Westbound p.m.);
- I-215, SR-74/Case Road to Redlands Boulevard (Westbound a.m., Eastbound p.m.);
- I-215, Barton Road to Mt. Vernon Avenue/Washington Street (Northbound a.m.);
- I-215, Baseline Road to Highland Avenue/SR-210 (Southbound a.m., Southbound p.m.);
- SR-60, SR-71/Garey Avenue to Reservoir Street (Eastbound p.m.);
- SR-60, SR-91 to Blaine Street/3rd Street (Eastbound p.m.);
- SR-60, Blaine Street/3rd Street to University Avenue (Eastbound p.m.);
- SR-60, Central Avenue to Fair Isle Drive/Box Springs Road (Westbound a.m.);
- SR-91, Arlington Avenue to Central Avenue (Eastbound a.m.); and
- SR-91, 14th Street to University Avenue (Westbound p.m.).

THIS PAGE INTENTIONALLY LEFT BLANK

Freeway ramp merge and diverge operations were also evaluated for existing baseline conditions. The results of this analysis are presented in Table 4.15.J, which shows all ramp merge and diverge areas analyzed are currently operating at satisfactory LOS D or better with the exception of:

- SR-60 Eastbound On-Ramp from Central Avenue (p.m. peak hour).

4.15.1.3 Responses to NOP Comments

During the NOP comment period, the City received comments on the project. The comments pertaining to traffic and circulation and responses to those comments are provided below:

Caltrans Comment Letter Dated February 29, 2012 (DEIR Appendix B)

A Traffic Impact Study (TIS) is necessary to determine this proposed project's near-term and long-term impacts to the State facilities and to propose appropriate mitigation measures. The study should be based on Caltrans' *Guide for the Preparation of Traffic Impact Studies (TIS)*, which is located at http://www.dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa_files/tisguide.pdf. Minimum contents of the traffic impact study are listed in Appendix "A" of the TIS guide.

Response

- 1) A traffic impact assessment (TIA) has been performed for the project. The study has been prepared to cover the subjects required under Caltrans TIS guidelines.

It should be noted that the project proposes to move the Alessandro Boulevard access from Gilman Springs Road, which could potentially improve the operation of Alessandro Boulevard/Gilman Springs Road.

- 3) Any existing inadequacies of freeways and roads cannot be attributed to this proposed project, but are considered in the TIA. While it is true that a portion of the City near I-215 has been designated for industrial development, it is also true that much of the project site was designated for business park development in the current General Plan. Initial studies suggest that the traffic attributable to the proposed project will be substantially less than the traffic generated by the site under the uses proposed in the General Plan. The adequacy of the Theodore Street interchange to accommodate future traffic has been studied as part of the TIA.
- 4) Any existing inadequacies of freeways and roads cannot be attributed to this proposed project. The proposed project does not include any land north of SR-60, so the need for schools, fire stations, hospitals, and other public facilities north of SR-60 would need to be addressed through some mechanism other than this project. The need for the on-site road system to accommodate through traffic has been studied as part of the TIA.
- 5) One goal of the WLCSP Circulation Plan is to separate project-related trucks from passenger vehicle traffic on surrounding local streets. Much of the project traffic will access SR-60 via a new interchange at Theodore Street, and project truck traffic will be prohibited on Redlands Boulevard south of Eucalyptus Avenue and on Street D to Cactus Avenue southwest of the project.
- 6) The adequacy of the new proposed Theodore Street interchange to accommodate future (cumulative) traffic has been studied as part of the TIA.
- 7) The TIA takes into consideration known projects in neighboring jurisdictions to examine cumulative traffic impacts.
- 8) The TIA studied the number of lanes needed for the study roadways that are significantly affected by the project. The number of mid-block lanes and intersection approach geometry needed will depend on a combination of traffic volumes and anticipated turning movements, which will differ by location.

Bush Letter Dated March 13, 2012 (Scoping Meeting Cards 2, DEIR Appendix B)

- 1) The adequacy of Alessandro Boulevard and Gilman Springs Road to accommodate project-related traffic has been studied as part of the TIA.
- 2) Moreno Valley's current General Plan calls for a realignment of Alessandro Boulevard and the relocation of its intersection with Gilman Springs Road. This has been studied as part of the TIA.

4.15.2 Existing Policies and Regulations

The City of Moreno Valley’s current General Plan was approved in July 2006, and the following goals and policies are extracted from the Circulation Element of the current General Plan.

Community Development

Policy 2.2.17 Discourage nonresidential uses on local residential streets that generate traffic, noise, or other characteristics that would adversely affect nearby residents.

Circulation Element

Objective 5.1 **Create a safe, efficient, and neighborhood-friendly street system.**

Policy 5.1.1 Plan access and circulation of each development project to accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles.

Policy 5.1.2 Plan the circulation system to reduce conflicts between vehicular, pedestrian and bicycle traffic.

Policy 5.1.3 Require adequate off-street parking for all developments.

Policy 5.1.4 Driveway placement shall be designed for safety and to enhance circulation wherever possible.

Policy 5.1.5 Incorporate American Disability Act (ADA) and Title 24 requirements in roadway improvements as appropriate.

Policy 5.1.6 Design new developments to provide opportunity for access and circulation to future adjacent developments.

Objective 5.2 **Implement access management policies.**

Policy 5.2.1 Locate residential units with access from local streets. Minimize direct residential access from collectors. Prohibit direct single-family driveway access on arterials and higher classification roadways.

Policy 5.2.2 Feed short local street into collectors.

Policy 5.2.3 Encourage the incorporation of traffic calming design into local and collector streets to promote safe vehicle speeds.

Policy 5.2.4 Design new subdivisions to minimize the disruptive impact of motor vehicles on local streets. Long, broad and linear streets should be avoided. Residential streets should be no wider than 40 feet, and should have an uninterrupted length of less than one half mile. Curvilinear streets and cul-de-sacs are preferred. Streets within the subdivision should be designed to facilitate access to residences and to discourage through traffic.

Objective 5.3 **Maintain Level of Service (LOS) “C” on roadway links, wherever possible, and LOS “D” in the vicinity of SR 60 and high employment centers.**

Policy 5.3.1 Obtain right-of-way and construct roadways in accordance with the designation shown on the General Plan Circulation Element Map and the City street improvement standards.

Policy 5.3.2 Wherever feasible, promote the development of roadways in accordance with the City standard roadway cross-sections, as shown in Figure 9-3. Cross-sections range from two-lane undivided roadways to 8-lane divided facilities.

- Policy 5.3.3** Create new roadway classifications to accommodate future traffic demand, including; Divided Major Arterial – Reduced Cross-Section, and Divided Arterial – 6-lane. These cross-sections are shown on Figure 9-3.
- Policy 5.3.4** For planning purposes, utilize LOS standards shown on Table 5 –1 to determine recommended roadway widths.
- Policy 5.3.5** Ensure that new development pays a fair-share cost to provide local and regional transportation improvements and to mitigate cumulative traffic impacts. For this purpose, require new developments to participate in Transportation Uniform Mitigation Fee (TUMF), the Development Impact Fee Program (DIF), and any other applicable transportation fee programs and benefit assessment districts.
- Policy 5.3.6** Where new developments would increase traffic flows beyond the LOS C (or LOS D, where applicable), require appropriate and feasible mitigation measures as a condition of approval. Such measures may include extra right-of-way and improvements to accommodate left-turn and right-turn lanes at intersections, or other improvements.
- Policy 5.3.7** Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible.
- Policy 5.3.8** Pursue arterial improvements that link and/or cross the State Route 60 (SR-60) Freeway, including an additional over-crossing at Graham Street.
- Policy 5.3.9** Address additional widenings at arterials providing access to SR-60 at Day Street, Frederick Street/Pigeon Pass Road, and Perris Boulevard.
- Objective 5.4** **Maximize efficiency of the regional circulation system through close coordination with State and regional agencies and implementation of regional transportation policies.**
- Policy 5.4.1** Coordinate with Caltrans and the Riverside County Transportation Commission (RCTC) to identify and protect ultimate rights-of-way, including those for freeways, regional arterial projects, transit, bikeways, and interchange expansion.
- Policy 5.4.2** Coordinate with Caltrans and RCTC regarding the integration of Intelligent Transportation Systems (ITS) consistent with the principles and recommendations of the Inland Empire Regional ITS Architecture Project.
- Policy 5.4.3** Work with property owners, in cooperation with RCTC, to reserve rights-of-way for potential Community and Environmental Transportation Acceptability Process (CETAP) corridors through site design, dedication, and land acquisition, as appropriate.
- Policy 5.4.4** The City Council will commit to establishing ongoing relationships with all agencies that play a role in the development of the City's transportation system. Council members who are appointed to these agencies as City representatives shall seek out leadership roles to maximize their effectiveness on behalf of the City. Council will strive to maintain continuity in their appointments of representatives.
- Policy 5.4.5** Work with RCTC, WRCOG, and the TUMF Central Zone Committee to facilitate the expeditious construction of TUMF Network projects, especially projects that directly benefit Moreno Valley.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- Policy 5.4.6** Cooperatively participate with SCAG, RCTC, and WRCOG in the planning for a transportation system that anticipates regional needs for the safe and efficient movement of goods and people.
- Policy 5.4.7** Utilizing a combination of regional, state and federal funds, development impact fees, and other locally generated funds, provide needed improvements along SR 60 and the associated interchanges, including interchange and grade separation improvements.
- Policy 5.4.8** Reserve rights-of-way to accomplish future improvements as specified in the Caltrans District 8 Route Concept Fact Sheet for SR-60. Specifically, SR-60 shall be built to six general purpose lanes and two High Occupancy Vehicle (HOV) lanes through Moreno Valley. Additional auxiliary lanes may be required between interchanges. The need for auxiliary lanes will be determined from future studies.
- Policy 5.4.9** Lobby the State Legislature to keep triple trailer trucks off highways in developed areas of California.
- Objective 5.5** **Maximize efficiency of the local circulation system by using appropriate policies and standards to design, locate, and size roadways.**
- Policy 5.5.1** Space Collectors between higher classification roadways within development areas at appropriate one-quarter mile intervals.
- Policy 5.5.2** Provide dedicated left-turn lanes at all major intersections on minor arterials and higher classification roadways.
- Policy 5.5.3** Prohibit points of access from conflicting with other existing or planned access points. Require points of access to roadways to be separated sufficiently to maintain capacity, efficiency, and safety of the traffic flow.
- Policy 5.5.4** Wherever possible, minimize the frequency of access points along streets by the consolidation of access points between adjacent properties on all circulation element streets, excluding collectors.
- Policy 5.5.5** Design streets and intersections in accordance with the Moreno Valley Municipal Code.
- Policy 5.5.6** Consider the overall safety, efficiency and capacity of street designs as more important than the location of on-street parking.
- Policy 5.5.7** For developments fronting both sides of a street, require that streets be constructed to full width. Where new developments front only one side of a street, require that streets be constructed to half width plus an additional 12-foot lane for opposing traffic, whenever possible. Additional width may be needed for medians or left and/or right turn lanes.
- Policy 5.5.8** Whenever possible, require private and public land developments to provide on-site and off-site improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation system. The City may require developers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.
- Policy 5.5.9** Design curves and grades to permit safe movement of vehicular traffic per applicable Caltrans and Moreno Valley standards.
- Policy 5.5.10** Provide adequate sight distances for safe vehicular movement at all intersections and driveways.

- Policy 5.5.11** Implement National Pollutant Discharge Elimination System (NPDES) Best Management Practices (BMPs) relating to construction of roadways to control runoff contamination from affecting water resources.
- Objective 5.6** **Support development of a ground access system to March Inland Port in accordance with its development plan as a major cargo airport.**
- Policy 5.6.1** Ensure that City arterials that provide access to and from March Inland Port are properly designed to accommodate projected traffic volumes, including truck traffic.
- Policy 5.6.2** Ensure that traffic routes to March Inland Port are planned to minimize impacts to City residential communities.
- Objective 5.7** **Design roads to meet the needs of the residents of the community without detracting from the “rural” atmosphere in designated portions of Moreno Valley. (Designated “rural” areas include those encompassed by the Residential Agriculture 2, Residential 1, Rural Residential and Hillside Residential zoning districts. “Urban” areas encompass all other zoning districts.)**
- Policy 5.7.1** Pursue development of modified sidewalk standards for local and collector roads within low density areas to reflect the rural character of those areas.
- Policy 5.7.2** Provide sidewalks on arterials in designated low density areas that provide access to schools and bus stops.
- Objective 5.8** **Encourage development of an efficient public transportation system for the entire community.**
- Policy 5.8.1** Support the development of high-speed transit linkages, or express routes, that would benefit the citizens and employers of Moreno Valley.
- Policy 5.8.2** Support the efforts of the March Joint Powers Authority in its pursuit of a Transit Center.
- Policy 5.8.3** Encourage public transportation opportunities that address the particular needs of transit dependent individuals in the City such as senior citizens, the disabled and low-income residents.
- Policy 5.8.4** Ensure that all new developments make adequate provision for bus stops and turnout areas for both public transit and school bus service.
- Policy 5.8.5** Continue ongoing coordination with transit authorities toward the expansion of transit facilities into newly developed areas.
- Objective 5.9** **Support and encourage development of safe, efficient and aesthetic pedestrian facilities.**
- Policy 5.9.1** Encourage walking as an alternative to single occupancy vehicle travel, and help ensure the safety of the pedestrian as follows:
- (a) All new developments shall provide sidewalks in conformance with the City’s streets cross-section standards, and applicable policies for designated urban and rural areas.
 - (b) The City shall actively pursue funding for the infill of sidewalks in developed areas. The highest priority shall be to provide sidewalks on designated school routes.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- Policy 5.9.2** Walkways shall be designed to minimize conflicts between vehicles and pedestrians.
- Policy 5.9.3** Where appropriate, provide amenities such as, but not limited to, enhanced paving, seating, and landscaping to enhance the pedestrian experience.
- Policy 5.9.4** Require the provision of convenient and safe pedestrian access to buildings from the public sidewalk.
- Objective 5.10** **Encourage bicycling as an alternative to single occupant vehicle travel for the purpose of reducing fuel consumption, traffic congestion, and air pollution.**
- Policy 5.10.1** Bikeways shall link residential neighborhood areas with parks, employment centers, civic and commercial areas, and schools.
- Policy 5.10.2** Integrate bikeways, consistent with the Bikeway Plan, with the circulation system and maintain Class II and III bikeways as part of the City’s street system.
- Policy 5.10.3** Support bicycle safety programs, and active enforcement of laws relating to the safe operation of bicycles on City streets.
- Policy 5.10.4** Link local bikeways with existing and planned regional bikeways.
- Objective 5.11** **Eliminate obstructions that impede safe movement of vehicles, bicyclists, and pedestrians.**
- Policy 5.11.1** Landscaping adjacent to City streets, sidewalks and bikeways shall be designed, installed and maintained so as not to physically or visually impede public use of these facilities.
- (a) The removal or relocation of mature trees, street trees and landscaping may be necessary to construct safe pedestrian, bicycle and street facilities.
- (b) New landscaping, especially street trees shall be planted in such a manner to avoid overhang into streets, obstruction of traffic control devices or sight distances, or creation of other safety hazards.
- Policy 5.11.2** Driveways shall be designed to avoid conflicts with pedestrian and bicycle travel.
- Objective 5.12** **Promote efficient circulation planning for all school sites that will maximize pedestrian safety, and minimize traffic congestion and neighborhood impacts.**
- Policy 5.12.1** Coordinate with school districts to identify suggested pedestrian routes within existing and new subdivisions for school children to walk to and from schools and/or bus stops.
- Program 5-1** Periodically review current traffic volumes, traffic collision data, and the pattern of urban development to coordinate, program, and as necessary revise the planning and prioritization of road improvements.
- Program 5-2** Periodically reassess the goals, objectives and policies statements of the Circulation Element and propose amendments, as necessary.
- Program 5-3** Develop a comprehensive strategy to ensure full funding of the circulation system. The strategy will include the DIF, TUMF, and other funding sources that may be available to the City. In addition, the creation of benefit assessment districts, and road and bridge fee districts may be considered where appropriate.

- Program 5-4** Develop a multi-year transportation infrastructure improvement program that, to the extent feasible, phases the construction of new projects in advance of new development.
- Program 5-5** The above-referenced program will prioritize circulation improvement projects to be funded from DIF, TUMF and other sources. Prioritization to consider the following factors: (a) Traffic safety; (b) Congestion relief; (c) Access to new development; and (d) Equitable benefit.
- Program 5-6** Conduct studies of specified arterial segments to determine if any additional improvements will be needed to maintain an acceptable LOS at General Plan buildout. Generally, these segments will be studied as new developments are proposed in their vicinity. Measures will be identified that are consistent with the Circulation Element designation of these roadway segments, such as additional turn lanes at intersections, signal optimization by coordination and enhanced phasing, and travel demand management measures. The study of specified arterial segments will be required to identify measures to maintain an acceptable LOS at General Plan buildout for at least one of the reasons discussed below:
- (a) Segments will need improvement, but their ultimate volumes slightly exceed design capabilities.
 - (b) Segments will need improvements but require inter-jurisdictional coordination.
 - (c) Segments would require significant encroachment on existing adjacent development if built out to their Circulation Element designations.
- Program 5-7** Establish traffic study guidelines to deal with development projects in a consistent manner. The traffic study guidelines shall include criteria for projects that propose changes to the approved General Plan land uses.
- Program 5-13** Implement Transportation demand management (TDM) strategies that reduce congestion in the peak travel hours. Examples include carpooling, telecommuting, and flexible work hours.

4.15.3 Methodology

This section summarizes: i) the traffic volume scenarios analyzed in this EIR and methods of traffic volume projection; ii) the proposed project's trip generation, distribution and assignment; and iii) opening year, 2022 background and Year 2035 Cumulative background levels of service.

4.15.3.1 Traffic Volume Scenarios

Existing Baseline, Existing Baseline Plus Phase 1, and Existing Baseline Plus Project Conditions. The existing year (2012) represents the baseline traffic conditions as they existed at the time the Notice of Preparation was issued to represent pre-project approval (existing physical conditions). The existing baseline plus project analysis determines direct project-related traffic impacts that would occur on the existing roadway system in a theoretical scenario in which the project is placed upon existing baseline conditions.

Within the project site, the proposed Phase 1 land uses were used for the "Plus Phase 1" scenarios, the proposed project buildout land uses were used for the "Plus Project" scenarios, while the existing land uses were used for the "No Project" scenarios. The Existing Plus Phase 1 and Existing plus Project analyses are intended to identify the project-specific impacts associated solely with the

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

development of the proposed project and the corresponding mitigation measures necessary to mitigate the project-related impacts.

Year 2017 and Year 2017 Plus Project Conditions. This analysis was removed from the revised TIA and DEIR sections – the reader is referred to Section 4.15.3.1 of the original DEIR for that text, tables, etc.

Year 2022 and Year 2022 Plus Phase 1 Conditions. The year 2022 analysis determines the project’s cumulative contribution to near-term traffic impacts based on a comparison of year 2022 conditions to year 2022 plus Phase 1 of the project conditions. Within the site, the proposed Phase 1 land uses were used for the “Plus Phase 1” scenarios while the existing land uses were used for the “No Project” scenarios.

The opening year 2022 cumulative analysis has been utilized to determine if improvements funded through local and regional transportation mitigation fee programs, such as the Transportation Uniform Mitigation Fee (TUMF) program and the City of Moreno Valley Development Impact Fee (DIF) program, can accommodate the cumulative traffic at the target LOS identified in the City of Moreno Valley General Plan. If the regionally funded improvements can provide the target LOS, and the payment of such funds for such improvements is foreseeable, then the project’s payment into the established fee programs will be considered as mitigation for cumulative impacts through the conditions of approval. Other improvements needed beyond the regionally funded improvements (such as localized improvements to non-TUMF, or non-DIF) are identified in the impacts section (Section 4.15.5).

The circulation system assumed in the analysis includes transportation improvement projects that are either under construction or are funded and planned for implementation in the short-term. These improvement projects are identified in SCAG’s 2012-2035 Regional Transportation Plan (RTP). The RTP is a long-range transportation plan based on 20-year growth projections that is developed and updated by SCAG every four years. The Federal Transportation Improvement Program (FTIP) is a capital listing of all transportation improvement projects proposed over a six-year period for the SCAG region. The FTIP implements the transportation projects and programs listed in the RTP in compliance with state and federal requirements. For the 2022 scenarios, only the projects in the FTIP and the RTP’s financially constrained¹ project list were assumed to be completed. The projects in the RTP’s Strategic Plan were not included because funding for them is too uncertain. Also, the proposed East-West Freight Corridor included in the financially constrained plan was not included because the freight corridor is expected to be funded through tolls to be collected by a process that has not yet been established and whose future efficacy is unknown. If it is constructed, then traffic impacts would be less than those described in this EIR. The 2022 improvements are shown in Figure 4.15.5.

Note: Figure 4.15.5 was added to the revised DEIR section.

¹ These are the projects for which funds are committed or have reasonably available revenue sources, and are probable for implementation.

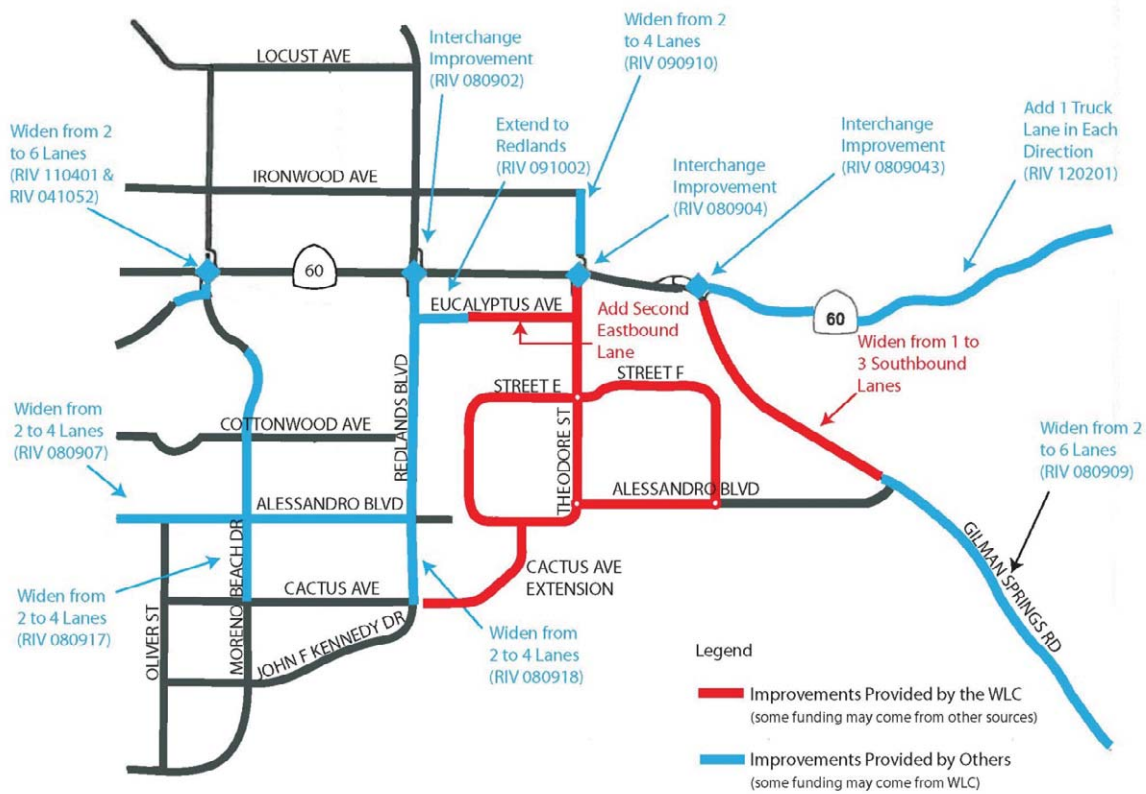

Figure 4.15.5: Roadway Improvements Assumed for 2022

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

Phase 1 of the proposed project will be completed in 2022 and includes 21,450,000 square feet of logistics warehouse uses. This is approximately 52 percent of the total project building space. The internal road system will be partially built out, with east-west through traffic served by the Cactus Avenue extension and Streets C and E. Theodore Street would serve north-south traffic as it does today.

Traffic projections for year 2022 conditions were derived from the RivTAM using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between existing (2012) baseline conditions and horizon year (2022) conditions. Specifically, traffic generated by other approved projects (cumulative projects) in the vicinity of the proposed project were included in the socioeconomic inputs for the year 2022 traffic volume scenario as shown on Figure 4 and Table 1 in the Traffic Impact Analysis Report, dated September 2014 (Appendix L-1). As noted previously, because some of the cumulative development projects may not be constructed at the anticipated time, or at all due to economic conditions, the cumulative impact analysis contained within the TIA is inherently conservative and would tend to overstate cumulative impacts. A detailed summary of the volume development methodology is included in the project Traffic Impact Analysis Report, dated September 2014 (Appendix L-1).

Project traffic volumes at study locations were the added to opening year cumulative volumes to develop opening year cumulative plus project traffic volumes.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Year 2035 Cumulative and Year 2035 Cumulative Plus Project Conditions. Year 2035 Cumulative conditions determine the project’s cumulative contribution to long-term traffic impacts under year 2035 with buildout of the land uses and circulation system in the General Plan. Within the project site, the proposed project buildout land uses were used for the “Plus Project” scenarios while the existing land uses were used for the “No Project” scenarios. This analysis has also been utilized to determine if improvements funded through local and regional transportation mitigation fee programs, such as the TUMF program and the City of Moreno Valley DIF program, can accommodate the cumulative traffic at the target LOS identified in the City of Moreno Valley General Plan. If the regionally funded improvements can provide the target LOS, and the payment of such funds for such improvements is foreseeable, then the project’s payment into the established fee programs will be considered as cumulative mitigation through the conditions of approval. Other improvements needed beyond the regionally funded improvements (such as localized improvements to non-TUMF, or non-DIF) are identified in the impacts section (Section 4.15.5).

For the 2035 scenarios, the roadway projects from the FTIP and RTP included in the year 2022 network were also included in the 2035 network. The future circulation network from the City of Moreno Valley General Plan was also incorporated into the year 2035 network. The General Plan identifies future circulation improvements that are funded through the City’s DIF, Western Riverside Council of Governments’ TUMF, and improvements made directly by developers. It is reasonable to assume that these improvements will be in place parallel with buildout of the General Plan land uses, because most of the improvements will be funded through fees on the new developments. If other sites do not fully build out per the General Plan, then the LOS on the study streets and intersection would likely be better than shown in the TIA. The 2035 improvements are shown in Figure 4.15.6.

Note: Figure 4.15.6 was added to the revised DEIR section.

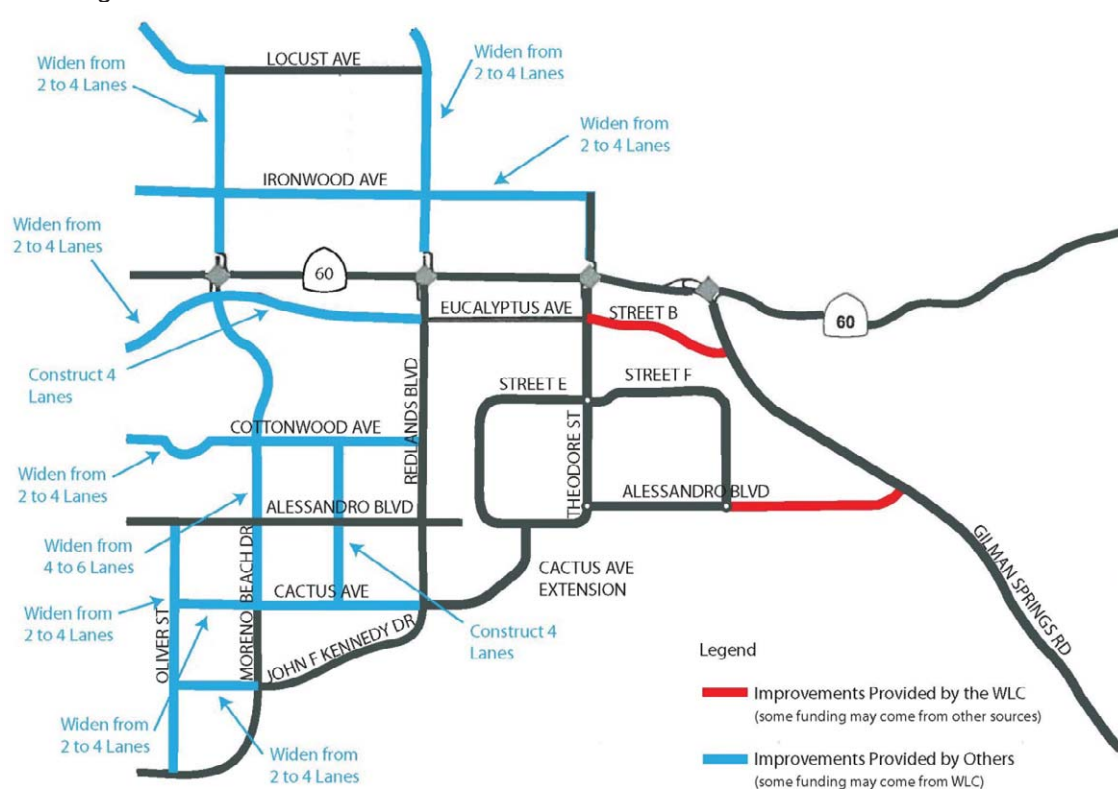

Figure 4.15.6: Roadway Improvements Assumed for 2035

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

Traffic projections for Year 2035 Cumulative conditions were derived from the RivTAM using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between existing (2012) baseline conditions and horizon year (2035) conditions. Specifically, traffic generated by other approved projects (cumulative projects) in the vicinity of the proposed project were included in the socioeconomic inputs to the RIVTAM for the Year 2035 Cumulative traffic volume scenario as shown in Figure 4 and Tables 1 and 2 in the Traffic Impact Analysis Report, dated September 2014 (Appendix L-1). As noted above, because some of the developments contained within the cumulative analysis may not be constructed at the anticipated time, or at all due to economic conditions, the cumulative impact analysis contained within the TIA is inherently conservative and would tend to overstate cumulative impacts. A detailed summary of the volume development methodology is included in the project Traffic Impact Analysis Report, dated September 2014 (Appendix L-1).

Project traffic volumes at study locations were to added Year 2035 Cumulative traffic volumes to develop Year 2035 Cumulative plus project traffic volumes.

Table 4.15.K summarizes the forecast years as well as each development scenario analyzed.

Table 4.15.K: Analysis Scenarios

Forecast Year	Scenarios Analyzed
2012	<ul style="list-style-type: none"> • Existing (2012) Baseline Conditions. • Existing (2012) Baseline Plus Phase 1 Conditions Project (21,450,000 square feet). • Existing Baseline plus Project Conditions.

4.15.3.2 Project Trip Generation, Distribution, and Assignment

Note: The following changes have been made in response to: Comments F-3-5, 11, and Appendix 176 in Letter F-3 from the California Clean Energy Committee; Comments F-6-1, 2, and 3 in Letter F-6 from the Endangered Habitats League; Comment F-9A-45 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comment F-9B-45 in Letter F-9B from Tom Brohard and Associates; Comment F-11-29 in Letter F-11 from the Sierra Club, San Gorgonio Chapter; Comment G-2-7 in Letter G-2 from Perry Johnson; Comment G-17-2 in Letter G-17 from Joanne Lindgren; Comment G-18-1 in Letter G-18 from Sam Zaidy; Comment G-34-5 in Letter G-34 from Lindsay Robinson; Comment G-35-4 in Letter G-35 from Peggy Hadaway and John Neal; Comment G-49-18 in Letter G-49 from Karen Jakpor; Comment G-50-2 in Letter G-50 from Ann McKibben; Comment G-51-5 in Letter G-51 from Michael McCoy; Comments G-52-1 and 2 in Letter G-52 from Steve Jiannino; Comment G-53-4 in Letter G-53 from Deanna Reader and Kenny Bell; Comment G-57-1 in Letter G-57 from Tracy Hodge; Comment G-68-3 in Letter G-68 from Craig and Joan Givens; Comment G-96-3 in Letter G-96 from Margie Breikreuz; and Comment G-97-1 in Letter G-97 from Otana Jakpor.

Trip generation represents the amount of traffic that is attracted and produced by a development project. The amount of traffic generated by a specific project is based on the specific land uses being proposed. Traffic engineers utilize different yet similar methodologies to anticipate trip generations.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Many times, average trip generation rates as published by the Institute of Transportation Engineers (ITE) are used to forecast trip rates. In some circumstances, however, use of the ITE trip generation rates is not deemed to be the most accurate methodology of forecasting trip generation because more precise data are available. Therefore, in an effort to forecast the number of vehicle trips potentially generated by the proposed project accurately, the TIA examined and compared the results of four different trip generation sources: (1) the ITE *Trip Generation*, 9th Edition; (2) the Fontana Truck Trip Generation Study (2003); (3) the 2011 NAIOP trip generation study for high-cube logistics warehouses in Riverside and San Bernardino Counties; and (4) Skechers Trip Generation Study (2011). The City’s TIA guidelines specify use of a combination of the first two sources, with the ITE Trip Generation Manual being the source of the trip generation rate and the City of Fontana Truck Trip Generation Study being the source of the vehicle mix percentages. Table 4.15.L summarizes the trip rates from each source.

Table 4.15.L: Trip Generation Rate Comparison (Skechers Data Added)

Source of Trip Generation Rates	A.M. Peak Hour			P.M. Peak Hour			Daily
	In	Out	Total	In	Out	Total	
ITE <i>Trip Generation Manual</i>	0.0759	0.0341	0.1100	0.0372	0.0828	0.1200	1.68
Fontana <i>Truck Trip Generation Study</i>	0.0357	0.0343	0.0700	0.0224	0.0506	0.0730	1.97
NAIOP 2011 <i>Trip Generation Study</i>	0.030	0.017	0.047	0.022	0.048	0.070	0.99
Skechers Traffic Counts	0.022	0.013	0.035	0.004	0.033	0.037	0.567

Source: Tables 3, 4 and 5, Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

The trip generation rates derived from existing driveway traffic counts collected at the Skechers Warehouse Facility in November 2011 showed that for all time periods the traffic generated by the Skechers building was only about one-third of what the ITE trip generation rates would have predicted. Furthermore, the actual truck traffic was less than half (41%) of what the methodology mandated in the City of Moreno Valley’s traffic impact guidelines (ITE trip generation rates with the vehicle mix from the Fontana Truck Trip Generation Study) would predict.

Several comments received on the Draft EIR suggested that the trip generation for the proposed project use a combination of a very high overall trip generation rate with a high heavy truck percentage to estimate the number of project truck trips. The City has found that this approach produces unreasonable trip generation rates when compared to actual field conditions. For example, the EIR for the Skechers high-cube warehouse building used this unreasonable approach and found the forecasts to be three times the actual post-construction trip generation for car trips and nearly eight times the actual trip generation for trucks¹. This approach could result in the construction of oversized and unnecessary roadway infrastructure with its own environmental consequences, creating an undue burden on development, and could ultimately discredit the City’s project review process in the eyes of the business community and members of the public. For these reasons, this approach was not used to estimate trips for the proposed project and the City’s Traffic Impact Guidelines was appropriately used instead.

The 2011 NAIOP provides the more accurate trip generation for the proposed project as the NAIOP study is the most comprehensive trip study performed for high-cube logistics warehouses. As shown in previously referenced Table 4.15.L, when using the NAIOP and derived trip generation rates, project trips are forecast to be lower than if the ITE trip generation rates were used. However, in order to be conservative, this EIR and the TIA utilize the ITE 9th Edition trip rates, which have the

¹ These figures are based on traffic counts taken at the Skechers building after it had been fully operational for over a year. See Technical Memorandum *Traffic Generated by the Skechers Warehouse*, Parsons Brinckerhoff to the City of Moreno Valley, November 14, 2012.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

effect of overestimating project impacts because high-cube logistics warehousing would comprise 99.4 percent of the overall project building area. Therefore, as determined in the TIA, trip generation rates for high-cube warehouse uses (Land Use 152) as published in the 9th Edition of ITE's *Trip Generation* manual, and currently widely accepted throughout Riverside and San Bernardino Counties, are the trip rates being utilized to determine the project's traffic impacts. For this reason, the actual traffic impacts of the proposed project are expected to be much less than those identified in the TIA and by extension this EIR. The project trip generation rates for the proposed project and existing land uses on the site are shown in Table 4.15.M.

Table 4.15.M: Project Trip Generation Rates for Proposed and Existing Land Uses

Land Use Type	Unit	AM Peak Hour			PM Peak Hour			ADT
		In	Out	Total	In	Out	Total

Figure 4.15.7 compares the trip generation estimate for the proposed project as used in this EIR to the trip generation assuming implementation of the NAIOP and Sketchers survey-derived rates. As shown in the figure, the trip generation estimate for the proposed project is much higher in comparison to the estimates using either the NAIOP or Sketchers rates, thus meeting CEQA’s standard of substantial evidence.

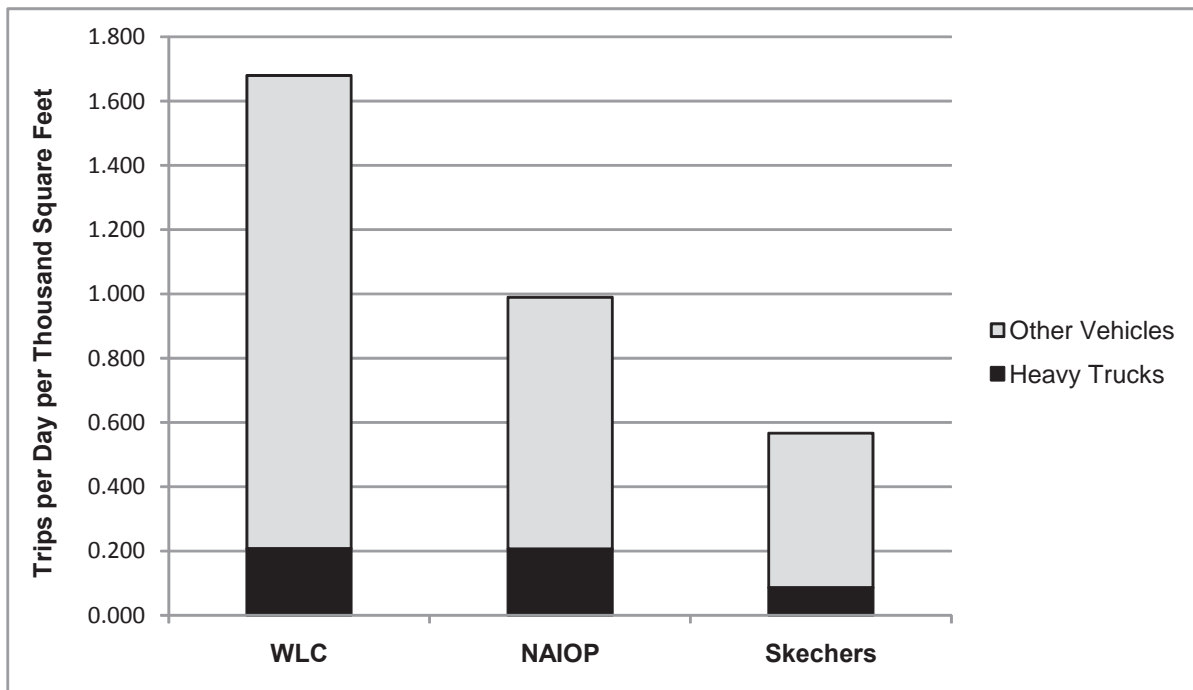

Figure 4.15.7: Comparison of Trip Generation from Southern California Sources

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

As shown in previously referenced Table 4.15.N, the project is estimated to generate a net total of approximately 69,542 daily trips with approximately occurring during a.m. peak hour and 5,010 occurring during the p.m. peak hour. Daily and hourly trip counts take into account only the trips generated by the project. Refinements to raw trip generation estimated using the ITE rates have been made to provide a more detailed breakdown of trips by vehicle mix, similar to the existing baseline count

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

data. Per City of Moreno Valley standard practice, vehicle mix percentages were obtained from the City of Fontana Truck Trip Generation Study, which is the recognized source throughout the County of Riverside and the County of San Bernardino for estimating the vehicle mix associated with industrial and warehouse uses. For this reason, the vehicle-mix from the Fontana Truck Trip Generation Study has been applied to ITE trip generation rates in order to determine the proposed project's passenger car and truck trip generation mix. Table 4.15.O shows the project trips by vehicle type. The PCE project trips by vehicle type differ between the surface street and freeway analyses because the freeway analysis uses a PCE factor of 1.5 for medium and heavy trucks while the surface street analysis uses PCE factors of 2.0 and 3.0 for medium and heavy trucks, respectively.

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

The City of Moreno Valley Transportation Engineering Division performed their own survey of trip generation at six warehouses in the City to address concerns over unrealistically high trip generation forecasts for warehouse oriented projects. This study used counts collected in Fall 2013, after the Draft EIR for the proposed project had been sent out for public review in February 2013. The City study confirmed that the vehicle mix for the Heavy Warehouse category in the Fontana *Truck Trip Generation Study* (i.e. the data used for the WLC TIA) produces a good, but conservative (i.e. somewhat high), estimate of truck trips percentages for high-cube warehouses while the Fontana Truck Terminal category produces an obvious over-estimate of truck traffic (see Figure 4.15.8).

For comparative purposes, the trip generation estimate for the proposed project was compared to the trip generation for existing approved land uses for the project area as shown in the final traffic study for the Moreno Highlands Specific Plan. The Moreno Highlands Specific Plan would generate 178,608 average vehicle trips per day, or more than two-and-a-half times as many trips (256%) as are forecast for the WLC (69,542 average vehicle trips per day). The Moreno Highlands traffic studies did not distinguish between car and truck traffic, and so did not provide a forecast in terms of PCEs. However, even if the Moreno Highlands plan were to generate no truck trips at all (only auto trips), it

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

would still generate nearly twice as many PCEs trips as the WLC. Thus, the World Logistics Center would generate substantially less traffic than the existing approved land uses for the project area as envisioned in the existing Moreno Highlands Specific Plan.

Trip distribution represents the probable starting and ending locations of traffic generated by a project. Trip distribution is heavily influenced by the geographical location of a project site in relation to local and regional land uses (i.e., the starting and ending locations), and access to a project site from the local and regional transportation system. The proposed project’s trip distribution was developed for both passenger cars and trucks.

Figure 4.15.8: Comparison of Vehicle Mixes from the City Survey and the Fontana Study
Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

The Fontana Truck Trip Generation Study¹ found that 80 percent of the vehicles entering or leaving warehouse sites are passenger cars, nearly all of which are used for commute trips by employees of the warehouses. Most of these trips are local trips resulting from current and future residents of Moreno Valley who would be afforded the opportunity to work locally with very short commutes as well as residents of neighboring cities who would access the project site using the local arterial network. Other passenger car trips would be generated by workers coming from more distant areas. In most cases, these trips would access the project site via SR-60 in the off-peak direction (i.e., commuters traveling to the project site from Los Angeles or Orange Counties).

Truck Distribution. The truck trip distribution patterns have been developed based on the anticipated travel patterns for the proposed project’s high-cube logistics warehousing trucks. Since the internal trips, the port-related trips, and the majority of external trips (all but those on I-10) use routes west of the project site, it is anticipated that a large majority of the WLC truck traffic will be oriented to the west of the project, with a much smaller amount to and from the east. In addition, the majority of project truck traffic would use the freeway system to enter and leave the project area due

¹ Truck Trip Generation Study, City of Fontana, August 2003.

to truck routing restrictions. Based on these factors, truck trips generated by the proposed project would be oriented in the following manner:

- 82 percent to/from the west via one or more freeways;
- 6 percent to/from the north via surface streets;
- 9 percent to/from the east utilizing SR-60 and I-10; and
- 3 percent to/from the southeast via surface streets.

Auto Distribution. Figure 29 of the WLC TIA indicates that daily passenger vehicle traffic will distribute in the following directions:

- 44 percent to/from the west on SR-60;
- 9 percent to/from the east on SR-60 (east of Gilman Springs Road);
- 11 percent to/from the southeast on Gilman Springs Road;
- 29 percent to/from the south on Cactus Avenue; and
- 7 percent to/from the north along Theodore Street.

Moreno Valley currently has a jobs/housing imbalance that results in long westbound commutes for thousands of city residents every workday. The WLC would create approximately 25,000 new jobs; nearly doubling the number of jobs in Moreno Valley. This would have four effects on commute patterns. First, many current and future residents of Moreno Valley would be able to work locally with very short commute trips.

Second, residents of neighboring cities who work at the WLC would have short commutes and, importantly, be able to access the site using the arterial road network. This is consistent with the policies of the Western Riverside Council of Governments and the Riverside County Transportation Commission to promote use of the arterial road network as an alternative to freeways. Tests with the RIVTAM model (see Figure 29 of the WLC TIA) suggest that nearly half of auto traffic associated with the WLC would be on surface streets; i.e., not on freeways.

Third, workers coming from more distant locations would, in most cases, be traveling on freeways in the off-peak direction; i.e., commuters traveling to the WLC from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to take advantage of the existing unused off-peak capacity of freeways, since the freeways were sized for flows in the peak direction.

Fourth, because the RIVTAM model assumes that WLC employees would work elsewhere if the WLC project were not implemented, then the availability of jobs at the east end of Moreno Valley would reduce the number of workers driving long commutes to distant jobsites to the west and southwest. Although the project would increase freeway auto traffic eastbound in the morning, it would also decrease the traffic in the more congested westbound direction. In the evening the pattern would reverse, with the project relieving traffic in the congested eastbound direction. Therefore, the WLC project would have a net beneficial impact on the regional freeway auto traffic. This is consistent with the policies of SCAG, WRCOG, and other regional governments and agencies to encourage better jobs/housing balances as a way to reduce peak directional flows on the regional freeway system.

The assignment of traffic from the project area to the adjoining roadway system is based upon the project trip generation, trip distribution, and the arterial highway and local street system improvements

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

that would be in place by the time of initial occupancy of the project. For more information on project trip generation and distribution for both trucks and passenger vehicles over and above the summary above, see Sections 4.C, 4.D, and 4.E in the project TIA (PB 2013, EIR Appendix L). It is important to note that all trucks must use established truck routes within the City of Moreno Valley by the Municipal Code, while passenger vehicles will distribute onto the freeway and local streets depending on their destinations.

It should be noted that all technical studies based all or in part on traffic (i.e., air quality, greenhouse gases, and noise) have used these same assumptions regarding trip generation, trip length, etc. from the project TIA for their assessments of project impacts.

Passenger Car Equivalents. The analytical methods used to forecast traffic impacts must take into account the driving characteristics of different classes of vehicles. This is typically done through the use of passenger car equivalent (PCE) factors, which convert the number of heavy vehicles in the traffic stream into an equivalent number of passenger cars. The term PCE was first used in the 1965 *Highway Capacity Manual* (HCM), and was determined by comparing the relative number of passing of trucks by passenger cars in relation to number of passing of passenger car by passenger cars. According to the *HCM 2000*:

The entry of heavy vehicles—that is, vehicles other than passenger cars (a category that includes small trucks and vans)—into the traffic stream affects the number of vehicles that can be served. Heavy vehicles are vehicles that have more than four tires touching the pavement.

Trucks, buses, and recreational vehicles (RVs) are the three groups of heavy vehicles addressed by the methods in this manual. Heavy vehicles adversely affect traffic in two ways:

- *They are larger than passenger cars and occupy more roadway space; and*
- *They have poorer operating capabilities than passenger cars, particularly with respect to acceleration, deceleration, and the ability to maintain speed on upgrades.*

The second impact is more critical. The inability of heavy vehicles to keep pace with passenger cars in many situations creates large gaps in the traffic stream, which are difficult to fill by passing maneuvers. The resulting inefficiencies in the use of roadway space cannot be completely overcome. This effect is particularly harmful on sustained, steep upgrades, where the difference in operating capabilities is most pronounced, and on two-lane highways, where passing requires use of the opposing travel lane.

Grade is by far the most important determinant in the PCE factor to be used. The HCM's recommended PCE for trucks ranges from 1.5 for places with slopes of less than 2 percent up to 7.0 for places with steep grades more than a mile long. HCM's recommended PCE factors were used for the freeway analysis.

For the analysis of surface streets, the City's TIA guidelines mandate the use of PCE factors taken from the San Bernardino County CMP, 2003 Update. These are somewhat higher than the HCM rates; for example, HCM recommends 2 PCEs per heavy truck while the San Bernardino County CMP uses 3. This means that use of the San Bernardino County CMP PCE rates represents a deliberately conservative approach in the sense that the analysis will tend to over-state the impact of trucks on traffic conditions.

4.15.3.3 Year 2017 Conditions

Note: Due to a change in project conditions and phasing, the Year 2017 analysis was eliminated from the revised TIA and DEIR section. *The reader is referred to the original DEIR section for that analysis and related tables and figures.*

Note: The following analysis of potential rail service to the project site was added in response to comments on the Draft EIR.

Potential Rail Alternative. This section describes why rail service is not considered a viable option for reducing the traffic impacts of the WLC. This conclusion is based on several factors, including the physical constraints to bringing rail service to the WLC site, the cost of cargo movement by rail relative to movement by truck, capacity constraints in the rail system that the WLC branch line would tie into, and the minimal effect that rail service would have even if all other factors could be overcome. These factors are discussed in turn below.

The Possible Alignments for Bringing Rail Service to the WLC Site. The WLC site is not currently served by rail. The rail lines nearest the site are the Union Pacific Yuma Line (single-track in this area), the Riverside County Transportation Commission's San Jacinto Branch Line (single-track, currently inactive), and the BNSF double-track line through the City of Riverside (see TIA Figure 36).

There are four general alignment possibilities for a branch line to the WLC. Each alignment is inherent with significant problems as follows:

- Western Alignment – Alignments running from the BNSF line in Riverside to the WLC, an approximate distance of 15 miles, would have to run through built-up areas of the Cities of Riverside and Moreno Valley. The cost of acquiring right-of-way through these areas, and the impacts to the community (noise, traffic disruption, safety, division of the community, etc.) render such alignments unviable. Moreover, trains using the at-grade rail crossings in the City of Riverside already impose substantial delays on road traffic. In fact, in recent years the City of Riverside has sued the ports over the issue of traffic impacts from additional trains passing through the city. Adding more crossings and more trains would exacerbate this problem.
- Southern Alignment – It would be possible to avoid densely populated and built-out areas by connecting to the San Jacinto Branch Line south of March Air Reserve Base. However, the only way to avoid established communities would be to pass along the northern portion of the Lake Perris State Recreation Area. The alignment, approximately 10 miles in length, would be a major impact as it would require constructing and operating a rail line along the slopes of the Lake Perris State Recreation Area and potentially the San Jacinto Wildlife Area. There would also be traffic impacts at road crossings, potential grade issues, and grade separated crossings needed for drainage channels and I-215. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways (which will be discussed in a later section).
- Northern Alignment – The shortest alignment to an existing rail line is to the north in the vicinity of Redlands Boulevard and connecting to the UP Yuma line near the intersection of Redlands Boulevard and San Timoteo Canyon Road, approximately five miles from the project site. This alignment would require extensive ROW acquisition, encounter very serious grade issues that would increase the length of track needed, result in environmental impacts on the Badlands, and require a grade separated crossing of SR-60. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- Eastern Alignment – The final possibility would be to connect to the UP Yuma line along an alignment parallel to SR-60. This alignment would connect to the existing rail network near the Morongo Golf Club at Tukwet Canyon, approximately five miles to the east of the WLC site. The eastern alignment would be affected by the same drawbacks as the northern alignment, with the addition of the need to construct a bridge over San Timoteo Creek.

As can be seen from the discussion above, providing rail service to the WLC along any of the possible alignments would in itself create serious environmental impacts.

Relative Costs of Truck and Rail Service. The loading and unloading of rail cargos requires special equipment and handling and can only be performed at specialized places, which adds to the cost of shipping goods by rail. On the other hand, the actual movement of goods by rail is more energy-efficient and less expensive than movement by truck. This combination of relatively high fixed costs at each end of a trip with low variable costs for the distance traveled means rail can be a less expensive way to ship cargo than truck, but only if the shipping distance is sufficiently long.

The break-even distance between rail and truck shipping has been the subject of several studies. The industry rule-of-thumb is that the rail becomes economically viable when cargos are shipped more than 500 miles. For example, the National Rail Plan, a nationwide guiding document from the U.S. Department of Transportation Federal Railroad Administration, has set the freight rail goal to, “Develop strategies to attract 50 percent of all shipments 500 miles or greater to intermodal rail.” In addition, the Plan highlights the importance that trucks have in conjunction with rail when moving freight, as trucks “excel in providing time-sensitive delivery services for high-value goods being transported over medium and short haul distances.” A local example is the Ports of Long Beach/Los Angeles Rail Master Planning Study, which indicates that rail loaded with two levels of shipping containers, “traditionally competes well with trucks at distances greater than 500 miles.” The San Pedro Bay Ports Rail Market Study shows the break-even point between truck and rail freight transport beginning east of Las Vegas and Phoenix, and north of the Bay Area. For shipments between the Ports of Los Angeles and Long Beach and the WLC, a distance of about 70 miles, shipping by rail would be far more expensive than by truck. Even if a rail line were built to the WLC, it would be uneconomical to use it for trips to and from the ports.

Capacity Constraints in the Rail System. If a rail line could be built to the WLC site and tenants could be induced to use it despite higher costs, this would only be helpful if the regional rail system had sufficient capacity to accommodate WLC freight without detriment to other users.

In fact, there are serious capacity constraints in the rail network in the Los Angeles Basin. Among other things, both BNSF and UP rail operations are already capacity-constrained on the lines between the ports and western Riverside County. Two studies, completed in the early 2000s and using the year 2000 as the existing condition, found that many of the rail lines were already operating near capacity. The studies evaluated 10 and 25 years of projected growth on the network and found that within 10 years (of the date of the study) the network would be over capacity. Without capacity increasing improvements, 10 years of train traffic growth was forecast to increase delay more than six-fold. This did not include additional delays that would be caused by trains serving the WLC.

The Los Angeles-Inland Empire Railroad Main Line Advanced Planning Study from October 2002 found that the “region’s rail system is inadequate for forecast train traffic.” The study presented other findings that illustrate the near-capacity state of the rail network, for example, “... just 25 percent of the forecast 2010 traffic is sufficient to roughly double the average delay per train, to 67.6 minutes for BNSF freight and 54.4 minutes for UP freight.” This occurs because small increases in train traffic result in disproportionate delays as the network nears capacity.

Several minor improvements to the rail network have been made since the 2002 study. However, accommodating estimated future demand in the year 2025 by providing capacity improvements alone would be costly; to meet future demand without rerouting would require capacity of some segments to be increased from two to four tracks. Therefore, an approach has been developed to revise train routing on the existing rail network and make limited capacity-increasing improvements. Even the limited improvements are estimated to cost over \$2 billion.

The fact that the rail system has limited capacity to accommodate additional traffic means that potential users have to be prioritized so that the capacity can be allocated efficiently. Highest priority would be for long-distance rail service direct from the ports. Short-distance cargo trips between the ports and the WLC would receive much lower priority than long-distance shipments. If regional passenger trains (e.g., Metrolink) share the tracks with freight trains, as is the case for some lines, then service to WLC would drop even further on the priority list. Based on existing capacity of the rail network and projected growth, the studies indicated that the rail network would be over capacity without further capital investments, which is beyond the scope of the WLC project.

Minimal Reduction in Traffic. Assuming that a rail line could be built to the WLC site and assuming that WLC freight could be accommodated by the rail network and that the costs for these things could be covered by subsidies or by increasing the prices on goods moved through the WLC, the question must be asked, “how much of a reduction in truck traffic impacts would be achieved?”

The answer is, “very little.” As was discussed earlier, the economics of freight shipment make rail viable only for trips of 500 miles or more. As is described in the TIA prepare for this EIR (Chapter 12, Section F), between 2 and 7 percent (depending on the year) of the truck trips beginning or ending in WLC go to the ports and these trips have no significant impact on freeway LOS for most of their lengths. So the effect of rail service on reducing truck impacts would be very small.

