Response to Comment G-95-20. The commenter wants the 250-foot buffer better defined, and wants more specificity in the aesthetic mitigation. The buffer is intended as a building setback, but walls, landscaping, and drive areas can be located within it as long as they are effectively screened from the adjacent residential areas (see revised MM 4.1.6.1B).

4.1.6.1B ~~Prior to the issuance of any discretionary permit for development under the WLCSP adjacent to Redlands Boulevard, Bay Avenue, and Merwin Street, the developer shall provide a plot plan or site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that accurately illustrate the appearance of the proposed development. The renderings shall be sufficient to demonstrate that views of the buildings and trucks will be effectively screened from view by existing residents upon maturity of planned landscaping. The location and number of view presentations shall be at the discretion of the City Planning Division.~~

4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.

Based on the requirements of the WLC Specific Plan (see Section 2.5), and with the mitigation proposed, only about a third of the tops of the warehouse buildings will be visible at most, and the planned berms, walls, and mature landscaping are expected to visually block views of the lower portions of the warehouse buildings. In addition, see Response to Comment G-95-18, which describes how MM 4.1.6.3A has been modified to preserve views of Mt. Russell.

Response to Comment G-95-21. The commenter believes the action listed on DEIR page 4.1-69 should be listed as Mitigation Measure 4.1.6.2A. See Response to Comment G-95-20 for changes to MM 4.1.6.1B related to views from the residential areas along Redlands Blvd. See also Response to Comment G-95-18 for changes to MM 4.1.6.3A related to views from SR-60.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-95-22. It is the commenter's opinion the façade accents described in the Specific Plan will not provide "substantial vertical and horizontal relief" per page 4.1-70 of the DEIR. The Specific Plan establishes design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project. The WLCSP Section 5.3 sets forth architectural guidelines, and the City Council will decide whether they are sufficient and will consider the comment before making a decision on the project.

Response to Comment G-95-23. The commenter points out the landscape standards do not define a minimum landscape buffer area. The Specific Plan includes a series of exhibits that illustrate a variety of design treatments along adjacent streets. The details of these areas will be included in project specific plot plans, however in general terms there will be at least 40 feet of landscape area behind the closest street right of way.

Response to Comment G-95-24. The City's General Plan provides ample opportunities for all types of residential and non-residential development within the City limits. While there are other planned logistics facilities within the City, there is also a considerable amount of industrial zoned land available for other uses available within the City to create a further diversified economic base to boost employment opportunities. The City Council will decide whether the project is consistent with the General Plan and will consider the comments prior to deciding whether to approve the project.

Response to Comment G-95-25. The commenter says the project is only "partially consistent with Policy 2.5.1. The City Council will determine whether the project is consistent with the Policy.

Response to Comment G-95-26. The commenter believes a 1,000-foot wide buffer of non-industrial land uses is needed for the west side of the project, then it is consistent with General Plan Policy 2.5.2. General Plan Policy 2.5.2 requires that industrial land uses be located to avoid adverse impacts. The 250-foot buffer that has been proposed for west side of the project provides a buffer, which includes landscaping and a berm or wall, will reduce projects impacts on adjacent uses, The air quality analysis determined that extending the buffer to 1,000 feet would not substantially further reduce the impact over a 250-foot buffer. Specifically, the results for the maximum incremental cancer risk are essentially the same for the 250-foot buffer and the 1,000-foot buffer. The buffer would not substantially reduce air quality impacts.

As shown in Section 4.3 of the EIR, the locations of the 10 in one million cancer risk contour line for the project design and the 1,000-foot buffer under the 30-year exposure duration are mostly coincident and overlap each other. The standard for implementing mitigation under CEQA is not whether it would have any benefit. The standard, as described in CEQA statute, is whether the proposed mitigation would avoid or "substantially reduce" a significant impact. A 1,000 foot buffer does not meet that standard and therefore does not need to be implemented. The City's Municipal Code Section 9.05.040B(9) requires a 250-foot setback between residential and industrial uses, based on project specific noise and air quality studies. Therefore, there is no need for a 1000-foot wide buffer of non-industrial land uses to be consistent with General Plan Policy 2.5.2. In addition, a buffer analysis indicates that a 1,000-foot buffer does not substantially reduce the impact (please refer to Master Response 4).

Response to Comment G-95-27. The commenter says a plot plan is needed to determine consistency with Policy 2.5.3. Since this is a programmatic EIR, future discretionary approvals will require additional California Environmental Quality Act (CEQA) analysis based on more details such as building size, location, architecture, and landscaping. The City would then require the plot plan to be consistent with this policy during their discretionary review process.

Response to Comment G-95-28. The commenter believes the Specific Plan does not have enough detail regarding façade treatments and mitigation is needed. The WLCSP Section 5.3 sets forth

architectural guidelines, and the City Council will decide whether they are sufficient and will consider the comment before making a decision on the project.

Response to Comment G-95-29. The commenter expressed concern about landscaping along the SR-60 Freeway. The Specific Plan provides design guidelines for the SR-60 area. The Plot Plan process provides for the City to review and approve every building proposal to insure compatibility with these guidelines and the General Plan policy cited in the comment. The ultimate decision on consistency will be made by the City Council.

Response to Comment G-95-30. The commenter had several specific design suggestions. Nothing in the proposed project suggests that the cited General Plan policy will not be carried out in the development of the WLC project. The Plot Plan process required by the Specific Plan allows for the City to review each building proposal and evaluate its consistency with the General Plan policies. The ultimate decision on consistency will be made by the City Council. The commenter says consistency with Policy 2.10.7 can only be done at the plot plan level. As outlined in the Response to Comment G-95-27 above, this is a programmatic EIR, future discretionary approvals will require additional CEQA analysis, and the City would require plot plans to be consistent with this policy during their discretionary review process. In addition, restrictions on lighting are already required as outlined in DEIR Section 4.1.6.4.

Response to Comment G-95-31. Section 5.2.12 of the Specific Plan 'Walls and Fences' lists design features that may include varied heights, wall plane offsets and angles. This addresses the commenter's concern.

The landscape areas shown in various cross sections in Section 4.2.8 illustrate that there is a minimum 20 foot landscape buffer as well as an additional 8 foot landscape area as part of the streetscape. This provides a total of 28 feet of landscaping between the sidewalk and the edge of development which is where a wall could be built. Additionally, the bioswales are in front of the sidewalk and therefore will not affect the landscaping for the purposes of screening.

Response to Comment G-95-32. The commenter wants mitigation added for a flat area next to SR-60 to provide for landscaping to effectively shield the buildings from freeway