Conclusions About the Rail Alternative. This analysis of the rail alternative found that bringing rail service to the site would be very costly, result in serious environmental impacts, create major disruption to existing communities, and take many years to design, acquire right-of-way, and construct. Even if a line were built, both economics and system constraints would deter its use for cargos between the WLC and the ports. Even if built and used, rail service would have very little effect on reducing the traffic impacts of the WLC. Based on these considerations, rail service was not included in the design of the WLC and is not discussed further in this EIR.

4.15.3.4 Year 2022 Conditions

Note: The analysis of Year 2022 conditions in the original DEIR was based on different project characteristics (i.e., +1 million square feet of warehousing) and different phasing. Therefore, the previous Year 2022 has been removed in its entirety and replaced with the following updated analysis. The reader is referred to the original DEIR section for the previous Year 2022 analysis.

Levels of service are discussed below for year 2022. As noted above, Phase 1 of the proposed project will be completed in 2022 and includes 21,450,000 square feet of logistics warehouse uses. This is approximately 52 percent of the total project building space. The internal road system will be partially built out, with east-west through traffic served by the Cactus Avenue Extension and Streets C and E. Theodore Street would serve north-south traffic as it does today. As discussed previously, roadway projects that are either under construction or are funded and planned for implementation in the short-term (i.e., improvement projects on the FTIP and the RTP’s Financially Constrained Project list) and therefore reasonably assured of being constructed within the scenario timeframe were added.

**Final Programmatic Environmental Impact Report

World Logistics Center Project**

Year 2022 Without Project Levels of Service. An intersection level of service analysis was conducted to determine intersection performance under opening year 2022 cumulative conditions. Table 4.15.P summarizes the levels of service for opening year cumulative conditions at study area intersections. As shown on Table 4.15.P, the same 12 intersections that exceeded the City's LOS standards under Existing No Project Conditions also exceed the LOS standards under 2022 No Project conditions. In addition, 20 other intersections were forecast to operate at LOS D or worse. The intersections that were forecast to exceed the City's LOS standards under opening year 2022 cumulative conditions were:

- Redlands Boulevard/Locust Avenue (a.m. and p.m.);
- Redlands Boulevard/SR-60 Westbound ramps (a.m. and p.m.);
- Theodore Avenue/Fir Avenue (p.m.);
- Oliver Street/Alessandro Boulevard (a.m. and p.m.);
- Redlands Boulevard/Alessandro Boulevard (a.m.);
- Moreno Beach Drive/Ironwood Avenue (a.m.);
- Moreno Beach Drive/SR-60 Eastbound ramps (a.m.);
- Lasselle Street/Iris Avenue (p.m.);
- Krameria Avenue; Perris Boulevard (a.m. and p.m.);
- Lasselle Street/Cactus Avenue (a.m. and p.m.);
- Frederick Street/Alessandro Boulevard (p.m.);
- Graham Street/Alessandro Boulevard (p.m.);
- Perris Boulevard/Alessandro Boulevard (p.m.);
- Graham Street/Cactus Avenue (a.m. and p.m.);
- Alessandro Boulevard/Sycamore Canyon Boulevard (p.m.);
- I-215 Southbound ramps/Cactus Avenue (p.m.);
- Elsworth Street/Cactus Avenue (p.m.);
- Martin Luther King Boulevard/Canyon Crest Drive (a.m.);
- Martin Luther King Boulevard/I-215 Northbound ramps (a.m.);
- Arlington Avenue/Victoria Avenue (a.m. and p.m.);
- Alessandro Boulevard/Chicago Avenue (a.m. and p.m.);
- Ramona Expressway/Evans Road (a.m.);
- Evans Road/Rider Street (a.m.);
- Placentia Avenue/Perris Boulevard (p.m.);
- Gilman Springs Road/Bridge Street (a.m.);
- SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road (a.m. and p.m.);
- SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road (a.m. and p.m.);
- W. 6th Street/California Avenue (a.m. and p.m.);
- San Timoteo Canyon Road/Alessandro Road (a.m. and p.m.);

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- San Timoteo Canyon Road/Live Oak Canyon Road (a.m. and p.m.);
- Redlands Boulevard/San Timoteo Canyon Road (a.m. and p.m.); and
- W. Crescent Avenue/Alessandro Road (a.m. and p.m.).

136	W Sunset Dr/Alessandro Rd	C	AWS	10.9	B	11.1	B

Notes: "CSS" means cross-street is stop-controlled "AWS" means all-way stop

"Non-Existent" indicates that the intersection exists in some scenarios but not in the scenario being reported

denotes LOS exceeding the target threshold

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

The year 2022 without project roadway levels of service are based on daily V/C ratios for the study area roadway segments. Table 4.15.Q summarizes the results of this analysis and shows the following two study area roadway segments are projected to operate with unsatisfactory daily V/C ratios under year 2022 without project conditions. These same roadway segments also operate with unsatisfactory LOS in the existing condition:

- Gilman Springs Road:
 - Between Alessandro Boulevard and Bridge Street; and
 - Between SR-60 and Alessandro Boulevard.

A freeway segment level of service analysis was conducted to determine freeway performance under year 2022 conditions. Table 4.15.R summarizes the levels of service at study area segments under year 2022 no project conditions. As shown in Table 4.15.R, the following 33 study freeway segments are forecast to operate at an unsatisfactory level of service during either the a.m. or p.m. peak hour:

- Northbound or Eastbound:
 - SR-60 Reservoir Street to Ramona Avenue (p.m.);
 - SR-60 Ramona Avenue to Central Avenue (p.m.);
 - SR-60 Central Avenue to Mountain Avenue (p.m.);
 - SR-60 Euclid Avenue to Grove Avenue (p.m.);
 - SR-60 Grove Avenue to Vineyard Avenue (p.m.);
 - SR-60 Vineyard Avenue to Archibald Avenue (p.m.);
 - SR-60 Valley Way to Rubidoux Boulevard (p.m.);
 - SR-60 Rubidoux Boulevard to Market Street (a.m.);
 - SR-60 Market Street to Main Street (p.m.);
 - SR-60 Martin Luther King Boulevard to Central Avenue (a.m. and p.m.);
 - SR-60 Pigeon Pass Road/Frederick Street to Heacock Street (p.m.);
 - SR-60 Heacock Street to Perris Boulevard (p.m.);
 - SR-91 I-15 to McKinley Street (p.m.);
 - SR-91 Pierce Street to Magnolia Avenue (p.m.)
 - I-215 La Cadena Drive to Barton Road (p.m.); and
 - I-215 Barton Road to Mt. Vernon Avenue (a.m. and p.m.).

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways

** Section is the number of lanes, with "U" for "undivided" and "D" for "divided" roadways

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

Indicates LOS exceeds the target level

- Southbound and Westbound:
 - SR-60 Reservoir Street to Ramona Avenue (a.m.);
 - SR-60 Ramona Avenue to Central Avenue (a.m.);
 - SR-60 Grove Avenue to Vineyard Avenue (p.m.);
 - SR-60 Valley Way to Rubidoux Boulevard (p.m.);
 - SR-60 Market Street to Main Street (a.m. and p.m.);
 - SR-60 Main Street to SR-91 (p.m.);
 - SR-60 Fair Isle Drive/Box Springs Road to I-215 (a.m. and p.m.);
 - SR-60 I-215 to Day Street (a.m.);
 - SR-91 McKinley Street to Pierce Street (p.m.);
 - SR-91 Pierce Street to Magnolia Avenue (p.m.);
 - SR-91 Magnolia Avenue to La Sierra Avenue (p.m.);
 - SR-91 La Sierra Avenue to Tyler Street (p.m.);
 - I-215 Columbia Avenue to Center Street (a.m.);
 - I-215 Center Street to Iowa Avenue/La Cadena Drive (a.m.);
 - I-215 Iowa Avenue/La Cadena Drive to Barton Road (a.m.); and
 - I-215 Barton Road to Mt. Vernon Avenue (a.m.).

A freeway weaving analysis was conducted on freeway segments where an on-ramp is closely followed by an off-ramp, and the two are joined by an auxiliary lane. Table 4.15.S summarizes the levels of service at weaving segments under opening year cumulative conditions. As shown on Table 4.15.S, the following six northbound or eastbound sections and one southbound or westbound sections are forecast to operate at unsatisfactory levels of service in either the a.m. peak or p.m. peak hour:

- Northbound or Eastbound:
 - SR-60 SR-71/ Garey Avenue to Reservoir Street (p.m.);
 - SR-60 Main Street to SR-91 (a.m. and p.m.);
 - SR-60 SR-91 to Blaine Street/3rd Street (p.m.);
 - SR-60 Central Avenue to Fair Isle Drive/Box Springs Road (p.m.);
 - SR-91 Arlington Avenue to Central Avenue (a.m.); and
 - I-215 SR-60 to Columbia Avenue (a.m. and p.m.).
- Southbound or Westbound:
 - SR-60 SR-91 to Blaine Street/3rd Street (p.m.).

Freeway ramp merge and diverge operations have been evaluated for year 2022 conditions. Table 4.15.T summarizes the levels of service under year 2022 no project conditions and shows the following three freeway ramp junction is forecast to operate at unsatisfactory levels of service in either the a.m. peak or p.m. peak hour:

- SR-60 eastbound On-Ramp from Central Avenue (p.m.).

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

4.15.3.5 Year 2035 Cumulative without the Project

Note: Due to a change in project conditions and phasing, the Year 2035 analysis was completely revised in the updated TIA and this DEIR section. The reader is referred to the original DEIR section for that analysis and related tables and figures.

An intersection level of service analysis was conducted to determine intersection performance under Year 2035 Cumulative without project conditions. For the 2035 scenarios, the roadway projects from the FTIP and RTP included in the year 2022 network were also included in the 2035 network. The future circulation network from the City of Moreno Valley General Plan was also incorporated into the year 2035 network that are funded through the City's Development Impact Fee (DIF), Western Riverside Council of Governments' Transportation Uniform Mitigation Fee (TUMF), and improvements made directly by developers. It is reasonable to assume that these improvements will be in place parallel with buildout of the General Plan land uses, because most of the improvements will be funded through fees on the new developments. If other sites do not fully build out per the General Plan, then the LOS on the study streets and intersection would likely be better than shown in the TIA. Table 4.15.U summarizes the levels of service at study intersections under Year 2035 Cumulative without project conditions.

Table 4.15.U summarizes the levels of service at study intersections under Year 2035 Cumulative without project conditions and shows the following 36 study intersections are forecast to operate at an unsatisfactory level of service during either the a.m. or p.m. peak hour:

- Theodore Street/Ironwood Avenue (p.m.);
- Theodore Street/SR-60 Westbound ramps (a.m. and p.m.);
- Theodore Street/SR-60 Eastbound ramps (p.m.);
- Theodore Avenue/Fir (Eucalyptus) Avenue (p.m.);
- Redlands Boulevard/Alessandro Boulevard (a.m. and p.m.);
- Moreno Beach Drive/Locust Avenue (a.m. and p.m.);
- Moreno Beach Drive/SR-60 Eastbound Ramps (a.m. and p.m.);
- Iris Avenue/Perris Boulevard (a.m. and p.m.);
- Kitching Street/Iris Avenue (a.m. and p.m.);
- Lasselle Street/Iris Avenue (p.m.);
- Lasselle Street/Cactus Avenue (a.m.);
- Graham Street/Alessandro Boulevard (p.m.);
- Indian Street/Cactus Avenue (p.m.);
- Alessandro Boulevard/Sycamore Canyon Boulevard (p.m.);
- I-215 Southbound Ramps/Cactus Avenue (p.m.);
- I-215 Northbound Ramps/Cactus Avenue (a.m. and p.m.);
- Elsworth Street/Cactus Avenue (a.m. and p.m.);
- Central Avenue/Lochmoor Drive (p.m.);
- Alessandro Boulevard/Mission Grove Parkway (p.m.);
- Martin Luther King Boulevard/I-215 Northbound Ramps (a.m.);

- Redlands Boulevard/San Timoteo Canyon Road (a.m. and p.m.).

Year 2035 Cumulative without project roadway levels of service are based on daily V/C ratios for the study area roadway segments. Table 4.15.V summarizes the results of this analysis. In this scenario, Gilman Springs Road and Redlands Boulevard are assumed to have been widened in accordance with General Plan policy to six and four lanes, respectively. As shown in Table 4.15.V, all study area roadway segments are projected to operate at acceptable daily V/C ratios under Year 2035 Cumulative without project conditions.

A freeway segment level of service analysis was conducted to determine freeway performance under Year 2035 Cumulative without project conditions. Table 4.15.W summarizes the levels of service at study area freeway mainline segments under Year 2035 Cumulative without project conditions and

shows the following 56 study segments are forecast to operate at an unsatisfactory level of service during either the a.m. or p.m. peak hour:

- Northbound or Eastbound:
 - SR-60 Reservoir Street to Ramona Avenue (a.m. and p.m.);
 - SR-60 Ramona Avenue to Central Avenue (a.m. and p.m.);
 - SR-60 Central Avenue to Mountain Avenue (a.m. and p.m.);
 - SR-60 Mountain Avenue to Euclid Avenue (a.m.);
 - SR-60 Euclid Avenue to Grove Avenue (a.m. and p.m.);
 - SR-60 Grove Avenue to Vineyard Avenue (a.m. and p.m.);
 - SR-60 Vineyard Avenue to Archibald Avenue (a.m. and p.m.);
 - SR-60 Archibald Avenue to Haven Avenue (a.m.);
 - SR-60 Valley Way to Rubidoux Boulevard (a.m.);
 - SR-60 Rubidoux Boulevard to Market Street (a.m.);
 - SR-60 Market Street to Main Street (a.m. and p.m.);
 - SR-60 Martin Luther King Boulevard to Central Avenue (a.m. and p.m.);
 - SR-60 Pigeon Pass Road/Frederick Street to Heacock Street (p.m.);
 - SR-60 Heacock Street to Perris Boulevard (p.m.);
 - SR-60 Redlands Boulevard to Theodore Street (p.m.);
 - SR-60 Gilman Springs Road to Jack Rabbit Trail (p.m.);
 - SR-91 I-15 to McKinley Street (p.m.);
 - SR-91 Pierce Street to Magnolia Avenue (a.m. and p.m.);
 - SR-91 La Sierra Avenue to Tyler Street (a.m. and p.m.);
 - SR-91 Adam Street to Madison Street (a.m.);
 - SR-91 Central Avenue to 14th Street (a.m.);
 - I-10 SR-60 to Beaumont Avenue (p.m.);
 - I-10 Beaumont Avenue to Pennsylvania Avenue (p.m.);
 - I-10 Pennsylvania Avenue to Highland Springs (p.m.);
 - I-10 Highland Springs Avenue to Sunset Avenue (p.m.);
 - I-10 S. Hargrave Street to Field Road (p.m.);
 - I-10 Morongo Trail to Main Street (p.m.);
 - I-215 Scott Road to Newport Road (p.m.);
 - I-215 SR-74 to Redlands Boulevard (p.m.); and

4.15.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, the proposed project would create potentially significant traffic impacts if it would:

- Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways, and freeways, pedestrian and bicycle paths, and mass transit.
- Cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp. A significant cumulative traffic impact would occur if the project contributes traffic toward those facilities operating at unsatisfactory LOS in the without project condition. The adopted LOS standards are as follows:
 - Roadway segments and intersections: LOS C; and LOS D as outlined in previously referenced Table 4.15.E.
 - Freeway mainline: LOS D.
 - Freeway Ramp Merge/Diverge: LOS D.
- Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.
- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location, which results in substantial safety risks.
- Substantially increase hazards to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- Result in inadequate emergency access.
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

The Moreno Valley General Plan Circulation Element, adopted July 2006, defines a preferred performance standard of LOS C (where feasible) for City roads (including intersections). However, the circulation element also allows peak hour levels of service in the LOS D range at certain locations. These locations include areas of high employment concentration or north/south roads in the vicinity of the SR-60. Therefore, if a roadway segment or intersection is projected to operate at an acceptable level of service (i.e., LOS C/D or better) without the project, and the project is expected to cause the intersection to operate at an unacceptable level of service, the project impact is considered significant.

The study area includes intersections and roadways in six cities besides Moreno Valley. Table 4.15.Z shows the various level of service standards for intersections within each jurisdiction. A project's impact on an intersection is considered significant if it causes the LOS to exceed the target level set by the jurisdiction or, if the LOS in the no project condition already exceeds the LOS level, if the project causes an increase in traffic delay beyond the no project condition.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 4.15.Z: Intersection LOS Standards by Jurisdiction

Jurisdiction	Type of Facility	# of Study Intersections	LOS Standard
Moreno Valley	Intersections adjacent to freeways or employment centers	57	D
	All other intersections	14	C
Beaumont	Most intersections	2	C
	Intersections with major highways	2	D
Perris	Intersections with SR-74, Ramona Expr, or I-215	5	E
	Expressway/arterial intersections	10	D
	All other intersections	6	C
Redlands	Intersections currently operating at "D" or worse	1	Existing LOS
	All other intersections	2	C
Riverside (County)	Most intersections*	7	C
	Intersections with Ramona Expressway	2	D
Riverside (City)	Intersections of collectors or higher roads	27	D
San Jacinto	Arterial intersections	1	D
Caltrans	State highway facilities currently operating at LOS "E" or "F"		Existing Density
	State highway facilities		D

* Intersections between arterials, highways, expressways, and freeway ramps within community development areas are allowed LOS "D" as an exception.

Source: Table 12, Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

All freeway mainline segments and freeway ramps are under the jurisdiction of Caltrans. LOS D has been established by Caltrans as the operating standard for freeway mainline segments and freeway ramps. Therefore, if a freeway segment is projected to operate at an acceptable level of service (i.e., LOS D or better) without the project, and the project is expected to cause the facility to operate at an unacceptable level of service (i.e., LOS E or F), the impact is considered significant. Previously referenced Table 4.15.E shows level of service criteria for freeway segments and ramps.

4.15.5 Less than Significant Impacts

Air traffic patterns, design hazard features, emergency access, and alternative transportation policies, plans, or programs are considered to have either no impact or less than significant impacts.

4.15.5.1 Air Traffic Patterns

Threshold	Would the proposed project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?
-----------	---

Airport facilities within the vicinity of the project site include the March Air Field, which is part of the March Air Reserve Base (MARB). The MARB encompasses approximately 6,500 acres of the Air Force Reserve's 452nd Air Mobility Wing, which provides host base support for numerous tenant active military units. It is also the home of 4th Air Force and multiple units of the California Air National

Guard. When March Air Force Base (March AFB) was converted from an active duty base to a Reserve Base in 1996, the decision resulted in approximately 4,400 acres of property and facilities being declared surplus and available for disposal actions, as well as joint use of the airfield. With the realignment of March AFB, the MARB Redevelopment Project Area was established. The MARB Redevelopment Project Area includes the entire 6,500-acre former active duty base area, and approximately 450 acres adjacent to the base in the industrial area of the City of Moreno Valley.

To implement the MARB Redevelopment Project Area and to facilitate the transition of a portion of the MARB from military to civilian uses, the March Joint Powers Authority, (March JPA) consisting of the County of Riverside and the Cities of Moreno Valley, Perris, and Riverside, was formed. The March JPA along with the U.S. Air Force pursued the establishment of March Air Field as a joint use airport.

The Air Force defines a "joint use airport" as one where the facilities which are owned and operated by the Air Force are made available for use by civil aviation. A joint use agreement between these parties was executed May 7, 1997, along with land leases for over 300 acres as the civilian airport name MIP. Under the agreement, the civilian (March JPA) and the military (AFRC) entities share essential aviation facilities such as the control towers and runways, as well as maintenance of facilities, under this joint use arrangement. Under the provisions of the Joint Use Agreement, the MIP is the civilian facility that is managed and operated by the MIP Airport Authority (MIPAA). The MIP includes air cargo operations such as the March Global Port, a 350-acre commercial air cargo and distribution center.

The Department of the Defense (Air Force) completed an Air Installation Compatible Use Zone (AICUZ) study for MARB in 1998. The AICUZ study was designed and is intended to aid in the development of compatible land uses in non-government areas surrounding military airfields to protect public safety and health. The study established three zones based on potential crash patterns: a Clear Zone and two Accident Potential Zones (APZs). The Clear Zone reaches from along the extended runway centerline to a distance of 3,000 feet, APZ 1 extends from 3,000 feet to 8,000 feet, and APZ II extends from 8,000 feet to 15,000 feet. According to the AICUZ, outside of the Clear Zone and APZs "the risk of aircraft accidents is not significant enough to warrant special consideration in land use planning." The proposed project site is not located within a Clear Zone, APZ 1, or APZ 2 for MARB as designated by the Air Force 2005 AICUZ Study. In addition to the AICUZ, Airport Influence Area boundaries around MARB have been adopted by County of Riverside Airport Land Use Commission (ALUC) in its Airport Land Use Plan (ALUP). The proposed project site is located within Influence Area III.

The project site is approximately 1.5 miles east of the March Air Field and is entirely within Airport Influence Area III of the MIP. As part of the standard process for development within Airport Influence Areas for MARB, proposed projects are required to be reviewed by the ALUC for consistency with the ALUP. As a standard condition imposed during ALUC reviews, development located within the boundaries of Influence Area III is required to provide navigation easements. Development that is allowed to occur within Airport Influence III of the MIP would not include any features that would alter air traffic patterns or the level of air traffic at the MIP; therefore, a less than significant air safety impact would occur and no mitigation is required.

4.15.5.2 Design Hazard Features

NOTE: The following changes have been made in response to: Comment E-3-13 in Letter E-3 from the Moreno Valley Unified School District; Comment F-11-36 in Letter F-11 from the Sierra Club, San Geronio Chapter; and Comment G-96-4 in Letter G-96 from Margie Breikreuz.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Threshold	Would the proposed project substantially increase hazards due to a design feature or incompatible use?
-----------	--

The design of roadways must provide adequate sight distance and traffic control measures. This provision is normally realized through roadway design to facilitate roadway traffic flows. Roadway improvements in and around the project site would be designed and constructed to satisfy all City and Caltrans requirements for street widths, corner radii, intersection control as well as incorporate design standards tailored specifically to project access requirements. Adherence to applicable City requirements would ensure the proposed project would not include any sharp curves or dangerous intersections.

During the project review process, City staff expressed a concern about the intersection of D Street and the eastern end of Cactus Avenue, east of Redlands Boulevard. Early designs showed it as a skewed “T” intersection, but the Specific Plan now shows it extending further west through the Open Space area, then turning north and connecting to Alessandro Boulevard. With this design change, no significant road design hazards are expected.

Temporary impacts associated with the construction of infrastructure improvements included as a part this project may temporarily restrict vehicular traffic or cause temporary hazards. The construction of infrastructure would coincide with roadway improvements, which would include road or lane closures as well as the presence of construction workers and equipment on public roads. Construction operations would be required to implement adequate measures to facilitate the passage of people and vehicles through/around any required road or lane closures. Site-specific activities, such as temporary construction activities, are finalized on a project-by-project basis by the City and are required to ensure adequate traffic flow. At the time of approval of any site-specific plans required for the construction of infrastructure as a part of typical conditions of approval, the project would be required to implement measures that would maintain traffic flow and access. In the absence of a roadway design hazard, no impact would occur; therefore, no mitigation is required.

An analysis of safety impacts resulting from potential conflicts between project traffic and local schools was performed for this EIR. As identified in the project TIA (Appendix L-1 of this EIR), the project would not produce a significant safety risk and appropriate safety features are already present on roads near local schools. Other than Perris Boulevard, which would experience a small number of project trucks (22 and 25 medium and heavy duty trucks in the a.m. and p.m. peak hours, respectively), none of the other truck routes would result in project trucks traveling near local schools. The safety impact of project-related passenger cars along streets near local schools was also evaluated by reviewing existing pedestrian facilities and collecting pedestrian counts at the intersections along project truck routes. All pedestrian crossings at signalized intersections near schools are protected. Crosswalks near schools are striped in yellow (per the California Manual on Traffic Control Devices page 1,282). In most cases, sidewalks exist along roadways and lead to the striped, protected crosswalks at the intersections. Intersection and roadway features along project truck routes were reviewed and it was determined that adequate pedestrian amenities already exist in the form of protected crossings, crosswalks, curb ramps, and pedestrian signals. For these reasons, project passenger cars and trucks would not create unsafe conflicts with pedestrians.

In addition, the new proposed high school #5 was analyzed in a technical memorandum (Tech Memo on High School #5, July 2014, Revised DEIR Appendix L). It was determined that if both the proposed school and the proposed WLCSP were approved the mitigation measures proposed in the DEIR would reduce all potential impacts to less than significant levels.

4.15.5.3 Emergency Access

Threshold	Would the proposed project result in inadequate emergency access?
-----------	---

Construction activities that may temporarily restrict vehicular traffic would be required to implement adequate measures to facilitate the passage of people and vehicles through/around any required road closures. Site-specific activities such as temporary construction activities are finalized on a project-by-project basis by the City and are required to ensure adequate emergency access.

The roadway improvements that will take place as a part of this project will improve the traffic circulation in the area. For example, emergency vehicles that currently pass through the site using either Theodore Street or Alessandro Boulevard would continue to have those routes available to them, and these roads will be upgraded to arterial standards within the proposed project limits. Access to Alessandro Boulevard would be provided by a connection to Redlands Boulevard at Cactus Avenue instead, of a direct extension to Alessandro Boulevard. The change would not lengthen the distance between Gilman Springs Road and the Riverside Community Regional Medical Center on Cactus Avenue or the route to and from the Kaiser Moreno Valley Community Hospital on Iris Avenue. The extension of Eucalyptus Avenue through the project area would improve access between the project site and the nearest existing fire station (the Moreno Beach fire station). As a condition of approval, the proposed project will also be required to construct a fire station on site.

These improvements would enhance the ability of emergency vehicles to access the project as well as the surrounding properties. Access to the project site is designed to accommodate large trucks with trailers used for the distribution of goods to and from the warehouses. This would provide ample vehicular access for emergency vehicles. During the operational phase of the proposed project, on-site access would be required to comply with standards established by the City Public Works Department. The size and location of fire suppression facilities (e.g., hydrants) and fire access routes would be required to conform to Fire Department standards. As required of all development in the City, the operation of the proposed project would conform to applicable Uniform Fire Code standards. The submittal of such plans would be considered a condition of approval, which would be part of the permitting process initiated by the applicant and approved by the City in accordance with City standards. As with any development, access to and through the project would be required to comply with the required street widths, as determined in the California Building Code (CBC), Master Plan of Streets, and the Uniform Fire Code. Therefore, implementation of the proposed project would not significantly impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; therefore, no mitigation is required.

4.15.5.4 Alternative Transportation Policies, Plans, or Programs

Threshold	Would the proposed project conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?
-----------	--

The proposed project would result in the development of employment opportunities and would therefore reduce vehicle miles traveled. Currently, approximately 70 percent of workers residing in the City of Moreno Valley commute to jobs outside the City. According to the U.S. Census Bureau, 21.7 percent of Moreno Valley workers commute more than 50 miles one-way to work, and another 20.8 percent drive 25 to 50 miles one way. Nearly four out of five Moreno Valley workers drive to work alone. The City is in need of employment opportunities to serve City and regional residents. A better jobs/housing balance results in shorter commute times, reduced vehicle miles traveled, and reduced traffic congestion. Locating jobs in areas such as the City is a public policy prerogative of the City, regional governmental entities such as SCAG, and the State of California as manifested by recent legislation such as SB 375. The project is consistent with these policies because it will provide

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

approximately 20,000¹ new jobs; nearly doubling the number of jobs in Moreno Valley. As a result, the percentage of Moreno Valley residents that need to commute regionally would be reduced.

An updated Housing Element, adopted by the City in February 2011, identified the Moreno Highlands area as a potential location for future jobs-producing land uses. In April 2011, the City adopted its Economic Development Action Plan, which identified eastern Moreno Valley as a potential area for major job-producing land uses. The proposed World Logistics Center project is consistent with this planning objective, as it provides a comprehensive plan for jobs-producing land uses.

The WLC Specific Plan provides for Class II bicycle lanes on all project streets (see WLCSP Section 3.4.3 and WLCSP Figure 3-18). In addition, WLCSP Section 6.0, Sustainability, Item 2 indicates showers and changing rooms will be available which will facilitate people using bicycles to get to and from work.

As stated previously, the proposed project would generate jobs for approximately 20,000 employees working in the eastern portion of the City that would help reduce the number of workers driving long commutes to distant jobsites, primarily to the west and southwest. This finding is supported by the results of the RivTAM traffic model projections used in the TIA. The provision of additional employment options in proximity to existing residential development in the City will help reduce local vehicle miles traveled as the employment generated by the project slowly improves the City's job/housing ratio, and more local jobs are created for City residents. Therefore, the proposed project is consistent with City policies encouraging alternative transportation. Since the project will not create any significant impacts related to non-vehicular transportation, no mitigation is required.

Although there is currently no transit service in the project area, the proposed project would be designed to accommodate bus access on all project streets. Bus turnouts and shelters would be provided at all active bus stops. It is expected that transit service would be provided once the project reaches a transit-supportable level of operations. Candidate streets for future bus routes within the project limits are Eucalyptus Avenue, Street C, Street E, and Street F as shown in WLCSP Figure 3-14.

The WLCSP provides for connections to existing trails to the west along Redlands Boulevard, and to the southwest along Cactus Avenue. In addition, the plan provides for a new trail connection from the southwest corner of the site around the land designated as open space under the WLCSP, to connect to a future planned "trailhead" at the northwest corner of the state-owned property to the south. The WLCSP also includes a "loop" trail segment through the WLCSP along Street F to Eucalyptus Avenue and back to Redlands Boulevard (see EIR Figure 3-12, *Non-Vehicular Circulation*). In addition, the project will be conditioned to provide sidewalks and landscaping treatments to allow for pedestrian access throughout the site. With these planned improvements, the WLCSP will have less than significant impacts regarding non-vehicular circulation and no mitigation is required.

4.15.6 Significant Impacts

The following potential impacts were determined to be significant, either because the project would contribute to an intersection, roadway segment or freeway facility already exceeding the LOS threshold, or because the project would cause the intersection, roadway segment or freeway to exceed the LOS threshold. The project would be required to make required on-site and adjacent off-site improvements, contribute to local and regional circulation improvement through the payment of the DIFs and TUMFs, and would therefore contribute to improvements that may mitigate the direct

¹ Based on a ratio of 0.5 employees per 1000 square feet of logistics. This ratio is taken from: *DTA Public Works Database; confirmed by "Employment Density Study," SCAG (2001), and "Logistics Trends and Specific Industries," NAIOP Research Foundation (March 2010). San Bernardino Planning Department.*

project impact or cumulative impact of the project. Mitigation of direct project impacts can be in the form of improvements to the intersection, or payment of the fees if projects funded by the fee would mitigate the project impact to a less than significant level.

Planned Improvements. As part of the analysis of project traffic impacts, it is important to note that development within the WLCSP will make a number of roadway and intersection improvements that are within or adjacent to project property (i.e., on-site improvements). These improvements include:

- Gilman Springs/Alessandro Boulevard Intersection;
- Gilman Springs/Eucalyptus Avenue Intersection;
- SR-60 Westbound Ramp/Theodore Street Intersection;
- SR-60 Eastbound Ramp/Theodore Street Intersection;
- Redlands Boulevard/Eucalyptus Avenue Intersection;
- Theodore Street/Eucalyptus Avenue Intersection;
- Theodore Street (Street A)/Alessandro Boulevard (Streets C and E) Roundabout;
- Theodore Street (Street A)/Streets E and F Roundabout;
- Street F/Street C Roundabout;
- Eucalyptus Avenue from Redlands Boulevard to Theodore Street (south side); and
- Cactus Avenue Extension from the existing Redlands Boulevard/Cactus Avenue intersection to internal loop Street "E".
- Internal Streets A, B, C, E, and F shown on WLCSP Circulation Plan (EIR Figure 3-10).

4.15.6.1 Existing (2012) With Phase 1 Conditions Traffic and Level of Service

Threshold:	<p>Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways, and freeways, pedestrian and bicycle paths, and mass transit.</p> <p>A significant project-specific traffic impact would occur if the project would cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp. A significant cumulative traffic impact would occur if the project contributes traffic toward those facilities operating at unsatisfactory LOS in the pre-project condition. The adopted LOS standards are as follows:</p> <ul style="list-style-type: none">• Roadway segments: LOS C and LOS D as outlined in previously referenced Tables 4.15.B and 4.15.C.• Intersections: LOS C and LOS D as outlined in previously referenced Table 4.15.Z.• Freeway mainline: LOS D.• Freeway Ramp Merge/Diverge: LOS D.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Impacts

Intersection Analysis. Existing baseline (year 2012) with Phase 1 intersection levels of service for the study area intersections are summarized in Tables 4.15.AA-1 and 4.15.AA-2, which shows there are 15 study intersections where Phase 1 of the project would have a significant impact. Twelve of these intersections already exceed the threshold of significance under existing conditions and would therefore be considered cumulative impacts and mitigation is required. Phase 1 of the project would cause a direct project impact at the other three intersections and mitigation is required.

Phase 1 of the project would worsen the existing LOS deficiency at the following 12 intersections under existing with Phase 1 conditions:

- Redlands Boulevard/Locust Avenue;
- Redlands Boulevard/SR-60 Westbound Ramps;
- Oliver Street/Alessandro Boulevard;
- Lasselle Street/Cactus Avenue;
- Gilman Springs Road/Bridge Street;
- SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road;
- SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road;
- San Timoteo Canyon Road/Alessandro Boulevard;
- San Timoteo Canyon Road/Live Oak Canyon Road;
- Redlands Boulevard/San Timoteo Canyon Road;
- Moreno Beach Drive/SR-60 EB Ramps; and
- Alessandro Boulevard/Chicago Avenue.

A project-specific significant impact would occur at the following three intersections under existing with Phase 1 conditions:

- Redlands Boulevard/Cactus Avenue;
- Arlington Avenue/Victoria Avenue; and
- Moreno Beach Drive/John Kennedy Drive.

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

Roadway Analysis. Existing baseline (year 2012) with Phase 1 roadway segment levels of service for the study area are summarized in Table 4.15.AB, which shows two roadway segments would operate at unsatisfactory levels of service. Phase 1 of the project would contribute toward the worsening of an already unsatisfactory LOS at the two roadway segments and, therefore, have a significant cumulative impact at these locations.

Phase 1 of the project would worsen the existing LOS deficiency at the following two roadway segments under existing with Phase 1 conditions:

- Gilman Springs Road between Alessandro Boulevard and Bridge Street; and
- Gilman Springs Road between SR-60 and Alessandro Boulevard.

Freeway Segment Analysis. Existing (2012) with Phase 1 freeway segment levels of service for the study area are summarized in Tables 4.15.AC-1 and 4.15.AC-2, which show seventeen freeway segments already operate at unsatisfactory levels of service. Phase 1 of the project would contribute toward the worsening of an already unsatisfactory LOS at sixteen locations and, therefore, have a cumulative impact at these locations and mitigation is required. Phase 1 of the project would create a significant impact and mitigation is required at the other location, since the project would decrease the LOS from satisfactory to unsatisfactory.

Phase 1 of the project would worsen the existing LOS deficiency at the following sixteen freeway segments under existing with Phase 1 conditions:

Northbound or Eastbound Sections (Table 4.15.AC-1):

- SR-60 Ramona Avenue to Central Avenue;
- SR-60 Central Avenue to Mountain Avenue;
- SR-60 Euclid Avenue to Grove Avenue;
- SR-60 Grove Avenue to Vineyard Avenue;
- SR-60 Vineyard Avenue to Archibald Avenue;
- SR-60 Market Street to Main Street;
- SR-60 Martin Luther King Boulevard to Central Avenue;
- SR-91 I-15 to McKinley Street;
- I-215 SR-74 to Redlands Avenue.
- Southbound or Westbound Sections (Table 4.15.AC-2):
 - SR-60 Reservoir Street to Ramona Avenue;
 - SR-60 Ramona Avenue to Central Avenue
 - SR-60 I-215 to Day Street;
 - SR-91 Pierce Street to Magnolia Avenue;
 - SR-91 Magnolia Avenue to La Sierra Avenue;
 - I-215 SR-74 to Redlands Avenue; and
 - I-215 Baseline Road to Highland Avenue.

A direct significant project impact would occur at the following one freeway segment under existing with Phase 1 conditions (Table 4.15.AC-1):

- Northbound or Eastbound Sections:
 - SR-91 Central Avenue to 14th Street.

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

█ Indicates LOS exceeds the target level

World Logistics Center Project**

Freeway Weaving Analysis. Existing (2012) with Phase 1 freeway weaving segment levels of service for the study area are summarized in Table 4.15.AD, which shows that six freeway weaving segments would operate at unsatisfactory levels of service. Phase 1 of the project would contribute toward the worsening of an already unsatisfactory LOS at these six freeway weaving segments and, therefore, would have a cumulative impact at these locations.

Phase 1 of the project would worsen the existing LOS deficiency at the following six freeway weaving segments under existing with Phase 1 conditions:

- Northbound or Eastbound:
 - SR-60 SR-71/S. Garey Avenue to S. Reservoir Road; SR-60 SR-91 to W. Blaine St/3rd Street;
 - SR-60 Blaine Street/3rd Street to University Avenue; and
 - SR-91 Arlington Avenue to Central Avenue.
- Southbound or Westbound:
 - SR-60 Central Avenue to Fair Isle Drive/Box Springs Road; and
 - SR-91 14th Street to University Avenue.

Indicates that the LOS exceeds the target level

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

Freeway Ramp Analysis. Existing (2012) with Phase 1 freeway ramp levels of service for the study area are summarized in Table 4.15.AE, which shows the SR-60 eastbound on-ramp from Central Avenue currently operates at LOS F in the p.m. peak hour and would also operate at LOS F under Existing Plus Phase 1 conditions, but with a higher traffic density. This would be considered a significant cumulative impact.

4.15.6.2 Year 2017 With Project Conditions Traffic and Level of Service Impacts

Note: This scenario was evaluated in the original Draft EIR but project phasing has changed since that time, so it is not included in this version of the Draft EIR. The reader is referred to the original Draft EIR to review this previous analysis.

The following analysis was added in response to comments based on revisions to the project Traffic Impact Assessment (TIA) and the phasing of the proposed WLC Specific Plan. It has been prepared to address issues raised by other CEQA court cases that required an EIR to show the traffic impacts of developing the entire proposed project at the time of baseline or existing conditions. The following provides that analysis.

THIS PAGE INTENTIONALLY LEFT BLANK

4.15.6.2 Existing (2012) With Project (Buildout) Conditions Traffic and Level of Service

Threshold:	<p>Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways, and freeways, pedestrian and bicycle paths, and mass transit.</p> <p>A significant project-specific traffic impact would occur if the project would cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp. A significant cumulative traffic impact would occur if the project contributes traffic toward those facilities operating at unsatisfactory LOS in the pre-project condition. The adopted LOS standards are as follows:</p> <ul style="list-style-type: none">• Roadway segments: LOS C and LOS D as outlined in previously referenced Tables 4.15.B and 4.15.C.• Intersections: LOS C and LOS D as outlined in previously referenced Table 4.15.Z.• Freeway mainline: LOS D.• Freeway Ramp Merge/Diverge: LOS D.
-------------------	---

Impacts

Intersection Analysis. Existing baseline (2012) with project buildout intersection levels of service for the study area intersections are summarized in Table 4.15.AF-1 and 4.15.AF-2, which shows there are 17 study intersections where the project would contribute to a significant impact and mitigation is required. Twelve of these intersections already exceed the threshold of significance under existing conditions and would therefore be considered cumulative impacts. The project would cause a direct project impact at another five intersections.

The project would worsen the existing LOS deficiency at the following 12 intersections under existing with project conditions:

- Redlands Boulevard/Locust Avenue;
- Redlands Boulevard/SR-60 Westbound Ramps;
- Oliver Street/Alessandro Boulevard;
- Moreno Beach Drive/SR-60 Eastbound Ramps;
- Lasselle Street/Cactus Avenue;
- Alessandro Boulevard/Chicago Avenue;
- Gilman Springs Road/Bridge Street;
- SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road;
- SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road;
- San Timoteo Canyon Road/Alessandro Road;
- San Timoteo Canyon Road/Live Oak Canyon Road; and
- Redlands Boulevard/San Timoteo Canyon Road.

denotes LOS exceeding the target threshold

Notes: "CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

"LT" and "RT" denote left turn and right turn respectively

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

A project-specific significant impact would occur at the following 5 intersections under existing with project conditions:

- Redlands Boulevard/Cactus Avenue;
- Moreno Beach Drive/John Kennedy Drive;
- Moreno Beach Drive/Ironwood Avenue;
- Arlington Avenue/Victoria Avenue; and
- Bridge Street/Ramona Expressway.

Roadway Analysis. Existing baseline (year 2012) with project roadway segment levels of service for the study area are summarized in Table 4.15.AG, which shows three roadway segments would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at two roadway segments and, therefore, have a significant cumulative impact at these locations and mitigation is required. At one roadway segment, the project would create a significant impact since the project would decrease the LOS from satisfactory to unsatisfactory conditions and mitigation is required.

The project would worsen the existing LOS deficiency at the following two roadway segments under existing with project conditions:

- Gilman Springs Road between Alessandro Boulevard and Bridge Street; and
- Gilman Springs Road between SR-60 and Alessandro Boulevard.

A project-specific significant impact would occur at the following roadway segment under existing with project conditions:

- Cactus Avenue Redlands Boulevard to Street D.

Freeway Segment Analysis. Existing (2012) with project freeway segment levels of service for the study area are summarized in Table 4.15.AH, which shows 10 freeway segments would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at eight locations and, therefore, have a cumulative impact at these locations. At two freeway segments, the project would create a significant impact since the project would decrease the LOS from satisfactory to unsatisfactory.

The project would worsen the existing LOS deficiency at the following eight freeway segments under existing with project conditions:

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

█ Indicates LOS exceeds the target level

Indicates that the LOS exceeds the target level

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

Northbound or Eastbound Sections:

- SR-60 Euclid Avenue to Grove Avenue;
- SR-60 Martin Luther King Boulevard to Central Avenue; and
- I-215 SR-74/Case Road to Redlands Avenue;
- Southbound or Westbound Sections:
 - SR-60 I-215 to Day Street;
 - SR-91 Pierce Street to Magnolia Avenue;
 - SR-91 Magnolia Avenue to La Sierra Avenue;
 - I-215 SR-74/Case Road to Redlands Avenue; and
 - I-215 Baseline Road to Highland Avenue/SR-210.

A significant direct project impact would occur at the following two freeway segments under existing with project conditions:

- Northbound or Eastbound Sections:
 - SR-91 Central Avenue to 14th Street.
- Southbound and Westbound Sections:
 - SR-60 Pigeon Pass Road/Frederick Street to Heacock Street.

Freeway Weaving Analysis. Existing (2012) with project freeway weaving segment levels of service for the study area are summarized in Table 4.15.A1, which shows six freeway weaving segments would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at five freeway weaving segments and, therefore, have a cumulative impact at these locations. At the other freeway weaving segment, the project would create a significant impact since the project would decrease the LOS from satisfactory to unsatisfactory.

The project would worsen the existing LOS deficiency at the following five freeway weaving segments under existing with project conditions:

- Northbound or Eastbound:
 - SR-60 SR-91 to Blaine St/3rd Street;
 - SR-60 W Blaine Street/3rd Street to University Avenue; and
 - SR-91 Arlington Avenue to Central Avenue.
- Southbound or Westbound:
 - SR-60 Central Avenue to Fair Isle Drive/Box Springs Road; and
 - SR-91 14th Street to University Avenue.

A project-specific significant impact would occur at the following freeway weaving segment under existing with project conditions:

- Northbound or Eastbound:
 - SR-60 from Central Avenue to Fair Isle Drive/Box Springs Road.

Indicates that the LOS exceeds the target level

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

Freeway Ramp Analysis. Existing (2012) with project freeway ramp levels of service for the study area are summarized in Table 4.15.AJ, which shows the SR-60 eastbound on-ramp from Central Avenue currently operates at LOS F in the p.m. peak hour and would also operate at LOS F under Existing Plus Project conditions, but with a higher traffic density. This would be considered a significant cumulative impact.

4.15.6.3 Year 2022 With Phase 1 Conditions Traffic and Level of Service Impacts

Threshold:	<p>Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways, and freeways, pedestrian and bicycle paths, and mass transit.</p> <p>Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?</p> <p>A significant project-specific traffic impact would occur if the project would cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp. A significant cumulative traffic impact would occur if the project contributes traffic toward those facilities operating at unsatisfactory LOS in the pre-project condition. The adopted LOS standards are as follows:</p> <ul style="list-style-type: none">• Roadway segments: LOS C and LOS D as outlined in previously referenced Tables 4.15.B and 4.15.C.• Intersections: LOS C and LOS D as outlined in previously referenced Table 4.15.Z.• Freeway mainline: LOS D.• Freeway Ramp Merge/Diverge: LOS D.
------------	--

Intersection Analysis. Year 2022 with Phase 1 intersection levels of service for the study area intersections are summarized in Tables 4.15.AK-1 and 4.15.AK-2, which shows 34 study intersections would operate at unsatisfactory LOS in the 2022 with Phase 1 condition. Twenty-eight of these intersections would exceed the threshold of significance under 2022 No Project conditions and would therefore be considered significant cumulative impacts requiring mitigation. At six of these intersections the level of service would drop from satisfactory to unsatisfactory with the addition of Phase 1 traffic, which would also be considered a significant cumulative impact requiring mitigation.

Phase 1 of the project would have a significant cumulative impact at the following 28 intersections under year 2022 with Phase 1 conditions:

- Redlands Boulevard/Locust Avenue;
- Redlands Boulevard/SR-60 Westbound Ramps;
- Oliver Street/Alessandro Boulevard;
- Moreno Beach Drive/Ironwood Avenue;

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Moreno Beach Drive/SR-60 Eastbound Ramps;
- Lasselle Street/Iris Avenue;
- Krameria Avenue/Perris Boulevard;
- Lasselle Street/Alessandro Boulevard;
- Lasselle Street/Cactus Avenue;
- Frederick Street/Alessandro Boulevard;
- Graham Street/Alessandro Boulevard;
- Martin Luther King Boulevard/Canyon Crest Drive;
- Perris Boulevard/Alessandro Boulevard;
- Graham Street/Cactus Avenue;
- Alessandro Boulevard/Sycamore Canyon Boulevard;
- Elsworth Street/Cactus Avenue;
- Arlington Avenue/Victoria Avenue;
- Alessandro Boulevard/Chicago Avenue;
- Ramona Expressway/Evans Road;
- Placentia Avenue/Perris Boulevard;
- Gilman Springs Road/Bridge Street;
- SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road;
- SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road;
- W. 6th Street/California Avenue;
- Ramona Expressway/Sanderson Avenue;
- San Timoteo Canyon Road/Alessandro Road;
- San Timoteo Canyon Road/Live Oak Canyon Road;
- Redlands Boulevard/San Timoteo Canyon Road; and
- W. Crescent Avenue/Alessandro Boulevard.

A significant cumulative impact would also occur at the following six intersections under year 2022 with Phase 1 conditions:

- Redlands Boulevard/Cactus Avenue;
- Kitching Street/Iris Avenue;
- Perris Boulevard/John F. Kennedy Drive;
- Iris Avenue/Perris Boulevard;
- Heacock Street/Alessandro Boulevard; and
- Day Street/Alessandro Boulevard.

THIS PAGE INTENTIONALLY LEFT BLANK

Roadway Analysis. Year 2022 with Phase 1 roadway segment levels of service for the study area intersections are summarized in Table 4.15.AL, which shows three roadway segments would operate at unsatisfactory levels of service. Phase 1 of the project would contribute toward the worsening of an already unsatisfactory LOS at two roadway segments and, therefore, have a significant cumulative impact at these locations and mitigation is required. One roadway segment would drop from satisfactory to unsatisfactory level of service with the addition of Phase 1 traffic, which would also be considered a significant cumulative impact and mitigation is required.

Phase 1 of the project would have a significant cumulative impact at the following roadway segments under year 2022 with Phase 1 conditions:

- Gilman Springs Road between Alessandro Boulevard to Bridge Street; and
- Gilman Springs Road between SR-60 and Alessandro Boulevard.

Phase 1 of the project would also create a significant cumulative impact at the following roadway segment under year 2022 with Phase 1 conditions:

- Redlands Boulevard from Fir (future Eucalyptus) Avenue to the SR-60 Eastbound Ramps.

Freeway Segment Analysis. Year 2022 with Phase 1 freeway segment levels of service for the study area are summarized in Table 4.15.AM, which shows 33 freeway segments would operate at unsatisfactory levels of service in the year 2022 with Phase 1 condition. Phase 1 of the project would contribute toward the worsening of an already unsatisfactory LOS at 29 freeway segments and, therefore, have a significant cumulative impact at these locations. At four freeway segments, Phase 1 of the project would create a decrease in the LOS from satisfactory to unsatisfactory, resulting in a significant cumulative impact.

Phase 1 of the project would have a significant cumulative impact at the following 29 freeway segments under year 2022 with Phase 1 conditions:

- Northbound or Eastbound Sections:
 - SR-60 S. Reservoir Street to Ramona Avenue;
 - SR-60 Central Avenue to Mountain Avenue;
 - SR-60 Euclid Avenue to Grove Avenue;
 - SR-60 Grove Avenue to Vineyard Avenue;
 - SR-60 Vineyard Avenue to Archibald Avenue;
 - SR-60 Valley Way to Rubidoux Boulevard;
 - SR-60 Rubidoux Boulevard to Market Street;
 - SR-60 Market Street to Main Street;
 - SR-60 Martin Luther King Boulevard to Central Avenue;
 - SR-60 Pigeon Pass Road/Frederick Street to Heacock Street;
 - SR-60 Heacock Street to Perris Boulevard;
 - SR-91 Pierce Street to Magnolia Avenue;
 - I-215 Columbia Avenue to Center Street;

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

**** Due to the severing of Alessandro Blvd and the diversion of traffic to other routes, there is no need to widen this section beyond the current 2U configuration.

□ Indicates LOS exceeds the target level

THIS PAGE INTENTIONALLY LEFT BLANK

- I-215 Iowa Avenue/La Cadena Drive to Barton Road; and
- I-215 Barton Road to Mt. Vernon Avenue.
- Southbound or Westbound Sections:
 - SR-60 Grove Avenue to Vineyard Avenue;
 - SR-60 Valley Way to Rubidoux Boulevard;
 - SR-60 Market Street to Main Street;
 - SR-60 Main Street to SR-91;
 - SR-60 Fair Isle Drive/Box Springs Road to I-215;
 - SR-60 I-215 to Day Street;
 - SR-91 McKinley Street to Pierce Street;
 - SR-91 Pierce Street to Magnolia Avenue;
 - SR-91 Magnolia Avenue to La Sierra Avenue;
 - SR-91 La Sierra Avenue to Tyler Street;
 - I-215 Columbia Avenue to Center Street;
 - I-215 Center Street to Iowa Avenue/La Cadena Drive;
 - I-215 Iowa Avenue/La Cadena Drive to Barton Road; and
 - I-215 Barton Road to Mt. Vernon Avenue.

Phase 1 of the project would create a significant cumulative impact at the following four freeway segments under year 2022 with Phase 1 conditions:

- Northbound or Eastbound Section:
 - SR-91 Central Avenue to 14th Street.
- Southbound or Westbound Sections:
 - SR-60 Rubidoux Boulevard to Market Street;
 - SR-60 Pigeon Pass Road/Frederick Street to Heacock Street; and
 - SR-60 Heacock Street to Perris Boulevard.

Freeway Weaving Analysis. Year 2022 with Phase 1 freeway weaving segment levels of service for the study area intersections are summarized in Table 4.15.AN-1 and 4.15.AN-2, which shows 10 freeway weaving segments would operate at unsatisfactory levels of service. Phase 1 of the project would contribute toward the worsening of an already unsatisfactory LOS at seven of the freeway weaving segments and, therefore, would have a cumulative impact at these locations. Phase 1 of the project would have a significant direct project impact at three freeway weaving segments under year 2022 with Phase 1 conditions.

Phase 1 of the project would have a cumulative impact at the following seven freeway weaving segments under year 2022 with Phase 1 conditions:

- Northbound or Eastbound:

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- SR-60 SR-71/S. Garey Avenue to Reservoir Street;
- SR-60 Main Street to SR-91;
- SR-60 SR-91 to W. Blaine Street/3rd Street;
- SR-60 Central Avenue to Fair Isle Drive/Box Springs Road;
- SR-91 Arlington Avenue to Central Avenue; and
- I-215 SR-60 to Columbia Avenue.
- Southbound or Westbound:
 - SR-60 SR-91 to W. Blaine Street/3rd Street;

Phase 1 of the project would also create a significant cumulative impact at the following three freeway weaving segments under year 2022 with Phase 1 conditions:

- Southbound or Westbound:
 - SR-60 Blaine Street/3rd Street to University Avenue;
 - SR-60 Central Avenue to Fair Isle Drive/Box Springs Road.
 - SR-60 Day Street to Pigeon Pass Road/Frederick Street.

Freeway Ramp Analysis: Year 2022 with Phase 1 freeway ramp merge/diverge levels of service are summarized in Table 4.15.AO, which shows one freeway ramp that would operate at unsatisfactory level of service. Phase 1 of the project would contribute toward the worsening of an unsatisfactory LOS at this freeway ramp and, therefore, would have a significant cumulative impact on the following ramp:

- SR-60 Eastbound On-Ramp from Central Avenue.

Phase 1 of the project would not create a significant cumulative impact to any freeway ramps in the year 2022 plus Phase 1 condition.

Indicates that the LOS exceeds the target level

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

THIS PAGE INTENTIONALLY LEFT BLANK

4.15.6.4 Year 2035 Cumulative With Project Conditions Traffic and Level of Service Impacts

Threshold: Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways, and freeways, pedestrian and bicycle paths, and mass transit.

Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

A significant project-specific traffic impact would occur if the project would cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp. A significant cumulative traffic impact would occur if the project contributes traffic toward those facilities operating at unsatisfactory LOS in the pre-project condition. The adopted LOS standards are as follows:

- Roadway segments: LOS C and LOS D as outlined in previously referenced Tables 4.15.B and 4.15.C.
- Intersections: LOS C and LOS D as outlined in previously referenced Table 4.15.Z.
- Freeway mainline: LOS D.
- Freeway Ramp Merge/Diverge: LOS D.

Intersection Analysis. Year 2035 Cumulative with project (buildout) intersection levels of service for the study area intersections are summarized in Tables 4.15.AP-1 and 4.15.AP-2, which shows 35 intersections that would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at 30 intersections and, therefore, have a significant cumulative impact. At five intersections, the project would create a significant cumulative impact since the project would cause a decrease in the LOS from satisfactory to unsatisfactory.

The project would contribute to a significant cumulative impact at the following 30 intersections under Year 2035 with project conditions:

- Theodore Street/Ironwood Avenue;
- Moreno Beach Drive/Locust Avenue;
- Moreno Beach Drive/SR-60 Eastbound Ramps;
- Iris Avenue/Perris Boulevard;
- Kitching Street/Iris Avenue;
- Lasselle Street/Iris Avenue;
- Lasselle Street/Cactus Avenue;
- Graham Street/Alessandro Boulevard;
- Alessandro Boulevard/Sycamore Canyon Boulevard;I-215 Southbound Ramps/Cactus Avenue;
- Central Avenue/Lochmoor Drive;

- Elsworth Street/Cactus Avenue;
- I-215 Northbound Ramps/Cactus Avenue;
- Martin Luther King Boulevard/I-215 Northbound Ramps;
- Central Avenue/Chicago Avenue;
- Central Avenue/Canyon Crest Drive;
- Arlington Avenue/Riverside Avenue/SR-91 Southbound Ramps;
- Arlington Avenue/Victoria Avenue;
- Alessandro Boulevard/Chicago Avenue;
- Alessandro Boulevard/Canyon Crest Drive;
- Ramona Expressway/Indian Street;
- Evans Road/Rider Street;
- Gilman Springs Road/Bridge Street;
- SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road;
- SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road;
- W. 6th Street/California Avenue;
- W. 6th Street/Beaumont Avenue;
- Reche Canyon Road/Reche Vista Drive;
- San Timoteo Canyon Road/Live Oak Canyon Road; and
- Redlands Boulevard/San Timoteo Canyon Road.

The project would create a significant cumulative impact at the following five intersections under Year 2035 Cumulative with project conditions since the project would cause a decrease in the LOS from satisfactory to unsatisfactory:

- Redlands Boulevard/Ironwood Avenue;
- Moreno Beach Drive/Cactus Avenue;

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

- Redlands Boulevard/Cactus Avenue;
- Moreno Beach Drive/Ironwood Avenue; and
- San Timoteo Canyon Road/Alessandro Road.

Roadway Segment Analysis. 2035 Cumulative plus project roadway segment levels of service for the study area roadway segments are summarized in Table 4.15.AQ, which shows the project would create a significant cumulative impact on the following roadway segment:

- Gilman Springs Road between Alessandro Boulevard and Bridge Street.

Freeway Segment Analysis. Year 2035 Cumulative with project freeway segment levels of service for the study area intersections are summarized in Tables 4.15.AR-1 and 4.15.AR-2, which shows 52 freeway mainline segments would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at 48 of the freeway segments and, therefore, have a significant cumulative impact at these locations. At four freeway segments, a significant cumulative impact would occur since the project would cause a decrease in the LOS from satisfactory to unsatisfactory.

The project would have a significant cumulative impact at the following 48 freeway segments under Year 2035 Cumulative with project conditions:

- Northbound or Eastbound Sections:
 - SR-60 Reservoir Street to Ramona Avenue;
 - SR-60 Ramona Avenue to Central Avenue;
 - SR-60 Central Avenue to Mountain Avenue;
 - SR-60 Mountain Avenue to Euclid Avenue;
 - SR-60 Euclid Avenue to Grove Avenue;
 - SR-60 Grove Avenue to Vineyard Avenue;
 - SR-60 Vineyard Avenue to Archibald Avenue;
 - SR-60 Archibald Avenue to Haven Avenue;
 - SR-60 Valley Way to Rubidoux Boulevard;
 - SR-60 Rubidoux Boulevard to Market Street;
 - SR-60 Market Street to Main Street;
 - SR-60 Martin Luther King Boulevard to Central Avenue;
 - SR-60 Pigeon Pass Road/Frederick Street to Heacock Street;
 - SR-60 Heacock Street to Perris Boulevard;
 - SR-60 Gilman Springs Road to Jack Rabbit Trail;
 - SR-60 Jack Rabbit Trail to I-10/Potrero Boulevard;
 - SR-91 Pierce Street to Magnolia Avenue;
 - SR-91 La Sierra Avenue to Tyler Street;
 - SR-91 Adam Street to Madison Street;

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

□ Indicates LOS exceeds the target level

 - SR-60 Main Street to SR-91;
 - SR-60 Martin Luther King Boulevard to Central Avenue;
 - SR-60 Fair Isle Drive/Box Springs Road to I-215;
 - SR-60 I-215 to Day Street;
 - SR-60 Redlands Boulevard to Theodore Street;
 - SR-91 Pierce Street to Magnolia Avenue;
 - SR-91 Magnolia Avenue to La Sierra Avenue;
 - SR-91 La Sierra Avenue to Tyler Street;
 - SR-91 Tyler Street to Van Buren Boulevard;
 - SR-91 Madison Street to Arlington Avenue;
 - I-10 SR-60 to Beaumont Avenue;
 - I-10 Pennsylvania Avenue to Highland Springs Avenue;
 - I-10 Highland Springs Avenue to Sunset Avenue;
 - I-10 8th Street to S. Hargrave Street;
 - I-215 SR-74 to Ellis Avenue;
 - I-215 Center Street to Iowa Avenue/La Cadena Drive; and
 - I-215 Baseline Road to Highland Avenue.

The project would create a significant cumulative impact at the following four freeway segments under Year 2035 Cumulative with project conditions:

- Northbound or Eastbound Sections:
 - I-10 8th Street to S. Hargrave Street.
- Southbound or Westbound Sections:

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- SR-60 from Martin Luther King Boulevard to Central Avenue;
- SR-60 from Heacock Street to Perris Boulevard; and
- SR-91 from Van Buren Boulevard to Adam Street.

Freeway Weaving Analysis. Year 2035 Cumulative with project freeway weaving segment levels of service are summarized in Tables 4.15.AS-1 and 4.15.AS-2, which shows 14 freeway weaving segments would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at 10 of the freeway weaving segments and, therefore, would have a cumulative impact at these locations. The project would create a significant cumulative impact at one freeway weaving segment since the project would cause a decrease in the LOS from satisfactory to unsatisfactory. The project would have a cumulative impact at the following 14 freeway weaving segments under Year 2035 Cumulative with project conditions:

- Northbound or Eastbound:
 - SR-60 SR-71/S. Garey Avenue to Reservoir Street;
 - SR-60 Main Street to SR-91;
 - SR-60 SR-91 to W. Blaine Street/3rd Street;
 - SR-60 W. Blaine Street/3rd Street to University Avenue;
 - SR-60 Central Avenue to Fair Isle Drive/Box Springs Road; and
 - SR-91 Arlington Avenue to Central Avenue.
- Southbound or Westbound:
 - SR-60 Haven Avenue to Archibald Avenue;
 - SR-60 SR-91 to W. Blaine Street/3rd Street;
 - SR-60 W. Blaine Street/3rd Street to University Avenue;
 - SR-60 University Avenue to Martin Luther King Boulevard;
 - SR-60 Central Avenue to Fair Isle Drive/Box Springs Road;
 - SR-60 Day Street to Pigeon Pass Road/Frederick Street;
 - SR-91 14th Street to University Avenue; and
 - I-10 Haugen-Lehmann Way to SR-111.

The project would create a significant cumulative impact at the following freeway weaving segment under Year 2035 Cumulative with project conditions:

- Southbound or Westbound Sections:
 - SR-60 Day Street to Pigeon Pass Road/Frederick Street.

Freeway Ramp Analysis. Year 2035 Cumulative with project freeway ramp merge/diverge levels of service are summarized in Table 4.15.AT, which shows ten freeway ramps would operate at unsatisfactory levels of service. The project would contribute toward the worsening of an already unsatisfactory LOS at three freeway ramps and, therefore, have a significant cumulative impact at

Indicates that the LOS exceeds the target level
 Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

these locations. The project would create a significant cumulative impact at five freeway ramp locations under Year 2035 Cumulative with project conditions since the project would cause a decrease in the LOS from satisfactory to unsatisfactory.

The project would have a significant impact at the following three freeway ramps under Year 2035 Cumulative with project conditions:

- SR-60 Eastbound On-Ramp from Central Avenue;
- SR-60 Eastbound On-Ramp from Gilman Springs Road;
- SR-60 Westbound On-Ramp from Theodore Street;

Westbound SR-60 Loop On-Ramp from Redlands Boulevard (R-16) will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

The project would also create a significant cumulative impact at the following five freeway ramps under Year 2035 Cumulative with project conditions:

- SR-60 Eastbound On-Ramp from Martin Luther King Boulevard;
- SR-60 Westbound Off-Ramp to Redlands Boulevard;
- SR-60 Westbound Direct On-Ramp from Redlands Boulevard;
- SR-60 Westbound Off-Ramp to Central Ave; and
- SR-60 Westbound Off-Ramp to Martin Luther King Boulevard.

Note: Section 4.15.6.5 has been added to this Final EIR in response to: Comment F-1-49 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society; Comment F-3-4 in Letter F-3 from the California Clean Energy Committee; Appendix 78 in Letter F-3 from the California Clean Energy Committee; Comment F-9A-22 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comments F-9C-2, 4, 5, 6, and 7 in Letter F-9C from Sustainable Systems Research, LLC; Comment F-11-23 in Letter F-11 from the Sierra Club, San Geronio Chapter; Comment F-13-11 in Letter F-13 from the Sierra Club and Friends for a Livable Moreno Valley; and Comment G-51-45 in Letter G-51 from Michael McCoy.

4.15.6.5 Freeway Impacts from Truck Trips to the Ports of Los Angeles and Long Beach

Threshold:	<p>Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways, and freeways, pedestrian and bicycle paths, and mass transit.</p> <p>Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?</p>
------------	---

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

A significant project-specific traffic impact would occur if the project would cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp. A significant cumulative traffic impact would occur if the project contributes traffic toward those facilities operating at unsatisfactory LOS in the pre-project condition. The adopted LOS standards are as follows:

- Roadway segments: LOS C and LOS D as outlined in previously referenced Tables 4.15.B and 4.15.C.
- Intersections: LOS C and LOS D as outlined in previously referenced Table 4.15.Z.
- Freeway mainline: LOS D.
- Freeway Ramp Merge/Diverge: LOS D.

Several comments received on the Draft EIR indicated confusion regarding the volume of truck traffic between the WLC and the Ports of Los Angeles and Long Beach. In general, the DEIR commenters seemed to believe that the truck traffic between the WLC and the ports will be much higher than will actually occur. This section responds to these comments by 1) describing the current share of port-related use of warehouse space, 2) estimating the truck traffic between the WLC and the ports using three different methods, 3) estimating the growth in WLC truck traffic to the port over time, and 4) determining whether WLC trucks would impose significant impacts on the freeways to the ports beyond those identified in previous chapters.

Current Share of Port-Related Warehouse Space. The DEIR commenters referred to SCAG's study titled *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities*. This study states that 13 percent of the occupied warehouse space in the SCAG region in 2009 was port-related. This indicates that while the ports are important sources of demand for warehouse space, the great majority of warehouse space serves other demands. In a large regional economy such as southern California this other demand amounted to 578 million square feet in 2009, and is growing over time.

The SCAG study also shows wide differentiation in the markets served. Riverside County serves only a small percentage of port-related demand while playing a much more important role in serving non-port demand. This differentiation reflects the tendency of warehouse tenants whose operations rely on the ports to self-select locations close to the port.

The information provided in the report indicates that only 5 percent of the warehouse space in Riverside County serves port-related demand, which suggests that the volume of truck traffic between the ports and warehouses in Riverside County, including those in WLC, will be relatively small.

The study also reached two conclusions regarding the regional supply of warehouse space, taken from the report's Executive Summary (pages ES-1 and ES-2):

“According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet.

During the year 2035, there will be a projected shortfall of space of about 228 million square feet, unless other land not currently zoned for warehousing becomes available.”

In other words, according to the SCAG study cited by the commenters, even if all of the land currently zoned for warehouse space were developed, there would still be a massive shortfall of warehouse space by 2035 unless projects like the WLC are approved and built.

Estimating Truck Trips between WLC and the Ports. In order to ensure that a reasonable worst-case scenario was used for the impact analysis, the number of truck trips between the WLC and the ports was forecast using three different methods, all based on data provided by regional planning agencies, with the highest of the three forecasts used for the analysis. The three methods were as follows:

- ***Method 1: RivTAM Model.*** The first method for estimating truck trips to the port was to use the RivTAM model. As described in Chapter 2, RivTAM is the standard traffic forecasting tool used by agencies in Riverside County to analyze the regional effects of proposed projects. Like most other traffic models, RivTAM assigns trips to destinations using a gravity model where the number of trips between each origin/destination pair increases in proportion to the number of trips generated at each end, but decreases in proportion to the distance between the origin and destination. The effect of distance on the likelihood of travel between origin-destination pairs is determined by the trip length distribution which in turn is based on survey data.

The WLC's proposed land uses were input into the RivTAM model as described in Chapter 2, the model was run, and the outputs were checked to find how many truck trips were assigned between the ports TAZs and the WLC. Using the RivTAM model to estimate truck trips yields 82 truck trips per day between the ports and the WLC if the WLC were built today (i.e., the 2012 Plus Full Build-Out scenario).

- ***Method 2: Based on Port Truck Study.*** The best information currently available on truck trips from the ports comes from the Ports of Los Angeles and Long Beach Year 2010 Marine Terminal Gate Surveys. These surveys found that 1.5 percent of truck trips entering the ports came from Riverside County and 1.7 percent of trucks leaving the ports went to Riverside County. These findings are consistent with an earlier study that found 1 percent of truck trips entering the ports came from Riverside County and 2 percent of truck trips leaving the ports went to Riverside County (the numbers are rounded in the study). Applying the percentages from the 2010 survey to the approximately 50,000 truck trips per day generated by the ports yields a total of approximately 800 trucks per day between the ports and Riverside County.

If we make the conservative assumption that every one of these 800 truck trips goes to a warehouse rather than to a factory, store, or some other destination, and divide these trips among the 136 million square feet of occupied warehouse space in Riverside County, we find an average of 5.9 truck trips to or from the ports per million square feet of warehouse space per day. Applying this rate to the 40.6 million square feet of warehouse space proposed for the WLC yields 240 truck trips per day between the ports and the WLC if the WLC were built today (the 2012 Plus Full Build-Out scenario).

- ***Method 3: Based on Truck Flows from Riverside County.*** The best information currently available on regional truck traffic patterns comes from SCAG's Goods Movement Study that was done in preparation for the 2012 RTP/SCS.

Applying the ports' 1.5 percent share of Riverside County truck trips applies to WLC's 11,600 medium and heavy truck trips per day yields 174 truck trips per day between the ports and the WLC if the WLC were built today (the 2012 Plus Full Build-Out scenario).

This analysis shows that a reasonable estimate of truck traffic between WLC and the ports would be in the range of 84 to 240 truck trips per day. The higher figure of 240 truck trips per day was used as a reasonable worst-case scenario.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Growth in Truck Trips to the Port. Some comments suggested that the analysis should consider the possibility that the share of warehouse space in the Inland Empire, and by extension the WLC, may grow over time. This section addresses those comments.

As discussed previously, currently only 1.5 percent of the truck trips in Riverside County are to or from the ports. In the future, port-related uses are anticipated to require a greater share of warehouse space. For Riverside County, SCAG estimates that the percentage of warehouse space devoted to port uses would more than triple between 2012 and 2035, from 5.0 percent to 16.3 percent.

The SCAG estimates show that the percentage of warehouse space devoted to port-related cargo will always be larger than the percentage of trucks going to and from the port. That is because the cargo that has come from the port to the warehouse then leaves the warehouse in trucks going to non-port destinations. There may also be inbound truck trips to warehouses from places other than the ports, delivering shipments of packaging material and other items which might be combined with port-related cargo, thus further reducing the proportion of trucks that come from the ports.

The estimated percentage of WLC trucks going to the ports is 2.07 for the Year 2012 scenario, 3.86 for the Year 2022 scenario, and 6.76 for the Year 2035 scenario. These estimates are based on 240 project truck trips per day to the port compared to 11,621 total medium and heavy truck trips to and from the WLC in the year 2012 scenario.

These percentages were then applied to the trip generation rates to obtain the number of WLC trucks to and from the port for each analysis period. The estimated quantity of WLC trucks going to the ports per day is 242 for the Year 2012 scenario, 254 for the Year 2022 scenario, and 786 for the Year 2035 scenario. Tests with the SCAG traffic model showed that these trips would split approximately evenly between SR-60 and SR-91 routes.

Determination of Whether Impacts are Significant. The potential for traffic impacts along the SR-60 and SR-91 corridors was assessed by manually adding the forecasts for WLC trucks to and from the port to the No-Project condition from the SCAG model. Because the ports and the freeways leading to them are in Los Angeles County, the threshold of significance for the analysis was taken from the Los Angeles County Congestion Management Program (CMP). The CMP states that a significant impact would be deemed to occur if the project increased demand on a highway by at least 2 percent causing LOS F or, if the highway facility already operates at LOS F, then a significant impact would be deemed to occur if the project increases traffic demand by 2 percent or more of capacity.

Analysis of the project's impacts to each section of the SR-60 and SR-91 corridors and in each direction, for both the a.m. and p.m. peak periods, was conducted for the 2012, 2022, and 2035 scenarios. The addition of the WLC traffic would increase freeway traffic volume ranging from 0.05 percent to 1.17 percent of non-project traffic, would not cause a significant impact on any segment of these freeways.

4.15.7 Mitigation of Significant Impacts

As described in detail in Section 4.15.4, the level of service performance standards used in this EIR are as follows:

- Roadway segments and intersections: LOS C, LOS D, or LOS E as outlined in previously referenced Tables 4.15.B, 4.15.C, and 4.15.D.

- Freeway mainline: LOS D (or existing density if currently operating at LOS E or F).
- Freeway Ramp Merge/Diverge: LOS D.

The methodology used to identify mitigation measures included:

- 1) Determining whether the LOS exceeded the target threshold in the Plus Project condition.
- 2) If so, then determining whether the appropriate measure of effectiveness under Plus Project conditions was below that under No Project conditions. Some study freeway segments were found to exceed the threshold of significance under Plus Project conditions but the traffic density was lower under Plus Project conditions than No Project conditions. This could happen because the project would cause some commuters to switch from the peak direction to the off-peak direction, thus reducing congestion at some locations. The project's impacts (both project direct and cumulative impacts) were considered significant only when the Plus Project condition was worse than the No-Project condition.
- 3) If the project had a significant impact, capacity-increasing improvements were then added incrementally until the LOS was within the target threshold of significance.
- 4) For cumulative impacts, determining whether the mitigations could be funded as part of an established fee program such as TUMF or DIF. If so, then payment into the TUMF or DIF program constitutes mitigation of impacts to the TUMF and DIF facilities.
- 5) For improvements that would not be funded from an established fee program the project's fair-share contribution was computed using the formula in Caltrans' *Guide for the Preparation of Traffic Impact Studies - Appendix "B"*. This formula defines the project's fair-share as the project-related traffic's percentage share of overall traffic growth, not including new traffic attributable to projects that have already been approved. Where there were significant impacts in both the a.m. and p.m. peak periods, the period with the higher share of project traffic was used to determine the fair-share contribution.

Potential mitigation measures were analyzed to determine whether they were feasible or not. Improvements were deemed to be infeasible if they would require the acquisition of existing homes or businesses, if they would result in excessive air, noise, or vibration impacts on existing homes, businesses, or sensitive natural environments, or would create safety impacts that could be considered less acceptable than a reduced traffic LOS. In cases where feasibility is uncertain, the recommended improvement was treated as feasible in order to produce a conservative estimate of project responsibilities (i.e. "conservative" in the sense that the project's responsibilities would not be under-estimated).

In cases where a proposed modification to an existing intersection would result in the elimination of an existing bus stop or bicycle lane the proposed mitigation would include the replacement of the bicycle lane or bus stop even if not explicitly stated. This is also true of the replacement of existing curbs, gutters, sidewalks, lights, and other existing design features.

Timing of Improvements. It is important to note that the specific timing of installation of the various identified improvements will occur as indicated by subsequent traffic studies when specific development is proposed in the future, as outlined in Mitigation Measure 4.15.7.4A. It is therefore not possible at this time, in this programmatic document, to identify the specific timing of roadway or other circulation improvements identified in this document.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

4.15.7.1 The TUMF Program

In 1988, the voters of Riverside County approved Measure A, a half-cent sales tax to fund transportation projects. In 2002, voters approved a 20-year extension of Measure A, this time including a Transportation Uniform Mitigation Fee or TUMF. The rationale behind TUMF was that having a single uniform fee program to mitigate the cumulative regional impacts of new development on the area's arterial highway system would be more effective than having multiple and potentially uncoordinated fee programs with varying policies, fee amounts, and project lists. Under the TUMF, developers of residential, industrial, and commercial property pay a development fee to fund transportation projects that will be required as a result of the growth the projects create. The program is recognition by voters that residents and employees in all of Western Riverside County's jurisdictions benefit from arterials located not just in their own city, but also in nearby cities as well.

The TUMF program is designed to provide a network of roads, bridges, interchanges, and railroad grade separations, known as the Regional System of Highways and Arterials (RSHA), needed to accommodate future growth in the area through 2035. The RSHA was developed by the Public Works Directors of the Western Riverside Council of Governments (WRCOG) member jurisdiction. A "Nexus Study" was then prepared in accordance with the California Mitigation Fee Act, which requires that a reasonable relationship exist between the impact fee collected and the proposed improvements for which a fee is used. The study determined the proportion of the cost of the improvements should be borne by different types of development based on the trip generating characteristics of each land use type. The Nexus Study was updated in 2010 and the RSHA was revised to reflect the most current transportation needs and costs for Western Riverside County. The new network reflected several changes due to completed projects and recommendations from the WRCOG Public Works Committee (PWC) to better represent the transportation needs of Western Riverside County.

TUMF is administered by the WRCOG. As administrator, WRCOG receives all fees generated from the TUMF as collected by the local jurisdictions. TUMF funds are programmed by WRCOG's partner agencies, which are responsible for prioritizing projects and overseeing their development.

The TUMF program uses six categories of land uses: two residential categories and four non-residential categories. The two residential types are single-family residential and multifamily residential. Non-residential uses are industrial, retail, service commercial, and high-cube warehouse, with fees assessed at different rates depending on the category. The high-cube warehouses in the WLC would fall into the "high-cube" category of non-residential development. As this fee level, if the WLC builds out completely, it would potentially pay more than \$70 million in TUMFs.

TUMF revenues are collected when a development reaches the Building Permit stage. Once collected and administrative costs and a mitigation allocation made to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP), TUMF revenues are allocated as follows:

- 46.39 percent is allocated for regional improvements. These revenues are programmed by the RCTC pursuant to an agreement with WRCOG.
- 46.39 percent is allocated to the geographic zone from which the fees are collected. Project prioritization and programming are undertaken by the jurisdictions in each of the five zones.
- 1.64 percent is allocated for regional transit projects. WRCOG administers the funds on behalf of the RTA which prioritizes and programs capital transit projects.
- 1.59 percent is allocated to the Multiple Species Habitat Conservation Plan.
- 4.0 percent is used for program administration.

Since its inception, TUMF has collected more than \$554 million in revenues, making it the largest multi-jurisdictional fee program in the nation. It has completed 46 projects with several dozen more under development. The projects successfully funded by the program include a variety of road widening, intersection improvements, and freeway interchanges, including:

- Widening Pigeon Pass Road from 2 lanes to 4 lanes from Climbing Rose Drive to Hidden Springs Drive;
- Widening the Ramona Expressway from 2 lanes to 6 lanes from I-215 to Evans Road;
- Improvements to the Ironwood Avenue/Moreno Beach Drive intersection;
- Improvements to the Ironwood Avenue/Nason Street intersection;
- Adding a northbound lane to Lasselle Street from John F Kennedy Drive to Alessandro Boulevard;
- Widening Oleander Avenue from Perris Boulevard to Indian Avenue;
- The Van Buren Boulevard/SR-91 Interchange Project;
- Widening State Street in Hemet from 2 to 4 lanes with a center turn lane; and
- Widening Sanderson Avenue from Menlo Avenue to Ramona Expressway.

This track record of success is a key reason why the TUMF projects have a good probability of being implemented. Between now and 2035, when the program is scheduled for completion, the TUMF program is forecast to provide nearly \$1.9 billion towards a total of \$4.2 billion in arterial road, bridge, intersection, and interchange improvements in Western Riverside County. Those components of infrastructure that are subject to and included in the TUMF program are identified in the TIA and this Traffic and Circulation section of the EIR.

4.15.7.2 The City of Moreno Valley Development Impact Fee Program

The City of Moreno Valley's Development Impact Fee (DIF) program is used to fund road and intersection improvements needed to accommodate new residential, commercial, and industrial development. The program collects fees from three categories of residential development (single-family, multifamily, and mobile homes) and five categories of commercial development (general commercial, regional commercial, general industrial, high-cube warehouse, and office) based on their respective trip generating characteristics. In many cases, developers dedicate right-of-way and/or construct improvements that are part of the TUMF or DIF programs in lieu of paying the fees. These facilities are typically part of a project's direct frontage or are necessary to accommodate traffic capacities in the immediate area of the project. DIF fees on high-cube warehouses are currently set at \$0.9955 per square foot, which means that the WLC would potentially pay more than \$40 million in DIF fees if the project builds out completely as planned. Like the TUMF Program, the City's DIF Program is a bona-fide Mitigation Fee Program that has been created in accordance with AB 1600. All development is required to pay into the DIF Program; funds raised pursuant to the DIF Program are held in a separate interest-bearing account; an infrastructure capital improvement program is adopted that funds transportation improvements as they are needed to maintain targeted levels of service; and the capital improvement program is implemented as development occurs and DIF fees are collected.

DIF funds are overseen by the City's Public Works Department. Department staff monitors traffic volumes and periodically develops a capital improvement program designed to ensure that improvements are installed to help maintain the City's target LOS threshold. The CIP is reviewed and approved by the city council. Examples of projects successfully completed using DIF funds include:

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Iris Ave. from Indian St. to Perris Blvd.
- Lasselle St./Bay Ave. traffic signal
- Lasselle St./Cottonwood Ave. traffic signal
- Cactus Ave. eastbound improvements from I-215 to Veterans Way

Similar to the TUMF, this track record of success is a key reason why the DIF projects have a good probability of being implemented. The DIF program supplements the TUMF program by funding elements of the City’s General Plan Circulation Element not covered by TUMF and, in some projects, by providing funds for additional capacity beyond what the TUMF project will provide. The DIF program has been updated several times, most recently in January 2013, to reflect changes in priorities as development occurs in different parts of the City.

Table 4.15.AU shows a sample of transportation improvement projects from the City’s Capital Improvement Program that used DIF and/or TUMF funds in combination with other funding sources.

Table 4.15.AU: Projects Using DIF and TUMF in Combination with Other Funding Sources

Project	DIF Funds	TUMF Funds	Other Funds	Sources of Other Funds
Iron Avenue / Heacock Street to Perris Boulevard	\$1,509,420	\$72,413	\$57,358	2005 Lease Revenue Bonds
Nason Street / Cactus Avenue Street Improvements	\$9,272,000		\$15,910,845	Measure "A"; State-Local Partnership Program; General Fund; General City C.P.; Successor Agency Tax Revenue; Redevelopment Agency Cap. Proj.; Eastern Municipal Water District; Riverside County Flood Control; 2007 Taxable Lease Revenue Bonds
SR-60 / Moreno Beach Drive South Side of Interchange (Phase 1)		\$3,500,000	\$6,110,735	Successor Agency; Redevelopment Agency
SR-60 / Nason Street Interchange	\$740,000		\$13,285,777	Measure "A"; Federal Demonstration Funds; Demo Toll Credit - Const.; Surface Transportation Program Local (construction); Surface Transportation Program Local Toll Credit - Const.
Heacock Street South Extension		\$300,000	\$564,172	Measure "A"
Emergency Vehicle Pre-emption at 117 Traffic Signals	\$93,534		\$840,000	Highway Safety Improvement Program
Nason Street / Riverside County Regional Medical Center Main Driveway Traffic Signal	\$250,000		\$50,000	Measure "A"
Transportation Management Center	\$316,578		\$214,646	Air Quality Management
Lasselle Street / John F. Kennedy Drive to Alessandro Boulevard		\$2,757,886	\$1,058,143	2005 Lease Revenue Bonds
Kitching Street / Alessandro Boulevard to Gentian Avenue	\$11,903		\$1,639,854	2005 Lease Revenue Bonds
Pigeon Pass Road Widening / Climbing Rose Drive to North City Limits	\$462,239	\$679,953	\$22,664	Measure "A"
Total	\$12,655,674	\$7,310,252	\$39,754,194	
Percentage of Total	21%	12%	67%

4.15.7.3 Required Improvements

Existing plus Project Direct and Cumulative Project Impacts. As individual projects within the WLC are processed, the City will require that each project do a traffic impact assessment in accordance with City guidelines. These project-level assessments will determine the timing of each transportation improvement measure and will ensure that the impact assumptions made in this programmatic EIR document are consistent with the analysis of potential impacts at the project-specific implementation stage.

This section is devoted to disclosing project impacts and identifying required improvements to improve the impacted location to within the applicable level of service standard. Each impacted facility is discussed in the text and the results are summarized in Tables AV through AY. These tables all follow a similar format which includes the following data fields (columns):

- (A) This field identifies the location of the impact.
- (B) This field identifies which agency has jurisdiction over the facility in question.
- (C) This field shows the agency's target LOS for the facility in question.
- (D) This field shows the LOS under Existing conditions. This is used to determine whether or not there is an existing deficiency.
- (E) This field shows the LOS under Existing Plus Project conditions. This is used to determine whether or not the project has a significant impact.
- (F) This field shows whether there is a significant impact. It is based on the thresholds of significance described in Chapter 4.
- (G) This field describes what improvements would be required to achieve the target LOS under Existing Plus Project conditions.
- (H) This field states whether the measure described in Column G is feasible or not. In some cases the needed improvements may not be feasible. For example, it may be infeasible to widen a road because doing so would cause major negative impacts to an adjacent neighborhood.
- (I) This field shows the LOS after all feasible mitigations have been implemented. If mitigation is infeasible then Column I will be the same as Column E.
- (J) This field states whether the impact would still be significant after all feasible mitigation measures have been implemented. For those facilities under the jurisdiction of the City of Moreno Valley (see Column B) a "No" in Column J indicates that the impact will be mitigated to a less than significant level. For those facilities outside the jurisdiction of the City of Moreno Valley, Column J indicates what would happen if the jurisdiction that controls the facility implements the recommended feasible mitigations. However, because the City of Moreno Valley cannot guarantee that the other agency will implement the needed improvement the City cannot guarantee that the impact will be mitigated to a less than significant level.
- (K) This field shows whether or not there is an existing deficiency. Generally speaking, under state law a developer is responsible for mitigating the impacts of their project but is not responsible for rectifying existing deficiencies that are the result of earlier projects. They need only pay a fair-share representing the portion of the deficiency that is attributable to their own project.
- (L) This field reports the action that the developers of the WLC will be required to take as a condition of approval.

PROJECT DIRECT IMPACTS (SHORT-TERM)

The direct impacts of the WLC project were determined by comparing the LOS of study facilities under Existing and Existing Plus Project conditions. The direct impacts of the project and the associated improvements necessary to obtain the target LOS are as follows.

Road Section Direct Impacts. The project's direct impacts on road sections are summarized in Table 4.15.AV. These impacts and the associated improvements necessary to obtain the target LOS would be:

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- **Cactus Avenue from Redlands Boulevard to Street D (S-22)** currently has one westbound lane and two eastbound lanes. The WLC would involve the reconstruction of Alessandro Boulevard along a new alignment that ends Cactus Avenue Extension, which would connect Cactus Avenue and Alessandro Boulevard (Street E) as the main route for east-west through traffic. Cactus Avenue would need to be widened to four lanes in conjunction with this change. The City will require the developer to pay a fair share for this improvement as a condition of approval.
- **Gilman Springs Road from Alessandro Boulevard to Bridge Street (S-16)** is already deficient and needs to be widened to four lanes and will need to be widened to six lanes in the future. In accordance with General Plan Policy 5.5.7, the City will require the developer to widen Gilman Springs Road to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer will receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair share contribution.

However, because Gilman Springs Road is partially a Riverside County facility and is thus partially outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made outside of its jurisdiction. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to four lanes between Alessandro Boulevard and Bridge Street, or even preclude any widening at all. The project's impacts in the Existing Plus Project scenario on Gilman Springs Road must therefore be considered significant and unavoidable. The City will work with Riverside County find funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

- **Gilman Springs Road from SR-60 to Alessandro Boulevard (S-17)** is already deficient and needs to be widened to four lanes. In accordance with General Plan Policy 5.5.7, the City will require the developer to widen Gilman Springs Road to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer will receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair share contribution.

However, because Gilman Springs Road is partially a Riverside County facility and is thus partially outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made outside of its jurisdiction. The project's impacts in the Existing Plus Project scenario on Gilman Springs Road must therefore be considered significant and unavoidable. The City will work with Riverside County to find funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

Intersection Direct Impacts. The project's direct impacts on study intersections are summarized in Table 4.15.AW. These impacts and the associated improvements necessary to obtain the target LOS would be:

- **Redlands Boulevard/Locust Avenue Intersection (IN-10)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing the intersection and adding left turn lanes on the eastbound and westbound approaches to the intersection would reduce project impacts to a less than significant level. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.

Table 4.15.AV: Existing plus Project Direct Impacts and Mitigation Measures on Roadway Segments

Study Roadway	From (A)	To (B)	Jurisdiction (C)	LOS Standard* (D)	Existing LOS (E)	Does the Project Have a Significant Impact? (F)	Mitigation Measures Required to Reduce Project Impacts to Less than Significant (G)	Is Mitigation Feasible? (H)	LOS After Feasible Mitigations are Implemented (I)	Impact Significant After Mitigation? (J)	Is There an Existing Deficiency? (K)	Developer Action Required (L)
Road Section Direct Impacts that can be Mitigated to a Less than Significant Level												
S-22	Cactus Ave.	Readlands Blvd Extension	Moreno Valley	C	A	Yes	Widen to 4 lanes	Yes	A	No	No	Pay fair share (95.9%)
Road Section Cumulative Impacts that are Considered Significant and Unavoidable (because they are not under the control of the City of Moreno Valley)												
S-16	Gilman Springs Rd	Alessandro Blvd (Street C)	Riverside County	D	F	Yes	Widen to 4 lanes	Yes	C	No	Yes	Pay fair share (12.2%)
S-17	Gilman Springs Rd	SF-60 Alessandro Blvd (Street C)	Riverside County	D	E	Yes	Widen to 4 lanes	Yes	C	No	Yes	Pay fair share (17.9%)

* LOS standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

Indicates LOS exceeds the target level

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

THIS PAGE INTENTIONALLY LEFT BLANK

- **Redlands Boulevard/SR-60 Westbound Ramps Intersection (IN-13)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing the intersection and adding a right turn lane on the northbound approach to the intersection would reduce project impacts to a less than significant level. It should be noted that the National Bridge Inventory 2012 Inspection Database⁵ indicates that the Redlands Boulevard bridge over SR-60 was designed for MS18/HS20 design loads and has a sufficiency rating for 94.5. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.
- **Oliver Street/Alessandro Boulevard Intersection (IN-20)** already exceeds the LOS threshold in the a.m. peak hour and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Changing from side-street stop control to all-way stop control would reduce project impacts to a less than significant level. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.
- **Redlands Boulevard/Cactus Avenue Intersection (IN-27)** currently operates within the LOS threshold but would exceed the threshold in both the a.m. and p.m. peak hour under Existing Plus Project conditions. Signalizing the intersection and adding left turn lanes on the eastbound and westbound approaches to the intersection would reduce direct project impacts to a less than significant level. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.
- **Moreno Beach Drive/John Kennedy Drive Intersection (IN-28)** currently operates within the LOS threshold but would exceed the threshold in the p.m. peak hour under Existing Plus Project conditions. Adding a westbound left-turn lane would reduce direct project impacts to a less than significant level. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.
- **Moreno Beach Drive/Ironwood Avenue Intersection (IN-36)** currently operates within the LOS threshold but would exceed the threshold in the a.m. peak hour under Existing Plus Project conditions. Adding a northbound right-turn lane would reduce direct project impacts to a less than significant level. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.
- **Moreno Beach Drive/SR-60 Eastbound Ramps Intersection (IN-37)** already exceeds the LOS threshold in the p.m. peak hour and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Adding an eastbound right-turn lane would reduce project impacts to a less than significant level. At the time of publication, improvements were already being made to the intersection.
- **Lasselle Street/Cactus Avenue Intersection (IN-53)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Constructing an additional lane for the westbound left turn, northbound left turn, and southbound left turn, and modifying the traffic signal to provide overlap phasing for northbound right turns and eastbound right turns would reduce cumulative project impacts to a less than significant level. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval.
- **Arlington Avenue/Victoria Avenue Intersection (IN-94)** currently operates within the LOS threshold but would exceed the threshold in the a.m. peak hour under Existing Plus Project conditions. Adding an additional westbound left-turn lane would reduce direct project impacts to a less than significant level.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

This intersection is under the jurisdiction of the City of Riverside. The City of Moreno Valley will require the developer to pay a fair share contribution towards this improvement as a condition of approval. However, because the intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Alessandro Boulevard/Chicago Avenue intersection (IN-95)** is already built out to near the practical limit before grade separation is required (it has five lanes for each approach). Despite this, it already operates at LOS "E" in the p.m. peak period and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. To achieve the target LOS under Existing Plus Project conditions, the addition of another northbound left-turn lane (with adjusted signal timing) would be required.

This intersection is under the jurisdiction of the City of Riverside. The City of Moreno Valley will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. However, because this intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Bridge Street/Ramona Expressway Intersection (IN-122)** currently operates within the LOS threshold but would exceed the threshold in the a.m. and p.m. peak hours under Existing Plus Project conditions. Signalizing the intersection would reduce direct project impacts to a less than significant level. However, there is a plan to close this intersection in the future and replace it with a grade-separated crossing west of the current location as part of the Villages of Lakeview project. It may not be worthwhile to signalize this intersection for only a few years before closing it.

This intersection is under the jurisdiction of the Riverside County. However, because the intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Gilman Springs Road/Bridge Street Intersection (IN-123)** already exceeds the LOS threshold in a.m. peak hour and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing this intersection would reduce project impacts to a less than significant level.

This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair share contribution towards this improvement as a condition of approval. However, because the intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

Table 4.15-AW: Existing plus Project Direct Impacts and Mitigation Measures on Intersections

Study Intersection	Jurisdiction	LOS Standard	Existing Conditions			Existing Plus Build-out			Does the Project Have a Significant Impact?	Mitigation Measures Required to Reduce Impacts to Less-Than-Significant	Is Mitigation Feasible?	LOS After Feasible Mitigations are Implemented			Impact Significant After Feasible Mitigations are Implemented?	Is There an Existing Deficiency?	Developer Action Required	
			AM	PM	PMI	AM	PM	PMI				AM LOS	PM LOS	PMI LOS				
Intersection Direct Impacts that can be Mitigated to a Less-Than-Significant Level

THIS PAGE INTENTIONALLY LEFT BLANK

- **SR-79 (Sanderson Avenue) Northbound/Gilman Springs Road Intersection (IN-124)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing this intersection would reduce project impacts to a less than significant level.

This intersection is under the jurisdiction of the Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the County of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **SR-79 (Sanderson Avenue) Southbound/Gilman Springs Road Intersection (IN-125)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing this intersection would reduce project impacts to a less than significant level.

This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **San Timoteo Canyon Road/Alessandro Road Intersection (IN-132)** already exceeds the LOS threshold in the a.m. peak hour and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing this intersection would reduce project impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Redlands. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. However, because the intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Redlands to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **San Timoteo Canyon Road/Live Oak Canyon Road Intersection (IN-133)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing this intersection would reduce project impacts to a less than significant level.

This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **Redlands Boulevard/San Timoteo Canyon Road Intersection (IN-134)** already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic using the intersection would experience longer delays resulting in an impact in the Existing Plus Project scenario. Signalizing this intersection and adding an eastbound right-turn storage lane with an overlap phase would reduce project impacts to a less than significant level.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

Freeway Direct Impacts. Unlike the surface streets, where intersection improvements are generally both feasible and desirable, the strategic situation for freeways in western Riverside County is such that major freeway improvements are becoming increasingly problematic over time. A key problem is that the rights-of way are essentially built out in many locations and cannot be expanded without severe impacts to existing communities (loss of homes and businesses, visual intrusion, increased noise and air quality impacts, etc.) and high costs to replace overcrossing structures. Moreover, there is a growing consensus that over-provision of freeway capacity facilitates long-distance commuting by car and leads to more auto-oriented residential development on the urban fringe, which in turn increases greenhouse gas emissions. This has resulted in a policy shift away from continued expansion of the freeway system, as reflected, for example, in the Riverside County Transportation Commission Ordinance No. 02-001 which reads in part:

“State Routes 91 and 60 and Interstate Routes 15 and 215 cannot cost effectively be widened enough to provide for the traffic expected as Riverside County continues to grow. In addition to the specific highway improvements listed in Section 1 above, congestion relief for these highways will require that new north–south and east-west transportation corridors will have to be developed to provide mobility within Riverside County and between Riverside County and its neighboring Orange and San Bernardino Counties.”

In other words, as a matter of policy, with the exception of spot improvements in some specific locations, the overall strategy to relieve congestion on SR-60 and SR-91 is to improve the capacity of surface streets that could serve as alternate routes to freeways. The policy to forego further widening of some sections of SR-60 and SR-91 is also noted in the Riverside County Congestion Management Program (CMP) which permits LOS F for some of the study freeway sections because those sections already operated at LOS F when the CMP was established in 1991. For these reasons, some of the identified mitigation measures may not be pursued even if they are deemed feasible in an engineering sense. In such cases, the project's payment into the TUMF and DIF programs and funding for the surface street improvements would constitute their mitigation because they help create viable alternative routes that would substitute for freeway travel for some trips. For the purposes of this EIR, however, impacts to freeways were treated as significant and unavoidable.

The project's direct impacts on the regional freeway system are summarized in Table 4.15.AX. These impacts and the associated improvements necessary to obtain the target LOS would be:

- **Direct Impacts on Freeway Mainline Basic Sections**

- *Eastbound SR-60 from Euclid Avenue to Grove Avenue (F-6) already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.⁶*

SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City

⁶ A transportation concept report is Caltrans' analysis of long-range demand for a highway.

of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- *Eastbound SR-60 from Martin Luther King Boulevard to Central Avenue (F-24)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The Transportation Concept Report does not call for further widening of this section, because further widening could only be accomplished by eliminating the existing shoulder resulting in no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.
- *Westbound SR-60 from I-215 to Day Street (F-27)* already exceeds the LOS threshold in the a.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

Westbound SR-60 from Pigeon Pass Road/Frederick Street to Heacock Street (F-29) currently operates at an acceptable LOS but would exceed the LOS threshold in the p.m. peak hour under Existing Plus Project conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- *Westbound SR-91 from Pierce Street to Magnolia Avenue (F-41)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- *Westbound SR-91 from Magnolia Avenue to La Sierra Avenue (F-42)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within

** Improvement identified in the current RTP and planned to be completed independent of the WLC project

* Not applicable because mitigation is infeasible

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

THIS PAGE INTENTIONALLY LEFT BLANK

the target threshold. However, this could only be accomplished by eliminating the existing shoulder resulting in no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.

- *Eastbound SR-91 from Central Avenue to 14th Street (F-49)* currently operates at an acceptable LOS but would exceed the LOS threshold in the a.m. peak hour under Existing Plus Project conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution toward improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- *Northbound I-215 from SR-74/Case Road to Redlands Boulevard (F-71)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.
- *Southbound I-215 from SR-74/Case Road to Redlands Boulevard (F-71)* already exceeds the LOS threshold in the a.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.
- *Southbound I-215 from Baseline Road to Highland Avenue (F-83)* already exceeds the LOS threshold in both the a.m. and p.m. peak hours and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would reduce the impact to a less than significant level. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.

- ***Direct Impacts on Freeway Weaving Sections***

- *Eastbound SR-60 from SR-91 to W. Blaine Street/3rd Street (W-21)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.
- *Eastbound SR-60 from W Blaine Street/3rd Street to University Avenue (W-22)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a second off-ramp lane would bring the LOS to within the target threshold.

SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- *Eastbound SR-60 from Central Avenue to Fair Isle Drive/Box Springs Road (W-25)* currently operates near capacity and the addition of the project would increase traffic above the target LOS threshold. Adding a mixed-flow lane would reduce the impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without eliminating the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.

Westbound SR-60 from Central Avenue to Fair Isle Drive/Box Springs Road (W-25) already exceeds the LOS threshold in the a.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level and bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.

- *Eastbound SR-91: Arlington Avenue to Central Avenue (W-48)* already exceeds the LOS threshold in the a.m. peak hour and traffic density would increase, resulting in an impact in the Existing Plus Project scenario. Adding a second off-ramp lane would bring the LOS to within the target threshold.

SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- *Westbound SR-91 from 14th Street to University Avenue (W-50)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a second off-ramp lane would reduce the impact to a less than significant level.

SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Direct Impacts on Freeway Ramps**

- *Eastbound SR-60 from On-Ramp from Central Avenue (R-2)* already exceeds the LOS threshold in the p.m. peak hour and traffic density would increase resulting in an impact in the Existing Plus Project scenario. Adding a mixed-flow lane would reduce the impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without eliminating the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.

PROJECT CUMULATIVE IMPACTS (LONG-TERM)

The long-term cumulative impacts of the WLC project were determined by comparing the LOS of study facilities under 2035 No Project and 2035 Plus Project conditions.

The long-term cumulative impacts of the project and the associated improvement measures necessary to obtain the target LOS are described below. In cases where the facility had mitigation measures identified for direct (Existing Plus Project) impacts and requires additional improvements under cumulative conditions, the improvements described below are the improvements required beyond those described in the previous section on direct impacts.

Cumulative Impacts on Road Sections. The project's direct impacts on road sections are summarized in Table 4.15.AY. These impacts would be:

- ***Gilman Springs Road from Alessandro Boulevard to Bridge Street (S-16)*** should be widened from 2 lanes to 4 lanes in the short term (see previous section on direct impacts) and may need to be further widened from 4 lanes to 8 lanes sometime in the 2022–2035 timeframe. Gilman Springs Road is a TUMF facility. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because Gilman Springs Road is partially a Riverside County facility and is thus partially outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made outside of its jurisdiction. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to six lanes between Alessandro Boulevard and Bridge Street, or even preclude any widening at all. The project's impacts on Gilman Springs Road must therefore be considered significant and unavoidable. The City will work with Riverside County and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

Cumulative Impacts on Study Intersections. The WLC project's cumulative impacts on study intersections are summarized in Table 4.15.AZ, and described in detail below:

- ***Redlands Boulevard/Ironwood Avenue Intersection (IN-11)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a second southbound left-turn lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- ***Theodore Street/Ironwood Avenue Intersection (IN-12)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Signalizing the intersection would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- ***Moreno Beach Drive/Cactus Avenue Intersection (IN-25)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a second eastbound left-turn lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- ***Redlands Boulevard/Cactus Avenue intersection (IN-27)*** requires signalization and the installation of eastbound and westbound left-turn lanes in the short term (see previous section on direct impacts) and may exceed the target LOS threshold at some point in the 2022-to 2035 period. Constructing a westbound left-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.

S-16	Gilman Springs Rd	Alessandro Blvd (Street C)	Riverside County	D	D	F	Yes	Widen to 8 lanes	Partially (to 6 lanes)	F	Yes	Yes	Pay Fair Share (12.2%)

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.
 ** WLC's impacts would already be mitigated with the measures identified for direct impacts.
 █ Indicates LOS exceeds the target level

IN-131	Riverside County	C	D	F	D	F	Yes	Adjusted NB approach to a dedicated LT and a shared LT/RT lane.	Yes	B	C	No	Yes	No	Pay TUMF

Notes: "CSS" means cross-street is stop-controlled "RABT" means roundabout "NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

"AM" and "PM" means all-way stop

* Not applicable because mitigation is infeasible

** The "Plus Build-out and Mitigations" condition is better than the "No-Project" condition

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

"LT" and "RT" denote left turn and right turn respectively

"TH" denotes through lanes

Moreno Beach Drive/Locust Avenue Intersection (IN-35) will exceed the target LOS threshold at some point in the 2022–2035 period. Signalizing the intersection and constructing a westbound left-turn lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.

- **Moreno Beach Drive/Ironwood Avenue Intersection (IN-36)** will exceed the target LOS threshold at some point in the 2022–2035 period. Adding northbound and southbound left-turn lanes and changing north/south lefts from split to protected left-turn phase would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- **Moreno Beach Drive/SR-60 EB Ramps Intersection (IN-37)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a southbound left-turn lane and changing the eastbound approach to one left-turn lane and one through lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- **Iris Avenue/Perris Boulevard Intersection (IN-39)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a second westbound left-turn lane and a second southbound left-turn lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- **Kitching Street/Iris Avenue Intersection (IN-40)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a third eastbound through lane, a second westbound left-turn lane, widening and reconfiguring the northbound approach to provide one left-turn lane, one through lanes, and two right-turn lanes, and modifying the traffic signal to provide overlap phasing for the northbound right-turn movement would reduce cumulative impacts to a less than significant level. The City will impose as a condition of approval that the WLC will provide fair-share funds to cover the cost of this improvement, which the City will use to construct the needed improvements.
- **Lasselle Street/Iris Avenue Intersection (IN-41)** will exceed the target LOS threshold at some point in the 2022–2035 period. Adding a third westbound left-turn lane and an eastbound right-turn lane would reduce cumulative impacts to a less than significant level. This improvement is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Graham Street/Alessandro Boulevard Intersection (IN-57)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a northbound left-turn lane and a westbound left-turn lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- **Alessandro Boulevard/Sycamore Canyon Boulevard Intersection (IN-66)** will exceed the target LOS threshold at some point in the 2022–2035 period. Providing a southbound right-turn overlap phase at the signal would reduce cumulative impacts to a less than significant level.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***I-215 NB Ramps/Cactus Avenue Intersection (IN-73)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing an eastbound right-turn lane, a westbound right-turn lane, a second northbound left-turn lane, and a second southbound left-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the March AFB Joint Powers Authority. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the March AFB Joint Powers Authority and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***Elsworth Street/Cactus Avenue Intersection (IN-74)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Widening the northbound approach to provide three left-turn lanes, one through lane, and one right-turn lane, and adding a westbound left-turn lane and eastbound right-turn lane would reduce cumulative impacts to a less than significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF funds in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection when the need for the improvement becomes warranted.
- ***Central Avenue/Lochmoor Drive Intersection (IN-75)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Converting the northbound approach to one left-turn lane and a shared left-right-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***Alessandro Boulevard/Mission Grove Parkway Intersection (IN-80)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Modifying the traffic signal to provide an additional eastbound left-turn, westbound left-turn, and northbound through lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the

City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***Martin Luther King Boulevard/I-215 Northbound Ramps Intersection (IN-85)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Signalizing the intersection would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is not eligible for TUMF funding. The City will work with the City of Riverside to establish a mechanism for collecting and distributing payments from developers for inter-jurisdictional impacts not covered by the TUMF program. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- ***Central Avenue/Chicago Avenue Intersection (IN-86)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Modifying the traffic signal to provide overlap phasing for the northbound right-turn movement would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***Central Avenue/Canyon Crest Drive Intersection (IN-88)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a southbound right-turn lane (and adjust signal timings), an eastbound right-turn lane, a second westbound left-turn lane, and a second northbound left-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***Arlington Avenue/Riverside Avenue/SR-91 Southbound Ramps Intersection (IN-90)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a third southbound left-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- ***Arlington Avenue/Victoria Avenue Intersection (IN-94)*** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a fourth eastbound through lane, a second

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

westbound left-turn lane, and a second westbound right-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- **Alessandro Boulevard/Chicago Avenue Intersection (IN-95).** This intersection is already built out to near the practical limit before grade separation is required (it has five lanes for each approach). Despite this, it already operates at LOS F in the p.m. peak period. To achieve the target LOS in 2035 would require the addition of lanes to the eastbound through, westbound left-turn, westbound through, northbound left-turn, southbound left-turn, and southbound right-turn movements. There are established residential communities on each corner that would be impacted by such a widening or by grade separation. These mitigation measures are thus likely to be infeasible, and the project impact at this location is therefore considered to be a significant and unavoidable.
- **Alessandro Boulevard/Canyon Crest Drive Intersection (IN-98)** will exceed the target LOS threshold at some point in the 2022–2035 period. Widening and reconfiguring the eastbound approach to provide one left-turn lane, one through lane, and two right-turn lanes; adding an additional westbound through lane; adding an additional northbound left-turn and northbound right-turn lane; and reconfiguring the southbound approach to one left-turn lane, three through lanes, and one shared through-right-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- **Ramona Expressway/Indian Street Intersection (IN-101)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing one eastbound right-turn lane, a second northbound left-turn lane, and one northbound right-turn lane, and modifying the traffic signal to provide overlap phasing for all right-turn movements would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Perris. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- **Evans Road/Rider Street Intersection (IN-107)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing an exclusive right-turn lane on the southbound approach would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Perris. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

- **W. 6th Street/California Avenue Intersection (IN-129)** will exceed the target LOS threshold at some point in the 2022–2035 period. Signalizing this intersection would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the City of Beaumont. Although it is a TUMF facility, signalization is not currently eligible for TUMF funding. The City will work with the City of Beaumont to establish a mechanism for collecting and distributing payments from developers for inter-jurisdictional impacts not covered by the TUMF program. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **W. 6th Street/Beaumont Avenue Intersection (IN-130)** will exceed the target LOS threshold at some point in the 2022–2035 period. Constructing a northbound right-turn lane, an eastbound right-turn lane, a second southbound left-turn lane, a second westbound left-turn lane, removing on-street parking and restriping to provide a second westbound through lane, modifying the traffic signal to provide protected phasing for eastbound and westbound left-turn movements, and overlap phasing for northbound and eastbound right-turn movements would reduce cumulative impacts to a less than significant level.

There are established commercial buildings on the corners on the northern part of the intersection that would be impacted by such a widening. These mitigation measures are thus infeasible, and the project impact at this location is therefore considered to be significant and unavoidable.

- **Reche Canyon Road/Reche Vista Drive Intersection (IN-131)** will exceed the target LOS threshold at some point in the 2022–2035 period. Converting the existing right-turn lane into a shared left-turn-and-right-turn lane would reduce cumulative impacts to a less than significant level.

This intersection is under the jurisdiction of the Riverside County. It is eligible for TUMF funding. The City will collect TUMF payments in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the Riverside County and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection when the need for the improvement becomes warranted.

Cumulative Freeway Mainline Mitigations. The WLC's cumulative impacts on the freeways system are summarized in Table 4.15.BA, and described in detail below:

THIS PAGE INTENTIONALLY LEFT BLANK

Table 4.15.BA.1: Year 2035 Cumulative Impacts and Mitigation Measures on Freeway Facilities

Study Facility	Jurisdiction	LOS Standard	Determination of Impact						Mitigation Measures Required to Reduce Impact to Less-Than-Significant	Is Mitigation Feasible?	LOS After Feasible Mitigations are Implemented			Impact Significant After Feasible Mitigations are Implemented?	Is There an Existing Deficiency?	Developer Action Required

* Indicates LOS exceeds the target level

** Although the target LOS is not met, conditions with the project and the mitigation measure would be better than No-Project conditions

*** The mitigation measures are in addition to the mitigation measure needed for direct Project impacts (see Table 76)

**** The additional lane needed between Redlands Blvd. and Moreno Beach Dr. as mitigation for R-16 is the same lane that is needed to mitigate impacts to R-17. Only one lane is needed; not one for R-16 and a second for R-17.

Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.

- **Eastbound SR-60 from Reservoir Street to Ramona Avenue (F-2)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

The state freeway system is owned and operated by Caltrans and is thus outside the jurisdiction of the City of Moreno Valley. The City will work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements. However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, this and all other freeway impacts must be considered as significant and unavoidable.

- **Westbound SR-60 from Reservoir Street to Ramona Avenue (F-2)** already exceeds the target LOS threshold and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold, resulting in a less than significant impact.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Ramona Avenue to Central Avenue (F-3)** already exceeds the LOS threshold and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Central Avenue to Mountain Avenue (F-4)** already exceeds the LOS threshold and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Mountain Avenue to Euclid Avenue (F-5)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Mountain Avenue to Euclid Avenue (F-5)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

The existing freeway right-of-way in this section cannot accommodate additional lanes and the right-of-way cannot be expanded without severe impacts to the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from Euclid Avenue to Grove Avenue (F-6)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

The existing freeway right-of-way in this section cannot accommodate additional lanes and the right-of-way cannot be expanded without severe impacts to the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Eastbound SR-60 from Grove Avenue to Vineyard Avenue (F-7)** already exceeds the LOS threshold and traffic density would increase and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Grove Avenue to Vineyard Avenue (F-7)** will exceed the target LOS threshold at some point in the 2022–2035 period this intersection. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Vineyard Avenue to Archibald Avenue (F-8)** already exceeds the LOS threshold and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Archibald Avenue to Haven Avenue (F-9)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Valley Way to Rubidoux Boulevard (F-17)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Valley Way to Rubidoux Boulevard (F-17)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means to either widen the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Rubidoux Boulevard to Market Street (F-18)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Market Street to Main Street (F-19)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Market Street to Main Street (F-19)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Main Street to SR-91 (F-20)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- **Westbound SR-60 from Martin Luther King Boulevard to Central Avenue (F-24)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Fair Isle Drive/Box Springs Road to I-215 (F-26)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Pigeon Pass Road/Frederick Street to Heacock Street (F-29)** currently operates at an acceptable LOS but will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Heacock Street to Perris Boulevard (F-30)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Heacock Street to Perris Boulevard (F-30)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Redlands Boulevard to Theodore Street (F-34)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing

that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Gilman Springs Road to Jack Rabbit Trail (F-36)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

Caltrans already has plans to build a truck climbing lane in this area. However, as explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Jack Rabbit Trail to Potrero Road (F-37)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

Caltrans already has plans to build a truck climbing lane in this area. However, as explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Pierce Street to Magnolia Avenue (F-41)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from La Sierra Avenue to Tyler Street (F-43)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from La Sierra Avenue to Tyler Street (F-43)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Tyler Street to Van Buren Boulevard (F-44)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Van Buren Boulevard to Adam Street (F-45)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Adam Street to Madison Street (F-46)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-91 from Madison Street to Indiana Avenue (F-47)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from SR-60 to Beaumont Avenue (F-52)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from SR-60 to Beaumont Avenue (F-52)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from Pennsylvania Avenue to Highland Springs Avenue (F-54)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would

increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Pennsylvania Avenue to Highland Springs Avenue (F-54)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from Highland Springs Avenue to Sunset Avenue (F-55)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Highland Springs Avenue to Sunset Avenue (F-55)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from 8th Street to S. Hargrave Street (F-58)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from 8th Street to S. Hargrave Street (F-58)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

- **Eastbound I-10 from S. Hargrave Street to Field Road (F-59)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from Main Street (Cabazon) to Main Street (F-61)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Southbound I-215 from SR-74 to Ellis Avenue (F-71¹)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-215 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Southbound I-215 from Center Street to Iowa Avenue/La Cadena Drive (F-75)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Southbound I-215 from Baseline Road to Highland Avenue (F-83)** will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than-significant level. The freeway right-of-way in this section cannot accommodate an additional lane (beyond the lane already identified in the current SCAG RTP) and cannot be widened without impacting the adjacent railroad. Since widening the freeway is infeasible, this impact is significant and unavoidable.

Cumulative Freeway Weaving Mitigations

- **Eastbound SR-60 from SR-71/Garey Avenue to Reservoir Street (W-1)** already exceeds the target LOS threshold and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

¹ I-215 currently runs unbroken between SR-74 and Redlands Avenue. The RTP includes a project (3M0731) that would split this freeway mainline section by adding a new interchange at Ellis Avenue. For this reason, this freeway section is listed as "I-215 SR-74 to Redlands" on tables describing conditions prior to construction of the Ellis Avenue interchange.

SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impact on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Haven Avenue to Archibald Avenue (W-9)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Main Street to SR-91 (W-20)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from SR-91 to W. Blaine Street/3rd Street (W-21)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from W Blaine Street/3rd Street to University Avenue (W-22)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from University Avenue to Martin Luther King Boulevard (W-23)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a second on-ramp lane would reduce the cumulative impact to a less than significant level.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Central Avenue to Faire Isle Drive/Box Springs Road (W-25)** already exceeds the LOS threshold and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Day Street to Pigeon Pass Road/Frederick Street (W-28)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

Cumulative Freeway Ramp Mitigations

- **Eastbound SR-60 from On-Ramp from Martin Luther King Boulevard (R-1)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would reduce the cumulative impact to a less than significant level. The Transportation Concept Report does not call for further widening of this section, which could only be accomplished by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.
- **Eastbound SR-60 from On-Ramp from Gilman Springs Road (R-10)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for freeway mainline segment F-36.)

Caltrans has plans to re-configure the SR-60/Gilman Springs Road interchange in the future. However, as explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from On-Ramp from Theodore Street (R-14)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for freeway mainline segment F-34.)

The City has a study underway to develop alternative designs for this interchange. The City will collect a fair-share contribution from the developer to implement this improvement in conjunction with the reconfiguration of the SR-60/Theodore Street Interchange. It should be noted the National Bridge Inventory 2012 Inspection Database¹ indicates that the Theodore Street bridge over SR-60 was designed for MS18 design loads and has a sufficiency rating for 97.9.

- **Westbound SR-60 from Off-Ramp to Redlands Boulevard (R-15)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring

¹ <http://nationalbridges.com/> Federal Highway Administration, searchable database last updated 2012

the LOS to within the target threshold, resulting in a less than significant impact. (This improvement is already identified as the mitigation for freeway mainline segment F-34.)

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Direct On-Ramp from Redlands Boulevard (R-17)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Off-Ramp to Central Avenue (R-18)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for freeway weaving segment W-25 in the direct impacts and mitigation list, Table 4.15.AX.)

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Off-Ramp to Martin Luther King Boulevard (R-19)** will exceed the target LOS threshold at some point in the 2022–2035 period and traffic density would increase resulting in a cumulative impact in the Year 2035 Plus Project scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for freeway mainline segment F-24.)

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

4.15.7.4 Mitigation Measures

- **4.15.7.4A** A traffic impact analysis (“TIA”) conforming to the guidelines for traffic impact analysis adopted by the City shall be submitted in conjunction with each Plot Plan application within the World Logistics Center Specific Plan. Prior to the approval of the Plot Plan, the City shall review the traffic impact analysis to determine if any of the traffic improvements listed in Final EIR Volume 2 Tables 4.15.AV through 4.15.BA (TIA Tables 74 through 79) of the traffic impact analysis prepared for the Program Environmental Impact Report are required to be completed prior to the issuance of a certificate of occupancy for each building. If the City determines that any of the improvements within Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated into insignificance, then the completion of construction of the improvements prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. Construction of improvements within the City shall be subject to credit/reimbursement agreement for those DIF and/or TUMF eligible costs. If the City determines that any of

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

the improvements outside Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated to a less than significant level, then the payment of any necessary fair share contribution as prescribed in Mitigation Measure 4.15.7.4G prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. If the City determines that the traffic impacts which will result from the construction or operation of a building will be significantly more adverse than those shown in the Program Environmental Impact Report, further environmental review shall be conducted prior to the approval of the Plot Plan pursuant to Public Resources Code § 21166 and CEQA Guidelines § 15162 to determine what additional mitigation measures, if any, will be required in order to maintain the appropriate levels of service.

- 4.15.7.4B** As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require the dedication of appropriate right-of-way consistent with the Subdivision Map Act for frontage street improvements contained within the World Logistics Center Specific Plan Circulation Map, as shown in this Program EIR Figure 3-10 (or Figure 22 in the TIA prepared for this Program EIR). Required dedications shall be made prior to the issuance of occupancy permits for the requested development.
- 4.15.7.4C** As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the Development Impact Fee (DIF) as set forth in Municipal Code Chapter 3.42. Required DIF payments shall be made prior to the issuance of occupancy permits for the requested development.
- 4.15.7.4D** As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the requisite Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Sections 3.55.050 and 3.55.060. Required TUMF payments shall be made prior to the issuance of occupancy permits for the requested development.
- 4.15.7.4E** In order to ensure that all of the Project's traffic impacts are mitigated to the greatest extent feasible, the Applicant shall contribute its fair share of the cost of the needed traffic improvements that are not within the City as identified in the World Logistic Center Specific Plan Traffic Impact Analysis (i.e., under the jurisdiction of other cities, the County of Riverside or Caltrans, pursuant to Mitigation Measure 4.15.7.4F). As used in this mitigation measure, the Applicant's "fair share" has been determined in compliance with the requirements of the Fee Mitigation Act, Government Code § 66000 et seq., and, pursuant to § 66001(g), does not require that the Applicant be responsible for making up for any existing deficiencies.

For example, the intersection of Martin Luther King Blvd. and the I-215 northbound ramps (Intersection 85) in the City of Riverside was identified as a place where the World Logistic Center contributes to cumulatively significant impacts, and where the fair share contribution of the World Logistic Center project as a whole was computed to be 6.2%. If the City of Riverside establishes a fair share contribution program consistent with this Mitigation Measure 4.15.7.4F to improve that intersection, then when a certificate of occupancy is to be issued for a 2-million square feet high-cube warehouse in the World Logistic Center (approximately 5% of the entire World Logistic Center project) the amount of the fair share payment due from the Applicant to the City of Riverside would be computed as follows:

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Amount Due	=	Total cost of Improvement	×	Total World Logistics Center fair share (6.2%) as determined by Traffic Impact Analysis	×	% attributable to the building that is subject to the certificate of occupancy (5%)
------------	---	---------------------------	---	---	---	---

$A \times B \times C = D$
<p>A= % attributable to the building that is subject to the certificate of occupancy (5%) B= Total World Logistics Center fair share (6.2%) as determined by Traffic Impact Analysis C= Total cost of Improvement D= Amount Due</p>

A similar calculation would be done for each subsequent building, with payments for each due at the time of issuance of the certificate of occupancy. As a result, while each building individually would not produce a significant impact, and therefore would not be required to pay any mitigation fees if considered by itself, the total amount of the payments for all of the buildings would be equal to the fair share payment for the entire World Logistic Center to the extent that the responsible jurisdiction has chosen to adopt a fair share contribution funding program consistent with Mitigation Measure 4.15.7.4F.

4.15.7.4F The Applicant shall pay a portion of the fair share of the cost of traffic improvements identified in the Transportation Impact Analysis for those significantly impacted road segments and intersections for each warehouse building within the World Logistics Center if the impacted jurisdiction has established a fair share contribution program prior to the approval of a building-specific plot plan. The City shall determine whether a fair share program exists in the impacted jurisdiction and, if one does exist, require that the appropriate fees are paid by the Applicant, consistent with the requirements below, prior to the issuance of a certificate of occupancy for the building in question. If no fair share program exists or if the existing programs are not consistent with the requirements below, then no payment of fees shall be required. The impacts are to be determined on a road segment or intersection basis. Nothing in this condition requires the payment of a traffic impact fee imposed by another jurisdiction which covers improvement to facilities where the project does not have a significant impact. Fair-share contributions will be determined on a building-by-building basis as a share of the impact of the Project as a whole (for each segment or intersection where the World Logistics Center project as a whole has a significant impact identified in the Programmatic Environmental Impact Report) as determined by the Traffic Impact Analysis and will be due as each certificate of occupancy is issued. The fair share payments for the significantly impacted road segments and intersections identified in the Programmatic Environmental Impact Report will be required even though the impact resulting from a specific building does not, by itself, cause a significant impact.

4.15.7.4G City shall work directly with Western Riverside Council of Governments to request that Transportation Uniform Mitigation Fee funding priorities be shifted to align with the needs of the City, including improvements identified in the World Logistics Center Specific Plan traffic impact analysis. Toward this end, City shall meet regularly with Western Riverside Council of Governments.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Congestion Management

In addition to and in concert with the mitigation measures defined above for or traffic impacts, the World Logistics Center would incorporate a number of measures that reduce single occupancy vehicle trips as part of design features and required mitigation measures to reduce air quality impacts. These design features and measures, described in more detail in Section 4.3 Air Quality, would create alternatives to single occupancy vehicle trips for those individuals that would be employed at the World Logistics Center. These measures include:

- Participation in Riverside County’s Rideshare Program
- Class II bike lanes for all project streets
- Pedestrian pathways throughout the project site
- Pedestrian connections to nearby residential areas
- Provision of bicycle storage space
- Preferential carpool/vanpool parking

In addition, the World Logistics Center Specific Plan requires that mass transit features, such as bus stops, be incorporated into the project, based on consultation with the Riverside Transit Agency.

4.15.7.5 Level of Significance after Mitigation

Even with implementation of **Mitigation Measures 4.15.7.4.A through 4.15.7.4.G**, and implementation of all the improvements identified in Tables 4.15.AV through 4.15.BA, direct and cumulative impacts on study area roadway segments, intersections, and freeway facilities would not be reduced to less than significant levels, including all improvement locations not under the control of the lead agency (i.e., outside of the City of Moreno Valley). This is because the primary determinant of the level of significance after mitigation is the agency responsible for the transportation facility in question. The City has no means for controlling when transportation improvements are made outside of its jurisdiction, and therefore, cannot guarantee when such improvements would be made. These roadways, intersections, and freeway facilities are grouped into four categories based on the jurisdiction the transportation facility is located and are summaries as follows.

On-Site Improvements. These are improvements and changes to the road system within the WLC project site that are being undertaken as part of the WLC project. The developer shall be responsible for constructing the improvements described in the TIA (Chapter 4, “Proposed Road Network”) in accordance with City standards for roadway construction and the roadway cross-sections in the proposed Specific Plan. Completion of these improvements shall constitute the developer’s mitigation of the project’s on-site impacts. When these improvements are completed, the project’s impacts on the roadway system within the WLC project site will be mitigated to a less-than-significant level.

Off-Site Improvements for Non-TUMF Roads Under the Jurisdiction of the City of Moreno Valley. These are improvements and changes to public streets in Moreno Valley that are outside the area covered by the proposed WLC Specific Plan Amendment. The developer shall be responsible for paying the DIF as set forth in Municipal Code Chapter 3.42 which the City shall use to implement the mitigation measures identified in Tables 4.15.AV, 4.15.AW, 4.15.AY, and 4.15.AZ (TIA Tables 74, 75, 77, and 78) pertaining to DIF facilities. The developer shall also be required to pay its fair share of the improvements to City streets that are not in the DIF program where there are significant project impacts. These payments shall constitute the developer’s mitigation of project impacts on this

category of roads. When these improvements are completed, the project's impacts on the City roadway and intersection system will be mitigated to a less-than-significant level.

Off-Site Improvements to TUMF Facilities. These are improvements and changes to roads and intersections that are part of the TUMF Regional System of Highways and Arterials, some of which are under the jurisdiction of Moreno Valley and others are located in other jurisdictions. The developer shall be responsible for paying the TUMF fees in effect at the time of approval. These payments shall constitute the developer's mitigation of project impacts to this category of roads and intersections.

The City shall implement the mitigation measures identified in Tables 4.15.AV, 4.15.AW, 4.15.AY, and 4.15.AZ pertaining to TUMF facilities under the City's jurisdiction. When these improvements are completed, the project's impacts on the roadway and intersection system within the WLC project site will be mitigated to a less than-significant level.

The City shall work with the other member agencies of WRCOG to program TUMF funds to implement the mitigation measures identified in 4.15.AV, 4.15.AW, 4.15.AY, and 4.15.AZ pertaining to TUMF facilities outside the jurisdiction of the City of Moreno Valley. To the extent that TUMF fees provided by the developer are used to implement the recommended improvements the project's impacts would be less-than-significant. However, because the City does not have direct control over TUMF funding the City cannot ensure that the identified improvements would be made. The project's impacts on these facilities must be considered significant and unavoidable.

Off-Site Improvements to Roads Outside the Jurisdiction of the City and Not Part of the TUMF Program. This category includes all of the recommended mitigation measures that are under the jurisdiction of Riverside County, Caltrans, and other municipalities and that are not included in the TUMF Regional System of Highways and Arterials.

At this time, the City does not have cooperative agreements with neighboring jurisdictions that would serve as a mechanism for collecting and distributing developer funds to cover the cost of cross-jurisdictions mitigation measures, other than the TUMF program. The City shall therefore work with the City of Redlands and Riverside County to collect funds from the developer and to implement the signalization of the San Timoteo Road/Alessandro Road intersection and the San Timoteo Road/Live Oak Canyon intersection (respectively). The City shall also work with the City of Riverside to collect a fair-share contribution from the developer to signalize the Martin Luther King Boulevard/I-215 northbound ramp intersection. To the extent that the City is able to establish such a mechanism (as described in Mitigation Measure 4.15.7.4F) and the other jurisdiction constructs the recommended improvement, the project's impacts would be less-than-significant. However, because the City cannot guarantee that such a mechanism will be established and does not have direct control over facilities outside of its jurisdiction the City cannot ensure that the identified improvements would be made. Thus, at this point the project's impacts on these facilities must be considered significant and unavoidable.

Similarly, the City has not entered into an agreement with Caltrans for the collection of developer payments for improvements to the state highway system other than freeway interchange improvements funded through the TUMF program. Nor has Caltrans established a program to collect fair-share contributions to freeway improvements such as those identified in Tables 4.15.AX and 4.15.BA. Instead, Caltrans has traditionally relied on other means to fund freeway improvements; means involving multiple stages of review and input from other agencies, with priorities and constraints applied at each stage, that preclude a direct connection between developer-provided fair-share funds and specific highway improvements.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Decisions on funding for improvements to the state highway system are made by four bodies, namely:

- **Legislature:** Establishes overall policies, including determining funding sources and distribution, and spending priorities through state statutes such as Revenue and Taxation Code, Streets and Highways Code, and Government Code. The Legislature appropriates funds through the annual budget for transportation projects and has authority to designate transportation projects statutorily.
- **California Transportation Commission (CTC):** The nine-member CTC, appointed by the Governor, reviews and adopts the state transportation programs and approves projects nominated by Caltrans and regional agencies for funding. The CTC recommends policy and funding priorities to the Legislature and is also responsible for project delivery oversight.
- **California Department of Transportation (Caltrans):** Caltrans owns, operates and maintains the state highway system. Caltrans plans, designs, and nominates interregional capital improvement projects on the state highway system and also manages the intercity rail operation.
- **Metropolitan Planning Organizations (MPOs) and Regional Transportation Planning Agencies (RTPAs):** MPOs and RTPAs are responsible for planning, coordinating and administering funds for regional transportation systems. In California, 17 MPOs and 48 RTPAs develop 20-year Regional Transportation Plans (RTPs) as well as 5-year Regional Transportation Improvement Program (RTIP), which identify projects for the regional portion of the State Transportation Improvement Program (STIP). SCAG is the MPO for Riverside County.

Most funds for improvements to the state highway system come through the State Highway Account (SHA), which receives funding from a variety of sources including:

- Motor vehicle fuel taxes, part of which goes into the Highway Users Tax Account, a portion of which goes to the SHA and the rest goes to cities and counties according to a statutory formula.
- The fuel tax swap, enacted in 2011 (Fuel Tax Swap Fix), reenacted the provisions of the Fuel Tax Swap of 2010 addressing issues raised by the passage of Propositions 22 and 26. The Fuel Tax Swap eliminated the state sales tax on gasoline and instead imposed an additional excise tax on gasoline of 17.3¢ (July 2010). The increase in the excise tax would generate revenues equivalent to what would have been collected from the state sales tax on gasoline. These revenues are intended for new road construction (STIP), highway maintenance and operations (SHOPP), and local roadways.
- The federal fuel tax, which goes into the Highway Trust fund for use on the portions of the system that are designated as federal aid highways.

In addition, local sales tax measures, such as Measure A in Riverside County, and the proceeds of Proposition 1B provide funding for improvements to certain portions of the state highway system.

The key feature of this system pertaining to the recommended freeway mitigation measures is that this system is outside the control of the City of Moreno Valley. The City shall work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements. However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, the project's impacts on the state highway system must be considered significant and unavoidable.

4.15.8 Summary of Project-Related Traffic Impacts

Based on the preceding analyses in Sections 4.15.5.1 through 4.15.6.4, the WLC project will have the following direct and cumulative air quality impacts:

Table 4.15.BB: Summary of Project-Related Traffic Impacts

Impact	Traffic and Circulation Topic/Issue	Impact Conclusion
4.15.5.1	Air Traffic Patterns	Less than Significant No Mitigation Required
4.15.5.2	Design Hazard Features	Less than Significant No Mitigation Required
4.15.5.3	Emergency Access	Less than Significant No Mitigation Required
4.15.5.4	Alternative Transportation Policies, Plans, or Programs	Less than Significant No Mitigation Required
4.15.6.1	Existing (2012) With Phase 1 Conditions Traffic and Level of Service	Less than Significant with Mitigation (on-site roads and intersections) Less than Significant with Mitigation (roads and intersections included in DIF within City) Less than Significant with Mitigation (roads and intersections included in TUMF within City) Significant and Unavoidable with Mitigation (roads and intersections included in TUMF outside City) Significant and Unavoidable with Mitigation (roads and intersections not in TUMF outside City) Significant and Unavoidable with Mitigation (all freeway mainline, weaving, and ramp facilities)
4.15.6.2	Existing (2012) With Project (Buildout) Conditions Traffic and Level of Service	Less than Significant with Mitigation (on-site roads and intersections) Less than Significant with Mitigation (roads and intersections included in DIF within City) Less than Significant with Mitigation (roads and intersections included in TUMF within City) Significant and Unavoidable with Mitigation (roads and intersections included in TUMF outside City) Significant and Unavoidable with Mitigation (roads and intersections not in TUMF outside City) Significant and Unavoidable with Mitigation (all freeway mainline, weaving, and ramp facilities)

NOTE TO READERS. *Revisions have been made to this section to address changes in the Specific Plan, revisions to the project hydrology study, and in response to comments regarding drainage and mitigation.*

4.16 UTILITIES AND SERVICE SYSTEMS

This section analyzes the existing and planned water supply, wastewater facilities, drainage or storm water facilities (as they relate to water), solid waste facilities, and natural gas and electrical facilities for the project site and the surrounding area, and evaluates the impacts to utility providers that could result from the construction and operation of the proposed on-site uses.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

This section is based on information obtained from utility providers serving the proposed WLC project site, most of which are included in Appendix J of this EIR:

- *City of Moreno Valley General Plan*;¹
- *Eastern Municipal Water District's 2010 Urban Water Management Plan*;²
- *Water Supply Assessment (WSA)* approved by the Eastern Municipal Water District Board of Directors on March 21, 2012);

¹ *City of Moreno Valley General Plan*, City of Moreno Valley, adopted by City Council Resolution No. 2006-83, July 11, 2006.

² *EMWD 2010 Urban Water Management Plan*, Eastern Municipal Water District, June 2011.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

- *Technical Memorandum – Dry Utilities World Logistics Center, Moreno Valley, CA*, Utilities Specialists, October 24, 2013; and
- *Sanitary Sewer Analysis Memorandum*, CH2MHill, October 18, 2013.

This section differs slightly from other sections in that it is organized by utility/service system type so continuity is maintained. Water Supply is found in Section 4.16.1, Wastewater Services are discussed in Section 4.16.2, Solid Waste Services are found in Section 4.16.3, and Energy Consumption is addressed in Section 4.16.4.

4.16.1 Water Supply

4.16.1.1 Existing Setting

The project site is located within the service area of the Eastern Municipal Water District (EMWD),¹ which owns, operates, and maintains the water system within the limits of the City and will be the purveyor of water to the proposed WLC project site. As illustrated in Figure 4.16.1, the EMWD's service area encompasses approximately 555 square miles. The water supply available to the EMWD in 2010 totals approximately 154,700 acre-feet (AF).² Water sources for the EMWD include imported water purchased from the Metropolitan Water District of Southern California (Metropolitan), groundwater sources, desalted groundwater, and recycled water from the EMWD's five regional water reclamation facilities. Imported water from Metropolitan is delivered to EMWD in several ways: directly as potable water; as raw water and treated at two local EMWD filtration plants; or as raw water for non-potable use. Approximately 80 percent of the EMWD's water is imported from Metropolitan and the remaining 20 percent is supplied by groundwater wells. Approximately 33 percent of the water produced by EMWD is recycled water. Groundwater supplies are drawn from the EMWD wells located in the Hemet, San Jacinto, Moreno Valley, Perris Valley, and Murrieta areas.

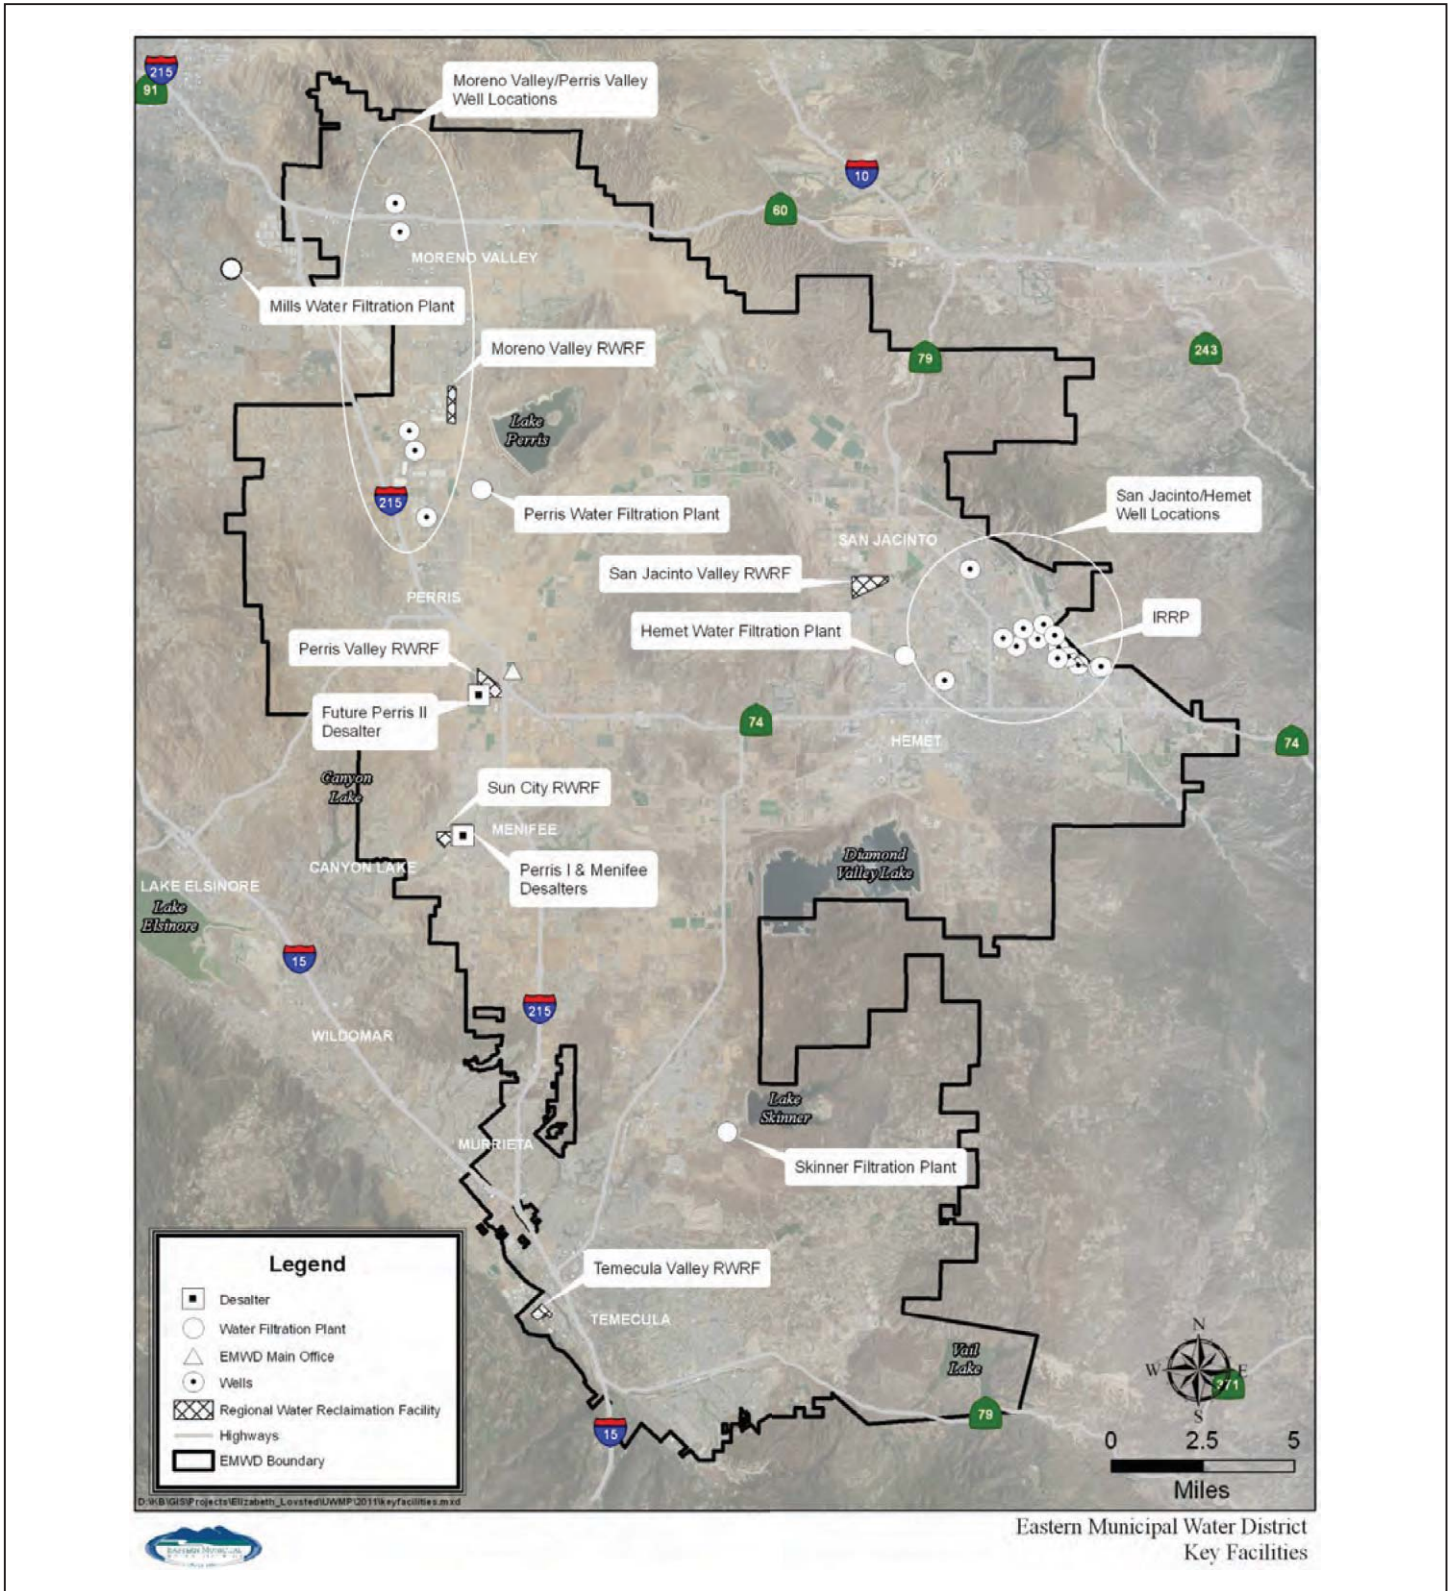

The following information was added at the request of the Metropolitan Water District of Southern California (Letter C-2) regarding their Inland Feeder facility. The figure showing the location of the Inland Feeder can be found at the end of comment Letter C-2 from the Metropolitan Water District of Southern California.

“Metropolitan owns property and owns and operates facilities on and adjacent to the site of the proposed project. As shown on the attached map, Metropolitan's irregularly shaped fee-owned property (APN 422-040-009 and 422-040-015), Inland Feeder Tunnel, and appurtenant tunnel access structure are located within the proposed specific plan area. In addition, Metropolitan's 145-inch-inside-diameter Inland Feeder pipeline and appurtenant structures extend through the specific plan area in the street rights-of-way for Eucalyptus Avenue, Theodore Street, and Davis Road. Metropolitan also has a 110-foot-wide easement along Davis Road.”

In June of 2011, the EMWD adopted its *2010 Urban Water Management Plan (UWMP)*, which details the EMWD's current and future water supply. The document found that with all of its existing and planned supplies, the EMWD can meet 100 percent of projected supplemental demand through 2035, even with a repeat of a severe drought. In addition, the UWMP addresses conservation, local supplies and reliability of imported supplies. Table 4.16.A identifies the EMWD's projected water supplies and demand.

¹ *Eastern Municipal Water District Service Area*, Eastern Municipal Water District, <http://www.emwd.org/.aspx?page=59>, website accessed April 2, 2012.

² An acre-foot covers one acre to a depth of one foot. An acre-foot is approximately 326,000 gallons which is enough to meet the needs of two average southern California households a year.

Demand Total		213,900	241,400	265,300	285,600	302,200

Source: EMWD 2010 Urban Water Management Plan, Eastern Municipal Water District, June 2011 (Tables 3 and 9, WSA 2012).

The proposed WLC project site is located within EMWD Pressure Zones (PZ) 1764 and 1900. Water is supplied to the project area via a pump station (1900 PZ pump station) located north of the intersection of Redlands Boulevard and Cottonwood Avenue. This pump station also delivers water to areas north of State Route 60 (SR-60). A 20-inch transmission main underlying Redlands Boulevard (Redlands Transmission Pipeline) delivers the pumped water from the 1900 PZ pump station to the 2080 PZ pump station located at Redlands Boulevard and Ironwood Avenue. The nearest recycled water line is a 24-inch transmission main located approximately 0.25 mile southwest of the project site, at the intersection of Redlands Boulevard and Cactus Avenue. Although there are no active recycled water lines adjacent to the project site, in the future, it may be possible to serve this project site with recycled water.

Water imported by the EMWD is treated at two facilities owned and operated by Metropolitan, the Mills and Skinner Filtration Plants, which serve the northwest and southern areas of the EMWD service area. Treated water is supplied north of the EMWD service area by the Mills Metropolitan Water Treatment Facility and in the southeastern portion of the EMWD service area by the Lake Skinner Water Treatment Facility. The City is located within the area served by the Mills Filtration Plant, which has a treatment capacity of 326 million gallons per day (mgd). The EMWD also utilizes untreated water delivered by Metropolitan from the State Water Project (SWP) pipeline running through the EMWD's jurisdiction. The EMWD currently treats the raw water for potable use or uses it raw for agriculture and for recharge. Treatment of raw water occurs at water filtration plants in Perris and in Hemet. The Hemet microfiltration plant has a capacity to filter 8,800 acre-feet per year (AFY) and the Perris microfiltration plant has the capacity to filter 17,600 AFY.

The EMWD constructed the Menifee Desalter and Perris Desalter facilities to recover high total dissolved solids (TDS) groundwater for potable use. In addition to being a source of water, the desalter facilities play a part in managing the groundwater subbasins by addressing the migration of brackish groundwater into areas of good quality groundwater. Additionally, the EMWD is currently in

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

the process of constructing a third desalter facility, the Perris II Desalter.¹ This additional facility will increase the production of desalinated water to approximately 12,000 AFY.

Based on the Water Allocation analysis released by the California Department of Water Resources (DWR) on March 22, 2010, export restriction could reduce Metropolitan deliveries by 150 to 200 thousand acre-feet (TAF) under mean hydrologic conditions, and operations could remain restricted until a long-term solution is found to improve the stability of the Bay-Delta region.

The SWP and Central Valley Project (CVP) are the responsible partners for operation of the DWR and Bureau of Reclamation (Reclamation), respectively. In November 1986, DWR and Reclamation signed the Coordinated Operations Agreement (COA). The COA was subsequently authorized and approved by the California State Legislature and Congress. Under COA, DWR and Reclamation agree to operate the SWP and CVP in a balanced manner to coordinate releases from upstream reservoirs and unregulated flows to meet Sacramento Valley in-basin and in-Delta uses, including water quality standards established by the State Water Resources Control Board (SWRCB).

Reclamation, as a Federal agency is required to consult with National Marine Fisheries Service (NMFS) and U.S. Fish and Wildlife Service (USFWS) under Section 7 of the Federal Endangered Species Act (FESA) to determine if a Federal action that it authorizes, funds, or implements could jeopardize the continued existence of a listed species in the wild, or destroy or modify the species' critical habitat. Because the SWP and CVP are operated in a balanced manner, the findings under Section 7 of the FESA affect operations of both the SWP and CVP.

The initial biological opinions related to long-term operations of the SWP and CVP were issued in 1993 by NMFS for protection of the winter-run Chinook salmon and by USFWS for protection of delta smelt. Operations of the SWP and CVP were modified to reduce potential adverse impacts to these species primarily through:

- Increased storage volumes of water in upstream reservoirs to provide adequate flows with appropriate temperatures for the winter-run Chinook salmon and adequate flows in the Delta for both species;
- Flows released from upstream reservoirs to provide adequate in-Delta flows and Delta outflows for these species; and
- Modification of periods of time when water can be diverted at the SWP and CVP south Delta intakes to reduce the potential for reverse flows, reduce the potential for high salinity in the south Delta, and reduce the potential for entrainment and entrapment of fish in the SWP and CVP south Delta intake facilities.

The biological opinions were modified as DWR and Reclamation modified operations of the SWP and CVP and new information related to aquatic resources became available. During this period, NMFS redesignated the Sacramento River winter-run Chinook salmon as “endangered” and designated two species as “threatened” (i.e., Central Valley spring-run Chinook salmon and Central Valley steelhead). Therefore, the consultations under Section 7 of the FESA were modified and new biological opinions were issued between 2000 and 2004. In 2005, the Department of the Interior was sued with respect to 2004 biological opinion issued by USFWS. Subsequently, USFWS re-issued the biological opinion in 2005; however, the Department of the Interior was sued in 2005 with respect to the re-issued biological opinion. The 2005 USFWS biological opinion was invalidated and United States District Court for the Eastern District of California (the Court) ordered a new biological opinion and issued interim operations orders to protect delta smelt until a new biological opinion could be

¹ *Water Supply Desalination Infrastructure South Perris Project, Perris II Desalter*, <http://www.emwd.org/modules/.aspx?documentid=90>, website accessed April 2, 2012.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

issued in 2008. The interim operations criteria included limitations for operation of the SWP and CVP south Delta intakes to protect delta smelt.

In response to these actions, Reclamation requested consultation with USFWS and NMFS in August 2008 with respect to the coordinated long-term operation of the SWP and CVP. In December 2008, the USFWS issued a new biological opinion on the coordinated long-term operation of the SWP and CVP on the effects to delta smelt. In June 2009, the NMFS issued a new biological opinion on the coordinated long-term operation of the SWP and CVP on the effects to currently listed species (e.g., Central Valley spring-run Chinook salmon, Central Valley steelhead, Southern District Population Segment of North American green sturgeon, and Southern Resident killer whale). Reclamation provisionally accepted and then implemented the Reasonable and Prudent Alternatives included in these biological opinions. The operational criteria included in the Reasonable and Prudent Alternatives resulted in changes to operations of upstream reservoirs, stream flows, Delta outflow, and SWP and CVP south Delta intakes.

Several lawsuits were filed in the Court related to various aspects of the USFWS and NMFS biological opinions, and to the acceptance and implementation of the associated Reasonable and Prudent Alternatives by Reclamation. Between 2009 and 2010, the Court ruled that Reclamation failed to conduct an environmental analysis under the National Environmental Policy Act (NEPA) of potential impacts to the human environment before provisionally accepting and implementing the Biological Opinion Reasonable and Prudent Alternatives. In 2010, the Court found certain portions of the USFWS biological opinion to be arbitrary and capricious, and remanded those portions of the biological opinion to USFWS. The Court ordered Reclamation to review the biological opinion and Reasonable and Prudent Alternative in accordance with NEPA. In 2011, the Court remanded the biological opinion to NMFS.

Reclamation has continued the consultation with USFWS and NMFS for modification of the biological opinions, and has initiated the NEPA process through publication of the Notice of Intent on March 28, 2012. The Court order required completion by Reclamation of the Environmental Impact Statement (EIS) and the USFWS biological opinion related to delta smelt by December 1, 2013. The Court order also required completion by Reclamation of the EIS and the NMFS biological opinion related to Central Valley spring-run Chinook salmon, Central Valley steelhead, Southern District Population Segment of North American green sturgeon, and Southern Resident killer whale by February 1, 2016. The Court did not vacate the biological opinions and, therefore, SWP and CVP operations are analyzed each year with respect to the Reasonable and Prudent Alternatives.

The most recent Metropolitan Regional Urban Water Management Plan (RUWMP) (Metropolitan November 2010, page 1-18) indicates that operational constraints similar to the most recent biological opinions and associated Reasonable and Prudent Alternatives would likely be continued until future long-term plans, such as the Bay Delta Conservation Plan (BDCP), would be implemented. A similar discussion was included in the EMWD Urban Water Management Plan (UWMP) (2010, page 38).

To address potential constraints on the SWP, Metropolitan is working with stakeholders throughout the State to develop and implement long-term solutions to the problem in the Bay Delta. The BDCP developed by State and Federal resource agencies, addresses ecosystem needs and securing long-term operating permits for the SWP. A working draft of the BDCP was released in November 2010 and reflects significant progress toward consensus on a plan to restoring the Bay-Delta ecosystem and associated sensitive species and provide for improved water supply and reliability.

The Metropolitan RUWMP also indicates that the SWP supplies with these considerations plus other water supplies (e.g., conservation, local and regional supplies, and Colorado River) would be adequate to meet Metropolitan water demands during dry years when water supplies generally are

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

restricted (Metropolitan November 2010, page 1-34, Figure 1-9). A similar discussion was included in the EMWD UWMP (2010, page 30, Table 3.3).

In evaluating the supply reliability for the 2010 RUWMP, Metropolitan assumed a new Delta conveyance would be fully operational by 2022, bringing supply reliability close to 2005 levels prior to supply restrictions imposed due to the Biological Opinions. This assumption is consistent with Metropolitan's long-term Delta action plan approved in 2007, and supported by recently passed legislation that included a roadmap for establishing governance structures and financing approaches to implement and manage a Delta solution. In response to the recent developments in the Delta, Metropolitan is engaged in planning processes that will identify solutions that, when combined with the rest of its supply portfolio, it will ensure a reliable long-term water supply for its member agencies. In the near term, Metropolitan will continue to rely on the plans and policies outlined in its RUWMP and Integrated Resources Plan (IRP) to address water supply shortages and interruptions (including potential shut downs of SWP pumps) to meet water demands. An aggressive campaign for voluntary conservation and recycled water usage, curtailment of groundwater replenishment water and agricultural water delivery are some of the actions outlined in the RUWMP. Metropolitan is maximizing supplies from existing agreements for water supply from its Palo Verde Crop Management and Water Supply Program and working with the State of Arizona in withdrawing water previously stored in that state's groundwater basin.

Imported sources of water will be supplemented by an increase in desalination of brackish groundwater, recycled water use, and water use efficiency. Metropolitan has analyzed the reliability of water delivery through the SWP and the Colorado River Aqueduct. Metropolitan's IRP and 2010 RUWMP conclude that, with the storage and transfer programs developed by Metropolitan, there will be a reliable source of water to serve its member agencies' needs through 2035.¹

NOP/Scoping Comments. A few residents asked how much water the project would use and if there was enough if we had another drought.

4.16.1.2 Existing Policies and Regulations

Policies and regulations for water sources include the following:

- Federal Water Pollution Control Act;
- Water Conservation in Landscaping Act;
- Water Recycling in Landscaping Act;
- Sections 13550–13556 of the State Water Code;
- Urban Water Management Planning Act;
- Senate Bill 901;
- Senate Bill 610; and
- City of Moreno Valley General Plan.

Federal Water Pollution Control Act. The Federal Water Pollution Control Act requires discharges (from point and non-point sources) into navigable water to meet stringent National Pollutant Discharge Elimination System (NPDES) permit standards. The U.S. Environmental Protection Agency

¹ *Eastern Municipal Water District 2010 Urban Water Management Plan*, Eastern Municipal Water District, June 2011.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

(EPA) has published regulations establishing requirements for application of storm water permits for specified categories of industries, municipalities, and certain construction activities. The regulations require that discharges of storm water from construction activity of 1.0 acre or more must be regulated and covered by an NPDES permit. When a construction area exceeds 1.0 acre in size, the applicant must develop and implement a Storm Water Pollution Prevention Plan (SWPPP). Additional analysis and information regarding NPDES requirements and regulations is provided in Section 4.9, *Hydrology and Water Quality*, of this EIR.

Water Conservation in Landscaping Act. To ensure adequate supplies are available for future uses and to promote the conservation and efficient use of water, local agencies are required to adopt water-efficient landscape ordinances. When such an ordinance has not been adopted, a finding as to why (based on the climatic, geologic, or topographical conditions) such an ordinance is not necessary must be adopted. In the absence of such, an ordinance drafted by the State of California applies within the affected jurisdiction. The City of Moreno Valley implements landscape and irrigation design standards (Chapter 9.17 of the City's Municipal Code), which address the proper maintenance of landscaping or irrigation systems.¹

Water Recycling in Landscaping Act. The Water Recycling in Landscaping Act requires that a water producer capable of providing recycled water that meets certain conditions notify local agencies eligible to receive the recycled water. It also requires necessary infrastructure be provided to support the delivery of recycled water. The EMWD enforces Ordinance No. 68.2 *Amended Rules and Regulations Governing the Provision of Recycled Water System Facilities and Service*, to promote the conservation and reuse of water resources and to ensure maximum public benefit from the use of the EMWD's recycled water supply by regulating its use in accordance with applicable Federal, State, and local regulations. Upon the determination that the EMWD is capable of providing recycled water services to the proposed site, the project applicant must submit an application form for the EMWD to review. The EMWD may prescribe requirements in writing to the applicant as to the off-site or on-site facilities necessary to be constructed, the manner of connection, the financial responsibility, and the use of the recycled water. Prior to receiving recycled water service, the proposed use shall be approved by the DHS. The EMWD will inspect on-site recycled water facilities to ensure initial and future continued compliance with the EMWD's regulations and other applicable requirements.

Sections 13550–13556 of the State Water Code. These sections of the State Water Code state that local, regional, or state agencies shall not use water from any quality source of potable water for non-potable uses if suitable recycled water is available as provided in Section 13550 of the Water Code.

Urban Water Management Planning Act (Cal. Water Code Section 10631). Since 1984, the Urban Water Management Planning Act, has required "urban water suppliers" to develop written "urban water management plans." While generally aimed at encouraging water suppliers to implement water conservation measures, it also created long-term planning obligations.

In preparing urban water management plans, urban water suppliers must describe the following:

- Existing and planned water supply and demand;
- Water conservation measures and a schedule for implementing and evaluating such measures; and

¹ *Landscape Requirements City of Moreno Valley, California, City of Moreno Valley.*

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

- Water shortage contingency measures.

The Urban Water Management Planning Act requires that urban water suppliers use a 20-year planning horizon and update the data in the urban water plans every five years.

In preparing their 20-year management plans, water suppliers must directly address the subject of future population growth. The suppliers must also identify sources of supply to meet demand. The plan must “identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier.” In identifying these future water sources, the suppliers need not conduct environmental review.

Senate Bill 901: Water Supply and Demand Reliability Assessment (Cal. Water Code Section 10910). Signed into law on October 16, 1995, Senate Bill 901 (SB 901) requires every urban water supplier to identify as part of its UWMP the existing and planned sources of water available to the supplier over a prescribed five-year period. SB 901 requires additional information to be included as part of an urban water management plan if groundwater is identified as a source of water available to the supplier. Provisions of SB 901 would require an urban water supplier to include in the plan a description of all water supply projects and programs that may be undertaken to meet total project water use. A city or county shall request each public water system serving a project to assess the projected water demand associated with said project and an assessment of whether the projected water demand associated with selected projects was included as part of the most recent UWMP. As part of this assessment, the public water system is required to indicate whether its total projected water supplies available during normal, single-dry, and multiple-dry water years will meet the project demand associated with the proposed WLC project, in addition to the public water system’s existing and planned uses.

Pursuant to Section 10912 of the State Water Code, a “project” is specifically defined as development meeting any of the following criteria:

- 500 or more dwelling units;
- Commercial center employing more than 1,000 persons or having more than 500,000 square feet;
- Office building employing more than 1,000 persons or having more than 250,000 square feet;
- A hotel/motel with 500 or more rooms;
- An industrial, manufacturing, processing plant, or industrial park employing more than 1,000 persons or occupying more than 40 acres, or having more than 650,000 square feet of floor area;
- A mixed-use project that would demand an amount of water equal to the amount of water required by a 500-dwelling unit project; or
- In areas where the public water system has fewer than 5,000 service connections, any development that would increase water demand by 10 percent or greater in the number of existing service connections, or in the case of a mixed-use development, an increase in water required by residential development representing a 10 percent or greater increase in the number of existing service connections.

After receiving such information, cities and counties may agree or disagree with the conclusions of the water purveyors, but cannot approve projects in the face of documented water shortfalls without first making certain findings.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The proposed WLC project is an Industrial Specific Plan that would meet the definition of a “project” and the water purveyor (EMWD) is therefore required to conduct a Water Supply Assessment (included as Appendix J) to indicate a reliable supply of water for the proposed WLC project.

Senate Bill 610: Water Supply Planning (Cal. Water Code Section Sections 10910 through 10915). Signed into law October 9, 2001, Senate Bill 610 (SB 610) resulted in amendments to Section 21151.9 of the Public Resources Code. Additionally, several sections of the Water Code were amended, one was repealed, while portions of one section were added and/or repealed. Revising provisions established by SB 901 and SB 610 requires that any city or county having determined that a project is subject to CEQA identify any public water systems that may supply water for the project and to request those public water systems to prepare a specified water supply assessment if the project exceeds the specified threshold for a water supply assessment (WSA). Such an assessment would include, among other information, the following:

- Identification of existing water entitlements, water rights, or water service contracts relevant to the water supply identified for a proposed WLC project; and
- The amount of water received pursuant to such entitlements, rights, or contracts.

SB 610 requires the public water system, city, or county to submit plans for acquiring the required water supply for the proposed WLC project if the WSA concludes that water supplies are or will become insufficient. Any such WSA and other information would be included in the environmental document prepared for the project pursuant to CEQA. A WSA¹ was prepared for the proposed WLC project to identify existing water entitlements, water rights, and/or water service contracts relevant to the water supply as it relates to the operation of the proposed WLC project.

City of Moreno Valley General Plan. The following policies within the *Community Development Element* and *Conservation Element* of the *City of Moreno Valley General Plan* pertain to utilities and are applicable to the proposed WLC project.

Community Development Element Policies

- Policy 2.11.1** Permit new development only where and when adequate water services can be provided.
- Policy 2.13.1** Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.
- Policy 2.13.2** Unless otherwise approved by the City, public water, sewer, drainage and other backbone facilities needed for a project phase shall be constructed prior to or concurrent with initial development within that phase.
- Policy 2.13.3** It shall be the ultimate responsibility of the sponsor of a development project to ensure that all necessary infrastructure improvements (including system-wide improvements) needed to support project development are available at the time that they are needed.

The following changes have been made in response to Comment F-13-32 in Letter F-13 from Johnson & Sedlack on Behalf of Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.

¹ Water Supply Assessment for the World Logistics Center Specific Plan, EMWD, March 21, 2012.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Conservation Element Policies and Objectives

Policy 7.3.1 Require water-conserving landscape and irrigation systems through development review. Minimize the use of lawn within private development, and within parkway areas. The use of mulch and native and drought-tolerant landscaping shall be encouraged.

Policy 7.3.2 Encourage the use of reclaimed wastewater, stored rainwater, or other legally acceptable non-potable water supply for irrigation.

Objective 7.5 Encourage efficient use of energy resources.

Policy 7.5.5 Encourage the use of solar power and other renewable energy systems.

4.16.1.3 Methodology

The WSA is based on evaluating the existing water supply available to the City, future water supply that is anticipated to be available to the City, and the identification of existing water demand and future demand with the development of the proposed WLC project. The analysis also identifies water conservation measures that would be incorporated by the proposed WLC project to reduce the project's total water demand, with special reference to outdoor water usage and associated landscaping systems.

4.16.1.4 Thresholds of Significance

The following thresholds of significance regarding impacts to utilities and service systems are based on the recommended questions contained in *Guidelines for California Environmental Quality Act* (as amended through January 1, 2011). A project would have a significant impact on the provision of utilities or service systems related to water supply if it would result in any of the following:

- Require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects;
- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects; and/or
- Have insufficient water supplies available to serve the project from existing entitlements and resources, or need new or expanded entitlements.

For the purpose of this EIR, significant and unavoidable impacts would occur if the aforementioned conditions cannot be overcome by reasonable design, construction, and maintenance practices.

4.16.1.5 Less than Significant Impacts

4.16.1.5.1 Construction or Expansion of Water Treatment Facilities

Threshold	Would the proposed WLC project require the construction of new water treatment facilities or expansion of existing facilities, the construction of which would cause significant environmental effects?
-----------	---

As previously identified, Metropolitan currently does not have surplus water available, due in part to pumping restrictions imposed on the SWP to avoid and minimize impacts to Federal- and State-protected fish species in the Delta. Imported sources of water will be supplemented by an increase in desalination of brackish groundwater, recycled water use, and water use efficiency. Metropolitan and the EMWD have analyzed the reliability of water delivery through the SWP and the Colorado River

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Aqueduct. Metropolitan's IRP and 2010 RUWMP conclude that, with the storage and transfer programs developed by Metropolitan, there will be a reliable source of water to serve its member agencies' needs through 2035. Based on the WSA prepared for the proposed WLC project, water demand for the proposed on-site uses would total approximately 1,991.25 AFY.¹ As identified in previously referenced Table 4.16.A, anticipated water supplies for the EMWD total 213,900 and 302,200 AFY in 2015 and 2035. The water demand required for the proposed WLC project totals 0.93 and 0.66 percent of the 2015 and 2035 projected EMWD supplies.

The EMWD's *2010 Urban Water Management Plan* and Metropolitan's *2010 Regional Urban Water Management Plan*² have stated that, with the addition of all existing and planned water supplies, it would have the ability to meet all of its member agencies' projected supplemental demand through 2035, despite the latest ruling regarding the allocation of SWP water. This is based on continued commitment to conservation programs, water recycling, and development of local water resources.

While the EMWD is capable of meeting all of its member agencies' projected demand through 2035, other efforts are taken to further reduce the retail demand due to demographics change and population growth. Passive conservation efforts already implemented by the EMWD include adherence to the plumbing code and installation of low-flow toilets and showerheads in all new construction. In addition to passive programs, active conservation programs/measures are also implemented. The EMWD has implemented all of the California Urban Water Conservation Council (CUWCC) and Best Management Practices (BMPs). The CUWCC was created to increase efficient water use throughout the State through partnership with urban water agencies (including the EMWD), public interest organizations, and private entities. In 1992, the EMWD signed the CUWCC's Memorandum of Understanding (MOU) Regarding Water Conservation in California and committed to developing and implementing fourteen comprehensive BMPs for urban water management.

The BMPs correspond to the fourteen Demand Management Measures (DMMs) listed in the Water Code Section 10631 (f) and include the following:

- Water survey programs for single-family residential and multifamily customers;
- Plumbing retrofits;
- Distribution system water audits, leak detection, and repair;
- Metering with commodity rates;
- Large landscape water audits and incentives;
- High-efficiency washing machine rebates;
- Public information;
- School education;
- Commercial, industrial, and institutional water conservation;
- Wholesale agency programs;
- Conservation pricing;
- Conservation corridor;
- Water waste prohibition; and
- Ultra-low flush toilet replacements.

¹ 0.75 acre-foot per acre x 2,655 acres = 1,991.25 acre-feet per year.

² *The Metropolitan Water District of Southern California Regional Urban Water Management Plan*, Metropolitan Water District of Southern California, November 2010.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

With implementation of passive and active conservation measures, the EMWD can significantly reduce its retail water demand and continue to do so in the future.

As previously identified, Metropolitan has analyzed the reliability of water delivery through the SWP and the Colorado River Aqueduct. Metropolitan's IRP and 2010 RUWMP conclude that, with the storage and transfer programs developed by Metropolitan, there will be a reliable source of water to serve its member agencies' needs through 2035.

The amount of water demand would be within the existing available supply even with a reduction in deliveries from the SWP. Imported sources of water will be supplemented by an increase in desalination of brackish groundwater, recycled water use, and water use efficiency, and implementation of aggressive conservation measures by the EMWD. The proposed WLC project would not require the construction of new water treatment facilities or expansion of existing facilities, which could cause significant environmental effects.

Annually, a 5-year Capital Improvement Plan (CIP) is prepared by the EMWD. The EMWD's CIP outlines specific projects and their funding sources. Each project is also submitted individually to the Board for authorization and approval. This allows the EMWD to match needed facilities with development trends accurately. Funding for the EMWD's microfiltration plants, distribution pipes, and the recharge and recovery program is listed in the most recent EMWD CIP.

All necessary water distribution facilities would be installed simultaneously with required roadway frontage improvements for each phase of development of the proposed WLC project. Therefore, the connection to the existing water delivery system would not result in substantial disturbance of existing roadways or water facilities. As previously identified, the potable water demand that would be required for the proposed WLC project would total 1,991.25 AFY. The amount of water demand would be within the existing available supply even with a reduction in deliveries from the SWP. Imported sources of water will be supplemented by an increase in desalination of brackish groundwater, recycled water use, and water use efficiency, and implementation of aggressive conservation measures by the EMWD. The proposed WLC project would not require the construction of new water treatment facilities or expansion of existing facilities, which could cause significant environmental effects.

It should be noted that the water consumption estimates in this section for future logistics uses within the WLCSP are likely overestimated by a significant factor, as a result of the emphasis on xeriscape or low-impact development (i.e., water conserving) design in the WLCSP. Sections 1.3.2 and 5.4) of the Specific Plan indicates that project design will incorporate features such as low-flow faucets and fixtures, rainwater harvesting systems for irrigation (where practical), and native non-irrigated landscaping to reduce the project's reliance on water. The size and composition of the landscape palette and the landscaping plan of the Specific Plan were developed in consultation with Robert Perry, a well-known horticultural scientist with many years of experience with drought-tolerant and low-water maintenance landscaping. Although water consumption on the WLC property will likely be much lower than anticipated, the analysis of environmental impacts relative to water consumption used a "worst-case" scenario as outlined in the WSA prepared by the EMWD (March 21, 2012).

Adherence to standard requirements identified by EMWD and the City associated with the design and installation of new water infrastructure, including the additional water storage tanks and connections to existing and future water infrastructure, would ensure that no significant impacts would result from the construction or operation of the proposed WLC project. Therefore, impacts related to this issue would be less than significant and no mitigation measures would be required other than those measures recommended in other sections addressing potential impacts of off-site improvements (e.g., cultural resources and biological resources).

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

In summary, development of the proposed WLC project will not result in the need for the construction of new water treatment facilities by the Eastern Municipal Water District, Metropolitan Water District of Southern California, or others. However, it will result in the need for several new water storage reservoirs, as shown in previously referenced Figure 3.7, *Offsite Improvement Areas*, and Figure 3.13, *Water System*.

4.16.1.6 Significant Impacts

4.16.1.6.1 Adequate Water Supply

Threshold	Would the proposed WLC project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?
-----------	--

A project-specific WSA¹ was prepared for the proposed WLC project to assess the water supply availability to the project site to satisfy the requirements under SB 610 and to make a determination that adequate water supplies are and will be available to meet the water demand associated with the proposed WLC project. In accordance with Water Code Section 10910(d) – (f), the WSA identifies:

- Any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed WLC project, and provides a description of the quantities of water received in prior years by the public water system, under existing water supply entitlements, water rights, or water service contracts.
- If no water has been received in prior years by the public water system, identify other public water systems or water service contract holders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts to the same source of water as the public water system.
- If groundwater is included in the proposed supply, identify the groundwater basin or basins from which the proposed WLC project will be supplied, and include any applicable documentation of adjudicated rights to pump. If the basin is not adjudicated, regardless of whether the basin has been identified as over-drafted, provide a detailed description and analysis of the amount and location of groundwater pumped by the public water system for the past five years from any groundwater basin from which the proposed WLC project will be supplied, and provide a detailed description and analysis of the amount and location of groundwater from the basin or basins from which the proposed WLC project will be supplied to meet the projected water demand associated with the proposed WLC project.

There has been a shift in the water demand patterns in the last 15 years, as the residential market has replaced the agricultural market as the largest local consumer of water. Metropolitan, based on its 2010 RUWMP,² has stated that, with the addition of all water supplies existing and planned, it would have the ability to meet all of its member agencies' projected supplemental demand through 2035 even under a repeat of a worst drought scenario. Based on this assertion, the EMWD has stated it is able to meet an increased demand for water over the next 20 years, even during drought conditions. This is based on continued commitment to conservation programs, additional water recycling, and continued development of local water resources.

It should be noted that the project site currently contains several non-potable agricultural water wells, but no yields from these wells were used to calculate water supply or demand related to the proposed project.

¹ *Water Supply Assessment for the World Logistics Center Specific Plan*, EMWD, March 21, 2012.

² IRPSIM is a sophisticated water supply and demand-balancing model that utilizes 77 sequential hydrologies to determine variations in supply and demand due to changes in weather conditions.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The EMWD continues to work closely with Metropolitan in the implementation of water management plans as a means of ensuring the reliability of the EMWD’s water supplies. Efforts to ensure reliable water supplies include the preparation and/or implementation of Groundwater Management Plans, Desalination Program, Seasonal Storage, and Conjunctive Use Water Recycling. The EMWD’s 2010 UWMP presents fifteen DMMs related to water conservation and water recycling programs split into two types (Foundational and Programmatic).

The potable water demand estimated for the proposed WLC project is within the limit of retail growth projected by the EMWD. Table 4.16.B presents the EMWD’s total water use. To develop the projections used in the WSA, the EMWD used a development-tracking database that assesses future water demands for specific projects. The EMWD uses this database to help plan for future water supply and infrastructure needs by monitoring new projects through various stages of development. Changes in density and land use are also tracked in this database for planning purposes.

Table 4.16.B: EMWD Average Water Demand (2010–2035)

Demand Sources (acre-feet/year)	Actual	Projected				
	2010	2015	2020	2025	2030	2035
Retail Potable Water Sales	77,700	113,800	120,700	136,100	150,300	162,200
Water Sales to Other Agencies	27,100	47,600	61,600	65,000	69,000	72,400
Other Water Uses/Losses	49,900	52,500	59,100	64,200	66,300	67,600
Total Average Demand	154,700	213,900	241,400	265,300	285,600	302,200

Source: *Water Supply Assessment, Table 9, EMWD, March 21, 2012.*

The EMWD’s 2010 UWMP also discusses the supply reliability for the EMWD during dry years. The supply for dry years is driven by demand. Demand increases slightly (less than 2%) during dry years, primarily due to the increased demand in winter for landscaping or agricultural water, and can be decreased up to 10 percent due to conservation as dry periods are extended. Tables 4.16.C, 4.16.D, and 4.16.E present estimates of demand from 2015 to 2035 in five-year increments for an average year, single dry year, and multiple dry years, respectively.

Neither groundwater production nor recycled water deliveries are expected to increase or decrease significantly during dry years. The EMWD depends on Metropolitan to supply additional water during dry years. Based on Metropolitan’s 2010 RUWMP, the EMWD is confident of its ability to meet customer demands beyond the next 20 years in all reasonably predictable hydrological scenarios. For water shortages and interruptions, the plans and policies outlined in the RUWMP will be implemented.

Table 4.16.C: EMWD Water Resources, Average Year Hydrology (2015–2035)

Water Conditions ¹	2015	2020	2025	2030	2035
Metropolitan Water District	149,300	170,700	190,700	210,000	226,200
Recycled Water	43,900	50,000	53,900	54,900	55,300

NOTE: The following revision has been added in response to Comment F-1-74 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society and F-11-44 in Letter F-11 from the Sierra Club.

The Water Supply Assessment considered the impact of climate change on water supplies. Climate change has the potential to affect not only local demand and supplies, but to reduce the amount of water available for import. Potential changes that may impact water supply include:

- Warmer temperatures leading to higher demand for water within EMWD’s service area and throughout California;
- Reduction in the Sierra Nevada snow pack;
- Increased intensity and frequency of extreme weather events; and
- Rising sea levels resulting in increased risk of damage from storms in the Delta, high tide event and the erosion of levees in the Delta.

One of the outcomes of climate change could be more frequent limitations on imported supplies. To limit the impact of climate change, EMWD’s long term planning focuses on the development of reliable local recourses and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD’s service area. The project developer is committed to water use efficiency and minimizing the use of potable water for landscape irrigation by using low water use fixtures, drought tolerant plants and recycled water where available as outlined in Mitigation Measure 4.16.1.6.1B.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

It is anticipated that the majority of water for future development would be supplied by imported water from Metropolitan, recognizing the following conditions:

- The ability of Metropolitan to meet the demands of member agencies as described in the 2010 RUWMP as the majority of EMWD's current and future supply rely on Metropolitan's supplies. This assessment is based on representations by Metropolitan that it will provide the water requested by the EMWD for the next 20 years under the conditions set forth in Water Code Section 10910 as authorized by Water Code Section 10631(k). This assessment is subject to review, modification, or rescission in the event that regulations, court decisions, or other events reduce or impair Metropolitan's ability to provide such water.
- The cost of new water supplies will continue to increase. The developer of this project is required to help fund the acquisition of new water supplies, new treatment or recycled water facilities, and water efficiency measures for existing customers to develop new water supplies.
- New customers may also be required to pay a higher commodity rate for water used than existing customers to offset the rising costs to the EMWD for new water supplies.
- The developer will install water-efficient devices such as low-flow toilets and landscaping according to the requirements of the EMWD's water use efficiency ordinance(s) at the time of construction to reduce the impact of this project on water supplies.

Metropolitan does not place imported water limits on a member agency, but predicts the future water demand based on regional growth information. Metropolitan stated in its 2010 RUWMP that, with the addition of all water supplies, existing and planned, Metropolitan would have the ability to meet all of its member agencies' projected supplemental demand through 2035 even under a repeat of historic drought scenarios. For any short-term water shortages and interruptions caused by disaster or unprecedented drought, the plans and policies outlined in the 2010 RUWMP will be implemented.

The proposed WLC project may be conditioned by the City to construct off-site and on-site water facilities needed to distribute water throughout the project area. A plan of service for the proposed WLC project would be approved by the EMWD that would identify specific on-site improvements. The nearest recycled water line is a 24-inch transmission main located approximately 0.25 mile southwest of the project site, at the intersection of Redlands Boulevard and Cactus Avenue. Although currently active recycled water lines are not adjacent to the project site, in the future, it may be possible to serve this project site with recycled water. Irrigated landscaped areas of the proposed WLC project site will be designed to connect to the recycled water system and would utilize recycled water in landscape areas to the extent feasible. EMWD policy recognizes recycled water as the preferred source of supply for all non-potable water demands, including irrigation of recreation areas, greenbelts, open space common areas, commercial landscaping, and supply for aesthetic impoundment or other water features. The majority of irrigated landscaped areas within the project site will be designed to use recycled water to the greatest extent possible when it becomes available.

Water Demand Based on the Existing General Plan Land Uses for the Project Site. As noted in Section 3.0, *Project Description*, the Community Development Element¹ of the City's General Plan currently designates the project site as a mix of residential, commercial, business park, and open space land uses. These land use designations are based on the previously approved (1992) Moreno Highlands Specific Plan (MHSP) and were used in developing EMWD's 2010 UWMP. Table 4.16.F summarizes the current land use designations at the project site, their associated acreages, and expected water demand from the 1992 MHSP EIR. The EIR prepared for the MHSP indicated that

¹ City of Moreno Valley General Plan Community Development Element, City of Moreno Valley, July 11, 2006.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

project would consume 11.8 million¹ gallons per day (mgd) or 9,840 acre-feet/year (AFY) of water at buildout of all the residential and non-residential uses.

Table 4.16.F: Moreno Highland Specific Plan Land Use Designations and Acreages

Land Use Designation	Acreage	Demand (AFY)
Residential Community		
Residential (7,763 dwelling units)	1,359.3	4,315
Parks and Open Space	701.9	3,159
Neighborhood Commercial	10.0	22
Cemetery	16.5	74
Public Facilities	347.7	1,168
Planned Business Center		
Business Park	360.8	271
Mixed Use	80.5	218
Community Commercial	16.0	36
Parks and Open Space	77.9	351
Public Facilities	67.4	226
Total	3,038	9,840

Source: Moreno Highlands Specific Plan, 1992.

The WSA prepared for the proposed project by the EMWD concluded that the water demand for the proposed on-site uses would be approximately 1,991.25 AFY.² The EMWD considers this a “worst-case” estimate based on the total acres and amount of square footage of warehousing proposed by the project. This estimate does not take into account the proposed project landscaping design with xeriscape (drought-tolerant plants) and on-site collection of runoff and channeling it to landscaped areas to minimize irrigation on the interior of the project site. For example, the “Water Budget Technical Memorandum” prepared by CH2MHill (see Appendix N) in September 2011 for the WLC project indicates that actual water usage of on-site buildings, based on the specific development characteristics of the WLC Specific Plan, would be on the order of 450 AFY, which is less than a quarter of the amount estimated by EMWD; however, this estimate does not include on-site irrigation of landscaping and could only be achieved if all on-site landscaping was irrigated by collection and distribution of on-site runoff from roofs and hardscape areas.

Taking into account the proposed water xeriscape landscaping plan, it is likely that actual water use for development within the WLC Specific Plan will be substantially less than the worst-case EMWD estimate. Therefore, for the purposes of analysis in this EIR, both the CH2MHill figure of 450 AFY and the EMWD’s worst-case estimate of 1,991 AFY figure will be used relative to water consumption. Under either scenario, the anticipated water demand for the proposed WLC project is substantially less than what is identified above for the General Plan land uses and what was used in the formulation of the 2010 UWMP. As identified in previously referenced Table 4.16.A, anticipated water supplies in the EMWD total 213,900 and 302,200 AFY in 2015 and 2035, respectively. The water demand required for the proposed WLC project would total 0.93 and 0.66 percent of the EMWD’s 2015 and 2035 supplies under worst-case conditions. The demand estimated for this project is substantially less and therefore still within the limit of growth projected in the 2010 UWMP.

¹ Based on 27,015 population times 200 gallons/person/day and 24,019 jobs at buildout

² *Water Supply Assessment Report for the World Logistics Center Specific Plan in Moreno Valley*, Eastern Municipal Water District, March 21, 2012.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

When compared to the currently approved MHSP, there would be an 80 percent decrease in projected water demand (7,849 AFY) with the development of the proposed WLC project. The site's water usage would decrease under the current development plan for the proposed WLC project and it would remain lower than what is anticipated in the General Plan and the 2010 UWMP. Additionally, the increased water demand for the site has been analyzed by the WSA, which determined that a suitable water supply exists for the proposed WLC project well into the future.

The project's water consumption represents substantially less than 1 percent of the consumption yearly capacity and because the EMWD indicates that water to service the project's proposed industrial uses is available, no significant water supply impacts would occur with implementation of the industrial use, and no mitigation would be necessary.

Metropolitan is currently engaged in planning processes that will identify solutions that, when combined with the rest of its supply portfolio, will ensure a reliable long-term water supply for its member agencies, the EMWD has determined that it will be able to provide adequate water supply to meet the potable water demand for the project in addition to existing and future users. However, until these supplies are secured, potential impacts of the proposed project on regional water supplies may be significant, and mitigation is required.

Specific Plan Design Features. Section 6.0 of the Specific Plan requires the careful use of xeriscape or drought-tolerant vegetation with minimal mechanical irrigation to minimize water use for landscaping. Sections 4.2 and 5.4 require implementation of water-conserving landscaping and Section 5.2.3 provides architectural design guidelines that will help minimize the consumption of water for landscape irrigation.

Mitigation Measures. The following measures are recommended to help ensure that the proposed WLC project will have less than significant impacts on long-term regional water supplies.

4.16.1.6.1A Prior to approval of a precise grading permit for each plot plan for development within the World Logistics Center Specific Plan (WLCSP), the developer shall submit landscape plans that demonstrate compliance with the World Logistics Center Specific Plan, the State of California Model Water Efficient Landscape Ordinance (AB 1881), and Conservation in Landscaping Act (AB 325). This measure shall be implemented to the satisfaction of the Planning Division. Said landscape plans shall incorporate the following:

- Use of xeriscape, drought-tolerant, and water-conserving landscape plant materials wherever feasible and as outlined in Section 6.0 of the World Logistics Center Specific Plan;
- Use of vacuums, sweepers, and other "dry" cleaning equipment to reduce the use of water for wash down of exterior areas;
- Weather-based automatic irrigation controllers for outdoor irrigation (i.e., use moisture sensors);
- Use of irrigation systems primarily at night or early morning, when evaporation rates are lowest;
- Use of recirculation systems in any outdoor water features, fountains, etc.;
- Use of low-flow sprinkler heads in irrigation system;

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Provide information to the public in conspicuous places regarding outdoor water conservation; and
- Use of reclaimed water for irrigation if it becomes available.

4.16.1.6.1B All buildings shall include water-efficient design features outlined in Section 4.0 of the World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development/Public Works. These design features shall include, but not be limited to the following:

- Instantaneous (flash) or solar water heaters;
- Automatic on and off water facets;
- Water-efficient appliances;
- Low-flow fittings, fixtures and equipment;
- Use of high efficiency toilets (1.28 gallons per flush [gpf] or less);
- Use of waterless or very low water use urinals (0.0 gpf to 0.25 gpf);
- Use of self-closing valves for drinking fountains;
- Infrared sensors on drinking fountains, sinks, toilets and urinals;
- Low-flow showerheads;
- Water-efficient ice machines, dishwashers, clothes washers, and other water-using appliances;
- Cooling tower recirculating system where applicable;
- Provide information to the public in conspicuous places regarding indoor water conservation; and
- Use of reclaimed water for wash down if it becomes available.

4.16.1.6.1C Prior to approval of a precise grading permit for each plot plan, irrigation plans shall be submitted to and approved by the City demonstrating that the development will have separate irrigation lines for recycled water. All irrigation systems shall be designed so that they will function properly with recycled water if it becomes available. This measure shall be implemented to the satisfaction of the City Planning Division and Land Development Division/Public Works.

Level of Impact After Mitigation. With implementation of the recommended mitigation measures, expected impacts to water supply over the long term will be reduced to less than significant levels.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4.16.1.6.2 Storm Water Drainage Requirements

Threshold	Would the proposed WLC project result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
-----------	--

As identified in the *Draft Master Plan of Drainage Report for World Logistics Center Specific Plan and Environmental Impact Report*¹ (Draft Drainage Report) and Section 4.9, *Hydrology and Water Quality*, the proposed WLC project storm water flows from the project site eventually drain into the Perris Valley Storm Channel (PVSC) then into Reach 3 of the San Jacinto River. The storm channel is owned and maintained by the Riverside County Flood Control and Water Conservation District (RCFCWCD). Flows routed to the PVSC are transported through Perris Valley and ultimately to the San Jacinto River. Flows are then conveyed through the San Jacinto River, Canyon Lake, again to the San Jacinto River (Reach 1), and ultimately to Lake Elsinore. In the event Lake Elsinore is at or beyond capacity, flows continue through Temescal Creek, the Santa Ana River (Reaches 1–3) and then to the Pacific Ocean.

It is anticipated that the development of these logistics warehouse facilities would include the construction of buildings, parking areas, sidewalks, roads and other infrastructure such as water, recycled water, and sewer infrastructure features. Because the development of the proposed WLC project would introduce a greater percentage of impervious surfaces, the post-development flow volumes generated on site are anticipated to be substantially higher than the pre-development flows.

Conditions resulting from this change would include increased runoff volumes and velocity; reduced infiltration; increased flow frequency, duration, and peak; shorter time to reach peak flow; and degradation in water quality. The majority of the proposed WLC project area currently has a low runoff coefficient, meaning that runoff during storms represents a relatively small portion of the total rainfall. The majority of the precipitation, particularly in smaller storms, infiltrates into the subsurface. The development of the proposed WLC project with impervious surfaces (such as roadways, parking lots, and buildings) would result in a condition in which nearly all rainfall becomes runoff. A significant impact would occur in the event that post-development storm water flows are greater than pre-development storm water flows leaving the site.

As detailed in the *Draft Master Plan of Drainage Report*,² the storm water runoff from the proposed WLC project site generally flows in a southerly direction toward the San Jacinto River. A topographic divide generally located west of Theodore Street separates storm water flows to the San Jacinto River in two directions. Runoff east of the divide flows at a gradient ranging from 1 to 2 percent toward the San Jacinto Wildlife Area (SJWA) and ultimately drains toward the Gilman Hot Springs hydro-subarea; and runoff west of the divide flows to the Perris Valley Storm Drain at a gradient ranging from 1 to 2 percent and ultimately drains toward the Perris Valley hydro-subarea. Both hydro-subareas eventually flow to the San Jacinto River, approximately 10 miles south of the project site. The project site is located in the Moreno Valley drainage area and is tributary to the San Jacinto River.

The westerly portion of the proposed WLC project site is located within the Moreno Master Drainage Plan (MMDP). The existing MMDP indicates that storm flows north of SR-60 will be routed to the proposed Sinclair Detention Basin. Flows released from the proposed basin will pass under SR-60 through the existing culverts and be conveyed to the drainage system identified as Line “F” in MMDP. The proposed basin will not be constructed prior to the proposed WLC project; therefore, this analysis

¹ *Draft Master Plan of Drainage Report for World Logistics Center Specific Plan and Environmental Impact Report*, CH2M Hill, September 2014.

² *Ibid.*

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

assumes that the Sinclair Detention Basin is not in place prior to construction and operation of the proposed WLC project.

As detailed in the *Draft Master Plan of Drainage Report*, storm flows originating from the Badlands reaching SR-60 are conveyed through a series of five culverts under SR-60 between Redlands Boulevard and Theodore Street, to earthen ditches that flow in a southerly direction. Based on the Logistic Building Runoff Management Plan (LBRMP) prepared by RBF in 2008, some of the culverts were partially blocked by sediment and debris allowing little flow from the culverts to enter the proposed WLC project site thus attenuating the flow during a 100-year storm event. Drainage peak flow rates from water ponds north of SR-60 are reduced due to the capacity of the existing culverts. As part of the construction of the Highland Fairview Corporate Park (HFVP) project, these existing culverts were combined into a 12-foot by 8-foot reinforced concrete box (RCB).¹ The RCB drains to the south along the west side of the logistics building within the HFVP project. A 36-inch and 42-inch storm drain underlying Eucalyptus Avenue join the RCB. The outflow from the drainage system sheet flows via a spreading area in to the agricultural land downstream. Farther south, the agricultural land drains to a RCFCWCD earthen channel at Redlands Boulevard, which flows to a Greenbelt Channel located south of Cactus Avenue and East of Redlands Boulevard and ultimately drains to the Perris Valley Storm Drain. Along the east side of Redlands Boulevard from Dracaea Street to the earthen channel collects flows from the west side of the project boundary. The v-ditch also outlets to the existing RCFCWCD earthen channel.

Open ditches along the Theodore Street convey runoff from adjacent areas. A series of existing drainage culverts crosses Gilman Springs Road conveying off-site runoff from the Badlands area onto the project site. Four of these culverts drain into somewhat defined natural drainage courses and drain into the SJWA. The existing culverts along Gilman Springs Road are undersized and therefore inadequate. The culverts provide some level of peak flow mitigation under a 100-year storm event; however, runoff will pond and overtop the road crossing onto the eastern portion of the proposed WLC project site. Therefore, the existing drainage courses in this area are undersized for the 100-year flow.

Previously referenced Tables 4.9.L, 4.9.M and 4.9.N (Section 4.9, *Hydrology and Water Quality*) identify changes in the flows, velocities, and volume of storm water runoff that would result from the development of buildings and impermeable surfaces without and with the development of the on-site basins. Due to the installation of impervious surfaces on the project site, the post-development flows would be higher than the pre-development flows. To avoid a significant impact to the existing drainage capacity, the post-development flows coming from the proposed WLC project site are required to be equal to or less than pre-development flows.² To reduce flows to below or equal to pre-development conditions, the on-site storm water flows would be routed to a series of on-site detention and infiltration basins³ by phase before flows are routed off site. While the increase in impervious surfaces attributable to the proposed WLC project would contribute to a greater volume and higher velocity of storm water flows, the proposed WLC project's detention and infiltration basins would accept and accommodate runoff that would result from project construction at pre-project conditions (previously referenced Tables 4.9.L, 4.9.M, and 4.9.N).

¹ The drainage facilities planned in the RCFCWCD MMDP (dated April 1991) were considered and incorporated in to the RCB storm drain system.

² As part of the MS4 Permit issuance requirements, projects must identify any Hydrologic Conditions of Concern and demonstrate that changes to hydrology are minimized to ensure that post-development runoff rates and velocities from a site do not adversely impact downstream erosion, sedimentation or stream habitat.

³ A detention basin is an area where excess storm water is stored or held temporarily and then slowly drains when water levels in the receiving channel recede. In essence, the water in a detention basin is temporarily detained until additional room becomes available in the receiving channel.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

As identified in the *Draft Master Plan of Drainage Report*¹ prepared for the project, the hydrology analysis consisted of dividing the area into six existing and proposed off-site and on-site tributary areas (A through F; refer to previously referenced Figure 4.9.1). There are five proposed drainage systems to be constructed as part of the proposed WLC project and are identified as Line A (consistent with Line F in the MMDP), Line B, Line C, Line D, and Line F as depicted in previously referenced Figure 4.9.4. Hydrologic modeling results identify that the 100-year 3-hour storm provides the highest peak flows.

The land uses and roadway facilities proposed under the Specific Plan would require modifications to the existing sub watersheds of the project vicinity. Table 4.16.G provides a comparison of the existing and proposed drainage areas and shows the proposed modifications to the existing sub watersheds would not substantially alter the existing drainage pattern of the project vicinity. A comparison of the total area in acres shows no change.

Table 4.16.G: Comparison of Existing and Proposed Drainage Areas

Existing Condition			Proposed Condition		
Watershed	Area (acres)	Hydro-subarea	Watershed	Area (acres)	Hydro-subarea
A	2,657	Perris Valley	A	2,746	Perris Valley
B	1,361	Gilman Hot Springs	B	1,147	Gilman Hot Springs
C	1,061	Gilman Hot Springs	C	1,149	Gilman Hot Springs
D	965	Gilman Hot Springs	D	1,013	Gilman Hot Springs
E	2,510	Gilman Hot Springs	E	2,545	Gilman Hot Springs
F	445	Gilman Hot Springs	F	399	Gilman Hot Springs
Total	8,999			8,999	

Source: Table 4.1, Draft Master Plan of Drainage Report, CH2MHILL, September 2014

To adequately contain and store the greatest volume that would be generated during the 2-year, 5-year, 10-year, and 100-year storm events (i.e., 100-year 3-hour storm event), the project site would require the construction of on-site detention and infiltration basins, on-site culverts, and on-site energy dissipaters. Table 4.16.H provides a comparison of the existing and proposed storm water runoff for the 100-year 3-hour storm events. As shown in Table 4.16.H, the proposed WLC project site in the existing condition currently discharges at a rate of 2,470 cfs to the Perris Valley Hydro-Subarea and 5,250 cfs to the Gilman Hot Springs Hydro-Subarea. With the installation of the on-site detention basins, culverts, and energy dissipaters, expected discharges that would occur as a result of development of the site under the Specific Plan would discharge at a rate of 2,170 cfs to the Perris Valley Hydro-Subarea and 4,665 cfs to the Gilman Hot Springs Hydro-Subarea, which is less than the existing condition.

Table 4.16.H: Comparison of Existing and Proposed Storm Water Runoff for 100-Year 3-Hour Storm Event

Hydro-Subarea	Watershed	Existing Condition	Proposed Condition
		Peak Discharge (cfs)	
Perris Valley	A	2,470	2,170
	B	1,130	930
Gilman Hot Springs	C	820	750
	D	815	795

	F	495	390
	Total	5,250¹	4,665

Source: Table 4-2 Draft Drainage Report, CH2MHill, September 2014

Specific Plan Design Features. The preceding information has outlined the Drainage Master Plan (DMP) for the proposed WLCSP. The DMP is designed to retain increased on-site runoff that will occur due to the presence of more impervious surfaces (e.g., roofs, parking lots, and streets) and channel it to landscaped areas. The DMP is also designed to prevent off-site runoff from exceeding that which occurs under existing conditions. Section 6.0 of the Specific Plan requires the careful use of xeriscape or drought-tolerant vegetation with minimal mechanical irrigation to minimize water use for landscaping. Sections 4.2 and 5.4 require implementation of water-conserving landscaping, and Section 5.2.3 provides architectural design guidelines that will help minimize the consumption of water for landscape irrigation.

In addition to the Specific Plan design features, the following mitigation is recommended to ensure that impacts associated with project-related drainage capacity are reduced to less significant levels.

Mitigation Measures. Implementation of **Mitigation Measure 4.16.1.6.2A** would ensure that the proposed WLC project would not result in storm water drainage flows that would require the construction of new storm water drainage facilities or expansion of existing storm water drainage facilities that would in turn cause significant environmental effects.

4.16.1.6.2A Each Plot Plan application for development shall include a concept grading and drainage plan, with supporting engineering calculations. The plans shall be designed such that the existing sediment carrying capacity of the drainage courses exiting the project area is similar to the existing condition. The runoff leaving the project site shall be comparable to the sheet flow of the existing condition to maintain the sediment carrying capacity and amount of available sediment for transport so that no increased erosion will occur downstream. This measure shall be implemented to the satisfaction of the City Land Development Division/Public Works.

Level of Significance after Mitigation. Adherence to **Mitigation Measure 4.16.1.6.2A** would result in the project's compliance with the City's existing storm water infrastructure requirements, reducing the potential impact associated with storm water drainage capacity to a less than significant level. Discussion of hydrological impacts from construction and operation of the WLC project are addressed in Section 4.9.6.1, *Construction-Related Water Quality Impacts*, and Section 4.9.6.2, *Operational Water Quality Impacts*.

4.16.1.7 Cumulative Impacts to Water Supply Services

The cumulative area for water supply-related issues is the EMWD service area (previously referenced Figure 4.16.1). Existing and future development within the EMWD's service area would demand additional quantities of water. The adopted UWMP (2010) projects population within the EMWD

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

service area to increase to 1,111,729 persons by the year 2035. Increases in population, square footage, and intensity of uses would contribute to increases in the overall regional water demand. The anticipated conversion of water-intensive uses (i.e., agriculture) and the implementation of existing water conservation measures and recycling programs would reduce the need for increased water supply.

As previously identified, Metropolitan will continue to rely on the plans and policies outlined in its RUWMP and IRP to address water supply shortages and interruptions (including potential shut downs of SWP pumps) to meet water demands. An aggressive campaign for voluntary conservation and recycled water usage, curtailment of groundwater replenishment water and agricultural water delivery are some of the actions outlined in the RUWMP. As previously stated, Metropolitan currently does not have surplus water available, due in part to pumping restrictions imposed on the SWP in place to avoid and minimize impacts to Federal- and State-protected fish species in the Delta. However, Metropolitan has analyzed the reliability of water delivery through the SWP and the Colorado River Aqueduct. Metropolitan's IRP and RUWMP conclude that, with the storage and transfer programs developed by Metropolitan, there will be a reliable source of water to serve its member agencies' needs through 2035. The EMWD would have water supplies for projected growth through 2035 in wet, dry, and multiple-dry years, so cumulative impacts to water supply would be less than significant. The proposed WLC project would connect to existing conveyance infrastructure and adequate treatment capacity is available, so the proposed WLC project would not make a significant contribution to any cumulatively considerable impacts on water supply or infrastructure.

With implementation of the WLC Specific Plan as proposed and **Mitigation Measures 4.16.6.1A** through **4.16.6.1C**, potential cumulative impacts to regional long-term water supplies will not be cumulatively considerable.

4.16.2 Wastewater Services

4.16.2.1 Existing Setting

The EMWD and the Edgemont Community Services District (ECSD) provides wastewater (sewer) services in the City of Moreno Valley. The EMWD provides wastewater treatment, collection, and disposal service to most of the City and surrounding area and the ECSD provides sewer service to a small area in the southwestern portion of the City limits. The EMWD owns, operates, and maintains four regional water reclamation facilities including the Moreno Valley Regional Water Reclamation Facility (MVRWRF). The MVRWRF facility is located south of the City limits and east of Perris Boulevard, south and adjacent to Mariposa Avenue. The MVRWRF treats domestic, commercial, and industrial wastewater, and currently accepts an average daily flow of approximately 11.2¹ mgd, with an existing capacity of approximately 16 mgd.² Reclaimed water from the MVRWRF is primarily used to irrigate agriculture lands, greenbelts, and median strip areas. The existing development on the site (seven residences and associated farming facilities) is served by private septic tank systems. An existing sewer pipeline is located underlying Redlands Boulevard along the western perimeter of the project limits and Fir Avenue along the northern perimeter of the project limits.

NOP/Scoping Comments. No comments were received during the scoping period specifically regarding wastewater service.

¹ Plus 0.4 mgd diverted to the Perris Valley Regional Water Reclamation Facility.

² Eastern Municipal Water District Moreno Valley Regional Water Reclamation Facility, <http://www.emwd.org/modules.aspx?documentid=1423>, website accessed April 3, 2012.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4.16.2.2 Existing Policies and Regulations for Wastewater Services

Federal Water Pollution Control Act The major piece of Federal legislation dealing with wastewater is the Federal Water Pollution Control Act, which is designed to restore and preserve the integrity of the nation's waters. In addition to the Federal Water Pollution Control Act, other Federal environmental laws have a bearing on the location, type, planning, and funding of wastewater treatment facilities.

Regional Water Quality Control Board. Operation of the MVRWRF is subject to regulations set forth by the California Department of Health Services (DHS) and the Regional Water Quality Control Board (RWQCB). NPDES permits are required for operators of publically owned treatment works, municipal separate storm sewer systems (MS4s), construction, projects, and industrial facilities who discharge to surface waters within the City.

City of Moreno Valley General Plan. The following are policies in the City's General Plan that pertain to wastewater services and are applicable to the proposed WLC project:

Community Development Element

- Policy 2.12.1** Prior to the approval of any new development application, ensure that adequate septic or sewer service capacity exists or will be available in a timely manner.
- Policy 2.13.1** Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.
- Policy 2.13.2** Unless otherwise approved by the City, public water, sewer, drainage and other backbone facilities needed for a project phase shall be constructed prior to or concurrent with initial development within that phase.
- Policy 2.13.3** It shall be the ultimate responsibility of the sponsor of a development project to ensure that all necessary infrastructure improvements (including system-wide improvements) needed to support project development are available at the time that they are needed.

4.16.2.3 Methodology

The methodology of determining wastewater service impacts is based on evaluating the existing wastewater infrastructure and capacity available to the City, future wastewater demand and capacity that is anticipated to be available to the City, and the identification of existing wastewater demands and future wastewater demands with the development of the proposed WLC project.

4.16.2.4 Wastewater Services Thresholds of Significance

The proposed WLC project is considered to have a significant impact on wastewater services if any of the following occurs:

- The project would exceed wastewater treatment requirements of the Santa Ana Regional Water Quality Control Board;
- The project would result in a determination by the wastewater treatment provider, which serves or may serve the project, that it lacks adequate capacity to serve the project's projected demand in addition to the provider's existing commitments; and/or

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- The project would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

4.16.2.5 Less than Significant Impacts

4.16.2.5.1 Wastewater Treatment Requirements

Threshold	Would the proposed WLC project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?
-----------	---

Local governments and water districts are responsible for complying with Federal regulations, both for wastewater plant operation and the collection systems (e.g., sanitary sewers) that convey wastewater to the wastewater treatment facility. Proper operation and maintenance is critical for sewage collection and treatment as impacts from these processes can degrade water resources and affect human health. For these reasons, publicly owned treatment works (POTWs) receive Waste Discharge Requirements (WDRs) to ensure that such wastewater facilities operate in compliance with water quality regulations set forth by the State. WDRs, issued by the State, establish effluent limits on the kinds and quantities of pollutants that POTWs can discharge. These permits also contain pollutant monitoring, recordkeeping, and reporting requirements. POTWs that intend to discharge into the nation’s waters must obtain a WDR prior to initiating discharge.

The proposed WLC project would result in a connection to the sewer line underlying Redlands Boulevard in the vicinity of the intersection of Redlands Boulevard and Brodiaea Avenue. It is anticipated that all wastewater generated by the proposed WLC project would be routed to and treated by the MVRWRF. The MVRWRF is considered to be a POTW, so operational discharge flows treated at the MVRWRF would be required to comply with waste discharge requirements contained within the WDRs for that facility. Compliance with condition or permit requirements established by the City, and waste discharge requirements at the MVRWRF would ensure that discharges into the wastewater treatment facility system from the operation of the proposed WLC project would not exceed applicable Santa Ana RWQCB wastewater treatment requirements. Expected wastewater flows from the proposed WLC project will not exceed the capabilities of the serving treatment plant, so no significant impact related to this issue would occur and no mitigation would be required.

4.16.2.5.2 Wastewater Treatment Capacity and/or New or Expanded Wastewater Treatment Facilities

Threshold	Would the proposed WLC project result in a determination by the wastewater treatment provider, which serves or may serve the project, that it lacks adequate capacity to serve the project’s projected demand in addition to the provider’s existing commitments?
Threshold	Would the proposed WLC project require the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

As previously noted, the proposed WLC project would connect to the existing sewer pipeline underlying Redlands Boulevard in the vicinity of the intersection of Redlands Boulevard and Brodiaea Avenue. Wastewater flows from the proposed WLC project site would be handled by the EMWD and would be conveyed to the MVRWRF located in the southwestern portion of the City, southwest of the

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

proposed WLC project site. Current capacity at this facility is 16 mgd¹ with an existing average inflow of approximately 11.2 mgd.² Under current conditions, the average daily surplus treatment capacity is approximately 4.5 mgd. Generally, water use and wastewater flows are related in that wastewater is generated from indoor water uses.

Flow from the Logistics Development is based on a factor of water use equivalent to 0.01 gpd/sf. These values were determined based on a water demand analysis and benchmarking study conducted to determine water generation factors for similar facilities as outlined in the Technical Memorandum titled *World Logistics Center Water Demands and Waste Water Generation for Buildings* dated March 13, 2012. Since this study is for Specific Plan purposes and because these wastewater generation factors are less than rates used to cover the broad spectrum of light industrial uses, a facility sizing factor was added. This factor is 2.0 times the 0.01 gpd/sf for a wastewater generation factor of 0.02 gpd/sf. Based on a square footage of 40.6 million, the wastewater generated from the logistics uses on the site is 812,000 gpd. An additional 5,100 gpd of flow was added to account for the in-project fueling station. Thus, the total wastewater generated from the site is 817,100 (0.82 mgd). The additional wastewater treatment demand of 0.82 mgd resulting from development of the proposed WLC project totals approximately 18.2 percent of current surplus treatment capacity. Improvements planned for the MVRWRF facility would increase capacity at this facility from 16 mgd to 18 mgd with an ultimate expansion of this facility of 41 mgd. The planned expansion of the MVRWRF to increase capacity from 16 mgd to 18 mgd was completed in December 2013.³ Impacts associated with wastewater facilities would be less than significant because the amount of wastewater generated by the project would be within the existing surplus treatment capacity at the MVRWRF. The proposed WLC project would not require the construction of new wastewater treatment facilities or expansion of existing facilities, which could cause significant environmental effects. Therefore, impacts associated with wastewater facilities would be less than significant and no mitigation is required.

4.16.2.6 Significant Impacts

No impacts related to wastewater services or facilities have been identified as significant for the proposed WLC project.

4.16.2.7 Cumulative Impacts to Wastewater Facilities

The cumulative area for wastewater-related issues is the MVRWRF service area (previously referenced Figure 4.16.1). Cumulative population increases and development within the area serviced by the MVRWRF would increase the overall regional demand for wastewater treatment service. The previous treatment capacity at the MVRWRF was 16 mgd. Improvements to this facility have increased capacity at this facility to 21 mgd. Ultimate expansion of this facility is expected to be 41 mgd. The MVRWRF is expected to have adequate capacity to service the City's wastewater needs through 2030. Any proposed changes to capacity of the MVRWRF or any facility maintained by EMWD are reviewed throughout the year. EMWD has a funding and construction mechanism in place that ensures improvements to EMWD facilities occurs in a timely manner. This funding mechanism is referred to as EMWD's Sewer Financial Participation Charge Program. For all new development within the EMWD service area, the Sewer Financial Participation Charge is allocated to assist in the financing of any future collection and disposal facilities and any future sewer treatment plant facilities.

³ Approval and Authorize an Amendment (246,044) to the Agreement with Carollo Engineers for Constuction Management and Engineering Support Services During Construction of the MVRWRF, Eastern Municipal Water District, July 2, 2014, <http://www.emwd.org/home/showdocument?id=10415>.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Cumulative development would not exceed the capacity of the wastewater treatment system because the MVRWRF would expand as growth occurred.

The proposed WLC project would not have a cumulatively significant impact on wastewater infrastructure because the proposed WLC project would not require the expansion of existing infrastructure, only connections to existing infrastructure would be required by the project. By adhering to the wastewater treatment requirements established by the Santa Ana RWQCB through the NPDES permit, wastewater from the project site that is processed through the MVRWRF would meet established standards. As the wastewater from all development within the service area of the MVRWRF would be similarly treated under the NPDES, no cumulatively significant exceedance of Santa Ana RWQCB wastewater treatment requirements would occur.

4.16.3 Solid Waste Services

4.16.3.1 Existing Setting for Solid Waste Services

Solid waste disposal and recycling services for the proposed WLC project site would be provided by Waste Management of the Inland Empire.¹ Waste Management of the Inland Empire separates and markets recyclable materials collected within its service area. Solid wastes would primarily be transported to the Badlands Sanitary Landfill located at 31125 Ironwood Avenue in Moreno Valley. Additionally, Waste Management of the Inland Empire will also use other County landfills in the area, such as the Lamb Canyon Landfill on County land near the City of Beaumont and the El Sobrante Landfill in the City of Corona. The Badlands Sanitary Landfill is designated a Class III landfill run by the County of Riverside.² Waste types accepted at the Badlands Sanitary Landfill include agricultural, construction/demolition, industrial, mixed municipal, and tires.

The Badlands Sanitary Landfill currently has a permitted capacity of 33.5 million cubic yards with a remaining capacity of 14.7 million cubic yards.³ The tonnage of any mass of solid waste is dependent on the material (e.g., metals, paper, and green waste) and its density (compacted or uncompacted). Utilizing conversion factors from various jurisdictions, one cubic yard of compacted municipal solid waste typically weighs 750 pounds (0.37 ton).⁴ Based on this conversion factor, remaining space at the Badlands Sanitary Landfill totals approximately 5.45 million tons with an estimated closure date of January 2024. The maximum daily permitted throughput of this facility is 4,000 tons/day. The Badlands Sanitary Landfill currently accepts approximately 1,683 tons/day.⁵

Recyclable materials collected by Waste Management of the Inland Empire are handled at the Moreno Valley Transfer Station owned and operated by Waste Management, Inc. The Moreno Valley Transfer Station is a large volume transfer and processing facility that accepts the following waste types: construction and demolition materials, green materials, metals, and mixed municipal waste. The Moreno Valley Transfer Station currently has a permitted capacity of 2,600 tons per day and currently accepts 2,000 tons per day. This facility currently has the capacity to accept an additional 600 tons per day.

¹ Trash service in the City of Moreno Valley is mandatory and Waste Management of Inland Valley is the only solid waste service provider.

² Class III landfills are required to be located where adequate separation can be provided between non-hazardous solid waste and surface and subsurface waters. This class of landfill is not permitted to accept hazardous waste.

³ *Badlands Sanitary Landfill Facility/Site Summary Details*, CalRecycle website, <http://www.calrecycle.ca.gov/AA-0006/>, website accessed April 2, 2012.

⁴ <http://www.recyclemaniacs.org/doc/measurement-tracking/CURC-profile-input-form-with-conversion-guide.xls>, website accessed December 21, 2011.

⁵ Based on 2011 average; e-mail correspondence with John Farrar, Administrative Services Assistant, County of Riverside Waste Management Department, December 21, 2011.

NOP/Scoping Comments. No comments were received during the scoping period specifically regarding solid waste service.

4.16.3.2 Existing Policies and Regulations

Assembly Bill 939 (AB 939) California Integrated Waste Management Act. AB 939 was signed into law in 1989 and established a 50 percent waste reduction requirement for cities and counties by the year 2000, along with a process to ensure environmentally safe disposal of waste that could not be diverted. Jurisdictions select and implement the combination of waste prevention, reuse, recycling, and composting that best meets the needs of their residents while achieving the diversion requirements of the Act. Cities and counties also have the flexibility to work cooperatively toward the 50 percent goal by forming a regional agency. According to the provisions of the Act, in the year 2000, waste-to-energy or biomass conversions may contribute 10 percent toward the goal, with the remaining 40 percent accomplished through source reduction, recycling, and composting. The statute also allows a time extension to meet these goals for cities and counties that experience adverse market or economic conditions.

Assembly Bill 1327 (AB 1327) California Solid Waste Reuse and Recycling Access Act of 1991. Signed into law in 1991, AB 1327 added Chapter 18 to Part 3 of Division 30 of the Public Resources Code. Chapter 18 required the California Integrated Waste Management Board (CIWMB) to develop a model ordinance for adoption of recyclable materials in development projects. Local agencies were then required to adopt the model, or ordinances of their own, in order to govern adequate areas for collection and loading of recyclable materials in development projects by September 1, 1993. If a local agency had not adopted a model ordinance by that date, the CIWMB model would be adopted and enforced by the local agency.

Senate Bill 1016 (SB 1016). As previously identified, the California Integrated Waste Management Act of 1989 (AB 939) requires each jurisdiction to divert 50 percent of its solid waste from being disposed in landfills. The new per capita disposal measurement system (SB 1016, Wiggins, Chapter 343, Statutes of 2008) became effective January 1, 2009. It builds on AB 939 compliance requirements by implementing a simplified measure of local jurisdictions' performance. SB 1016 accomplishes this by changing to a disposal-based indicator: the per capita disposal rate, which uses only two factors: a jurisdiction's population and its disposal as reported by disposal facilities. SB 1016 changes how each jurisdiction's progress is measured to reach the 50 percent goal for diverting waste from landfills. This measurement is no longer determinative of compliance. In order for the CIWMB and jurisdictions to more properly focus on successful program implementation, SB 1016 shifts from the historical emphasis on using calculated generation and estimated diversion to using annual disposal as a factor when evaluating jurisdictions' program implementation.

Riverside County Integrated Waste Management Plan. The Riverside Countywide Integrated Waste Management Plan (RCIWMP), adopted by the Riverside County Board of Supervisors on January 14, 1997, and approved by the CIWMB on September 23, 1998, outlines the goals, policies, and programs the County and its cities, including the City of Moreno Valley, would implement to create an integrated and cost-effective waste management system that complies with the provisions of AB 939 and its diversion mandates. The RCIWMP is composed of the Riverside Countywide Summary Plan, the Source Reduction and Recycling Element (SRRE) for the County and each of its cities, the Nondisposal Facility Element (NDFE) for the County and each of its cities, the Household Hazardous Waste Element (HHWE) for the County and each of its cities, and the Riverside Countywide Siting Element.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

City of Moreno Valley General Plan. The following are policies and programs in the City’s General Plan that pertain to solid waste and are applicable to the proposed WLC project:

Conservation Element

Policy 7.8.1 Encourage recycling projects by individuals, non-profit organizations, or corporations and local businesses, as well as programs sponsored through government agencies.

Program 7-1 Support regional solid waste disposal efforts by the County of Riverside.

4.16.3.3 Methodology

The solid waste analysis is based on evaluating the existing capacity of nearby landfills that serve the City, future solid waste capacity that would be available to the City, and the identification of existing solid waste demand and future solid waste demand associated with the development of the proposed WLC project. The analysis also identifies existing City goals, policies, and programs that the City implements to reduce generated waste.

4.16.3.4 Solid Waste Services Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, a project is considered to have a significant impact on solid waste services if it results in either of the following:

- The project would be served by a landfill with insufficient permitted capacity to accommodate the project’s solid waste disposal needs; and/or
- The project would fail to comply with applicable Federal, State, and local statutes and regulations related to solid waste.

4.16.3.5 Less than Significant Impacts

The following solid waste impacts were determined to be less than significant. Adherence to established regulations, standards, and policies would reduce potential solid waste impacts to a less than significant level.

4.16.3.5.1 Solid Waste Facilities

Threshold	Would the proposed WLC project be served by a landfill with insufficient permitted capacity to accommodate the project’s solid waste disposal needs?
-----------	--

Solid waste collection is a “demand-responsive” service and current service levels can be expanded and funded through user fees without difficulty. The proposed WLC project is anticipated to generate approximately 104.6 tons of solid waste per day (38,164 tons/year).¹ Solid waste from the proposed WLC project would be hauled by Waste Management of Inland Valley and transferred to the Badlands Sanitary Landfill, located in Moreno Valley. The Badlands Sanitary Landfill has a daily permitted throughput of 4,000 tons per day, a remaining capacity of 14,730,025 cubic yards, and an

¹ South Coast Air Quality Management District. CalEEMod Manual, Appendix D, Table 10.1, Solid Waste Disposal Rate for Unrefrigerated Warehouse. <http://www.aqmd.gov/caleemod/user's-guide>. Calculation: 0.94 tons/thousand square feet/year x 40,600 thousand square feet = 38,164 tons per year.

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

estimated closure date of 2024.¹ The average daily throughput at the Badlands Sanitary Landfill for 2011 is estimated at 1,683 tons/day² with a current surplus capacity totaling 2,317 tons/day.

The volume of solid waste generated by the proposed WLC project per day represents 2.6 percent of the current permitted throughput and 4.5 percent of the current surplus capacity at the Badlands Sanitary Landfill. As adequate daily surplus capacity exists at the receiving landfill, development of the proposed WLC project would not significantly affect current operations or the expected lifetime of the landfill serving the project area. No significant solid waste disposal impact would occur and no mitigation is required.

4.16.3.5.2 Solid Waste Reduction

Threshold	Would the proposed WLC project fail to comply with applicable federal, state, and local statutes and regulations related to solid waste?
-----------	--

Federal, State and local governments have enacted a variety of laws and established programs to deal with the transport, use, storage, and disposal of hazardous materials to reduce the risks to public health and the environment. These laws and programs supplement existing regulations designed to control the contamination of air and water resources. There are no active landfills operating in Riverside County that accept hazardous wastes. Hazardous wastes generated within the County are disposed of at distant "Class I" landfills. The DHS regulates companies that haul hazardous waste. The California Highway Patrol (CHP) is responsible for the inspection of motor carriers that haul hazardous wastes. Inspections are made on roadways, at freeway truck scales and truck yards. The shipment of hazardous materials by truck or rail is regulated by Federal safety standards under the jurisdiction of the USDOT. Federal safety standards are also included in the California Administrative Code, Environmental Health Division. The EPA ensures that containers of hazardous materials are properly labeled with instructions for use. The California Department of Industrial Relations, Cal-OSHA Division regulates the use of hazardous materials in the workplace. Regulations governing the storage and use of hazardous materials are also contained in the Uniform Building Code and the Uniform Fire Code. The Hazardous Materials Branch (HMB) of the Environmental Health Services Division of the Riverside County Health Department operates a hazardous waste program. The HMB inspects those involved in generating, hauling, storage, treating, and disposing of these wastes. The HMB also operates mobile household hazardous waste roundups and checks loads at local landfills for hazardous wastes.

The City of Moreno Valley is responsible for meeting the requirements of AB 939 and SB 1016, which includes a 50 percent reduction in disposal by the start of 2000 and preparation of a solid waste reduction plan to help reduce the amount of solid waste disposed of at the landfills. Programs implemented by the City of Moreno Valley to satisfy the mandated reduction in solid waste include, but are not limited to, the following:

- Public outreach via print and electronic media (public education);
- Municipal solid waste ordinances and product and landfill bans (policy incentives); and
- Operation of material recovery and composting facilities (facility recovery).

The proposed WLC project would be required to coordinate with the waste hauler to develop collection of recyclable materials for the project on a common schedule as set forth in applicable

¹ *Badlands Sanitary Landfill Facility/Site Summary Details*, CalRecycle website, <http://www.calrecycle.ca.gov/SWFacilities//AA-0006/>, website accessed April 2, 2012.

² Based on 2011 average; e-mail correspondence with John Farrar, Administrative Services Assistant, County of Riverside Waste Management Department, December 2, 2012.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

local, regional, and State programs. Recyclable materials that would be recycled by the project include paper products, glass, aluminum, and plastic.

Additionally, the proposed WLC project would be required to comply with applicable elements of AB 1327, Chapter 18 (California Solid Waste Reuse and Recycling Access Act of 1991) and other applicable local, State, and Federal solid waste disposal standards, thereby ensuring that the solid waste stream to the Badlands Sanitary Landfill is reduced in accordance with existing regulations. Impacts are considered less than significant and require no mitigation.

4.16.3.6 Significant Impacts

No impacts related to solid waste services or facilities have been identified as significant for the proposed WLC project; therefore, no mitigation is required.

4.16.3.7 Cumulative Impacts to Solid Waste Services

AB 939 mandates the reduction of solid waste disposal in landfills. While the Badlands Sanitary Landfill has an estimated closure date of 2024, as previously identified, the City's waste hauler will also use other County landfills in the area (e.g., Lamb Canyon Landfill and El Sobrante Landfill). The estimated closure date of the Lamb Canyon Landfill is 2023 and the estimated closure date of the El Sobrante Landfill is 2030. With planned expansion activities of landfills in the project vicinity and projected growth rates contained in the City's General Plan EIR, sufficient landfill capacity would exist to accommodate future disposal needs through City buildout in 2030. Therefore, buildout of the City General Plan would not create demands for solid waste services that would exceed the capabilities of the County's waste management system. Consequently, cumulative impacts associated with solid waste within the City would be considered less than significant.

4.16.4 Energy Consumption

This section discusses the conditions that exist on the project site and the regulatory framework that governs the supply and demand for direct and indirect energy requirements. Appendix F of the *CEQA Guidelines* describes the energy conservation information and analyses that should be included in an EIR, including emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. Energy conservation is defined in terms of decreased reliance on natural gas and oil, decreased per capita energy consumption, and increased reliance on renewable energy sources.

4.16.4.1 Existing Setting

Electricity. Southern California Edison (SCE) currently has two existing 115 kilovolt (kV) overhead power transmission lines within the proposed WLC project limits. One is located along Gilman Springs Road from the south to Eucalyptus Avenue, then east on Eucalyptus Avenue to Theodore Street and then north on Theodore Street across SR-60. The second 115 kV transmission line is located along Brodiaea Avenue from the west to Davis Road then southeast into the San Jacinto Wildlife Area. In the project area, SCE also maintains 12 kV overhead distribution lines along Redlands Boulevard, Theodore Street, and Alessandro Boulevard just west of the project site.

The proposed WLC project would be supplied electricity by Moreno Valley Electric Utility (MVEU). MVEU currently has an existing electrical substation west of the project area at the southwest corner of Moreno Beach Drive and Cottonwood Avenue. This substation currently has a capacity to distribute 28 megawatts (MW) of electricity based on two existing 28 MW units (i.e., if one unit goes off, the other unit still maintains capacity to handle the demand). Ultimate capacity of this substation is 90

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

MW based on four 28 MW units. The current peak load for this substation is 22 to 26 MW; therefore, there is an existing 2 to 6 MW surplus capacity available. MVEU has underground 12 kV distribution lines along Cottonwood Avenue from the west to Redlands Boulevard, then north along Redlands Boulevard to Fir Street (now Eucalyptus Avenue), and then east along Eucalyptus Avenue to Theodore Street. The existing underground conduit underlying Eucalyptus Avenue currently serves the existing Skechers warehouse, office, and factory store. It should be noted that the MVEU indicated these assumptions are valid at this time, but could change if other development occurs before the proposed project.

Natural Gas. The proposed WLC project would be supplied natural gas by the Southern California Gas Company (SCGC). SCGC currently maintain a 4-inch medium-pressure service line underlying Redlands Boulevard that runs from SR-60 on the north to Cactus Avenue on the south and then runs west along Cactus Avenue with a stub-out to the north at Merwin Street. SCGC has low-pressure facilities that serve the residential areas located west of Redlands Boulevard and southwest of Merwin Street and Bay Avenue.

Throughout the proposed WLC project area, there are existing high-pressure natural gas transmission mains ranging in diameters of 16 inches up to 36 inches. SCGC currently maintains two 30-inch diameter transmission pipelines traversing the project site that run in an east-west direction and are located north and south of Alessandro Boulevard. There are also three transmission pipelines (a 16-inch, 30-inch, and 36-inch diameters) that run in a north-south direction along Virginia Street, south of Alessandro Boulevard. The 36-inch diameter pipeline also runs east from Virginia Street parallel with the 30-inch pipeline that runs south of Alessandro Boulevard.

Within the proposed WLC project site, SCGC maintains a gas line blow-down facility and flow metering station at Alessandro Boulevard and Virginia Street. Further south on Virginia Street, the San Diego Gas and Electric Company (SDG&E) maintains a natural gas compression station, known as the Moreno Compressor Station, which supplies gas to San Diego via 16-inch, 30-inch, and 36-inch transmission pipelines that continue to the south. SCGC has a gas transmission regulator station located at the southeast corner of Gilman Springs Road and Laurene Lane east of the proposed WLC project site.

Questar currently maintains a 16-inch gas transmission pipeline that underlies Alessandro Boulevard from Gilman Springs Road to Theodore Street, where it heads south to the Maltby Avenue alignment and then heads west toward Redlands Boulevard.

NOP/Scoping Comments. There were no specific comments regarding energy systems during the scoping process.

4.16.4.2 Existing Policies and Regulations

4.16.4.2.1 Federal Regulations

Energy Policy and Conservation Act. The Energy Policy and Conservation Act of 1975 sought to ensure that all vehicles sold in the U.S. would meet certain fuel economy goals. Through this Act, Congress established the first fuel economy standards for on-road motor vehicles in the U.S. Pursuant to the Act, the National Highway Traffic and Safety Administration (NHTSA), which is part of the U.S. Department of Transportation (USDOT), is responsible for establishing additional vehicle standards and for revising existing standards. Since 1990, the fuel economy standard for new passenger cars has been 27.5 mpg. Since 1996, the fuel economy standard for new light trucks (gross vehicle weight of 8,500 pounds or less) has been 20.7 mpg. The Corporate Average Fuel

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Economy (CAFE) program, administered by the EPA, was created to determine vehicle manufacturers' compliance with the fuel economy standards. The EPA calculates a CAFE value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information generated under the CAFE program, the USDOT is authorized to assess penalties for noncompliance.

Energy Policy Act of 1992. The Energy Policy Act (EPA) of 1992 was passed to reduce the country's dependence on foreign petroleum and improve air quality. EPA includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. EPA requires certain Federal, State, and local governments and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are also included in EPA. Federal tax deductions will be allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the act to consider a variety of incentive programs to help promote AFVs.

Energy Policy Act of 2005. The Energy Policy Act of 2005 includes provisions for renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a Federal purchase requirement for renewable energy.

4.16.4.2.2 State Regulations

California Code of Regulations Title 24, Part 6. Enacted in 1978, this part of the California Code established energy efficiency standards for residential and nonresidential buildings in response to a legislative mandate to reduce California's energy consumption. These standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The most recent standards were adopted and went into effect January 1, 2010.¹ Such standards include the provision of cool roofs, demand control ventilation, skylights for day-lighting in buildings, thermal breaks for metal building roofs, and lighting power limits. These standards are expected to reduce the growth in electricity use of residential and non-residential buildings. Continual updates to Title 24 along with the State's implementation of AB 1493 and SB 1368 will have a major impact on the State's attainment of the AB 32 goals.

California Code of Regulations Title 24, Part 11. This part of the California Code is known as the California Green Building Standards Code (CALGreen Code) and was enacted to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts with positive environmental impacts and through encouragement of sustainable construction practices. The CALGreen Code is not intended to substitute or be identified as meeting the certification requirements of any green building program that is not established and adopted by the California Building Standards Commission (CBSC). This update to Part 11 of Title 24 of the California Code of Regulations was effective January 1, 2011.

California Code of Regulations Titles 14 and 27. These parts of the California Code require energy efficient practices as part of solid and hazardous waste handling and disposal.

¹ *Nonresidential Compliance Manual for California's 2008 Energy Efficiency Standards*, California Energy Commission, effective January 1, 2010, <http://www.energy.ca.gov/title24/2008standards/index.html>, website accessed on March 4, 2010.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4.16.4.2.3 Regional and Local Regulations

City of Moreno Valley General Plan. The City’s General Plan Chapter 9 (Goals and Objectives) establishes goals and objectives to guide development within the City. Specific policies associated with energy facilities relevant to the proposed WLC project include:

- Objective 7.5 Encourage efficient use of energy resources.
- Policy 7.5.1 Encourage building, site design, and landscaping techniques that provide passive heating and cooling to reduce energy demand.
- Policy 7.5.5 Encourage the use of solar power and other renewable energy systems.
- Policy 7.7.2 Require new electrical and communication lines to be placed underground.

4.16.4.3 Methodology

The energy analysis is based on evaluating the existing energy supply available to the City, future energy supply that is anticipated to be available to the City, and the identification of existing electricity and natural gas demand and future demand with the development of the proposed WLC project. The analysis also identifies energy conservation measures that would be incorporated by the proposed WLC project to reduce the project’s total energy demand.

4.16.4.4 Thresholds of Significance

Appendix G of the *CEQA Guidelines* (2011) does not include thresholds to determine potential environmental impacts resulting from project-related electrical and natural gas demand and use. However, Appendix F of the *CEQA Guidelines* (2011) provides guidance on what should be considered in an EIR’s discussion of energy impacts. This includes but is not limited to energy-consuming equipment and processes operation; total energy requirements of the project by fuel type and end use; energy conservation equipment and design features; and identification of energy supplies that would serve the project. Consideration of environmental impacts includes an evaluation of the project’s energy requirements and energy use during operation and the degree to which the project complies with current energy standards. The guidance suggests that particular emphasis be placed on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy (see Public Resources Code section 21100(b) (3)).

4.16.4.5 Less Than Significant Impacts

Based its size, energy impacts of the WLC project are potentially significant.

4.16.4.6 Significant Impacts

Impact 4.16.4.6.1 Construction or Expansion of Electrical and Natural Gas Facilities

Threshold	Would the proposed WLC project require the construction of new electrical and/or natural gas facilities or expansion of existing facilities, the construction of which would cause significant environmental effects?
-----------	---

Based on calculations contained Tables 4.16.I and 4.16.J, the proposed WLC project would consume approximately 376,426 megawatt-hours (MWh) of electricity and almost 14.6 million cubic feet of natural gas per year. The estimated electrical demand assumes no on-site electrical generation by photovoltaic panels.

**Final Programmatic Environmental Impact Report

cf = cubic feet.

Source: Technical Memorandum – Dry Utilities, Utility Specialists, October 24, 2013.

The WLC Specific Plan requires future installation of solar photovoltaic panels on the roof of each warehouse building to offset the energy demands of the office portion of the building. The following utility improvements are based on a “worst-case” assumption that on-site solar electrical generation is not available and electrical service would have to be provided by MVEU. In addition, partial or complete connection to the existing electrical grid may be necessary even with roof-mounted solar photovoltaic panels so there is redundancy (backup) in case of an emergency or during nighttime when no on-site power is being generated (i.e., some warehouses may operate 24/7). At this time, it is not anticipated that any uses will install sufficient on-site power generation and storage to be totally independent of the existing electrical grid.

A number of SCE facilities would still require relocation and expansion of MVEU facilities in order to provide network backup (i.e., if the solar generation equipment were to fail) and accommodate the potential increase in electrical demand no matter the contribution of project alternative energy generated. Power poles, guy poles, and guy anchors for the existing overhead 115 kV line along Theodore Street and Gilman Springs Road will need to be relocated at the time these roadways are widened. The portion of the existing 115 kV line along Eucalyptus Avenue may also need to be relocated into the new Eucalyptus Avenue alignment between Theodore Street and Gilman Springs Road at the time the roadway is constructed. The existing 115 kV line along Brodiaea Avenue may be able to be protected in place except for a few hundred feet where the transmission line intersects with the new Merwin Street, which will need to be relocated to accommodate street and storm drain channel improvements.

The existing 12 kV overhead power distribution lines along Redlands Boulevard will need to be undergrounded when the roadway is developed to its ultimate width. The existing 12 kV overhead power feeder lines located along Theodore Street and Alessandro Boulevard will need to be relocated and undergrounded as these roadway improvements take place during the development of the proposed WLC project. The existing 12 kV overhead power feeder line running south along Virginia Street to the Moreno Compressor Station (planned as Open Space) will be protected in place. The existing overhead service lines from the Theodore Street 12 kV line along Dracaea Avenue to the east and along Cottonwood Avenue to the west can be abandoned when existing on-site residences served by these facilities are abandoned. Per SCE requirements, SCE 12 kV undergrounded lines

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

cannot be in a common trench with MVEU facilities and require a separate underground facility with a minimum 6 feet from other utility lines.

Based on the *Technical Memorandum – Dry Utilities World Logistics Center, Moreno Valley, CA*, (Utility Specialists, October 24, 2013) prepared for the proposed WLC project, construction of the first three logistics buildings that would occur during the initial phase of construction can be served by the existing MVEU substation at Cottonwood Avenue and Moreno Beach Drive, as long as capacity is still available at that station. Subsequent buildings in Phase 1 of construction will require the expansion of this substation. The expansion that would occur to meet this demand would be the addition of two new 28 MW transformer units which can be accommodated within the existing substation property. New 12 kV underground feeder circuits, including trenching, conduit, electrical vaults, and conductors will need to be installed from the substation to the proposed WLC project site. These improvements will occur along Cottonwood Avenue, along Moreno Beach Drive, and along Alessandro Boulevard, Brodiaea Avenue, and Cactus Avenue. These improvements are expected to take place concurrently with roadway construction.

To meet the proposed WLC project's ultimate annual demand of 376,426 MW, a new 112 MW substation will be constructed within the project limits at a central location near one of SCE's 115 kV transmission lines that will feed power to the substation. The *Dry Utilities* memo for the project indicates two potential locations; the first adjacent to the SCE transmission lines along Gilman Springs Road, and the other adjacent to the SCE transmission lines along Brodiaea Avenue. Impacts of constructing the new station at either of these on-site locations may be the same.

SCE will require approximately 2 acres for a switching station near the new 112 kV substation proposed by MVEU to serve the proposed WLC project. All MVEU primary distribution conductors within the project will be installed within underground conduits and vaults within the public roadway rights-of-way or within easements as a joint trench with telephone, cable television, and natural gas. Since the installation or relocation of electrical facilities would take place concurrently with roadway construction and/or within dedicated easements, or protected in place, the construction of these facilities would not result in significant environmental effects. Previously referenced Figure 3.16 depicts the proposed electrical facilities assuming 100 percent backup electrical service to the WLC site.

SCGC has indicated that the existing 4-inch medium-pressure line underlying Redlands Boulevard and Cactus Avenue can be extended into and looped around the proposed WLC project roadway alignments to serve the proposed development. New two-inch gas lines will also be installed to accommodate the proposed WLC project's demand. No gas lines will be installed on Gilman Springs Road since all buildings will be served from the interior gas lines. Natural gas facilities will be installed in the public street rights-of-way and easements as a joint trench with telephone, cable TV and electrical services. The gas main in Eucalyptus Avenue will be on the south side of the street and in its own trench as it was not included in the common trench installed to serve the Skechers building.

Relocation of natural gas transmission lines within the proposed WLC project into public street rights-of-way and easements will be necessary to support site development and grading. These include 11,100 feet of the 30-inch gas pipeline in Cottonwood Avenue from Redlands Boulevard to Theodore Street and then southeast to Virginia Street and Alessandro Road intersection; 1,900 feet of 30-inch gas line from Gilman Springs Road at Lisa Lane southwest to Alessandro Boulevard; 1,000 feet of 16-inch gas line owned by Questar from Gilman Springs Road southwest to Alessandro Road and 4,000 feet of 16-inch gas line owned by Questar on the Maltby Avenue alignment from Merwin Street to Theodore Street. The remaining transmission gas lines are anticipated to be protected in place within the proposed streets or easements between buildings. The regulator station located at the southeast corner of Gilman Springs Road and Laurene Lane east of the proposed WLC project will need to be relocated as part of the widening of this road. The gas facility on Alessandro Boulevard

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

and Virginia Street will remain in place as the project develops in this area. The SDG&E natural gas compression station on Virginia Street south of the project site, known as the Moreno Compressor Station, along with a smaller facility on Virginia Street at Boadicea Avenue will be protected in place. Since the installation or relocation of natural gas facilities would take place concurrently with roadway construction and or within dedicated easements, or protected in place, the construction of these facilities would not result in significant environmental effects. Previously referenced Figure 3.16 depicts the proposed natural gas facilities.

The supply of natural gas and electricity is demand-responsive. The project proponent would be required to meet the service requirements of these utility providers, which would ensure that a less than significant impact related to the provision of power would result from development of the proposed logistics uses.

Additionally, the proposed WLC project would be required to adhere to Title 24, Part 6, of the California Code of Regulations, which identifies energy efficiency standards for residential and nonresidential buildings. These standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The most recent standards were adopted and went into effect January 1, 2011. The 2011 standards for residential and non-residential buildings are expected to reduce the growth in electricity use and reduce the growth in natural gas use. Such standards include the provision of cool roofs, demand control ventilation, skylights for day-lighting in buildings, thermal breaks for metal building roofs and lighting power limits.

Specific Plan Design Features. As noted in Section 3.5.9.1 of the Project Description, the project intends to achieve applicable elements of certification from the U.S. Green Building Council Leadership in Energy and Environmental Design (LEED), and encourages LEED Certification. The project will encourage sophisticated construction techniques that will provide pollution prevention and control such as noise, air quality, erosion and sediment controls. Both site planning and future building design will encourage current best practices for use of recycled materials and products, such as recycled steel, and crushed concrete and pavement materials. The use low-emitting VOC building materials will be used on site.

Compliance with such standards would be reviewed before the issuance of a building permit by the City. Because the proposed WLC project would be required to adhere to standards contained in Title 24 in addition to requirements set forth by the respective utility providers, development of the proposed WLC project would not result in the wasteful, inefficient or unnecessary consumption of energy.

NOTE: The following addition is in response to Comment F-13-32 in Letter F-13 from the Sierra Club et al.

The WLCSP will require extensive energy conservation measures, solar energy systems, and underground utilities to be installed on future development. In these ways, the WLC project is consistent with General Plan Objective 7.5 and Policies 7.5.1, 7.5.5, and 7.7.2.

NOTE: The following measures include many of the mitigation recommendations in Comment E-2A-25 in Letter E-2A from the City of Riverside.

Mitigation Measures. Even with implementation of the WLCSP design measures regarding energy conservation, the following specific measures are recommended to help ensure that potential impacts of the WLC project relative to energy use will remain at less than significant levels:

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

4.16.4.6.1A Each application for a building permit shall include energy calculations to demonstrate compliance with the California Energy Efficiency Standards confirming that each new structure meets applicable Building and Energy Efficiency Standards. The plans shall also ensure that buildings are in conformance with the State Energy Conservation Efficiency Standards for Nonresidential buildings (Title 24, Part 6, Article 2, California Administrative Code). This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions. Plans shall show the following:

- Energy-efficient roofing systems, such as “cool” roofs, that reduce roof temperatures significantly during the summer and therefore reduce the energy requirement for air conditioning.
- Cool pavement materials such as lighter-colored pavement materials, porous materials, or permeable or porous pavement, for all roadways and walkways not within the public right-of-way, to minimize the absorption of solar heat and subsequent transfer of heat to its surrounding environment.
- Energy-efficient appliances that achieve the 2008 Appliance Energy Efficiency Standards (e.g., EnergyStar Appliances) and use of sunlight-filtering window coatings or double-paned windows.

4.16.4.6.1B Prior to the issuance of any building permits within the World Logistics Center Specific Plan, each project developer shall submit energy calculations used to demonstrate compliance with the performance approach to the California Energy Efficiency Standards to the Building and Safety and Planning Divisions that shows each new structure meets the applicable Building and Energy Efficiency Standards. Plans may include but are not necessarily limited to implementing the following as appropriate:

- High-efficiency air-conditioning with electronic management system (computer) control.
- Variable Air Volume air distribution.
- Outside air (100 percent) economizer cycle.
- Staged compressors or variable speed drives to flow varying thermal loads.
- Isolated High-efficiency air-conditioning zone control by floors/separable activity areas.
- Specification of premium-efficiency electric motors (i.e., compressor motors, air handling units, and fan-coil units).
- Use of occupancy sensors in appropriate spaces.
- Use of compact fluorescent lamps in place of incandescent lamps.
- Use of cold cathode fluorescent lamps.
- Use of Energy Star exit lighting or exit signage.
- Use of T-8 lamps and electronic ballasts where applications of standard fluorescent fixtures are identified.
- Use of lighting power controllers in association with metal-halide or high-pressure sodium (high intensity discharge) lamps for outdoor lighting and parking lots.
- Use of skylights (may conflict with installation of solar panels in some instances).

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Consideration of thermal energy storage air conditioning for spaces or hotel buildings, meeting facilities, theaters, or other intermittent-use spaces or facilities that may require air-conditioning during summer, day-peak periods.

4.16.4.6.1C Prior to the issuance of a building permit, new development shall demonstrate that each building has implemented the following:

- 1) Install solar panels with a capacity equal to the peak daily demand for the ancillary office uses in each warehouse building;
- 2) Increase efficiency for buildings by implementing either 10 percent over the 2008 Title 24's energy saving requirements or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict; and
- 3) Require the equivalent of "Leadership in Energy and Environmental Design Certified" for the buildings constructed at the World Logistics Center based on Leadership in Energy and Environmental Design Certified standards in effect at the time of project approval.

This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions.

4.16.4.7 Cumulative Impacts to Energy Facilities

As indicated in Section 4.16.4.6.1, the proposed WLC project would not result in significant impacts related to energy consumption with implementation of the WLC Specific Plan as proposed, and with the recommended project-specific mitigation measures. The project will adhere to Title 24, Part 6, of the CCR, which identifies state energy efficiency standards. Adherence to these energy efficiency standards would reduce the amount of energy consumed by the proposed WLC project. The WLCSP will require future development to install solar photovoltaic panels on the roof of each building to meet the electrical demand of the office portion of each warehouse building. The proposed WLC project will implement "green building" characteristics and its design will help reduce energy consumption. With these measures, the WLC project will not make a significant contribution to cumulative energy facility impacts.

THIS PAGE INTENTIONALLY LEFT BLANK

NOTE TO READERS. Revisions have been made to this section to reflect changes in Programmatic DEIR Sections 2 through 4 in response to comments on the DEIR and as a result of changes in the WLC project.

5.0 OTHER CEQA TOPICS

Section 15126 of the *CEQA Guidelines* requires that all aspects of a project must be considered when evaluating its impacts on the environment, including planning, acquisition, development, and operation. As part of this analysis, the EIR must also identify (1) significant environmental effects of the proposed WLC project; (2) significant environmental effects that cannot be avoided if the proposed WLC project is implemented; and (3) growth-inducing impacts.

5.1 SIGNIFICANT ENVIRONMENTAL EFFECTS WHICH CANNOT BE AVOIDED IF THE PROPOSED WLC PROJECT IS IMPLEMENTED

Table 5.A illustrates the significant unavoidable impacts anticipated to result from the proposed WLC project, even with implementation of the project-specific mitigation measures identified in the Section 4.0 analyses.

Table 5.A: Significant Environmental Effects Which Cannot Be Avoided

Topic	Type of Impact	Impact
Aesthetics	Scenic Vistas	The DEIR originally indicated no feasible mitigation was available to mitigate for the direct impacts associated with the loss of existing viewsheds in the area. Mitigation was modified/added to help reduce these impacts.
Aesthetics	Scenic Resources and Scenic Highways	The DEIR originally indicated no feasible mitigation was available to mitigate the changes to existing viewsheds from SR-60 and from Gilman Springs Road, both considered local scenic roads by the City. Mitigation was modified/added to help reduce these impacts. With this mitigation, these impacts are consistent with relevant General Plan policies regarding views.
Aesthetics	Substantial degradation of the existing visual character or quality of the site and its surroundings	The DEIR originally indicated no feasible mitigation was available to mitigate for the direct impacts associated with the substantial change in visual character from agriculture to high cube warehouse uses with building heights of 60 to 80 feet. Mitigation was modified/added to help reduce these impacts.
Aesthetics	Cumulative Aesthetic Impacts	The cumulative effect of development in the region will continue to result in the modification of existing viewsheds especially along SR-60. Construction of the proposed WLC project, in conjunction with other planned development, would contribute to the obstruction of existing views. Even with the revised mitigation measures, the project's cumulative impact will not be reduced to a less than significant level.
Air Quality	Construction Air Pollutant Emissions	Construction activities would result in exceedance of SCAQMD threshold for VOC, CO, NO _x , PM ₁₀ , and PM _{2.5} . Even after application of mitigation measures, estimated air pollutant emissions during construction activities would remain significant and unavoidable for NO _x , and PM ₁₀ and localized PM ₁₀ concentrations.
Air Quality	Operational Air Pollutant Emissions	No feasible mitigation is available. Estimated air pollutant emissions during operation of the project will remain significant

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 5.A: Significant Environmental Effects Which Cannot Be Avoided

Topic	Type of Impact	Impact
		and unavoidable for VOC, CO, NO _x , PM ₁₀ , and PM _{2.5} and localized PM ₁₀ concentrations.
Air Quality	Consistency with Air Quality Management Plan (AQMP)	The project will produce significant amounts of air pollutants on a daily and cumulative basis, both during construction and operation. Even with implementation of proposed mitigation, emissions will result in exceedances that are not consistent with implementation of the current AQMP.
Air Quality	Cumulative Air Pollutant Emissions	The Basin is in nonattainment for PM ₁₀ and ozone at the present time. Construction of the proposed WLC project, in conjunction with other planned developments within the cumulative study area, would contribute to the existing nonattainment status. Therefore, the proposed WLC project would exacerbate nonattainment of air quality standards within the SCAQMD and contribute to adverse cumulative air quality impacts.
Air Quality	Sensitive Receptors	Residents inside the project boundary could be exposed to significant short-term and long-term PM ₁₀ concentrations on an ongoing basis. The health effects from short-term PM exposure include irritation of the eyes, nose, throat; coughing, and chest tightness; and aggravation of existing lung diseases. Long-term exposure can reduce lung functions; chronic bronchitis; changes in lung morphology; and/or death. Even with mitigation measures air quality impacts from the project will be significant and unavoidable.
NOTE: Climate change was removed as a cumulative impact because the project can take credit for regional GHG emission reductions from the State's cap-and-trade program involving refineries and diesel truck fuel.		
Land Use and Planning	Divide an existing neighborhood (impacts on existing residences)	The site contains seven rural residences that cannot be effectively buffered against the impacts of adjacent warehouse buildings and operations (i.e., air pollution and health risks). Mitigation was added to help reduce noise, dust and other air pollutant-related impacts on the rural residences.
Noise	Short-Term Construction Noise	Project construction will create significant noise levels for on-site uses and off site away from the project site due to construction vehicle travel.
Noise	Long-Term Traffic Noise	Residential land uses along a number of local roadways will experience noise levels that are projected to exceed City standards from project-related traffic. Potential noise attenuation improvements may not be physically or economically feasible due to building and roadway constraints.
Noise	Cumulative Noise Levels	Noise from project-related traffic and cumulative development will eventually exceed City noise standards and the project will make a substantial contribution to that cumulative impact.
Transportation	Off-Site Impacts to TUMF Facilities	<p>These are impacts requiring improvements and changes to roads that are part of the TUMF Regional System of Highways and Arterials, some of which are under the jurisdiction of Moreno Valley and others are located in other jurisdictions. The developer shall be responsible for paying the TUMF fees in effect at the time of approval. These payments shall constitute the developer's mitigation of project impacts to this category of roads.</p> <p>The City shall work with the other member agencies of WRCOG to program TUMF funds to implement the mitigation measures identified in 4.15.AT through 4.15.AY pertaining to TUMF facilities outside the jurisdiction of the City of Moreno Valley. To the extent</p>

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 5.A: Significant Environmental Effects Which Cannot Be Avoided

Topic	Type of Impact	Impact
		that TUMF fees provided by the developer are used to implement the recommended improvements the project's impacts would be less-than-significant. However, because the City does not have direct control over TUMF funding the City cannot ensure that the identified improvements would be made. The project's impacts on these facilities must be considered significant and unavoidable.
Transportation	Off-Site Improvements to Roads Outside the Jurisdiction of the City and Not Part of the TUMF Program	<p>These are impacts requiring improvements to transportation facilities that are under the jurisdiction of Riverside County, Caltrans, and other municipalities and that are not included in the TUMF Regional System of Highways and Arterials.</p> <p>The City does not have cooperative agreements with neighboring jurisdictions that would serve as a mechanism for collecting and distributing developer funds to cover the cost of cross-jurisdictions mitigation measures, other than the TUMF program. To the extent that the City is able to establish such a mechanism and the other jurisdiction constructs the recommended improvement, the project's impacts would be less-than-significant. However, because the City cannot guarantee that such a mechanism will be established and does not have direct control over facilities outside of its jurisdiction the City cannot ensure that the identified improvements would be made. The project's impacts on these facilities must be considered significant and unavoidable.</p> <p>Similarly, the City has not entered into an agreement with Caltrans for the collection of developer funds for improvements to the state highway system other than freeway interchange improvements funded through the TUMF program. Nor has Caltrans established a program to collect fair-share contributions to freeway improvements such as those identified in EIR Tables 4.15.AX and 4.15.BA (TIA tables 40 and 68). The City shall work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements. However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, the project's impacts on the state highway system must be considered significant and unavoidable.</p>

1 The DEIR originally indicated there was no mechanism for the mitigation of impacts to the loss of 25 acres of Unique Farmland and/or existing agricultural operations. The acquisition of an offsite agricultural conservation easement was added as mitigation which will reduce the project's impact to State Designated Farmland to a less than significant level.

5.2 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES WHICH WOULD BE CAUSED BY THE PROPOSED PROJECT SHOULD IT BE IMPLEMENTED

Section 15126(c) of the *CEQA Guidelines* mandates that the EIR must address any significant irreversible environmental changes which would be involved in the proposed action should it be implemented. An impact would fall into this category if it resulted in any of the following:

1. The project would involve a large commitment of non-renewable resources;

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

2. The primary and secondary impacts of the project would generally commit future generations of people to similar uses;
3. The project involves uses in which irreversible damage could result from any potential environmental incidents associated with the project; and/or
4. The project will consume large amounts of energy that are produced from non-renewable fossil fuels, although the WLC Specific Plan indicates the proposed uses will efficiently consume energy and water resources.

Determining whether the proposed WLC project may result in significant irreversible effects requires a determination of whether key resources would be degraded or destroyed in such a way that there would be little possibility of restoring them. The project site is generally marginal agricultural land; however, as identified within the City's General Plan, the City anticipates the eventual conversion of agricultural uses to urban uses and the proposed WLC project would permanently alter the site by converting predominantly agricultural uses to urban warehousing. This is a significant irreversible environmental change that would occur as a result of project implementation. Because no significant mineral resources were identified within the project limits, no significant impacts related to this issue would result from development of the project site. Natural resources in the form of construction materials would be utilized in the construction of the proposed WLC project and energy resources in the form of electricity and natural gas would be used during the long-term operation of the project; however, their use is not expected to result in a negative impact related to the availability of these resources. Existing scenic vistas were identified as being visible from the project limits. Implementation of the proposed WLC project would result in the obstruction of views of the Badlands, Mt. Russell and Mystic Lake/San Jacinto Wildlife Preserve from the nearest sensitive visual receptors and those traveling along roadways in the project vicinity. This is a significant and irreversible environmental change that would occur as a result of project implementation. Cumulatively, future development along SR-60 would also result in the obstruction of the existing views of surrounding mountains and visual features.

In addition, this logistics warehouse project, in concert with the other built or approved industrial warehouse projects to the north and west, will fundamentally change the character and land use pattern of this portion of the City. Many of the project-specific impacts are addressed, as outlined above, but the land use change represented by this and other industrial projects represents a substantial irreversible change in community character for this area.

5.3 GROWTH-INDUCING IMPACTS

The project area is largely vacant undeveloped land, although there are seven existing single-family homes in various locations on the proposed WLC project site along with associated ranch/farm buildings. The site has been farmed since the early 1900s and has supported dry (non-irrigated) farming, livestock grazing, and limited citrus groves. Much of the site continues to be used for dry farming.

The northern side of the proposed WLC project site abuts SR-60 and the eastern side abuts Gilman Hot Springs Road. Additionally, the southwestern portion of the project site is adjacent to existing single-family residential uses at the intersection of Redlands Boulevard and Alessandro Boulevard. With implementation of the General Plan Amendment and new Specific Plan, the project has the potential to induce or create conditions that would accelerate development of vacant parcels in the surrounding area from the creation of new employment opportunities and increasing the demand for goods and services.

The following changes have been made due to revision to the Specific Plan project size.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The City's population has grown steadily over the past decades. Population projections developed by SCAG estimate the City's population will reach approximately 213,700 persons by the year 2020 and approximately 255,200 persons by the year 2035. The extent to which the new jobs created by a project are filled by existing residents is a factor that tends to reduce the growth-inducing effect of a project. Construction of the proposed WLC project will create short-term construction jobs. These short-term positions are anticipated to be filled by workers who, for the most part, reside in the project area; therefore, construction of the proposed WLC project will not generate a permanent increase in population within the project area. Development envisioned under the proposed Specific Plan consists of approximately 40.6 million square feet of logistics warehouse and general warehouse facilities.

Development of the proposed high-cube logistics warehouse and general warehouse facilities will create jobs in the local economy. It is estimated that the WLCSP project would result in approximately 27,684 new job opportunities (20,300 on-site jobs plus 7,384 direct/induced jobs). The new employment opportunities resulting from development of the proposed high-cube logistics warehouse and general warehouse uses will raise the City's current jobs-to-housing ratio by providing additional jobs to local residents. While the place of residence of the persons accepting employment provided by the proposed uses is uncertain, due to the City's projected jobs/housing ratio, it is reasonable to assume that a large percentage of these jobs would be filled by persons already living within the City or project area. The project does not include a residential component. The proposed WLC project is located within an area that is currently largely vacant and planned for mix of residential, commercial, business park, and open space land uses in accordance with the General Plan Community Development Element. The proposed WLC project includes a General Plan Amendment to change the existing mix of land use designations to Logistics Development and Light Logistics. Therefore, no significant increase in population of the City would result from the development or operation of the proposed WLC project.

The *Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California* ("Study," DTA 2013) estimates that approximately 7,384 indirect/induced jobs will be created in the County, of which 3,692 jobs are projected to be within the City as a result of project implementation. While the specific location of the potential additional indirect/induced jobs created within the County cannot be specifically determined, it is reasonable to assume that a large percentage of these jobs will be support service jobs and are likely to be located in the proposed WLC project vicinity, and therefore the City. As detailed in the Study, total recurring revenues available to the City are estimated at approximately \$11,272,323 per year. The greatest percentage of revenue is attributed to the Property Tax In-Lieu of Vehicle License Fee (40.1%), followed by Secured Property Tax (29.1%), and Business Receipts Tax and Licenses (10.7%). Total recurring costs to the City are estimated at approximately \$5,473,736 per year. The greatest percentage of cost is attributed to the Police Services (36.4%), followed by Infrastructure and Parks Maintenance Costs (33.2%), and Fire Services (13.5%).

Project recurring annual fiscal surplus that would be available to the City is estimated at \$5,798,587 which is equal to 2.06 times the project annual City General Fund costs.

The following changes have been made due to revision to the Specific Plan project size.

The project proposes to eliminate the potential for 7,700 units of residential housing planned under the Moreno Highlands Specific Plan, although this anticipated change is already included in the City's current Housing Element which has been certified by HCD. This change would incrementally reduce the population and housing growth potential for this property from that projected in the current SCAG regional growth forecast. However, the project would add 40.6 million square feet of logistics warehouse space in the eastern portion of the City. Since the City currently has a jobs-to-housing ratio substantially lower than the region (i.e., SCAG region), it is likely that much of the employment that would be generated by this project can be accommodated by the existing workforce in the City

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

and surrounding area. In that way, the project is growth-inducing in terms of employment. Due to relatively high vacancy rates in the City, it is also likely that the housing needs of new employees that do not already live in the City (i.e., own or rent) could largely be accommodated by the City's existing housing stock. Therefore, the proposed WLC project would only produce modest (i.e., not significant) growth inducement within Moreno Valley.

As previously noted, the specific location of the additional indirect jobs created within the County cannot be specifically determined; however, it is likely that some percentage of these jobs will be support service jobs and are likely to be located in the project vicinity. The Study assumes that one-half of these indirect jobs will be located within the City. The Study indicates that the creation of new jobs to the City will lead to more consumer spending by employees in existing retail establishments within the City, as well as new retail development that will be attracted to the City as a result of this spending. Job creation also results in increased tax revenues to the City through increased property taxes and sales taxes associated with development of the proposed WLC project. However, it is important to note that because of the difference in timing of the development of the various phases of the proposed WLC project, the number of employees summarized above will not be realized at the same time.

Development of the proposed WLC project is projected to create approximately 16,521 construction-related jobs within the City. Similar to recurring employment (i.e., permanent), it is likely that a large percentage of these jobs will be located in the general vicinity of the proposed WLC project and therefore within the City.

The proposed WLC project does not include a residential component; therefore, the jobs generated by the proposed WLC project would not need to support new households as a result of direct employment or indirect employment. Based on the potential increase in jobs (additional 20,300 direct jobs) within the City and no substantial increase in population as a result of the project, the City's jobs-to-housing ratio would improve from the existing (2011) ratio of 0.45 to 0.88, thus achieving a greater jobs-to-housing balance within the City. As development of the proposed WLC project is expected to occur over the course of many years, the jobs-to-housing ratio will not be significantly changed immediately. The City's current jobs-to-housing ratio is exceptionally low when compared to SCAG standards; therefore, the need for employment is immediate. A balance between jobs and housing within the City would have a positive impact by decreasing costs associated with commuting, traffic congestion, air pollution, and improves the standard of living. It also provides savings and a better quality of life to consumers in the operation and maintenance of automobiles, lessening commute times and saving to local public agencies in terms of the need to construct and maintain new road improvements.

Streets, water and sewer utilities, and municipal services would be extended to serve the proposed WLC project. The proposed WLC project will benefit other development projects in the project area, and therefore, could potentially induce additional business and job growth by removing an impediment to growth, such as a lack of basic infrastructure or services. However, the proposed WLC project is located proximate to other existing warehouse, commercial, and residential uses. Therefore, the project will necessitate extension of major infrastructure, however, the project will not result in substantial population growth that has not already been planned for in the City's General Plan. As the type and intensity of use proposed for the project site would be consistent once implementation of the General Plan Amendment and Zone Change take place, and because the improvements necessary for development of the site would not facilitate growth that has not been anticipated in the project area, no significant growth-inducing effect would occur, and no mitigation is required.

5.4 URBAN DECAY

A detailed analysis of potential employment and fiscal impacts of the project is provided in Section 4.13, *Population, Housing, and Employment*. This analysis concludes the proposed project is not expected to cause or contribute to any conditions of urban decay within the City of Moreno Valley.

5.5 ENERGY CONSUMPTION

A detailed analysis of energy consumption, according to Appendix F of the *CEQA Guidelines*, is included in Section 4.16, *Utilities and Service Systems*.

NOTE TO READERS. *This section has been revised based on changes to the WLC Specific Plan and in response to comments on the Programmatic DEIR, mainly taking out the CDFW Conservation Buffer Area in the No Project/General Plan Alternative.*¹

6.0 ALTERNATIVES TO THE PROPOSED PROJECT

6.1 INTRODUCTION

An EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment. In compliance with *CEQA Guidelines* Section 15126.6(a), this Draft EIR must also describe “a range of reasonable alternatives to the project, or to the location of the project which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.” The EIR need not consider every conceivable alternative; rather it must consider a reasonable range of potentially feasible alternatives to the project, or to the location of the project, which would avoid or substantially lessen significant effects of the project, even if “these alternatives would impede to some degree the attainment of the project objectives, or would be more costly” (*CEQA Guidelines* Section 15126.6(b)). The discussion of project alternatives must “include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project.” An EIR must evaluate a “No Project” alternative in order to allow decision-makers to compare the effect of approving the project to the effect of not approving the project.

The City of Moreno Valley (City), acting as the CEQA Lead Agency, is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. The range of alternatives addressed in an EIR is governed by a “rule of reason,” which requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. Of the alternatives considered, the EIR need examine in detail only those the Lead Agency determines could feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project. Per *CEQA Guidelines* Section 15364, “feasible” has been defined as “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.”

6.1.1 Summary of the Proposed Project

NOTE: The following changes have been made due to revisions to the Specific Plan project size.

The proposed World Logistics Center (WLC) project is generally located in the eastern portion of the City in northwestern Riverside County. The project site is immediately south of SR-60, between Redlands Boulevard and Gilman Springs Road (the easterly city limit), extending to the southerly city limit. Previously referenced Figure 1.1 in the *Executive Summary* depicts the location of the proposed project within the region and the City. The major roads that currently provide access to the project site are Redlands Boulevard, Theodore Street, Alessandro Boulevard, and Gilman Springs Road.

The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of

¹ *Comment G-95-83 in Letter G-95 from Thomas Thornsley.*

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The land owned by the California Department of Fish and Wildlife (CDFW; formerly California Department of Fish and Game [CDFG]) immediately south of the WLC Specific Plan property is utilized for dry farming agriculture and forms the northern end of the San Jacinto Wildlife Area (SJWA). The SJWA contains a wide diversity of birds and other wildlife in and around Mystic Lake. The project proposes an amendment to the General Plan to designate this area as Open Space from its current residential and industrial land use designations.

6.1.2 Project Objectives

NOTE: The following changes have been made due to revisions to the Specific Plan project size.

The primary purposes of the proposed project are to 1) establish the 2,610-acre WLC Specific Plan land use designations and development standards that will direct the development of a world-class corporate park specifically designed to support the logistics warehouse and operational needs of large companies and corporate users; and 2) designate 1,084 acres of vacant land owned by the CDFW as Open Space in the City's General Plan to ensure the continued and intended purpose of the SJWA. The WLC Specific Plan outlines the following overall objectives for development proposed in the Specific Plan:

- Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.
- Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.
- Create a major logistics center with good regional and freeway access.
- Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.
- Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly to accommodate the next-generation of logistics buildings.
- Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

- Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.
- Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.
- Encourage new development consistent with regional and municipal service capabilities.
- Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.
- Provide thousands of construction job opportunities during the project's buildout phase.
- Provide appropriate transitions between on-site and off-site uses.

6.1.3 Summary of Proposed Project Significant Impacts

NOTE: The following changes have been made to the project-related significant impacts due to the revised agricultural and air quality reports (refer to Sections 4.2 and 4.3 in this EIR).

The analysis provided in Section 4.0 determined that, despite the implementation of mitigation measures, significant environmental impacts would result from the construction and operation of the proposed project. To satisfactorily provide the CEQA-mandated alternatives analysis, the alternatives considered must reduce any of the following project-related significant unavoidable impact(s):

- Aesthetics: Loss of views, scenic highways, and visual character;
- Air Quality: Short-term emissions of VOC, NO_x, CO, and PM₁₀ in excess of SCAQMD daily limits during construction and localized PM₁₀ concentrations;
- Air Quality: Long-term emissions of CO, VOC, NO_x, PM₁₀, and PM_{2.5} resulting from increased vehicular trips and operation of the proposed on-site uses and localized PM₁₀ concentrations;
- Air Quality: Inconsistent with AQMP due to change in land uses from existing General Plan;
- Air Quality: Short-term emissions from VOC, NO_x, CO, and PM₁₀ cumulatively exacerbating the nonattainment of air quality standards within the Basin.
- Air Quality: Long-term emissions of ozone, PM₁₀ and PM_{2.5} cumulatively exacerbating the nonattainment of air quality standards within the Basin.
- Land Use: Impacts to onsite residences from adjacent warehouse development;
- Noise: On-site and off-site levels of project-related traffic noise; and
- Transportation: Project contributions to cumulatively considerable impacts to various extra-territorial facilities, various TUMF facilities, and State-controlled transportation facilities.

6.2 ALTERNATIVES CONSIDERED BUT NOT CARRIED FORWARD FOR DETAILED ANALYSIS

NOTE: The following changes have been made due to revisions to the Specific Plan project size.

In determining an appropriate range of alternatives to be evaluated in the EIR, three possible alternatives were considered and rejected because they could not accomplish the basic objectives of the project as listed above or they were considered infeasible. Per the *CEQA Guidelines* (Section 15126.6(c)), factors that may be considered when addressing the feasibility of alternatives include failure to meet most of the stated project objectives, infeasibility, or inability to avoid significant

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

environmental effects. The purpose of the proposed project is to establish the 2,610-acre WLC Specific Plan that will result in the development of 40.6 million square feet of high-cube logistics warehouse uses and designation of 1,085 acres of vacant land owned by CDFW as Open Space. The proposed project would provide for and expand employment and revenue opportunities within the City.

The following development scenarios were considered and rejected as potential alternatives to implementation of the proposed project:

- All Residential Use Alternatives; and
- Mixed Use Alternatives that emphasize residential uses.

Based on Section 15126.6 of the *CEQA Guidelines*, these alternatives were rejected based on the criteria of not feasibly attaining most of the basic objectives of the project while reducing or avoiding any of the significant effects of the proposed project. The reason or reasons for not selecting each of the rejected alternatives are discussed below.

6.2.1 All Residential Uses¹

A number of residential uses, including very low density (2-acre or 5-acre lots) were considered prior to deciding on all warehousing uses, but it was concluded that any residential alternatives, or alternatives that emphasized residential uses, would further exacerbate the City's jobs/housing imbalance and did not meet any of the project goals. In addition, the City's Economic Strategy Plan excludes additional residential development in this area. For these reasons, all Residential Use Alternatives were rejected for further analysis. However, an evaluation of the largely residential Moreno Highlands Specific Plan (MHSP) was provided under the No Project/Existing General Plan alternative (see below).

6.2.2 Mixed Use Alternatives

The EIR examines two Mixed Use Alternatives with varying amounts of residential and non-residential uses. The No Project-Existing General Plan Alternative is based on the approved mixed use MHSP. In addition, Alternative 3 (Mixed Use B) evaluates the impacts of substituting logistics warehouse uses for the non-residential uses currently included in the MHSP. After extensive evaluation, it was concluded that any reasonable combination of residential and non-residential uses (i.e., light industrial, business park, office, commercial) would result in impacts similar to those of the MHSP, Alternative 2 (mixed non-residential uses but no residential uses), or Alternative 3 (Moreno Highlands Specific Plan with logistics warehousing as the main non-residential use). For this reason, no other Mixed Use Alternatives were considered further in this analysis.

6.3 ALTERNATIVES ANALYSIS

NOTE: Changes were made to the project alternatives as a result of the reduction in the proposed project site by 100-acres which resulted in reductions of land uses for certain alternatives as indicated below and shown in Tables 6.A and 6.B, as well as subtraction of 910 acres from the Moreno Highlands Specific Plan due to the purchase of land by the State for conservation purposes.

¹ Ones that are exclusively residential or ones that emphasize residential uses.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

6.3.1 Summary of Alternatives

The following alternatives have been identified and evaluated to provide decision-makers with a reasonable range of alternatives that would eliminate or reduce the impacts of the project. Factors considered in selecting the alternatives include site suitability, availability of infrastructure, other plans or regulatory limitations, economic viability, and whether the project proponent can reasonably acquire, control, or otherwise have access to the alternative site. An EIR need not consider an alternative whose impact cannot be reasonably ascertained and whose implementation is remote or speculative. In accordance with *CEQA Guidelines*, the alternatives considered in this EIR include those that 1) could accomplish most of the basic objectives of the project, 2) are reasonably feasible given the nature of the project and surrounding land uses, and 3) could avoid or substantially lessen one or more of the significant effects of the project. It should also be noted that alternatives proposed in the DEIR are theoretical and may never be developed even if approved. The following development scenarios have been identified as potential alternatives to implementation of the proposed project:

- No Project/No Build Alternative;
- No Project/Existing General Plan (modified Moreno Highlands Specific Plan);
- Alternative 1: Reduced Density (28 MSF or 30 percent less logistics warehousing);
- Alternative 2: Mixed Use A – Warehousing/Business Park/Office/Commercial;
- Alternative 3: Mixed Use B – MHSP with logistics warehousing; and
- Alternative Sites: Moving the project to some other available site.

Tables 6.A and 6.B summarize the alternatives. Table 6.C shows the current land use designations.

Table 6.A: Summary of Analyzed Alternatives

Project Alternative	Alternative Description
No Project/No Build (“baseline” conditions)	<i>The following changes have been made due to revision to the Specific Plan project size. The proposed WLC Specific Plan would not be developed with 2,610 acres proposed for high-cube logistics warehouse. No development would occur and the majority of the site would remain in dry farming, with a small amount in rural residential uses.</i>
No Project/Existing General Plan (modified Moreno Highlands Specific Plan)	The following changes have been made in response to comments on the DEIR. This alternative would result in development of the project with the land uses currently shown in the City’s General Plan which currently designates the project area as a mix of residential, commercial, business park, and open space land uses. The 3,038-acre Moreno Highlands Specific Plan (MHSP) is a master planned, mixed-use community that originally consisted of 7,763 residential units on approximately 2,435 acres and approximately 603 acres of business, retail, institutional, and other uses. During review of the DEIR, a comment was made that the MHSP could not be built as originally approved because since that time the State had purchased 1000 acres as a buffer for the San Jacinto Wildlife Area. Therefore, the portion of the MHSP that could be built today would consist of up to 4,051 residential dwelling units on approximately 709.3 acres and approximately 603 acres of business, retail, institutional, and other uses. In addition, the 1,085 acres owned by the CDFW are currently designated as Residential, Public Facilities, and Open Space in the City’s General Plan and would be designated as permanent Open Space under this alternative, similar to the proposed project.
Alternative 1 Reduced Density	<i>The following changes have been made due to revision to the Specific Plan project size. This alternative would develop approximately 28 million square feet of logistics warehousing (approximately 30% less than under the proposed project) on the 2,610 acres of land under the Specific Plan, including 74.3 acres for open space. The 1,085 acres owned by the CDFW would be designated as Open Space in the City’s General Plan, similar to the proposed project.</i>

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 6.A: Summary of Analyzed Alternatives

Project Alternative	Alternative Description
Alternative 2 Mixed Use A	This alternative would result in development of the entire property with a mix of 1,400 acres of logistics warehousing (22 million square feet), 1,000 acres of light manufacturing, assembly, or business park uses (20 million square feet), 50 acres of retail commercial uses (500,000 square feet), 100 acres of professional or medical office uses (1 million square feet), and 70 acres of open space. The 1,085 acres owned by the CDFW would be designated as Open Space in the City's General Plan, similar to the proposed project.
Alternative 3 Mixed Use B	This alternative would develop the project site similar to the land use plan of the MHSP but with 10 million square feet of logistics warehousing on the 603 acres proposed for business, retail, institutional, and other uses under the MHSP. The 1,085 acres owned by the CDFW would be designated as Open Space in the City's General Plan, similar to the proposed project.
Alternative Sites	This alternative would relocate development under the proposed project to another site of 2,610 acres in the surrounding region. This analysis included potential sites in nearby cities and several unincorporated sites in the general project area.

NOTE: The following changes to the table have been made due to revision to the Specific Plan project size.

Table 6.B: Alternatives to the World Logistics Center Specific Plan

Alternative	Logistics Warehousing	Light Industrial	Retail Commercial	Office	Other
Proposed Project	2,610 acres 40.6 MSF (100%) 0.28 FAR	0 acres 0 SF	0 acres 0 SF	0 acres 0 SF	74.3 acres Open Space
No Project/No Build (baseline)	0 acres 0 SF (0%)	0 acres 0 SF	0 acres 0 SF	0 acres 0 SF	2,610 acres Agriculture
No Project/Plan Modified Moreno Highlands Specific Plan ¹	0 acres 0 SF (0%)	361 acres (BP)	106.5 acres 1.1 MSF (various) 0.23 FAR	0 acres 0 SF	709.3 acres Residential 4,051 units 861 acres Open Space and Public Facilities
Alternative 1 Reduced Density	2,610 acres 28 MSF (70%) 0.25 FAR	0 acres 0 SF	0 acres 0 SF	0 acres 0 SF	74.3 acres Open Space
Alternative 2 Mixed Use A	1,400 acres 22 MSF (54%) 0.36 FAR	1,000 acres 20 MSF 0.46 FAR	50 acres 0.5 MSF 0.23 FAR	100 acres 1.0 MSF 0.23 FAR	70 acres Open Space
Alternative 3 Mixed Use B ²	603 acres 10 MSF (25%) 0.38 FAR	0 acres 0 SF	0 acres 0 SF	0 acres 0 SF	1,146 acres Residential 6,532 units 861 acres Open Space and Public Facilities

Project Total	3,038.0	3,038.0

1 MHSP adopted by City Council March 17, 1992.

2 Based on removal of 910 acres purchased by the State as a buffer for the San Jacinto Wildlife Area.

6.3.2 Environmental Impacts That Are Similar to the Proposed Project

Eight of the seventeen environmental issues for all the alternatives considered would result in a similar level of impact when compared to the project. Rather than repeat a discussion of these non-significant impacts under each alternative, a summary of these impacts is presented below.

- Agricultural Resources
- Biological Resources
- Hydrology and Water Quality
- Cultural Resources
- Geology and Soils
- Hazards and Hazardous Materials
- Land Use and Planning
- Mineral and Forestry Resources
- Public Services/Recreation

The level of impact associated with these topics would be similar if developed as proposed by the project or if developed with any of the alternatives. Where impacts related to any of these issues do differ among project alternatives, an appropriate discussion is provided for the respective alternative.

6.3.2.1 Agricultural and Forestry Resources

Development of any of the alternatives, with the exception of the Off-Site Alternative, would have similar agricultural-related impacts. The Moreno Valley General Plan policies and zoning designations support agriculture only as an interim use. No land in the City is designated solely for agricultural use or for agricultural preservation and no property within the City limits is located within a Williamson Act contract area. As such, no impacts related to Williamson Act land would occur with implementation of

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

any of the alternatives. As identified in Sections 4.2.6.1 and 4.2.6.2 of the EIR, the development of the project site with urban uses would result in the conversion of State- and locally-designated Farmland (Unique Farmland and Farmland of Local Importance, respectively). With implementation of the revised mitigation, including acquisition of an offsite conservation easement for the loss of unique farmland, impacts to agricultural resources would be reduced to less than significant levels. Therefore, compared with the proposed project, all on-site alternatives would have less than significant impacts on agricultural resources.

There are no lands within the City of Moreno Valley designated as forest or forestland, according to the Fire and Resource Assessment Program mapping system maintained by the California Department of Forestry and Fire Protection. Therefore no impacts related to forestry resources would occur and no mitigation is required.

6.3.2.2 Biological Resources

All build alternatives would require site development resulting in the grading of the entire project site. According to the project biological report, the project area does not contain any wildlife movement corridors or linkages. The project biological report concluded that development of the project as proposed would not have any significant impact on wildlife movement in the area, and would not fragment habitat or adversely affect wildlife movement through the surrounding areas. Therefore, all on-site build alternatives would also similarly have a less than significant impact on wildlife movement and corridors.

Burrowing owl, a species of concern, was identified within the southern portion of in the WLCSP project site and offsite facilities during focused surveys conducted in 2013. Based on available research and expected site conditions, the project and all on-site alternatives may create potentially significant impacts on wildlife, including listed species, from diesel particulate emissions and toxic air contaminants related to truck exhaust (although somewhat reduced by prevailing winds), increased roadkill on Gilman Springs Road and new roadkill on future local streets close to the SJWA, and increased indirect impacts from additional lighting and noise. No federal or state endangered/species were detected on the project site during the focused biological resource surveys. However, it is likely that one or more endangered or threatened species or bird or other wildlife may be present on the SJWA property near the project site at various times of the year. With implementation of the recommended Mitigation Measures 4.4.6.1A through 4.4.6.1C, impacts to listed species will be reduced to less than significant levels for all on-site alternatives.

The project site is within the Stephen's Kangaroo Rat Habitat Conservation Plan (SKR HCP) Fee Area, but is not within a Stephen's Kangaroo Rat Core Area. Focused surveys for SKR are not required for this project as it lies within the SKR Fee Area; therefore, under the SKR HCP, only payment of a local mitigation fee is required.

The project area is located within the Reche Canyon/Badlands Area of the MSHCP. Development of the project area would not conflict with the conservation goals established by the MSHCP for Cell Group X or Cell Group E. In addition, no conflict from development would occur in relation to the Reche Canyon/Badlands Area Plan, the Area Plan Subunit 4, the Area Plan Subunit 3, Proposed Core 3, or Existing Core H. No development is proposed within the portion of the project area that lies within Cell Group D and the SJWA. This area is already owned by the State and managed by the CFDW. However, development that will be adjacent to the SJWA property may cause significant indirect impacts to species within the SJWA, which will require mitigation (i.e., designing an appropriate buffer along this "urban edge" will help minimize potential impacts on the SJWA). The project is adjacent to the SJWA and is subject to the project guidelines provided in MSHCP Section 6.1.4 (Guidelines Pertaining to the Urban/Wildlands Interface). Development occurring on the project site is also required to adhere to the Best Management Practices (BMPs) found in Appendix C of the

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

MSHCP. The project site is not located within any Amphibian, Mammalian, or Special Linkage Areas identified by the MSHCP. The project site is in an area requiring burrowing owl surveys, is within the MSHCP Criteria Area Species Survey Area (CASSA), and is within the Narrow Endemic Plant Species Survey Area (NEPSSA); however, surveys performed for the site confirmed such plants do not exist on the project site. From available information, potential indirect impacts to avian and other biological resources within Mystic Lake and the SJWA will be reduced to less than significant levels by the creation of a 250-foot on-site setback or buffer area in Mitigation Measure 4.4.6.1A, which will be in addition to the existing setback provided by the CDFW Conservation Buffer Area just south of the proposed development area.

The MSHCP and its Implementation Agreement contain a fee mitigation program pursuant to which local agencies collect development impact fees and remit such fees to the Riverside Conservation Authority (RCA). These fees are in turn used to acquire lands that are suitable for habitat preservation for species covered by the MSHCP. Payment of the local MSHCP mitigation fee will be required of the project and all on-site alternatives prior to the issuance of building permits. Participation in the MSHCP and contribution of MSHCP fees provides compensation for the loss of raptor foraging habitat due to approved projects. Typically, a project proponent would participate as outlined in the MSHCP, so that loss of raptor foraging habitat is typically considered to be less than significant and no mitigation is required.

The project is consistent with the major MSHCP requirements relative to core areas, criteria cells, threatened and endangered species. In addition, the project complies with the MSHCP guidelines for urban/interface, riparian/riverine areas, or related buffers (with implementation of Mitigation Measures 4.4.6.1A, 4.4.6.1B, 4.4.6.2A, and 4.4.6.2B). In addition, future development will be required to demonstrate that it is also consistent with all MSHCP requirements, including indirect impacts such as lighting, noise, and air pollution effects, which shall be implemented through adherence to Mitigation Measures 4.4.6.3A through 4.4.6.3C and 4.4.6.4A through 4.4.6.4J.

With implementation of Mitigation Measures 4.4.6.1A and 4.4.6.1B, 4.4.6.2A and 4.4.6.2B, 4.4.6.3A through 4.4.6.3C, and 4.4.6.4A through 4.4.6.4J, potential impacts related to MSHCP consistency will be reduced to less than significant levels for all on-site alternatives.

A formal jurisdictional delineation (JD) was conducted within the WLCSP and offsite facilities by MBA in September 2007 and again in March 2012. A total of 15 primary drainage features were identified during these combined surveys. The 2013 JD report concludes that two drainage features (Drainage 12 and 15) have been determined to be jurisdictional waters of the U.S. under Section 404 and 401 of the CWA. Drainages 7, 8, 9, 12, and 15 were determined to be waters of the state and subject to the jurisdiction of both the CDFW and RWQCB. A number of sub-drainages or tributaries were also identified. Implementation of Mitigation Measures 4.4.6.3A through 4.4.6.3C will ensure there will be no significant impacts to Waters of the U.S. or Waters of the State as a result of future development within the project.

One catch basin and portions of Drainage Feature 7 and 9 on the project site are considered riparian/areas, as defined by the MSHCP. If impacts to any of these areas cannot be avoided, a DBESP report and relevant mitigation will be required by the RCA for the project and all on-site alternatives. The project area does not contain habitat suitable for sensitive riparian species, such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. Additionally, no vernal pools or ephemeral ponds were observed on the project area and no suitable habitat for any fairy shrimp species was identified on site. The project area currently contains extensive raptor foraging habitat, which is considered a type of sensitive natural community. Impacts to the large amount of raptor foraging habitat is a significant impact that requires mitigation.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

The project may have a potentially significant indirect impact on Mystic Lake from diesel fuel emissions and nitrogen deposition. However, it is anticipated that indirect impacts from diesel fuel emissions and nitrogen deposition would be reduced under all other alternatives as each would result in a reduction in the number of diesel trucks and resultant diesel emissions.

With implementation of Mitigation Measures 4.4.6.1A and 4.4.6.1B, 4.4.6.2A and 4.4.6.2B, 4.4.6.3A through 4.4.6.3C, and 4.4.6.4A through 4.4.6.4J, potential impacts to riparian habitat or other sensitive natural communities, including on-site drainages, will be reduced to less than significant levels for all on-site alternatives.

No USFWS designated Critical Habitat for any species is located within the project area; therefore, no further action with regard to Critical Habitat is necessary. Extensive surveys were completed in 2005, 2010, 2012, and 2013 and concluded that Los Angeles pocket mouse was not present. However, to ensure that no impacts occur, Mitigation Measure 4.4.6.4E has been recommended.

For those species that are not covered by the take and incidental take provisions of the MSHCP (e.g., burrowing owl), the MSHCP requirements dictate that further protective action be taken. Burrowing owl, a species of concern, was identified within the southern portion of in the WLCSP project site and offsite facilities during focused surveys conducted in 2013. Because suitable habitat is present within the project area for the burrowing owl and because the species is highly mobile, a potential exists that, at some future date prior to project development, this species may occupy the development sites. This is a potentially significant impact requiring mitigation. Implementation of Mitigation Measures 4.4.6.4A through 4.4.6.4E would reduce impacts to burrowing owl and migratory bird species, and Los Angeles pocket mouse to less than significant levels for all on-site alternatives.

The only substantial differences among the built alternatives and the No Project/Existing General Plan (Moreno Highlands Specific Plan) is that any residential uses proximate to the San Jacinto Wildlife Area may incrementally increase adverse impacts by introducing domestic dogs and cats into the area that might prey on native wildlife.

6.3.2.3 Cultural Resources

Development of any of the identified build alternatives would result in extensive ground-disturbing activities affecting the entire project site, and similar cultural resource impacts would be anticipated when compared to the proposed project. There is no evidence to suggest that the project site has ever been utilized for human burials. In the unlikely event that human remains are discovered during grading or construction activities within the project site, compliance with State law (Health and Safety Code § 7050.5) (HSC § 7050.5) would be required. Compliance with existing State law would ensure that impacts related to the discovery of buried human remains would be less than significant and no mitigation is required. The *Cultural Resources Assessment* prepared for the proposed project concluded that it is possible that unknown cultural resources could be discovered during project-related construction. Adherence to Mitigation Measures 4.5.6.1A through 4.5.6.1E will reduce potential impacts to archaeological resources to less than significant levels for all on-site alternatives.

Mitigation Measure 4.5.6.1A requires surveying the seven occupied residential parcels for archaeological resources since these properties could not be surveyed at the time the EIR was prepared. These surveys will identify the potential for significant historical resources on these properties. In addition, Mitigation Measure 4.5.6.2A will further reduce the potential impacts of the project on historical resources for all on-site alternatives.

As described in the *Paleontological Resources Assessment*, no paleontological resources were observed during the field survey. However, the project site is considered to have a moderate paleontological sensitivity; therefore, impacts are considered potentially significant and mitigation is

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

required. Adherence to Mitigation Measures 4.5.6.3A and 4.5.6.3B will reduce potential impacts to paleontological resources to less than significant levels for all on-site alternatives.

6.3.2.4 Geology and Soils

Development of any of the on-site build alternatives would have similar geologic and soil-related impacts. Although no active faulting was observed, some local discontinuous fracturing was observed and documented. The A-P Earthquake Fault Zone is located on the eastern border of the project site (refer to Figure 4.6.1 of the EIR). Adherence to Mitigation Measures 4.6.6.1A through 4.6.6.1C, as well as other requirements identified and required by the City, will ensure fault rupture hazards are reduced to a less than significant level for all on-site alternatives.

The level of potential ground motion is considered moderate to high in the City of Moreno Valley and, therefore, in the project area. In accordance with the City's General Plan Safety Element (Objective 6.1),¹ project development, as well as alternatives, will require geological and geotechnical investigations by State-licensed professionals. The geotechnical investigations will provide design considerations and earthwork recommendations to ensure that ground shaking impacts are appropriately mitigated. In addition, California Code of Regulations (CCR), Title 24, also known as the California Building Standards Code, contains building design and construction requirements relating to fire and life safety, and structural safety. The California Building Code (CBC) also includes standards designed to ensure that structures within California are built to withstand expected levels of seismic activity for each earthquake region throughout the State. Adherence to Mitigation Measure 4.6.6.2A, as well as other requirements identified and required by the City, will ensure ground shaking hazards are reduced to a less than significant level for all on-site alternatives.

On-site soils are identified as having a moderate to low shrink-swell potential. Implementation of Mitigation Measures 4.6.6.3A through 4.6.6.3D, and adherence to actions identified in subsequent geotechnical investigations, as well as other requirements identified and required by the City, will ensure that the potential impact from expansive soils are reduced to a less than significant level for all on-site alternatives.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

A large older landslide has been mapped primarily off site on the northeasterly flanks of Mount Russell, near the southwest portion of the property. The landslide appears to have originated on the higher slopes off site and moved northeast, partially onto the subject property. The Specific Plan designates 74.3 acres in the southwestern portion of the property as open space. This 74.3 acres includes the steepest slopes on site (i.e., the Mount Russell foothills), which will reduce the potential for significant landslide or rockfall impacts on the project to less than significant levels; therefore, no mitigation is needed. Because this condition exists, it is anticipated that all other on-site alternatives would also restrict development within this area resulting in a less than significant impact, similar to the proposed project.

Development of the site would require the movement of on-site soils. Portions of the site have been and are being used for dry farming, and several rural residences are present. Prior to the issuance of grading permits, the project proponent will be required to prepare and submit detailed grading plans as each phase is developed. These plans will be prepared in conformance with applicable standards of the City's Grading Ordinance. Soils covering the project site have a slight-to-high erosion hazard potential and because the project would be required to adhere to the City's Grading Ordinance, obtain an NPDES Permit, prepare an SWPPP and a WQMP, construction and operational impacts

¹ Moreno Valley General Plan, Chapter 9 Goals and Objectives, pg. 9-30.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

associated with soil erosion hazards are considered to be less than significant for all on-site alternatives, and no mitigation is required.

Septic tanks would not be used under any of the on-site alternatives as existing sewer infrastructure is readily available to serve any on-site development.

None of the on-site alternatives propose any activity known to cause damage by subsidence (e.g., oil, gas, or groundwater extraction). The project site is underlain by relatively dense alluvial and dense sedimentary bedrock materials at depth and the potential for settlement is considered low. Because the project site does not exhibit characteristics of a high potential for subsidence or settlement, impacts are considered less than significant. No mitigation is required.

The potential for liquefaction generally occurs during strong ground shaking within relatively cohesionless loose sediments where the groundwater is typically less than 50 feet below the surface. Because the project site does not exhibit characteristics of a high potential for liquefaction induced settlement (i.e., relatively dense soils with groundwater levels in excess of 100 feet), impacts are considered less than significant for all on-site alternatives. No mitigation is required.

6.3.2.5 Hazards/Hazardous Materials

Development of the any of the on-site build alternatives would result in the on-site handling of hazardous substances, both during project construction and operation. It is assumed that, like any current use, these substances would continue to be used in accordance with applicable local, State, and Federal standards. There are no existing or proposed schools within a quarter mile of the proposed project site and the site is not identified on the DTSC's hazardous materials sites. Air traffic-related hazards would not occur at the proposed project site as it is not located within the safety hazard zones of March Air Reserve Base.

A portion of the project area is mapped as a very high fire hazard area, while the Badlands directly east of the project area are considered a High Fire Hazard Area.¹ Development of the eastern portion of the project could expose persons or property to wildland fire risks given the designation of a portion of the project area as a Very High Fire Hazard Area. Regardless of these designations, all new structures in the project area must be constructed in compliance with Title 24 of the California Code of Regulations to safeguard life and property from fire hazards, including the installation of automated fire suppression systems. Compliance with these standards would be enforced during building permit review and the construction inspection period for all on-site alternatives. Given the proximity of Station #58 and with all new structures constructed in compliance with Fire and Building Code regulations, the susceptibility and exposure of the project to wildland fires would be limited. The WLCSP addresses potential impacts related to future fire protection services for this area by including a new fire station site. In addition, buildings will be setback from the western side of Gilman Springs Road due to the location of the San Jacinto Fault through this area, which will further reduce the potential for project fire risks. Implementation of these measures will help reduce potential wildland fire risks to a less than significant level, and no additional mitigation is required.

All on-site alternatives will be designed, constructed, and maintained in accordance with applicable standards associated with vehicular access, ensuring that adequate emergency access and evacuation will be provided. Construction activities that may temporarily restrict vehicular traffic would be required to implement appropriate measures to facilitate the passage of persons and vehicles through/any required road closures. Compliance with existing regulations for emergency access and

¹ Letters from Fire Chief dated May 4 and June 27, 2011, and City of Moreno Valley General Plan, Final Program EIR, Section 5.5 Hazards, Figure 5.5-2.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

evacuation will ensure that impacts related to this issue are less than significant, and no mitigation is required.

Due to the suspected age of the rural residential structures on the site, it is possible that demolition of these structures may involve asbestos-containing materials (ACMs) and/or lead-based paint (LBP). Demolition of these structures may need to be supervised or conducted by contractors certified to remove and dispose of ACMs and/or LBP.

In addition, Alternatives 1, 2, and 3 include a liquefied natural gas/compressed natural gas (LNG/CNG) fueling station to be constructed somewhere in the Logistics Development (LD) land use area. This LNG/CNG facility is referred to as “logistics support” in the WLC Specific Plan. It would sell natural gas to fuel vehicles serving or visiting the project. This facility is not proposed under the No Project/No Build Alternative or the No Project/Existing General Plan Alternative. Since this facility would store natural gas under liquefied and/or compressed conditions, there is a potential for fire and/or explosion, creating a potentially significant hazards impact requiring mitigation.

With implementation of Mitigation Measures 4.8.6.1A and 4.8.6.1B, impacts associated with potential hazardous materials in existing rural residential structures (all on-site alternatives) or from the proposed fueling facility will be reduced to less than significant levels for Alternatives 1, 2, and 3.

6.3.2.6 Hydrology and Water Quality

As with the proposed project, the development of any of the on-site alternatives would require the modification of the existing on-site pattern of drainage and would require the installation of drainage improvements that may include on-site collection/routing pipes, landscaped swales, sand filters, and porous pavement features.¹ While the extent of the impermeable surfaces (rooftops, driveways, parking areas, etc.) required under each alternative is reduced from that required for the proposed project, the environmental impact of these improvements would be similar. All local, State, and Federal policies and regulations pertaining to surface water and groundwater resources would remain in effect under these alternatives. Sedimentation and erosion from any on-site development has the potential to affect water quality. Similar to the proposed project, the construction of any on-site use would be required to follow applicable NPDES requirements, including the preparation of and adherence to an SWPPP and BMPs.² These requirements have been incorporated as Mitigation Measures 4.9.6.1A through 4.9.6.1C (refer to Section 4.9.6.1 of the EIR) and Mitigation Measures 4.9.6.2A through 4.9.6.2C (refer to Section 4.9.6.2 of the EIR). As with the proposed project, runoff from paved surfaces, especially during “first-flush” events, may be contaminated by sediment, debris, and other contaminants. A standard condition with any such development would be preparation and implementation of a Water Quality Management Plan, which would effectively mitigate post-construction water quality impacts from the developed area. This requirement has been incorporated as Mitigation Measure 4.9.6.2A (refer to Section 4.9.6.2 of the EIR). The project site is not identified as a groundwater recharge area, so none of the on-site alternatives would interfere with groundwater recharge. Anticipated on-site flows would be routed to the onsite and off-site water quality features such as vegetated swales, clarifiers, and sand filters to protect downstream water quality.

New development is required to maintain off-site flows to below or equal to pre-development conditions, and this is incorporated as Mitigation Measure 4.9.6.1A (refer to Section 4.9.6.1). The project site is not located within a flood zone and the project site is not susceptible to mudslides, tsunamis, seiches, or flooding as a result of dam or levee failure. Similar to the proposed project,

¹ *Draft Master Plan of Drainage Report for World Logistics Center Specific Plan and Environmental Impact Report*, CH2MHILL, September 2014.

² *Preliminary Water Quality Management Plan for World Logistics Center Specific Plan*, CH2MHILL, September 2014.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

potential impacts related to hydrology and water quality would be less than significant for all on-site alternatives.

6.3.2.7 Land Use and Planning

Like the proposed project, these alternatives would comply with applicable provisions of local and regional plans (e.g., Water Quality Control Plan and Air Quality Management Plan). However, the proposed project was not included as part of the 2007 AQMP and is considered to not be consistent with the AQMP. This is a significant and unavoidable impact. Compliance with applicable City policies related to development within the project site would ensure that on-site alternative uses would be compatible with existing development in the project area. Land uses associated with less intense alternatives may have less impact on existing on-site land uses compared to the proposed project, depending on the types of uses proposed.

6.3.2.8 Mineral Resources

There are no lands within the City of Moreno Valley designated by the California Department of Conservation as known significant resource areas, defined by the state as Mineral Resources Zone 2 areas. As identified in the City's General Plan, lands within the City of Moreno Valley and its Sphere of Influence are designated MRZ-3 and MRZ-4 zones, which are not defined as significant mineral resource areas. Development of the project site with any build alternatives would not result in the loss of or reduce the availability of mineral resources or the resource base from which they would be derived. Compared with the proposed project, no greater impact would occur for any of the on-site project build alternatives.

6.3.2.9 Public Services/Recreation

As with the proposed project, none of the build alternatives would include a residential component (with the exception of the No Project/Existing General Plan Alternative) and potential jobs generated by the build alternatives would be filled to some degree by people already residing in the City, similar to the proposed project. Therefore, there would be no increase in existing population and no increase in demand for park and recreation facilities resulting from development of Alternatives 1 or 2. Alternative 3 would have increased population from new housing under the MHSP land use plan; it would also have parks to serve those new residents. Because no increase in demand for City recreational facilities would occur, impacts associated with recreation for any of the build alternatives would be similar in magnitude as the proposed project. Compared with the proposed project, no greater impact would occur for any of the project build alternatives.

6.3.3 Description and Impact Analysis of Alternatives

The following discussion compares the impacts of each alternative with the impacts of the proposed project, as detailed in Sections 4.1 through 4.16 of this EIR. A conclusion is provided as to whether each alternative would result in one of the following:

- Reduction or elimination of the impact;
- A greater impact than the project;
- The same impact as the project; or
- A new impact in addition to the impacts of the proposed project impacts.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

6.3.4 No Project/No Build Alternative

NOTE: The following changes have been made due to revision to the Specific Plan project size.

Under the No Build Alternative, no development would take place within the project limits. No ground-disturbing activities would take place, nor would any form of structure or facility be erected. Impacts associated with this alternative, when compared to the proposed project, would not occur. In the absence of development, no impacts would occur and this alternative would be the environmentally superior alternative. However, prohibiting development of the site, as suggested by this alternative, would not fulfill any of the primary objectives of the proposed project. Retention of the project site in its current condition would not create a high cube logistics facility consisting of approximately 2,610 acres of high-cube warehouse uses and it would not expand employment opportunities within the City and surrounding area. This alternative provides a baseline comparison to the proposed project.

Impact Analysis. The No Project/No Build Alternative would not result in any new physical environmental effects. However, this alternative would not meet any of the project objectives as identified in Table 6.D.

Note: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR, therefore, they are being corrected at this time.

Table 6.D: Comparison of No Project/No Build Alternative to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.	No
Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.	No
Create a major logistics center with good regional and freeway access.	No
Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.	No
Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.	No
Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.	No
Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.	No
Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.	No
Encourage new development consistent with regional and municipal service capabilities.	No
Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.	No
Provide thousands of construction job opportunities during the project's buildout phase.	No
Provide appropriate transitions or setbacks between on-site and off-site uses.	No

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

6.3.5 No Project/Existing General Plan Alternative

This section has been revised in response to Comment G-95-83 in Letter G-95 from Thomas Thornsley. The CDFW Conservation Buffer Area (approximately 1,000 acres) has been removed from this alternative analysis. The 1,000 acre CDFW Conservation Buffer Area is approximately 33 percent of the existing General Plan. Therefore, this analysis was revised by reducing impacts estimated in the original DEIR by approximately 33 percent.

Pursuant to CEQA (§15126.6[e][2]), the No Project Alternative should discuss what would reasonably be expected to occur, based on current plans and consistent with available infrastructure and community services, in the foreseeable future. It is reasonable in the event the proposed project were not approved, the site would be developed in accordance with the existing General Plan land uses in the future.

The No Project/Existing General Plan Alternative would result in development of the project with the land uses currently shown in the City's General Plan. The City's General Plan currently designates the project area as a mix of residential, commercial, business park, and open space land uses in accordance with the MHSP. The approved 2,038-acre MHSP (without the CDFW Conservation Buffer Area) is a master planned, mixed-use community, consisting of up to 4,051 residential dwelling units on approximately 1,435 acres and approximately 603 acres of business, retail, institutional, and other uses. The 1,085 acres owned by the CDFW are currently designated as Residential, Public Facilities, and Open Space in the City's General Plan however, as it is owned by the CDFW, this area would not be developed and the property will not remain with these designations as part of this alternative.

The following impact analysis for this alternative evaluates the same seventeen environmental topics addressed for the proposed project as contained in Sections 4.1 through 4.16 of this EIR.

Impact Analysis. Eight environmental issues would have impacts similar to those identified for the proposed project. These include the following:

- Agricultural and Forestry Resources
- Cultural Resources
- Biological Resources
- Geology and Soils
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Recreation

Impacts associated with these topics would be similar to the proposed project because development of the site under the No Project/Existing General Plan Alternative would result in a similar footprint of development. For this reason, impacts to these land-oriented impact topics would be similar resulting in the same level of impact. The remaining environmental issues would, in some cases, result in similar impacts, but would be different enough to be discussed separately.

Aesthetics: The No Project/Existing General Plan Alternative would introduce a variety of residential and non-residential buildings on the site that would be much lower in height than the proposed WLC project in conformance with City Development Code standards. As a result, views of surrounding uplands from adjacent roadways (e.g., Redlands Boulevard, SR-60, and Gilman Springs Road) would not be blocked and aesthetic impacts would likely be less than significant, subject to architectural and design review of actual proposed buildings in the future. Development under this alternative would reduce potential aesthetic impacts to less than significant levels.

Air Quality: The No Project/Existing General Plan Alternative would require site grading and construction similar to that required of the proposed project. As identified in Section 4.3 of this EIR, short-term construction emission impacts associated with construction activities on the project site

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

were significant and unavoidable for all criteria pollutants with the exception of SO_x. Since the No Project/General Plan Alternative would require that the same amount of land be graded, it would require similar grading and construction activities on site. Therefore, it is reasonable to anticipate that short-term construction emission impacts would also be significant and unavoidable for all criteria pollutants, with the exception of SO_x, under this alternative. Air quality impacts associated with the remaining criteria pollutants would be significant and unavoidable with this alternative, similar to what was identified for the proposed project.

Under the No Project/Existing General Plan Alternative, the site would be developed with approximately 361 acres of business park uses, 106.5 acres of professional/medical office uses, and up to 4,051 residential units on 709.3 acres. Based on these land uses, the No Project/Existing General Plan Alternative would generate approximately 119,667 daily vehicle trips. The total trip generation associated with this alternative is approximately 72 percent higher than that identified for the proposed project.

Similar to the proposed project, the traffic increase under this alternative contributes to significant and unavoidable emissions of CO, VOC, NO_x, PM₁₀, and PM_{2.5} based on SCAQMD daily air quality significance thresholds. Therefore, this alternative would also have significant and unavoidable impacts on local air quality. The long-term air quality impacts resulting from this alternative would still contribute criteria pollutants to an air basin that is in nonattainment for these criteria pollutants, similar to the proposed project. As identified in Table 6.E, long-term operational air pollutant emissions associated with the No Project/Existing General Plan Alternative would exceed SCAQMD emissions thresholds for all criteria pollutants, with the exception of SO_x.

When compared with the proposed project, emissions of NO_x and PM₁₀ associated with the No Project/Existing General Plan Alternative would decrease and emissions of CO and VOC would increase. PM_{2.5} emissions are similar for both the project and the No Project. Similar to the proposed project, the generation of these emissions would still result in a cumulative contribution of air pollutants in a nonattainment basin; therefore, impacts remain significant and unavoidable.

Note: The air pollutant and greenhouse gas emissions for this alternative were revised, as the dwelling units assumed in the DEIR (7,283 units), was changed to 4,051 units. In addition, the home-work trip length was increased from 10 miles to 27 miles (see the 2015 Air Quality, Greenhouse Gas, and Health Risk Assessment Report).

Table 6.E: No Project/Existing General Plan Alternative Operational Emissions

Source	Pollutant Emissions, lbs/day					
	CO	VOC	NO _x	SO _x	PM ₁₀	PM _{2.5}
Proposed Project (mitigated; without existing)	1,396	593	1,097	NA	1,121	304
No Project/Existing General Plan	3,494	765	712	14	973	300
Net Change (no project minus proposed)	+2,098	+172	-385	NA	-148	-4
SCAQMD thresholds	550	55	55	150	150	55
Alternative exceeds thresholds?	Yes	Yes	Yes	No	Yes	Yes

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment Report, 2015

Global Climate Change: GHG emissions associated with the No Project/Existing General Plan Alternative are correspondingly decreased as this alternative does not include a logistics warehouse component. As identified in Table 6.F, the No Project/Existing General Plan Alternative would

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

generate metric tons of 2,601 uncapped CO₂ equivalent¹ (mt CO₂e), which is approximately 58 percent less than what was identified for the proposed project.

Table 6.F: Comparison of Greenhouse Gas Emissions

Type of Development	AB 32 Capped Annual Mitigated MTCO ₂ e Emissions	Uncapped Annual Mitigated MTCO ₂ e Emissions	Change from Uncapped Project Emissions
Proposed Project	372,073	6,210	0%
No Project/No Build ¹	59	0	-100%
No Project/General Plan ²	264,089	2,601	-58%
Alternative 1: Reduced Density	260,451	4,347	-30%
Alternative 2: Mixed Use A	574,763	6,856	+10%
Alternative 3: Mixed Use B	222,235	2,925	-53%
Alternative Sites	372,073	6,210	0%

MTCO₂e is metric tons of carbon dioxide equivalents, which is a standard unit of measure for greenhouse gases.

¹ Estimated based on existing tractor uses.

² Based on approved Moreno Highland Specific Plan.

Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment*, 2015 (see Appendix D); construction emissions excluded.

Hazards and Hazardous Materials: Development of the No Project/Existing General Plan Alternative would still result in the on-site handling of hazardous substances, both during project construction and operation. It is reasonable to assume that, like any current use, these substances would continue to be used in accordance with applicable local, State, and Federal standards. Impacts associated with the transport or use of hazardous materials or potential upsets or accidents would not be increased in magnitude because the intensity of development is still below what is envisioned under the proposed project. Therefore, it is not expected that increased quantities of hazardous materials would be present on site. With the adherence to existing hazardous materials regulations, impacts associated with hazards and hazardous materials under the No Project/Existing General Plan Alternative would remain less than significant.

Under this alternative, a liquefied natural gas/compressed natural gas (LNG/CNG) fueling station would not be constructed on the site, so there would be no potential for fire and/or explosion involving natural gas. Therefore, this impact is reduced from that identified under the proposed project.

Noise: The No Project/Existing General Plan Alternative would result in the construction of a mix of residential, commercial, business park, and open space land uses in accordance with the MHSP. As identified in Section 4.12 of this EIR, short-term construction noise impacts associated with the development of the project site were significant and unavoidable for both on-site and off-site uses. Since the No Project/Existing General Plan Alternative would require similar site development during construction, short-term construction noise impacts would also be significant and unavoidable and similar in magnitude compared to the proposed project. The increase in project-related traffic under the No Project/Existing General Plan Alternative would result in an increase in traffic-related noise. When compared to the proposed project, noise impacts associated with the No Project/Existing General Plan Alternative would be increased in magnitude as there would be a reduction in vehicles.

¹ Carbon dioxide equivalent (CO₂e) is an internationally accepted measure that expresses the amount of other greenhouse gases (e.g., methane and nitrous oxide) in terms of the amount of carbon dioxide (CO₂). The CO₂e measure is used as a way to measure the warming potential of a greenhouse gas as compared to CO₂.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

However, impacts would remain significant and unavoidable as some noise would still be generated under this alternative and there is no feasible mitigation to reduce noise impacts.

Population and Housing: The No Project/Existing General Plan Alternative would result in the development of up to 4,051 residential dwelling units on 709.3 acres and approximately 603 acres of business, retail, institutional, and other uses. Based on the California Department of Finance Population and Housing Estimates,¹ the City of Moreno Valley is estimated to have approximately 3.783 persons per household. Based on this figure, the construction of up to 4,051 residential dwelling units is projected to increase the City's population by approximately 15,325 persons resulting in a direct population increase in the City. This level of population growth is not accounted for with the proposed project and potential impacts related to population growth are greater than that identified for the proposed project. Construction of the development envisioned under this alternative would create temporary construction jobs, and some portion of these jobs would be likely filled by people already residing within the City. Utilizing an employment factor of one employee for every 629 square feet of commercial retail/service space,² the No Project/Existing General Plan Alternative is anticipated to generate approximately 1,749 commercial service jobs.³ Utilizing an employment factor of one employee for every 1,548 square feet of business park (light industrial) space,⁴ the No Project/Existing General Plan Alternative is anticipated to generate approximately 5,103 business park jobs.⁵ Under this alternative, additional jobs would be generated by the introduction of commercial retail/service uses (addition of 1,749 jobs) and business park uses (addition of 5,103). When this alternative is compared to the proposed project, the number of new jobs in the City would be a 72 percent decrease from the proposed project (6,852 jobs opposed to approximately 24,000 jobs).

The No Project/Existing General Plan Alternative would result in a decreased number of jobs created from the development of commercial retail/service and business park uses in comparison to the proposed project. However, a large influx of new residents to the City is anticipated due to the construction of up to 4,051 residential dwelling units envisioned by this alternative. The project would not directly affect population growth as compared with new residential development, because it is not creating homes. While the proposed project would generate employment opportunities, the jobs created are not expected to induce substantial growth in the City or region over and above the growth anticipated by the City's General Plan and the SCAG's regional growth forecasts. Population and housing impacts under this alternative would be greater in magnitude when compared to the proposed project. Therefore, impacts associated with this issue would be greater.

Public Services: Unlike the proposed project, demands on schools, parks, other public facilities, law enforcement, and fire protection services would be greater in magnitude as residential uses (impacts to schools and parks) are proposed under this alternative. Like the proposed project, development under this alternative would require payment of development impact fees for schools, police services, and fire services. The payment of development impact fees would be expected to offset impacts to these public services that would result from the development of this alternative. Therefore, when compared to the proposed project, impacts associated with public services would remain less than significant with the payment of development impact fees and increased property tax revenues.

Unlike the proposed project, the No Project/Existing General Plan Alternative proposes the construction of residential uses. Therefore, implementation of this alternative would result in an

Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

increase in existing population and a corresponding increase in demand for park and recreation facilities resulting from development. Because a potential increase in demand for recreational facilities would occur, impacts associated with recreation for this alternative would be greater in magnitude as compared to the proposed project, but would still be expected to be less than significant with the provision of parkland and open space as part of the alternative project, increased property tax revenues, and payment of park fees as applicable.

Traffic: As indicated in Table 6.G, the No Project/Existing General Plan Alternative would generate approximately 119,668 daily vehicle trips. Compared to the proposed project, the No Project/Existing General Plan Alternative, which assumes development of existing General Plan uses, would result in an increase of 72 percent of daily traffic trips. The increase in traffic may cause an existing intersection or roadway segment to operate at a deficient LOS. While significant traffic impacts may occur under this alternative, these impacts would be mitigated in a manner similar to those of the proposed project. However, despite the identification of mitigation measures, certain freeway segments and interchange improvements would not be under the jurisdiction of the City and cannot be guaranteed to be in place when development under this alternative would become operational. Therefore, when compared to the proposed project, traffic impacts would be greater due to the additional trip generation. However, the resulting impact significance would be similar and would remain significant and unavoidable until the improvements are in place.

Table 6.G: Comparison of Average Daily Trips

Type of Development	Average Daily Trips	Change
Proposed Project ¹	69,542	
No Project/No Build	314	-99.6%
No Project/Existing General Plan ²	119,668	+72%
Alternative 1: Reduced Density	48,321	-28%
Alternative 2: Mixed Use A	208,988	+201%
Alternative 3: Mixed Use B	78,985	+14%
Alternative Sites	69,542	0%

² Based on modified Moreno Highland Specific Plan (see Table 6.C).

Source: Parsons Brinckerhoff estimates based on project traffic study, September 2014 (see Appendix D).

Utilities and Service Systems: Existing utility infrastructure for storm water and wastewater is present in adjacent roadways or parcels. Like the proposed project, the applicant would connect to existing utility infrastructure subject to the terms and conditions of the City, EMWD, and RCFCWCD. As indicated in Table 6.H, the No Project/Existing General Plan Alternative would generate approximately 1,569,083 gallons of wastewater per day, which is almost nine times the amount of wastewater that would be generated by the proposed project. Similar to the proposed project, development under this alternative would be required to pay infrastructure fees and obtain approval from the wastewater treatment provider that would ensure there is excess capacity for the wastewater that would be generated by the proposed development. Therefore, impacts related to wastewater and wastewater treatment would remain less than significant when compared to the proposed project.

The development of the existing General Plan land uses associated with this alternative would also require the installation of water supply infrastructure to serve the project site. As indicated in Table 6.I, the No Project/Existing General Plan Alternative would require approximately 4,888,456 gallons of water per day, which is almost three times what would be required by the proposed project. When compared to the proposed project, water usage demands would be substantially increased in magnitude.

Table 6.I: Comparison of Average Water Use

Type of Development	Gallons per day

Alternative Sites	1,761,260

Source: DEIR Section 16 and *Water System Planning and Design Principle Guidelines Criteria*, Eastern Municipal Water District, February 2006.

Like the proposed project, the No Project/Existing General Plan Alternative would also generate solid waste. As identified in Table 6.J, this alternative would generate 17,494 tons of solid waste per year, which is 47 percent less than what the proposed project would generate. Therefore, demands on solid waste services and landfill capacity would be decreased in magnitude. Similar to the proposed project, development under the No Project/Existing General Plan Alternative would be required to adhere to the provisions of the solid waste provider that would service the project site. When compared to the proposed project, solid waste impacts under this alternative would remain less than significant.

Cumulative Impacts: Similar to the proposed project, this alternative would contribute toward the permanent conversion of farmland, air quality operational emissions, short-term and long-term noise impacts, and increased traffic operations on local roadways and at local intersections. Although this alternative would have a greater amount of traffic, the amount of operational emissions would be

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

reduced in magnitude from that identified for the proposed project as this alternative does not include a logistics warehouse component. Because there are no feasible mitigation measures to reduce the cumulative impacts associated with long-term operational air pollutant emissions, noise, and increased traffic, long-term air quality and traffic impacts would remain significant and unavoidable.

Impact Conclusions. Under the No Project/Existing General Plan Alternative, impacts related to short-term construction-related air quality would be similar to the proposed project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Long-term operational-related air quality impacts would be reduced from that identified for the proposed project but would remain significant and unavoidable. Under this alternative, population and housing impacts would be greater in magnitude as residential uses are proposed. Similar to the proposed project, the associated increases in employment are accounted for in the City General Plan and other applicable local and regional plans.

The development of the No Project/Existing General Plan Alternative would have increased demands on public services and recreation facilities due to the residential component and population growth, however, the payment of fees, provision of onsite parkland and open space, higher property tax revenues, and adherence to development requirements would reduce these impacts to a less than significant level. Water supply availability is expected to be available although water demand is increased. Water demand was determined to be available for the proposed project. Because of the increase in vehicle trips achieved under this alternative, impacts to the operation of local roadways and intersections would be proportionally greater than what was identified for the proposed project; therefore, long-term traffic impacts would remain significant and unavoidable. Traffic-related noise would be greater in magnitude and noise impacts would be significant and unavoidable like the proposed project.

Meets Project Objectives. Under this alternative, only some of the proposed project objectives would be met as a variety of uses would be built, as shown in Table 6.K. Development of this alternative would provide new employment opportunities for residents of Moreno Valley but not nearly to the degree as the proposed project.

Note: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR; therefore, they are being corrected at this time.

Table 6.K: Comparison of No Project/Existing General Plan Alternative to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.	No
Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.	No
Create a major logistics center with good regional and freeway access.	No
Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.	Yes
Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.	No
Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.	No
Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.	No

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 6.K: Comparison of No Project/Existing General Plan Alternative to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.	No
Encourage new development consistent with regional and municipal service capabilities.	Yes
Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.	Yes
Provide thousands of construction job opportunities during the project's buildout phase.	No
Provide appropriate transitions or setbacks between on-site and off-site uses.	Yes

6.3.6 Alternative 1: Reduced Density

NOTE: The following changes have been made due to revision to the Specific Plan project size.

With the intent of avoiding or substantially reducing significant impacts, and in particular the significant impacts that cannot be reduced to a less than significant level through implementation of mitigation measures created by the project's traffic, air quality, and noise impacts, the City has considered a Reduced Density Alternative. This alternative includes development of the project site with approximately 28 million square feet of logistics warehousing, including 74.3 acres for open space. The 1,085 acres owned by the CDFW would be designated as Open Space in the City's General Plan, similar to the proposed project. Under this alternative, the proposed logistics uses would represent a net decrease of approximately 31 percent (28 million square feet) as compared with the proposed project.

Because of the large area, approximately 2,610 acres, of the proposed project that is proposed for development, public facilities, or off-site improvements, a variety of reduced density alternatives could be considered that might substantially reduce or eliminate one or more of the significant and unavoidable impacts of the proposed project. For example, warehousing development on the site would have to be reduced to approximately one percent of the project site, or 400,000 square feet, of the WLC project's proposed high-cube logistics warehouse building area in order to eliminate significant and unavoidable impacts associated with air quality in order to reduce air pollution emissions to less than applicable SCAQMD thresholds. The only way this could logically occur would be to develop a small portion of the site (i.e., less than one percent) and leave the rest of the site vacant. In addition, even this substantial reduction in the proposed high-cube logistics warehouse building area and/or developable area would not eliminate the proposed project's other significant and unavoidable impacts associated with aesthetics, air quality, noise, and transportation listed above in 6.1.3. Any of the viable alternatives that are examined in this EIR would entail some type of development on all or most of the project site, rather than development of an illogically small portion of the site (i.e., one percent).

Impact Analysis. The following nine environmental issues would have impacts similar to those identified for the proposed project:

- Aesthetics
- Agricultural and Forestry Resources
- Cultural Resources
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

- Biological Resources
- Recreation
- Geology and Soils

Impacts associated with these topics would be similar to the proposed project because development of the site under Alternative 1 would result in a similar footprint of development but with less square footage for logistics warehouse buildings. For this reason, impacts to these land-oriented impact topics would be similar resulting in the same level of impact.

As identified in Section 4.1 of this EIR, the proposed project would result in significant and unavoidable impacts associated with scenic vistas, local scenic roads, character of the site and surroundings, and cumulatively considerable aesthetic impacts. Implementation of this alternative would result in development of the same high-cube logistics land uses, building heights and mass, but at a level equivalent to 70 percent of the proposed project. For this reason, and in the same exact manner as the proposed project, this alternative would result in significant and unavoidable impacts associated with scenic vistas, local scenic roads, character of the site and surroundings, individually and on a cumulatively considerable basis.

As identified in Section 4.2 of this revised EIR, the proposed project would not result in significant impacts associated with the loss of unique farmland, the elimination of existing agricultural operations, or cumulatively considerable agricultural resources impacts with implementation of the recommended mitigation, including acquisition of an offsite agricultural conservation easement. Implementation of this alternative would result in development on the same existing agricultural lands, but each development site would be developed at a level equivalent to 70 percent of the proposed project. Therefore, this alternative would not result in significant impacts associated with the loss of unique farmland, the elimination of existing agricultural operations, and on a cumulatively considerable basis.

The remaining environmental issues would, in some cases, result in similar impacts, but would be different enough to be discussed separately as follows.

Air Quality: Because the amount of land to be graded with Alternative 1 would be the same to that of the proposed project, the same quantity of construction equipment would be used and a similar quantity of building materials would be used during earthmoving activities. Therefore, construction emissions from the development of Alternative 1 would be similar as the proposed project; perhaps slightly decreased. As identified in Section 4.3 of this EIR, the proposed project would result in significant and unavoidable air quality impacts from CO, VOC, NO_x, and PM₁₀ air pollution emissions and localized PM₁₀ concentrations. Implementation of this alternative would result in development on the same land areas, but each development site would be developed at a level equivalent to 70 percent of the proposed project. For this reason, and in approximately the same manner as the proposed project, the Reduced Density Alternative would result in significant and unavoidable air quality impacts from CO, VOC, NO_x, and PM₁₀ emissions during project construction.

Assuming the same level of mitigation as the proposed project, there would be no cancer risks associated with this alternative since the use of new technology diesel engines do not contribute to cancer risk as described in Section 4.3.

Under this alternative, average daily traffic volumes would be reduced by approximately 30 percent in comparison with the proposed project. As indicated in Table 6.L, the volume of each operational pollutant emitted during operation of this alternative would be correspondingly reduced. However, operational emissions for CO, VOC, NO_x, PM₁₀, and PM_{2.5} would exceed daily SCAQMD thresholds for air pollution emissions as shown in Table 6.L, in the same manner as the proposed project. Although the application of green building design principles may reduce emissions from building

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

operations (such as heating and cooling), such standards and principles would not reduce CO, VOC, NO_x, PM₁₀, and PM_{2.5} emissions to below SCAQMD thresholds.

NOTE: The Alternative 1 air pollutant and greenhouse gas emissions have decreased because part of the emissions were based on a percentage of the project's emissions (which have decreased) and the other emissions were remodeled.

Table 6.L: Alternative 1 Operational Emissions

Source	Pollutant Emissions, lbs/day					
	CO	VOC	NO _x	SO _x	PM ₁₀	PM _{2.5}
Proposed Project	1,396	593	1,097	21	1,121	304
Alternative 1	977	415	768	15	785	213
Net Change (Alternative minus proposed)	-419	-178	-329	-6	-336	-91
SCAQMD thresholds	550	55	55	150	150	55
Alternative 1 exceeds thresholds?	Yes	Yes	Yes	No	Yes	Yes

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment, 2015.

As shown in Table 6.L, the volume of operational air pollutant emissions would be reduced when compared to the proposed project. As identified in Section 4.3 of this EIR and as stated above, the proposed project would result in air quality impacts from CO, VOC, NO_x, PM₁₀, and PM_{2.5} operational emissions that cannot be mitigated to below SCAQMD thresholds, resulting in significant and unavoidable impacts. Similarly, the Reduced Density Alternative would result in air quality impacts from CO, VOC, NO_x, PM₁₀, and PM_{2.5} operational emissions that cannot be mitigated to below SCAQMD thresholds, resulting in significant and unavoidable impacts in approximately the same manner as the proposed project.

Global Climate Change: As identified in Section 4.7 of this EIR, the proposed project would generate approximately 6,200 MTCO_{2e} per year at buildout from uncapped operational sources after mitigation, resulting in a less than significant impact. As identified in Table 6.F, the Reduced Density Alternative would generate 4,347 MTCO_{2e} per year of uncapped emissions. GHG emissions resulting from operation of the uses envisioned under the Reduced Density Alternative would be correspondingly reduced in comparison to the proposed project, as this alternative would reduce the number of daily traffic trips and energy consumed by approximately 30 percent. Although the Reduced Density Alternative would generate approximately 30 percent less GHG than the proposed project, impacts associated with cumulative global climate change would remain less than significant in approximately the same manner as the proposed project, since it is assumed that this alternative would incorporate similar mitigation as for the project.

Noise: As identified in Section 4.12 of this EIR, construction-related noise impacts of the proposed project were reduced through mitigation measures. However, construction-related noise impacts within the Specific Plan area and off-site construction area would remain significant and unavoidable, even with implementation of the mitigation measures. Under the Reduced Density Alternative, the same amount of land would be disturbed, the same quantity of construction equipment would be used, and a similar quantity of building materials would be used. Therefore, noise impacts associated with the construction of this alternative would be the same as those identified under the proposed project, but would likely occur over a shorter period of time due to the reduced square footage. As identified in Section 4.12 of this EIR and as stated above, the proposed project would result in construction-related noise impacts within the Specific Plan area and off-site construction area that cannot be mitigated to below a level of significance. Consequently, impacts would remain significant and unavoidable. With the implementation of mitigation identified for the proposed project, the short-term construction-related noise impacts associated with the Reduced Density Alternative would also remain significant and unavoidable in the same exact manner as the proposed project, as

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

construction noise is not able to be reduced to noise levels less than 60 dBA (L_{eq}). As with the proposed project, the noise generated under the Reduced Density Alternative would also be generated during loading/unloading, truck movements on roadways, and parking lot activities.

As identified in Section 4.12 of this EIR under the proposed project, the increase in future traffic noise along certain local roadway segments would increase beyond the threshold of perception resulting in an impact and the need for mitigation. However, as stated in the EIR, there are no feasible mitigation measures to reduce noise levels to below significant levels. The reduction in project-related traffic under the Reduced Density Alternative (i.e., minus approximately 30%) would result in a similar decrease in long-term traffic noise due to the reduction of traffic trips to the project site. However, under this alternative, the future increases in traffic-related noise would have a similar effect on local roadway segments, resulting in significant impacts in approximately the same manner as the proposed project. Although this alternative's contribution to future traffic noise would be reduced, thereby reducing overall mobile source noise impacts within the area, even with a reduction in overall mobile source noise, roadway noise along certain roadway segments would remain significant and unavoidable in approximately the same manner as the proposed project.

Population and Housing: This alternative would result in the development of approximately 28 million square feet of logistics space. Utilizing an employment factor of one employee for every 1,667 square feet of logistics space,¹ the Reduced Density Alternative is anticipated to generate approximately 16,797 jobs.² It is anticipated that most of these jobs would be filled by persons already residing in the area; therefore, no significant population increase would occur with the development of these logistics jobs. When this alternative is compared to the proposed project, the number of new jobs would be approximately 30 percent less than the proposed project. Similar to the proposed project, impacts related to population and housing would remain less than significant as this alternative would continue the existing development trend envisioned by the City. This alternative would not improve the City's jobs/housing ratio to nearly the same degree as the proposed project.

Public Services: Demands on schools, parks, other public facilities, law enforcement, and fire protection services would be incrementally less but in general similar in magnitude as that associated with the proposed project as no residential uses (and corresponding impacts to schools and parks) are proposed under this alternative. Like the proposed project, development under this alternative would require payment of development impact fees for schools, police services, and fire services. The increase in property taxes and payment of development impact fees would offset impacts to public services that may result from the development of the uses envisioned under this alternative. Similar to the proposed project, impacts associated with public services would remain less than significant.

Traffic: As identified in Section 4.15 of this EIR, the proposed project would result in significant impacts to freeways and interchanges in the baseline condition and future year (2022, 2030, and 2035) time horizons. Because improvements to freeways and interchanges are under the authority of Caltrans, it is uncertain if improvements to these roadways would be constructed prior to when project impacts would occur, resulting in a significant and unavoidable significant to freeways and interchanges. As identified in previously referenced Table 6.G, the Reduced Density Alternative would generate approximately 48,321 total vehicle trips, which is approximately 30 percent less than the total trip generation for the proposed project (69,542 total vehicle trips). The reduction in traffic under the Reduced Density Alternative (i.e., minus approximately 30%) would result in a similar decrease in traffic volumes on local roadways. However, under this alternative, the future increases in traffic volumes would have a similar effect on freeways and interchanges, resulting in significant impacts similar to those identified for the proposed project. Since the City does not have control over when freeway improvements would occur, traffic impacts to freeways and interchanges would remain

¹ Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California, David Taussig & Associates, Inc., September 2014.

² 1 employee/1,667 square feet of logistics uses x 28,000,000 square feet of logistics use = - 16,797 logistics jobs.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

significant and unavoidable in approximately the same manner as the proposed project, until such improvements can be installed or constructed by Caltrans.

Utilities and Service Systems: Limited storm water and wastewater infrastructure is currently located in adjacent roadways or parcels within the project area. Like the proposed project, development under this alternative would be required to provide necessary infrastructure to support the future development of the site. The resulting development under this alternative would be subject to the terms and conditions of the City and EMWD. Similar to the proposed project, development under the Reduced Density Alternative would also include implementation of master plans for potable water, sewer, recycled water, and drainage for the project study area. Since the development under this alternative would be similar in use and size to the proposed project, it is anticipated that the same type and quantity of utility infrastructure would be required for the area. Therefore, implementation of these master plans under this alternative would have similar impacts to those identified for the proposed project.

The development of the Reduced Density Alternative would require the installation of water supply infrastructure of a size and extent needed to serve the proposed project. As indicated in previously referenced Table 6.I, the amount of water demand associated with the Reduced Density Alternative (1,202,011 gallons per day) would be 32 percent less than that required for the proposed project. Similar to the proposed project, development under this alternative would be required to obtain verification from the water purveyor that water is available to serve the development. Since this alternative would utilize less water than the proposed project and because EMWD has stated that water supply required for the proposed project is available, it is reasonable to conclude that if this alternative was built, adequate water would be available. Therefore, impacts related to water usage and water treatment/conveyance facilities would remain less than significant with mitigation implemented, similar to the proposed project.

As identified in previously referenced Table 6.H, the Reduced Density Alternative would generate approximately 198,376 gallons of wastewater per day, which is approximately 30 percent less than that generated by the proposed project. This alternative's demands on wastewater treatment and capacity at existing wastewater treatment facilities would be reduced in magnitude. Similar to the proposed project, development under this alternative would be required to pay infrastructure fees and obtain approval from the wastewater treatment provider that would ensure there is excess capacity for the wastewater that would be generated by the proposed development. Therefore, like the proposed project, adherence to existing requirements identified by the City and EMWD would result in impacts remaining at a less than significant level.

Like the proposed project, the Reduced Density Alternative would also generate solid waste. As identified in previously referenced Table 6.J, the Reduced Density Alternative would generate 30,786 pounds of solid waste per day, which is approximately 30 percent less than what the proposed project would generate. The reduction in solid waste generated by the uses under this alternative would have a reduced demand of solid waste services and landfill capacity. Therefore, demands on solid waste services and landfill capacity would be reduced in magnitude. However, similar to the proposed project, development under the Reduced Density Alternative would be required to adhere to the provisions of the solid waste provider that would service the project site. As with the proposed project, solid waste impacts would remain less than significant.

Cumulative Impacts: The Reduced Density Alternative would contribute to the permanent conversion of farmland, but the proposed mitigation, including acquisition of an offsite agricultural conservation easement, will reduce impacts to less than significant levels, as also reduce the cumulative impacts associated with the conversion of farmland, cumulative impacts associated with farmland conversion to less than significant levels, similar to the proposed project. Although the amount of operational air pollutant emissions would be reduced in magnitude, because there are no

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

feasible mitigation measures to reduce long-term air pollutant operational emissions, cumulative impacts would remain significant and unavoidable in approximately the same manner as the proposed project.

The Reduced Density Alternative would reduce traffic volumes that would occur in the project vicinity. However, the additional traffic associated with this alternative would contribute to deficient levels of service on freeway segments during the lifetime of the project. Since the City is not in control of when freeway improvements are made, impacts associated with deficient LOS on freeway segments would remain significant and unavoidable in approximately the same manner as the proposed project, until such time that the freeway improvements are installed or constructed by Caltrans. Similarly, noise generated from traffic on roadway segments within the project area may result in certain roadway segments experiencing noise levels beyond the City's noise standard. Implementation of the identified mitigation measures would reduce noise but it would not reduce noise levels to a less than significant level. Therefore, cumulative impacts associated with traffic noise levels would remain significant and unavoidable in approximately the same manner as the proposed project.

As identified in Section 4.1 of this EIR, the proposed project would result in significant and unavoidable impacts associated with scenic vistas, local scenic roads, character of the site and surroundings, and cumulatively considerable aesthetic impacts. Implementation of this alternative would result in development of the same high-cube logistics land uses, building heights and mass, but at a level approximately 70 percent of the proposed project. For this reason, and in the same manner as the proposed project, this alternative would result in significant and unavoidable impacts associated with scenic vistas, local scenic roads, character of the site and surroundings, and on a cumulatively considerable basis.

Impact Conclusions. Under the Reduced Density Alternative, development of the same high-cube logistics land uses, building heights and mass, but at a floor area level approximately 70 percent of the proposed project, would be constructed resulting in significant and unavoidable impacts associated with scenic vistas, local scenic roads, character of the site and surroundings, and on a cumulatively considerable basis in the same exact manner as the proposed project. Impacts related to short-term construction-related air quality would be the same as the proposed project, because the same amount of land would be disturbed and the same mix of equipment would be utilized. The Reduced Density Alternative would result in significant and unavoidable air quality impacts from CO, VOC, NO_x, PM₁₀, and PM_{2.5} emissions during project construction, in the same exact manner as the proposed project. Long-term operational-related air quality impacts would be incrementally reduced when compared to the project, but the emissions cannot be mitigated to below SCAQMD thresholds and would remain significant and unavoidable in approximately the same manner as the proposed project. Similarly, impacts related to short-term construction-related noise cannot be mitigated to a less than significant level and would be significant and unavoidable in the exact same manner as the proposed project. Although traffic-related noise would be reduced when compared to the project, impacts would have a similar effect on local roadway segments and would remain significant and unavoidable as there are no feasible mitigation measures that would be able to reduce impacts to a less than significant level, in approximately the same manner as the proposed project. Under this alternative, the volume of water required and the amount of wastewater and solid waste generated would be reduced in comparison to the proposed project and the decrease in the amount of logistics uses would result in a reduction of permanent jobs that would be created. Consequently, this alternative would have incrementally reduced demands on public services, recreation, and water use. Similar to the proposed project, increased property tax revenues, the payment of fees, and adherence to City development and utility requirements would reduce these impacts to less than significant levels.

Because of the decrease in vehicle trips achieved under this alternative, impacts to the operation of local roadways and intersections would be proportionally reduced from those identified for the proposed project. However, under this alternative, the future increases in traffic volumes would have

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

a similar effect on freeways and interchanges, resulting in significant impacts similar to those identified for the proposed project. Since the City does not have control over when freeway improvements would occur, traffic impacts to freeways and interchanges would remain significant and unavoidable for impacts associated with freeway segments in approximately the same manner as the proposed project, as the City does not have control of when such freeway improvements can be installed or constructed by Caltrans.

In summary, the Reduced Density Alternative would incrementally reduce almost all of the project impacts by reducing the total square footage of development. However, all of the impacts identified as significant and unavoidable under the proposed project, including aesthetics, air quality, noise, and traffic would still be significant and unavoidable under this alternative.

Meets Project Objectives. As shown in Table 6.M, under this alternative, some of the project objectives are met, but not nearly to the same degree as the proposed project.

Note: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR; therefore, they are being corrected at this time.

Table 6.M: Comparison of Reduced Density Alternative to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.	Not to the same degree as the proposed project
Provide the land use designations and infrastructure plans necessary to meet current market demands and to support the City's Economic Development Action Plan.	Not to the same degree as the proposed project
Create a major logistics center with good regional and freeway access.	Not to the same degree as the proposed project
Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.	Yes
Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.	Yes
Provide a major logistics center to accommodate a portion of the ever-expanding t rave volumes at the Ports of Los Angeles and Long Beach.	Not to the same degree as the proposed project
Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.	Not to the same degree as the proposed project
Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.	Not to the same degree as the proposed project
Encourage new development consistent with regional and municipal service capabilities.	Not to the same degree as the proposed project
Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.	Not to the same degree as the proposed project
Provide thousands of construction job opportunities during the project's buildout phase.	Not to the same degree as the proposed project
Provide appropriate transitions or setbacks between on-site and off-site uses.	Yes

6.3.7 Alternative 2: Mixed Use A

With the intent of avoiding or substantially reducing significant impacts created by the project's traffic, air quality, and noise impacts, the City has considered Mixed Use A Alternative. This alternative

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

includes development of the project site with approximately 1,410 acres of logistics warehousing (22 million square feet), 1,000 acres of light industrial uses (20 million square feet), 50 acres of retail commercial uses (500,000 square feet), 100 acres of professional or medical office uses (1.0 million square feet), and 150 acres of open space. The 1,085 acres owned by the CDFW would be designated as Open Space in the City’s General Plan, similar to the proposed project.

Impact Analysis. The following nine environmental issues would have impacts similar to those identified for the proposed project:

- Aesthetics
- Agricultural and Forestry Resources
- Cultural Resources
- Biological Resources
- Geology and Soils
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Recreation

The remaining environmental issues would, in some cases, result in similar impacts, but would be different enough to be discussed separately.

Air Quality: Because the amount of land to be graded with Alternative 2 would be similar to that of the proposed project, a similar mix of equipment as the proposed project would operate during earthmoving activities. Therefore, construction emissions from the development of Alternative 2 would be similar to the proposed project, which is significant and unavoidable for CO, VOC, NO_x, and PM₁₀.

Assuming the same level of mitigation as the proposed project, there would be no cancer risks associated with this alternative since the use of new technology diesel engines do not contribute to cancer risk as described in Section 4.3.

As indicated in Table 6.N, the volume of each operational pollutant emitted during operation of this alternative would be correspondingly increased due to the substantial increase in traffic from this alternative relative to the proposed project. Like the proposed project, operational emissions for CO, VOC, NO_x, PM₁₀, and PM_{2.5} would still exceed daily SCAQMD thresholds. Application of green building design principles could reduce emissions from building operations such as heating and cooling; however, such standards and principles would not reduce CO, VOC, NO_x, PM₁₀, and PM_{2.5} emissions to below SCAQMD thresholds.

NOTE: The Alternative 2 air pollutant and greenhouse gas emissions have decreased because part of the emissions were based on a percentage of the project’s emissions (which have decreased) and the other emissions were remodeled.

Table 6.N: Alternative 2 Operational Emissions

Source	Pollutant Emissions, lbs/day					
	CO	VOC	NO _x	SO _x	PM ₁₀	PM _{2.5}
Proposed Project	1,396	593	1,097	21	1,121	304
Alternative 2	5,683	1,307	1,794	35	2,135	603
Net Change (Alternative minus project)	+4,287	+714	+697	+14	+1,014	+299
SCAQMD thresholds	550	55	55	150	150	55
Alternative 2 exceeds thresholds?	Yes	Yes	Yes	No	Yes	Yes

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment, 2015.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The volume of operational air pollutant emissions would be increased when compared to the proposed project during operations only and impacts would remain significant and unavoidable.

Global Climate Change: This alternative would generate 6,856 metric tons of uncapped GHG emissions resulting from operation of the uses envisioned under the Mixed Use A Alternative would be approximately 10 percent higher than those of the proposed project (see Table 6.F). The Mixed Use A Alternative would generate more greenhouse gas than the proposed project; impacts associated with cumulative global climate change would be less than significant.

Noise: Under the proposed project, construction-related noise impacts were mitigated through adherence to the identified mitigation measures. However, even with the mitigation measures, construction-related noise impact within the Specific Plan area and off-site construction area would remain significant and unavoidable. Under the Mixed Use A Alternative, a similar amount of land would be disturbed; therefore, noise impacts associated with the construction of this alternative would be similar to those identified under the proposed project. With the implementation of mitigation identified for the proposed project, the short-term construction-related noise impacts associated with this alternative would still remain significant and unavoidable as construction noise is not able to be reduced to below noise levels less than 60 dBA (L_{eq}). As with the proposed project, the noise generated under the Mixed Use A Alternative would be generated during loading/unloading, trash compacting, truck movements on roadways, and parking lot activities. The operation-related noise impacts associated with this alternative would remain less than significant with implementation of the mitigation measures, as identified for the proposed project.

The increase in project-related traffic under this alternative would result in an incremental increase in long-term traffic noise due to an increase of traffic trips to the project site. Under the proposed project, the increase in future traffic noise along certain local roadway segments would increase beyond the threshold of perception resulting in the need for mitigation. However, as stated in the EIR, there are no feasible mitigation measures to reduce noise levels to below appropriate levels. Under this alternative, future increases in traffic-related noise would have a similar effect on local roadway segments. When compared to the proposed project, this alternative's contribution to future traffic noise would be increased, thereby increasing overall mobile source noise impacts within the area. It is anticipated that roadway noise along certain roadway segments would remain significant and unavoidable.

Population and Housing: The Mixed Use A Alternative would result in the development of 22 million square feet of logistics warehousing, 20 million square feet of light industrial uses, half a million square feet of retail commercial uses, one million square feet of professional/medical office uses, and 150 acres of open space. Utilizing an employment factor of one employee for every 1,667 square feet of logistics space,¹ the logistics warehousing component of the Mixed Use A Alternative is anticipated to generate approximately 13,197 jobs.² Utilizing the same employment factor of one employee for every 1,667 square feet of light industrial uses, the light industrial component of the Mixed Use A Alternative is anticipated to generate approximately 11,998 jobs.³ Utilizing employment factors of one employee for every 628 square feet of commercial use and one employee for every 481 square feet of office use,⁴ this alternative would additionally create up to 2,875 jobs (796 retail jobs⁵ and 2,079

¹ Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California, David Taussig & Associates, Inc., September 2014.

² 1 employee/1,667 square feet of logistics uses × 22 million square feet of logistics use = 13,197 logistics jobs.

³ 1 employee/1,667 square feet of light industrial uses × 20 million square feet of light industrial use = 11,998 light industrial jobs.

⁴ Table II-B Average Employees Per Acre, Southern California Association of Governments Employment Density Study, The Natelson Company, October 31, 2001.

⁵ 1 employee/628 square feet of commercial uses × 500,000 square feet of commercial uses = 796 retail jobs.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

office jobs).¹ Many of the logistics warehousing, light industrial, and retail jobs are likely to be filled by persons already residing in the area.

However, unlike logistics, light industrial, and retail jobs, which can often be filled by most working adults, professional/medical office jobs under this alternative may require the employment of persons in specialized fields, which may not include persons already living in the area. Persons from outside of the area may be required to relocate to Moreno Valley to fill positions in the office space, resulting in an incremental population increase in the City. When this alternative is compared to the proposed project, the number of new residents would be higher than that identified for the proposed project. Under this alternative, up to approximately 28,070 jobs could be created. The number of new jobs in the City would be 17 percent greater than the proposed project (24,000 potential jobs). However, similar to the proposed project, impacts related to population and housing would remain less than significant as this alternative would continue the existing development trend envisioned by the City.

Public Services: As discussed above, the Mixed Use A Alternative could result in an incremental population increase within the City. Because of the increased amount of office development that would occur within the project limits, demands on schools, parks, other public facilities, law enforcement, and fire protection services would be greater in magnitude than what was identified for the proposed project. However, similar to the proposed project, development under this alternative would result in higher property tax revenues and payment of development impact fees for schools, police services, and fire services. The payment of development impact fees would offset any impacts to these public services that may result from the development of this alternative. Therefore, when compared to the proposed project, impacts associated with public services would remain less than significant with the payment of development impact fees.

Traffic: As identified in previously referenced Table 6.G, this alternative would generate approximately 208,988 total traffic trips. In comparison to the proposed project, this alternative would almost triple total traffic trips. With such an increase in traffic, an increase in volumes on nearby roads and intersections would be greater in magnitude when compared to the proposed project. Impacts to LOS at nearby intersections and roadway segments would occur under the Mixed Use A Alternative to an even greater degree than under the proposed project, and would require even more extensive mitigation. The addition of traffic volumes associated with this alternative could result in deficient LOS at many more intersections in the project vicinity during the lifetime of the development. While significant traffic impacts may occur under this alternative, these impacts would be mitigated in a manner similar to those of the proposed project. Even if mitigation measures were identified for all these intersections, certain roadway improvements would not be under the jurisdiction of the City and cannot be guaranteed to be in place when development under this alternative would become operational. Therefore, as identified for the proposed project, traffic-related impacts would remain significant and unavoidable under the Mixed Use A Alternative.

Utilities and Service Systems: Like the proposed project, development under the Mixed Use A Alternative would connect to existing utility infrastructure subject to the terms and conditions of the City and EMWD. As indicated in previously identified Table 6.H, this alternative would generate approximately 1,830,000 gallons of wastewater per day, which is over six times what the proposed project would generate (286,459 gallons of wastewater per day). When compared to the proposed project, wastewater treatment demand would be increased in magnitude as more wastewater would be generated under this alternative. However, like the proposed project, adherence to existing requirements identified by the City and EMWD may result in impacts remaining at a less than significant level.

¹ 1 employee/481 square feet of office uses × 1 million square feet of office uses = 2,079 office jobs.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The development of the warehousing, light industrial, commercial, and office uses associated with this alternative would also require the installation of water supply infrastructure to serve the project site. As previously indicated in Table 6.I, the Mixed Use A Alternative would require approximately 3,420,000 gallons of water per day, which is almost twice as much as would be required by the proposed project (1,761,260 gallons of water per day). When compared to the proposed project, water usage demands would be increased. However, similar to the proposed project, development under this alternative would be required to obtain verification from the water purveyor that water is available to serve the development. Therefore, impacts related to water usage and water treatment/ce facilities would remain less than significant when compared to the proposed project.

Like the proposed project, the Mixed Use A Alternative would also generate solid waste. As previously identified in Table 6.J, this alternative would generate 481,344 pounds of solid waste per day, which is over thirteen times as much as the proposed project would generate (37,016 pounds of solid waste per day). Therefore, demands on solid waste services and landfill capacity would be increased in magnitude. Similar to the proposed project, development under the Mixed Use A Alternative would be required to adhere to the provisions of the solid waste provider that would service the project site. As with the proposed project, solid waste impacts under this alternative would remain less than significant.

Cumulative Impacts: Similar to the proposed project, this alternative would contribute toward the permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. The amount of operational air pollutant emissions and traffic would be increased in magnitude and there are no mitigation measures that would reduce long-term air quality operational impacts to below SCAQMD thresholds. Likewise, there are no mitigation measures that would reduce impacts associated with increased traffic in the area. Therefore, cumulative impacts associated with long-term air quality and long-term traffic would remain significant and unavoidable. Similarly, noise generated from traffic on roadway segments within the project area may result in certain roadway segments experiencing noise levels beyond the City's noise standard. Implementation of the identified mitigation measures would reduce noise but it would not reduce noise levels to a less than significant level. Therefore, cumulative impacts associated with traffic noise levels would remain significant and unavoidable. This alternative would also require the development of the project site. The revised EIR contains mitigation (acquisition of an offsite agricultural conservation easement) that would reduce the cumulative impacts associated with the conversion of Unique Farmland, cumulative impacts associated with farmland conversion to less than significant levels.

Impact Conclusions. Under this alternative, impacts related to short-term construction-related air quality and noise impacts would remain significant and unavoidable, similar to the proposed project. Long-term air quality operational impacts under this alternative would be increased in magnitude, remain significant and unavoidable, and would result in similar conditions as identified for the proposed project. The Mixed Use A Alternative would decrease the amount of logistics warehousing and would add light industrial, commercial, and office uses that would generate more permanent and more varied jobs than the proposed project, but some uses may require skilled workers who are not current residents of the City. The office uses proposed under this alternative may incrementally increase the total number of people that would be added to the City's population and could have greater demands on public services and recreation. However, the increased property tax revenues, payment of fees, and dedication of parkland would reduce these impacts to a less than significant level. This alternative would increase the amount of wastewater generated, increase the amount of potable water required, and increase the amount of solid waste produced on site. Similar to the proposed project, adherence to utility requirements would reduce these impacts to less than significant levels. Because of the increase in vehicle trips resulting from this alternative, impacts to the operation of local roadways and intersections would be proportionally increased from the proposed project and remain significant and unavoidable.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Because of the increase in vehicle trips under this alternative, impacts to the operation of local roadways and intersections would be proportionally increased from what was identified for the proposed project. Long-term traffic impacts would remain significant and unavoidable for impacts associated with freeway segments as the City does not have control of when such freeway improvements would occur. Similarly, traffic-related noise would be increased in magnitude and cannot be mitigated to a less than significant level in a manner similar to the proposed project.

In summary, the Mixed Use A Alternative would increase employment opportunities but would substantially increase traffic, noise, and air quality impacts. All the impacts identified as significant under the proposed project, including air quality health risks, would still be significant under this alternative.

Meets Project Objectives. Under this alternative, four of the proposed project objectives are not met as shown in Table 6.O.

Note: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR; therefore, they are being corrected at this time.

Table 6.O: Comparison of the Mixed Use A Alternative to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.	Yes
Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.	Yes
Create a major logistics center with good regional and freeway access.	No
Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.	Yes
Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.	Yes
Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach	No
Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.	No
Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.	No
Encourage new development consistent with regional and municipal service capabilities.	Yes
Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.	Yes
Provide thousands of construction job opportunities during the project's buildout phase.	Yes
Provide appropriate transitions or setbacks between on-site and off-site uses.	Yes

6.3.8 Alternative 3: Mixed Use B

This alternative would develop the project site similar to the land use plan of the Moreno Highlands Specific Plan (MHSP) but with 10 million square feet of logistics warehousing on the 603 acres proposed for business, retail, institutional, and other uses under the MHSP. The 1,085 acres owned by the CDFW would be designated as Open Space in the City's General Plan, similar to the proposed project.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Impact Analysis. Many of the environmental impacts of this alternative would be equivalent to those identified for the No Project/Existing General Plan Alternative, the main differences being traffic, health risks, and greenhouse gas emissions.

Air Quality: Alternative 3 would require site grading and construction similar to that required of the proposed project. As identified in Section 4.3 of this EIR, short-term construction emission impacts associated with construction activities on the project site were significant and unavoidable for all criteria pollutants with the exception of SO_x. Since Alternative 3 would require that the same amount of land be graded, it would require similar grading and construction activities on site. Therefore, it is reasonable to anticipate that short-term construction emission impacts would also be significant and unavoidable for all criteria pollutants, with the exception of PM_{2.5} and SO_x, under this alternative. Air quality impacts associated with the remaining criteria pollutants would be significant and unavoidable with this alternative, similar to what was identified for the proposed project.

Under Alternative 3, the site would be developed at the same residential density and intensity as the MHSP but would have 10 million square feet of logistics warehousing on 603 acres instead of the mixed non-residential uses proposed under the MHSP. Based on these land uses, Alternative 3 would generate approximately 78,985 daily vehicle trips (see Table 6.G) compared to 69,542 trips from the proposed project (a 14% increase).

NOTE: Alternative 3 air pollutant and greenhouse gas emissions have decreased because part of the emissions were based on a percentage of the project's emissions (which have decreased) and the other emissions were remodeled.

Table 6.P: Alternative 3 Operational Emissions

Source	Pollutant Emissions, lbs/day					
	CO	VOC	NOx	SOx	PM ₁₀	PM _{2.5}
Proposed Project	1,396	593	1,097	21	1,121	304
Alternative 3	2,912	569	762	15	960	278
Net Change (Alternative minus project)	+1,516	-24	-335	-6	-161	-26
SCAQMD thresholds	550	55	55	150	150	55
Alternative 3 exceeds thresholds?	Yes	Yes	Yes	No	Yes	Yes

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment, 2015.

The volume of each operational pollutant emitted during operation of this alternative would be incrementally increased due to the proposed mix of land uses. Therefore, this alternative would also have significant and unavoidable impacts on local air quality. The long-term air quality impacts resulting from this alternative would still contribute criteria pollutants to an air basin that is in nonattainment for these criteria pollutants, similar to the proposed project. As identified in previously referenced Table 6.P, long-term operational air pollutant emissions associated with Alternative 3 would exceed SCAQMD emissions thresholds for all criteria pollutants, with the exception of SO_x.

Assuming the same level of mitigation as the proposed project, there would be no cancer risks associated with this alternative since the use of new technology diesel engines do not contribute to cancer risk as described in Section 4.3.

When compared with the proposed project, air quality impacts associated with Alternative 3 would be mixed in that criteria pollutants would be higher but diesel particulate matter and truck-related emissions would be less, and potential health risks would be shifted from existing to future residents; more residents could be exposed to health risks. Similar to the proposed project, the generation of

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

these emissions would still result in a cumulative contribution of air pollutants in a nonattainment basin; therefore, impacts remain significant and unavoidable.

Global Climate Change: GHG emissions associated with Alternative 3 are substantially decreased. As identified in previously referenced Table 6.F, Alternative 3 would generate uncapped emissions of 2,925 metric tons of carbon dioxide equivalents, which is approximately half (53%) of that identified for the proposed project.

Noise: Under the proposed project, construction-related noise impacts were mitigated through adherence to the identified mitigation measures. However, even with the mitigation measures, construction-related noise impact within the Specific Plan area and off-site construction area would remain significant and unavoidable. Under the Mixed Use B Alternative, a similar amount of land would be disturbed; therefore, noise impacts associated with the construction of this alternative would be similar to those identified under the proposed project. With the implementation of mitigation identified for the proposed project, the short-term construction-related noise impacts associated with this alternative would still remain significant and unavoidable as construction noise cannot be reduced to noise levels less than 60 dBA (L_{eq}). As with the proposed project, the noise generated under the Mixed Use B Alternative would be generated during resident trips to and from the project, as well as non-residential loading/unloading, trash compacting, truck movements on roadways, and parking lot activities. The operational-related noise impacts associated with this alternative would be significant and adverse, even with implementation of the mitigation measures, similar to the proposed project.

Population and Housing: The Mixed Use B Alternative would result in the development of 6,532 residential units on 1,146 acres, plus 10 million square feet of logistics warehousing and 150 acres of open space. Utilizing an employment factor of one employee for every 1,667 square feet of logistics space,¹ the logistics warehousing component of the Mixed Use B Alternative is anticipated to generate approximately 6,000 jobs.² Utilizing a household size of 3.8 persons per unit, it is estimated this alternative would generate 24,821 new residents in the City as well. The number of new jobs in the City would be 82 percent less than the proposed project (24,000 potential jobs). This alternative would eventually have a jobs/housing ratio of 0.22, which is much lower than the existing job/housing ratio of the City. Therefore, this alternative would have substantially greater impacts related to population and housing compared to the proposed project.

Public Services: As discussed above, the Mixed Use B Alternative could result in a substantial population increase within the City. Because of the increased population, demands on schools, parks, other public facilities, law enforcement, and fire protection services would be greater in magnitude than what was identified for the proposed project. Similar to the proposed project, development under this alternative would provide increased property tax revenues and payment of development impact fees for schools, police, fire, and recreation services. The payment of development impact fees would offset any impacts to these public services that may result from the development of this alternative. Therefore, when compared to the proposed project, impacts associated with public services would remain less than significant with the payment of development impact fees.

Traffic: As identified in previously referenced Table 6.G, this alternative would generate approximately 78,985 total traffic trips, which is approximately 12 percent more than the proposed project. This would incrementally increase traffic and impacts to LOS at nearby intersections and roadway. The addition of traffic associated with this alternative could result in deficient LOS at more intersections in the project vicinity during the lifetime of the development. While significant traffic impacts may occur under this alternative, these impacts would be mitigated in a manner similar to those of the proposed project. Even if mitigation measures were identified for all these intersections,

¹ Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California (David Taussig & Associates, Inc., September 2014).

² 1 employee/1,667 square feet of logistics uses × 10 million square feet of logistics use = 5,999 logistics jobs.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

certain roadway improvements would not be under the jurisdiction of the City and cannot be guaranteed to be in place when development under this alternative would become operational. Therefore, as identified for the proposed project, traffic-related impacts would remain significant and unavoidable under the Mixed Use B Alternative.

Utilities and Service Systems: Like the proposed project, development under the Mixed Use B Alternative would connect to existing utility infrastructure subject to the terms and conditions of the City and EMWD. As indicated in previously identified Table 6.H, this alternative would generate approximately 1,681,656 gallons of wastewater per day, which is more than a six-fold increase to what the proposed project would generate (286,459 gallons of wastewater per day). When compared to the proposed project, wastewater treatment demand would be substantially increased under this alternative, but adherence to existing requirements identified by the City and EMWD would likely result in less than significant impacts with planned expansion of wastewater treatment capacity.

The development of logistics rather than commercial and other non-residential uses under the MHSP would require the installation of water supply infrastructure to serve the project site. As previously indicated in Table 6.I, the Mixed Use B Alternative would require approximately 5,196,801 gallons of water per day, which is over three times what would be required by the proposed project (1,761,2601 gallons of water per day). When compared to the proposed project, water usage demands would be substantially increased. Similar to the proposed project, development under this alternative would be required to obtain verification from the water purveyor that water is available to serve the development. Therefore, impacts related to water usage and water treatment/conveyance facilities are assumed to remain at less than significant levels similar to the proposed project.

Like the proposed project, the Mixed Use B Alternative would also generate solid waste. As previously identified in Table 6.J, this alternative would generate 116,800 tons of solid waste per year, which is almost three times more than what the proposed project would generate (37,016 tons of solid waste per year). Therefore, demands on solid waste services and landfill capacity would be substantially increased. Similar to the proposed project, development under the Mixed Use B Alternative would be required to adhere to the provisions of the solid waste provider that would service the project site. As with the proposed project, solid waste impacts under this alternative would remain less than significant.

Cumulative Impacts: Similar to the proposed project, this alternative would contribute toward the permanent conversion of farmland, air quality operational emissions, short-term and long-term noise impacts, and increased traffic operations on local roadways and at local intersections. This alternative would have slightly more traffic and operational emissions. Because there are no feasible mitigation measures to reduce the cumulative impacts associated with long-term operational air pollutant emissions, short-term and long-term noise, and increased traffic, these impacts would remain significant and unavoidable. Alternative 3 would also require the development of the project site. Since there is no feasible mitigation that would reduce the cumulative impacts associated with the conversion of farmland, cumulative impacts associated with farmland conversion would remain significant and unavoidable.

Impact Conclusions. Under Alternative 3, impacts related to short-term construction-related air quality would be similar to the proposed project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Long-term operational-related carbon monoxide emissions would be higher than the proposed project and would remain significant and unavoidable. Like the proposed project, long-term air quality relative to criteria pollutants would still be significant, with the exception of SO_x. Assuming the same level of mitigation as the proposed project, there would be no cancer risks associated with this alternative since the use of new technology diesel engines do not contribute to cancer risk as described in Section 4.3.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

The development of Alternative 3 would have increased demands on public services and recreation facilities to serve future residential uses. However, increased property tax revenues, payment of development impact fees, and adherence to development requirements would reduce these impacts to a less than significant level. Water supply availability is expected to be available as water demand is expected to be the same. Water demand was determined to be available for the proposed project. There would be an increase in vehicle trips under this alternative, and impacts to the operation of local roadways and intersections would be similarly increased compared to that identified for the proposed project; therefore, long-term traffic impacts would remain significant and unavoidable. Development of this alternative would provide new employment opportunities and homes for residents of Moreno Valley, but new employment opportunities would be significantly reduced compared to the proposed project.

In summary, the Mixed Use B Alternative would incrementally increase traffic and not improve the City’s jobs/housing balance over the long-term. However, this is the only alternative that would reduce a significant impact of the project (aesthetics – views) by substantially reducing the amount of warehousing on the site and replacing it with residential uses. Views of the area would still transition from vacant agricultural land to suburban development, but it would have a residential appearance compared to the proposed project. All the other impacts identified as significant under the proposed project, including likely air quality health risks, would still be significant under this alternative.

Meets Project Objectives. This alternative would not meet most of the objectives of the project related to employment and land use, as shown in Table 6.Q, and would not establish a major regional logistics center in this portion of the City.

NOTE: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR; therefore, they are being corrected at this time.

Table 6.Q: Comparison of Alternative 3 to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.	No
Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City’s Economic Development Action Plan.	No
Create a major logistics center with good regional and freeway access.	No
Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.	Yes
Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.	No
Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.	No
Create a project that will provide a balanced approach to the City’s fiscal viability, economic expansion, and environmental integrity.	No
Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.	No
Encourage new development consistent with regional and municipal service capabilities.	No
Significantly improve the City’s jobs/housing balance and help reduce unemployment within the City.	Yes

World Logistics Center Project**

Table 6.Q: Comparison of Alternative 3 to the Project Objectives

Project Objectives	Does the Alternative Meet the Project Objectives?
Provide thousands of construction job opportunities during the project's buildout.	No
Provide appropriate transitions or setbacks between on-site and off-site uses.	Yes

6.3.9 Alternative Sites Analysis

NOTE: The following changes have been made due to revision to the Specific Plan project size.

This alternative examines different sites in the surrounding region to determine if an alternative location would reduce or eliminate one or more significant impacts of the project. This analysis must be based on feasible sites that could realistically support the proposed project (i.e., a contiguous 2,610-acre site for 40.6 million square feet of high-cube and light logistics warehouse uses as envisioned by the WLC Specific Plan). The surrounding jurisdictions were contacted to identify potential alternative sites for the proposed project. Figure 6.1 shows the locations of the various jurisdictions that were contacted and/or analyzed in this evaluation and Table 6.R presents the results of that analysis.

Table 6.R indicates that there are no feasible alternative sites in the surrounding or nearby jurisdictions that could support the proposed project (i.e., that have enough vacant land zoned or available for logistics warehousing with good freeway and/or rail access). Therefore, none of these sites will be evaluated further.

Table 6.R: Evaluation of Potential Alternative Sites

Jurisdiction/Map Reference*	Contact/Results
City of Moreno Valley	John Terell, the City's former Community Development Director, indicated there are no sites available within the City that have nearly that amount of vacant land planned or designated for industrial-related uses, which is why the WLC project is being proposed on the current site as this is the largest available vacant land left in the City (personal communication, December 2012).
City of Banning	Zai Abu Bakar, Community Development Director, indicated that the City does not have any vacant industrial property that large (personal communication, November 21, 2012). The City of Banning has a number of much smaller parcels (50–100 acres) zoned for industrial use along the I-10 Freeway corridor, but these are not contiguous and are under multiple ownerships. Therefore, there is no alternative site for the proposed project within the City of Banning.
City of Beaumont	Rebecca Deming, Director of Planning, indicated "the City does have some vacant industrial zoning and Specific Plan Zoning for industrial areas along the 60 freeway" (personal communication, November 26, 2012). A review of the City's online mapping indicates the following three potential sites of contiguous vacant land with freeway access that could support industrial uses: A. South of SR-60/East of SR-79: Site consists of 319 acres planned for general/community commercial and industrial uses, but with scattered rural residential uses adjacent to many of the vacant parcels. B. North of SR-60/West of I-10/South of Oak Valley Parkway: Site consists of approximately 463 acres planned for a variety of residential uses under the Oak Valley Specific Plan. C. South of SR-60/West of I-10/North of West 4 th Street: Site includes 193 acres just

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 6.R: Evaluation of Potential Alternative Sites

Jurisdiction/Map Reference*	Contact/Results
	<p>west of new commercial center and planned for “urban village overlay” with industrial along the freeway.</p> <p>Even the largest site (B) is less than 20 percent of the size of the WLC project site in Moreno Valley, and even all together the three sites total 974 acres which is 36 percent of the WLC project site. None of the sites is owned by the developer; Site B is under single ownership, while the other two are under multiple ownership. Based on this information, there are no feasible alternatives sites in the City of Beaumont for the proposed project.</p>
City of Calimesa	<p>Gus Romo, Community Development Director, was contacted and indicated there are not 2,600 acres designated or that have the potential to be zoned for warehouses in Calimesa (personal communication, November 21, 2012). Therefore, there is no alternative site for the proposed project within the City of Calimesa.</p>
City of Menifee	<p>Patti Nahill, contract City Planner, indicated that there was no place in the City with 2,600 vacant acres available for industrial uses (personal communication, November 27, 2012). The City was incorporated on October 1, 2008, and is still working on its General Plan, so the applicable zoning would be Industrial Park (IP). There are three areas in the City with vacant land that could support industrial uses:</p> <ul style="list-style-type: none"> A. East of I-215 North of Scott Road: Approximately 280 acres with suburban and rural residential uses adjacent to the north and south, and an approved Specific Plan (140 acres) to the east. These areas have multiple owners. B. West of I-215 North of Scott Road: Approximately 600 acres with rural residential to the north, west, and south. This area has multiple owners. C. North Menifee Specific Plan: This area is only 120 acres and the current land use designation is Specific Plan, but the underlying zoning was industrial. This area is under single ownership. <p>Even the largest area (A) is only 22 percent of the size of the WLC project site in Moreno Valley, and even all together the three areas only total 1,000 acres which is 37 percent of the WLC project site. None of the sites is owned by the developer; Area C is under single ownership, while the other two areas are under multiple ownership. Based on this information, there are no feasible alternative sites available in the City of Menifee for the proposed project.</p>
City of Perris	<p>According to the City’s website (www.cityofperris.org), the Perris Valley Commerce Center Specific Plan (adopted January 2012) east of I-215 has 1,866 total acres designated for light industrial uses, but some of this area is already developed or planned/approved for development. If this entire area were dedicated to high cube logistics warehousing, it would represent about two-thirds of the land within the proposed WLC Specific Plan. This land is also under ownership of hundreds of individual owners, and the vacant land is not in large contiguous blocks. Therefore, there is no feasible alternative site for the proposed project within the City of Perris.</p>
City of Riverside	<p>Steve Hayes, City Planner, indicated there were no sites close to the required size within the City limits. The only large sites he was aware of were less than 50 acres each and not contiguous with each other (personal communication, November 26, 2012). Therefore, there is no feasible alternative site for the proposed project within the City of Riverside.</p>
City of San Jacinto	<p>Asher Hartel, former Planning Director (retired), said the City of San Jacinto did not have the required amount of vacant land available zoned for industrial use in the City, and there are no freeways or rail service immediately available to the City. He did say the City’s “Gateway” area in the northwestern portion of the City, along Ramona Expressway, had approximately 1,700 acres and is mostly vacant, but the property is designated for a mix of residential, commercial, and business park uses in the General Plan, and any non-residential uses would have to be high employment generators (personal communication, November 27, 2012). Therefore, there is no feasible alternative site for the proposed project within the City of San Jacinto.</p>

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 6.R: Evaluation of Potential Alternative Sites

Jurisdiction/Map Reference*	Contact/Results
County of Riverside	<p>Frank Coyle, former Deputy Director, Advanced Planning Division Riverside County Planning Department, suggested the County's GIS Department could identify all vacant unincorporated land zoned Light Industrial or Business Park along the I-215 corridor south of Moreno Valley to the City of Perris (personal communication, November 21, 2012). Larry Ross with the County's GIS Department said its research shows a total of 1,280 acres of vacant land designated for light industrial or business park uses where warehousing would be appropriate (see Figure 6.1)(personal communication, November 26, 2012 and data/mapping info sent November 29, 2012). This land constitutes hundreds of parcels under separate ownerships distributed along the west side of I-215 from Nandina Avenue south to Nuevo Road. This "corridor" land is spread out up to a half mile away from the freeway and is not in large contiguous blocks, and it is adjacent to many rural residential parcels and uses. In addition, it is less than half the size needed for a similar amount of logistics warehousing development as under the proposed project. For these reasons, it would be infeasible to consolidate and propose development of industrial-zoned unincorporated land along this portion of I-215.</p> <p>In addition to the I-215 corridor, the "Villages of Lakeview" property located south of Mystic Lake off of Ramona Expressway is at least one additional potential site in the general project area that has sufficient acreage to accommodate the WLC project. This property has already been proposed for a variety of residential uses (11,350 units on 2,800 acres) but the EIR for that project was successfully challenged in court this year (Riverside County EIR 471). While the property is large enough, it is already proposed for residential development so it would be infeasible to use this property to support development equivalent to the proposed project.</p> <p>Although it is relatively far from the project area (approximately 22 miles to the west-northwest along the east side of I-15 south of SR-60), the Mira Loma area of the County supports a variety of large warehouses and has rail service available, so it is a potential location for additional logistics warehouses. The Jurupa Area Plan indicates that warehouse uses are allowed only in the area bounded by San Sevaine Channel from Philadelphia Street southerly to Galena Street on the east, Galena Street from the San Sevaine Channel to Riverside Drive, then Riverside Drive westerly to Milliken Avenue, then Milliken Avenue north to Philadelphia Street on the west, and Philadelphia Street easterly to the San Sevaine Channel on the north. A visual inspection of aerial photographs of the Mira Loma area indicates the largest individual vacant parcel or group of adjacent vacant parcels in this area occupies approximately 800 acres, most of which is currently being used for agriculture (i.e., vineyards)(east of I-15 on both sides of Bellegrave Avenue). Otherwise, there are no vacant parcels of more than 100 acres in size in this area (not shown in Figure 6.1).</p>
City of Jurupa Valley (not shown in Figure 6.1)	<p>The newly incorporated City of Jurupa Valley, located south of SR-60 just west of the City of Riverside, also has vacant industrial-zoned land available for warehousing, but all currently vacant parcels are 50 acres or less in size and not contiguous as to be able to form a parcel nearly large enough to support the proposed project (Ernest Perea, former City contract planner, personal communication, January 4, 2013).</p>
March Joint Powers Authority	<p>The March JPA website (www.marchjpa.com) indicates there is a total of approximately 750 acres of developable land west of I-215, north of Van Buren Boulevard and south of Alessandro Boulevard within the MJPA. At present, this land is planned for a mixture of business park, commercial, industrial, public facilities, and open space uses. Even if all this land was committed to logistics warehousing, it would only represent 28% of the WLC project site. Therefore, an alternative site for the proposed project on March JPA property is infeasible.</p>

World Logistics Center Project**

6.4 COMPARISON OF PROJECT ALTERNATIVES

The following discussion compares the impacts of each alternative with the impacts of the proposed project, as detailed in Sections 4.1 through 4.16 of this EIR. Table 6.S compares the impacts of the alternatives with those of the proposed project. This table identifies whether the alternative results in (1) a reduction of the impact; (2) a greater impact than the project; or (3) the same impact as the project.

Table 6.S: Comparison of Alternatives to the Proposed Project

Environmental Issue	Proposed Project	No Project	No Project	Alt. 1	Alt. 2	Alt. 3
		No Build	Existing General Plan	Reduced Density	Mixed Use A	Mixed Use B
Aesthetics	SIG	NI	←LTS	=	=	←LTS
Agricultural and Forest Resources	LTS/mit	NI	=	=	=	=
Air Quality	SIG	NI	SIG	←SIG	→SIG/+	SIG
Biological Resources	LTS/mit	NI	=	=	=	=
Cultural Resources	LTS/mit	NI	=	=	=	=
Geology and Soils	LTS/mit	NI	=	=	=	=
Global Climate Change	LTS/mit	NI	LTS	LTS/mit	LTS/mit	LTS/mit
Hazards and Hazardous Materials	LTS/mit	NI	=	=	=	=
Hydrology and Water Quality	LTS/mit	NI	=	=	=	=
Land Use and Planning	SIG	NI	LTS	=	=	=
Mineral Resources	NI	=	=	=	=	=
Noise	SIG	NI	←SIG	←SIG	←SIG	←SIG
Population, Housing, and Employment	LTS	NI	+	=	=	+
Public Services (police, fire, schools, parks)	LTS/mit	NI	=	=	=	=
Transportation and Traffic	SIG	NI	→SIG	←SIG	→SIG+	→SIG
Utilities and Service Systems (water, wastewater, etc.)	LTS/mit	NI	=	=	=	=

Proposed Project

- NI: No Impact
- LTS: Less than Significant Impact
- LTS/mit: Less than Significant Impact with Mitigation
- SIG: Significant Impact with or without Mitigation

Project Alternatives

- = Compared with the proposed project, no change in the significance of impact will occur.
- Compared with the proposed project, the significance of the impact is increased.
- ← Compared with the proposed project, the significance of the impact is reduced.
- + Compared with the proposed project, a new impact has been identified.
- ←SIG Compared with the proposed project, the volume or extent of the impact is reduced, yet still significant.

6.5 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

As detailed above in Table 6.S, the No Project/Existing General Plan Alternative has mixed impacts relative to the proposed project; it reduces aesthetic impacts to less than significant levels but worsens the jobs/housing ratio by introducing more housing than employment-generating uses. The

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Reduced Density Alternative incrementally reduces a number of impacts of the proposed project (e.g., traffic, air quality, and noise) but cannot reduce them to less than significant levels even with mitigation. The Mixed Use A Alternative substantially increases traffic and related impacts compared to the project impacts, but it does not create any additional significant impacts. The Mixed Use B Alternative would incrementally increase traffic and would not improve the jobs/housing balance. In addition, this alternative would also worsen the jobs/housing ratio of the City by allowing the construction of many more homes than job-creating land uses. Regarding air quality impacts (criteria pollutants), development of any land uses would likely exceed SCAQMD thresholds mainly due to the size of the proposed project site.

The *CEQA Guidelines* (Section 15126.6 (e)[2]) requires that an environmentally superior alternative be identified in the EIR. Based on the analysis in this section and the summary contained in Table 6.S, Alternative 1 – Reduced Density – is the only alternative that reduces traffic, air quality, and related impacts by reducing the total square footage of warehousing by approximately 30 percent. Alternative 3—Mixed Use B—is the only alternative that would reduce a significant impact of the proposed project (i.e., aesthetics – views). However, it would worsen the jobs/housing balance of the City over the long term. For these reasons, Alternative 1 – Reduced Density —has been deemed to be environmentally superior to the proposed project. However, none of the alternatives achieves the objectives of the project to nearly the same degree as the proposed project.

Table 6.T compares Alternative 1 to the project objectives and indicates that Alternative 1 does not meet most of the major goals of the proposed project mainly because of the reduced total square footage by 30 percent, which also reduces the amount of new employment and property tax revenues generated to the City.

NOTE: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR; therefore, they are being corrected at this time. In addition, some numerical changes result from the changes to the Specific Plan area.

Table 6.T: Comparison of the Environmentally Superior Alternative to the Project Objectives

Project Objectives	Degree to Which Alternative 1 Satisfies the Project Objectives
Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.	Not to the Same Degree as the Proposed Project. This alternative would provide only 16,797 new employees compared to 24,000 from the proposed project (30% less).
Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.	Not to the Same Degree as the Proposed Project. The alternative introduces substantially less employment-generating uses on the site which is not consistent with the City's Economic Strategic Plan.
Create a major logistics center with good regional and freeway access.	Not to the Same Degree as the Proposed Project. The alternative would allow 28 MSF of logistics warehousing near the SR-60 Freeway but it would be less attractive as a major regional logistics center compared to the proposed project.
Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.	Meets Objective. Development of the project area under this alternative would most likely proceed under some form of specific plan, which would help ensure future development was consistent with a comprehensive plan for the area.
Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.	Meets Objective. The alternative would develop a smaller amount of logistics warehousing compared to the proposed project, but it would still be master planned, most likely under a specific plan.

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

Table 6.T: Comparison of the Environmentally Superior Alternative to the Project Objectives

Project Objectives	Degree to Which Alternative 1 Satisfies the Project Objectives
Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.	Not to the Same Degree as the Proposed Project. The alternative would allow 28 MSF of logistics warehousing vs. 40.6 MSF for the proposed project.
Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.	Not to the Same Degree as the Proposed Project. The alternative would not provide nearly as much new warehouse capacity to form a regional port-oriented logistics center compared to the proposed project.
Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.	Not to the Same Degree as the Proposed Project. The alternative would produce 30% less employment than under the proposed project, and would also provide less property tax revenue and be able to pay for less public improvements and infrastructure compared to the proposed project.
Encourage new development consistent with regional and municipal service capabilities.	Not to the Same Degree as the Proposed Project. It is unclear if a substantially reduced logistics warehousing project could afford to provide the necessary infrastructure to support the planned development compared to the proposed project.
Significantly improve the jobs/housing balance and help reduce unemployment within the City.	Not to the Same Degree as the Proposed Project. This alternative would provide only 16,797 new employees compared to 24,000 from the proposed project (30% less).
Provide thousands of construction job opportunities during the project's buildout phase.	Not to the Same Degree as the Proposed Project. The alternative would not provide as much work for as many construction workers compared to the proposed project
Provide appropriate transitions or setbacks between on-site and off-site uses.	Meets Objective. A smaller logistics warehouse project may be able to provide equal or greater transitions and buffers from existing off-site residential uses compared to the proposed project.

7.2 ACRONYMS AND ABBREVIATIONS

§	Section
§§	Subsection
°C	degrees Celsius
°F	degrees Fahrenheit
µg/m ³	Micrograms per cubic meter
AAQS	Ambient Air Quality Standards
AB	Assembly Bill
ACC	Andrew Chang and Company
ACM	Asbestos-Containing Material
AF	acre-feet
AFRES	Air Force Reserve
AFV	Alternative Fuel Vehicle
AFY	acre feet per year
AICUZ	Air Installation Compatible Use Zone
ALUC	Airport Land Use Commission
ALUP	Airport Land Use Plan
amsl	above mean sea level
A-P Act	<i>Alquist-Priolo Earthquake Fault Zoning Act</i>
APN	Assessor's Parcel Number
AQMP	Air Quality Management Plan
AST	Aboveground Storage Tank
Basin	South Coast Air Basin
BAU	Business As Usual
BDCP	Bay Delta Conservation Plan
BMP	Best Management Practice
BP	Business Park
BV&A	Bear Valley and Alessandro Development Company
BVIC	Bear Valley Irrigation Company
BVLWC	Bear Valley Land and Water Company

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)

CAA	Federal Clean Air Act
CAAQS	California Ambient Air Quality Standards
CAFE	Corporate Average Fuel Economy
CalEEMod	California Emissions Estimator Model
CalEPA	California Environmental Protection Agency
CalFire	California Department of Forestry and Fire Protection
CALGreen Code	California Green Building Standards Code
California Register	California Register of Historic Resources
Caltrans	California Department of Transportation
CAPSSA	Criteria Area Plant Species Survey Area
CARB	California Air Resources Board
CASQA	California Stormwater Quality Association
CASSA	Criteria Area Species Survey Area
CAT	California Climate Action Team
CBC	California Building Code
CBOC	California Burrowing Owl Consortium
CBSC	California Building Standards Commission
CCAA	California Clean Air Act
CCR	California Code of Regulations
CDFG	California Department of Fish and Game, former name of the California Department of Fish and Wildlife
CDFW	California Department of Fish and Wildlife, formerly known as the California Department of Fish and Game
CDGB	Community Development Block Grant
CDMG	California Department of Mines and Geology
CEC	California Energy Commission
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response Compensation Liability Act
CESA	California Endangered Species Act
CFCs	chlorofluorocarbons
CFR	Code of Federal Regulations

CFS	calls for service
cfs	cubic feet per second
CGP	Construction General Permit
CGS	California Geological Survey
CH ₄	Methane
CHP	California Highway Patrol
CIP	Capital Improvement Plan
CIWMB	California Integrated Waste Management Board
CLUP	Comprehensive Land Use Plan
CNDDDB	California Natural Diversity Data Base
CNEL	Community Noise Equivalent Level
CNG	Compressed Natural Gas
CNPS	California Native Plant Society
CO	Carbon Monoxide
CO ₂	Carbon Dioxide
CO ₂ e	Carbon Dioxide Equivalent
COA	Coordinated Operations Agreement
CPD	(HUD Office of) Community Planning and Development
CPUC	California Public Utilities Commission
CRA	California Resource Agency
CRA	Cultural Resource Assessment
CSC	California Species of Concern
CUPA	Certified Unified Program Agency
CUWCC	California Urban Water Conservation Council
CVC	California Vehicle Code
CVP	Central Valley Project
CWA	(Federal) Clean Water Act
CWC	California Water Code
DAMP	Drainage Area Management Plan

**Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project**

dB	decibel
dBA	decibel on the A-weighted scale
DBESP	Determination of a Biologically Equivalent or Superior Preservation
DCIA	Directly Connected Impervious Area
DE	Diesel Emissions
DEH	Department of Environmental Health
DHS	(California) Department of Health Services
DIF	Development Impact Fee
DMM	Demand Management Measure
DMP	Drainage Master Plan
DOC	(California) Department of Conservation
DOF	(California) Department of Finance
DTA	David Taussig & Associates, Inc.
DTSC	(California) Department of Toxic Substance Control
DWR	(California) Department of Water Resources
e.g.	<i>exempli grātiā</i> , for example
ECSD	Edgemont Community Services District
EDR	Environmental Data Resources
EIC	Eastern Information Center
EIR	Environmental Impact Report
EIS	Environmental Impact Statement
EMWD	Eastern Municipal Water District
EPA	U.S. Environmental Protection Agency

7.3 GLOSSARY OF GENERAL TERMS

Acre-Foot. An acre-foot is the quantity of volume of water that covers one acre to a depth of one foot; equal to 43,560 cubic feet or 325,851 gallons.

Aesthetics. The perception of artistic elements, or elements in the natural or human-made environment that are pleasing to the eye.

Air Quality Criteria. Air quality criteria are the levels of pollution and length of exposure at which adverse effects on health and welfare occur.

Air Quality Standards. Air quality standards are the prescribed level of pollutants in the outside air that cannot be exceeded legally during a specified time in a specified geographical area.

Ambient Noise. Ambient noise is the composite of noise from all sources near and far. The ambient noise level constitutes the normal or existing level of environmental noise at a given location.

Applicant. An applicant is a person who proposes to carry out a project that needs a lease, permit, license, certificate, or other entitlement, for use or financial assistance from one or more public agencies.

Arterial. An arterial is a major street carrying the traffic of local and collector streets to and from freeways and other major streets, with controlled intersections and generally providing direct access to non-residential properties.

Attainment. Attainment means that there is compliance with State and Federal ambient air quality standards within an air basin.

A-Weighted Decibel (dBA). The dB on the A-weighted scale is the sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.

California Environmental Quality Act (CEQA). Enacted in 1970, CEQA requires State and local agencies to estimate and evaluate the environmental implications of their actions. It aims to prevent environmental effects of the agency actions by requiring agencies, when feasible, to avoid or reduce the significant environmental impacts of their decisions. If a proposed activity has the potential for a significant adverse environmental impact, an environmental impact report (EIR) must be prepared and certified as to its adequacy before taking action on the proposed project (*California Public Resources Code* §§21000 et seq.)

Capacity. The maximum rate of flow at which vehicles can be reasonably expected to traverse a point or uniform segment of a lane or roadway during a specified time period under prevailing roadway, traffic, and control conditions.

Collector. Relatively low-speed, low-volume street that provides circulation within and between neighborhoods. Collectors usually serve short trips and are intended for collecting trips from local streets and distributing them to the arterial network.

Community Noise Equivalent Level (CNEL). A 24-hour energy equivalent level derived from a variety of single-noise events, with weighting factors of 5 and 10 dBA applied to the evening (7 p.m. to 10 p.m.) and nighttime (10 p.m. to 7 a.m.) periods, respectively, to allow for greater sensitivity to noise during these hours.

Congestion Management Plan (CMP). A mechanism employing growth management techniques, including traffic level of service requirements, standards for public transit, trip reduction programs involving transportation systems management and jobs/housing balance strategies, and capital improvement programming, for the purpose of controlling and/or reducing the cumulative regional traffic impacts of development.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Cumulative Impact. As used in CEQA, the total impact resulting from the accumulated impacts of individual projects or programs over time.

Day-Night Average Level (L_{dn}). The average equivalent A-weighted sound level during a 24-hour day, obtained after the addition of 10 decibels to sound levels in the night after 10 p.m. and before 7 a.m. (Note: CNEL and L_{dn} represent daily levels of noise exposure averaged on an annual or daily basis, while L_{eq} represents the equivalent energy noise exposure for a shorter time period, typically one hour.)

Decibel (dB). The decibel (dB) is the unit of level that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.

Emission Standard. The maximum amount of pollutant legally permitted to be discharged from a single source, either mobile or stationary.

Environment. In CEQA, the environment are “the physical conditions which exist within the area which will be affected by a proposed project, including land, air, water, mineral, flora, fauna, noise, and objects of historic or aesthetic significance.”

Environmental Impact Report (EIR). A report required pursuant to the California Environmental Quality Act that assesses all the environmental characteristics of an area, determines what effects or impacts will result if the area is altered or disturbed by a proposed action, and identifies alternatives or other measures to avoid or reduce those impacts.

Equivalent Energy Level (L_{eq}). L_{eq} is the sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. L_{eq} is typically computed over 1-hour, 8-hour, and 24-hour sample periods.

Feasible. To be feasible, according to CEQA, means to be capable of being accomplished in a successful manner within a reasonable time taking into account economic, environmental, social, and technological factors.

Findings. Findings required by CEQA are the conclusions made regarding the significance of a project in light of its environmental impacts. A Statement of Overriding Considerations does not obviate the need to make other required CEQA findings.

Floor Area Ratio (FAR). The FAR is the gross floor area permitted on a site divided by the total net area of the site, expressed in decimals to one or two places. For example, on a site with 10,000 net square feet of land area, a floor area ratio of 1.0 will allow a maximum of 10,000 gross square feet of building floor area to be built. On the same site, an FAR of 1.5 would allow 15,000 square feet of floor area; an FAR of 2.0 would allow 20,000 square feet; and an FAR of 0.5 would allow 5,000 square feet. Also commonly used in zoning, FARs typically are applied on a parcel-by-parcel basis as opposed to an average FAR for an entire land use or zoning district.

Floor Area, Gross. The sum of the horizontal areas of the several floors of a building measured from the exterior face of exterior walls, or from the centerline of a wall separating two buildings, but not including any space where the floor-to-ceiling height is less than six feet. Some cities exclude specific kinds of space (e.g., elevator shafts and parking decks) from the calculation of gross floor area.

Freeway. A freeway is a high-speed, high-capacity, limited-access road serving regional and countywide travel. Such roads are free of tolls, as contrasted with turnpikes or other toll roads. Freeways generally are used for long trips between major land use generators. Major streets cross at a different grade level.

Incorporation by Reference. “Incorporation by reference” is a CEQA term meaning reliance on a previous environmental document for some portion of the environmental analysis of a project. See *CEQA Guidelines* §15150.

Initial Study. An Initial Study is a preliminary CEQA analysis that can be prepared by a Lead Agency to determine whether an EIR or Negative Declaration must be prepared, and identifying the significant environmental effects to be analyzed in an EIR.

Land Use. Any land use is the determination by a governing authority of the use to which land within its jurisdiction may be put so as to promote the most advantageous development of the community.

Lead Agency. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project. The Lead Agency decides whether an EIR or Negative Declaration is required for a project, and causes the appropriate document to be prepared.

Level of Service (LOS). LOS is a qualitative measure describing operational conditions within a traffic stream and how motorists and/or passengers perceive them.

Maximum Noise Level (L_{max}). The maximum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging.

Mitigation Measure. A mitigation measure is a change in a project designed to avoid, minimize, rectify, reduce, or compensate for a significant environmental impact.

Mitigation Monitoring and Reporting Program (MMRP). When a lead agency adopts a mitigated negative declaration or an EIR, it must adopt a program of monitoring or reporting which will ensure that mitigation measures are implemented. (See CEQA Statute §21081.6(a) and *CEQA Guidelines* §§15091(d) and 15097.)

Noise. Noise is any sound that is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing, or is otherwise annoying (unwanted sound).

Noise Contours. Noise contours are lines drawn about a noise source indicating equal levels of noise exposure.

Notice of Determination (NOD). An NOD is a brief notice filed with the State Clearinghouse to document project approval. The filing of the NOD starts the statute of limitations period. (See *CEQA Guidelines* §15373.)

Notice of Preparation (NOP). An NOP is a brief notice to notify the public, Responsible and Trustee Agencies that an EIR is being prepared for a project. The notice serves to solicit guidance from those agencies and the public about the scope and content of the environmental information to be included in the EIR. (See *CEQA Guidelines* §15375.)

Peak Hour. The hour of highest traffic volume on a given section of roadway between 7:00 a.m. and 9:00 a.m. or between 4:00 p.m. and 6:00 p.m.

Programmatic EIR. A programmatic EIR is an EIR that examines the impacts that would result from a conceptual plan or policy action envisioned by the lead agency, which is carried out at a more general level of analysis based upon the development information available. (See *CEQA Guidelines* §15161.)

Project. According to CEQA, a project is the whole of an action that has the potential to result in significant environmental change in the environment, directly or ultimately. (See *CEQA Guidelines* §15378.)

Project Description. A project description describes the basic characteristics of the project including location, need for the project, project objectives, technical and environmental characteristics, project size and design, project phasing and required permits. The level of detail provided in the project description varies according to the type of environmental document prepared.

Project EIR. A project EIR is an EIR that examines the impacts that would result from development of a specific project. (See *CEQA Guidelines* §15161.)

Public Hearing. A public hearing is a mechanism for providing the public an opportunity to comment on and present evidence relating to a proposed project and its Draft EIR.

Final Programmatic Environmental Impact Report

Volume 3 – Revised Draft EIR (Clean)

World Logistics Center Project

Responsible Agencies. According to CEQA, responsible agencies are all public agencies other than the Lead Agency that have discretionary approval power over the project. (See *CEQA Guidelines* §15381.)

Reviewing Agencies. Reviewing agencies are local, State, and Federal agencies with jurisdiction over the project area or resources potentially affected by the project. Cities and counties are also considered reviewing agencies.

Scoping Meeting. A scoping meeting is an optional meeting pursuant to CEQA in which the lead agency meets with members of the public or agency representatives after the Notice of Preparation has been issued to discuss environmental issues related to a project. Scoping sessions provide the opportunity to discuss environmental issues, project alternatives and potential mitigation measures that may warrant in-depth analysis in the environmental review process.

Sensitive Receptors. Sensitive receptors are people or institutions with people that are particularly susceptible to illness from environmental pollution, such as the elderly, very young children, people already weakened by illness (e.g., asthmatics), and persons engaged in strenuous exercise.

Significant Effect on the Environment. A significant effect on the environment means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance (*CEQA Guidelines* §15382).

Thresholds of Significance. Thresholds of significance are criteria for each environmental issue area to assist with determinations of significance of project impacts. They are based on *CEQA Guidelines* Appendix G.

Trustee Agency. According to CEQA, a Trustee agency is a State agency that has jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California. (See *CEQA Guidelines* §15386.)

Volume (Transportation). The volume of traffic is the total number of vehicles that pass over a given point or section of a roadway during a given time interval. Volumes may be expressed in terms of annual, daily, hourly, or sub-hourly periods.

Wastewater. Wastewater is water carrying dissolved or suspended solids from homes, farms, businesses, and industries. The wastewater treatment process includes any process that modifies characteristics of the wastewater, usually for the purpose of meeting effluent standards.

Zoning. Regulation by zone districts of the height, use, and area of structures, the use of land, and the density of population and intensity of allowable uses.

7.4 GLOSSARY OF PROJECT-SPECIFIC DEFINITIONS

The following definitions are excerpts from Section 3.4, *Project Description*.

Annexation Area: This term refers to an 85-acre parcel located adjacent to Gilman Springs Road that is to be annexed into the City of Moreno Valley. The parcel is already within the City's adopted Sphere of Influence adopted on November 21, 1985.

CDFW Conservation Buffer Area: This term refers to a 910-acre parcel owned by the State of California as part of the San Jacinto Wildlife Area (SJWA). This land is within the City of Moreno Valley and is included in the approved Moreno Highlands Specific Plan. That plan designates this property for a broad mix of urban uses including suburban residential, schools, parks, and roads. This land was purchased by the State in 1991 to act as a buffer between the sensitive biological resources of the SJWA and the future urban development under the Moreno Highlands Specific Plan. This land has been actively farmed for many decades and most of it remains in active production. The southwestern portion contains areas of non-native grasslands, although aerial photographs show that

this area has been intermittently tilled over the last 80 years. This property is included in the General Plan Amendment and the Zone Change to replace the current urban land uses that are permitted and replace them with Open Space and Public Facility designations. This property is not within the proposed World Logistics Center Specific Plan. This Buffer Area is a large part of the “Other Project Areas” described herein.

General Plan Amendment: One of the proposed entitlements is a General Plan Amendment (GPA) that will permit the establishment of logistics land uses on the 3,714-acre property located east of Redlands and south of SR-60. The following General Plan Elements will be amended: Community Development; Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and General Plan Goals and Objectives. The GPA will replace the current Moreno Highland Specific Plan/General Plan Designations with the following land use designations: (a) 2,610 acres for high cube logistics development; (b) 1,084 acres of Open Space; and (c) 20 acres for Public Facilities.

Moreno Highlands Specific Plan: This term refers to the currently approved Specific Plan that covers 3,038 acres of the project area. This Specific Plan permits the development of a master planned, mixed-use community consisting of up to 7,763 residential dwelling units and approximately 603 acres of business, retail, institutional, and other uses. This development will be replaced with the World Logistics Center Specific Plan and 1,104 acres of Open Space and Public Facilities uses.

Off-site Analysis Zone: This term refers to an approximately 1,000-foot wide zone adjacent to the south and east boundaries of the Specific Plan area that was studied by Michael Brandman Associates (MBA) as part of the assessment of potential impacts on biological resources. It covers approximately 1,637.5 acres.

Off-site Improvement Areas: Development under the Specific Plan will require construction of a number of offsite infrastructure improvements covering approximately 104 acres of land adjacent to the Specific Plan Site including, but not limited to the following facilities (see Figure 3.7):

- Debris Basins easterly of Gilman Springs Road;
- Water reservoirs and access roads located northeast, north, and west of the project site;
- SR-60 interchange improvements; and
- Roadway, water, sewer, drainage, and utility improvements extending north and west from the project.

Other Project Areas: The San Diego Gas & Electric Company (SDG&E) and the Southern California Gas Company (SCGC) own a total of 194 acres of land immediately south of the Specific Plan site. These properties are included in the proposed General Plan Amendment and the Zone Change to designate them for Open Space and Public Facilities uses. These designations are consistent with present uses. These properties are not within the proposed World Logistics Specific Plan. Approximately 174 acres of the land owned by SDG&E will be designated as Open Space. Nineteen acres of SDG&E land and one acre of SCGC land will be designated as Public Facilities.

Project Site or Project Area: This term refers to the entire 3,818-acre area covered by the EIR encompassed by: (a) the Specific Plan Area (2,610 acres); (b) the CDFW Conservation Buffer Area (910 acres); (c) the Public Facilities Lands area (194 acres); and (d) the Off-site Improvement Area on 104 acres.

Proposed Project or World Logistics Center Project: General term applied to all of the entitlements outlined above that are addressed in this EIR, including:

WLC Specific Plan	2,610 acres
General Plan Amendment.....	3,714 acres
Zone Change	3,714 acres
Tentative Parcel Map	1,539 acres
Annexation85 acres
Off-site improvements	104 acres

Final Programmatic Environmental Impact Report
Volume 3 – Revised Draft EIR (Clean)
World Logistics Center Project

Specific Plan Site: Approximately 2,610 acres of the project area are included in the proposed World Logistics Center (WLC) Specific Plan, located generally south of the SR-60 Freeway, east of Redlands Boulevard, west of Gilman Springs Road, and north of the San Jacinto Wildlife Area.

State Lands: Refers to lands owned by the State of California and includes the San Jacinto Wildlife Area (SJWA) located south of the Specific Plan Site, and the Lake Perris State Recreation Area (LPSRA) located southwesterly of the Specific Plan Site.

Tentative Parcel Map Area: A Tentative Parcel Map is being processed to subdivide 1,539 acres of the project for financing purposes only. This property is owned by the project applicant. Approval of the map will confer no development rights to the property.

WLC Specific Plan: The WLC Specific Plan proposes a master-planned logistics campus to include up to 40.4 million square feet of high-cube logistics warehousing, up to 200,000 square feet of light logistics uses, a site for logistics support uses (LS designation) and 74.3 acres of Open Space in the southwest corner of the site. The Specific Plan includes extensive development standards, design guidelines and review procedures for all development within the project.

World Logistics Center Project: The term refers to all related development and planning activities currently proposed by Highland Fairview in the Rancho Belago area of the eastern end of the City of Moreno Valley. The WLC property is generally located south of the State Route 60 freeway, east of Redlands Boulevard, west of Gilman Springs Road, and north of Mystic Lake and the San Jacinto Wildlife Area.

Zone Change: The project includes a Zone Change covering 3,714 acres which will designate 1,084 acres of land for Open Space (CDFW and SDG&E properties), 20 acres for Public Facilities (SDG&E, SCGC properties) and 2,610 acres for the World Logistics Center Specific Plan.
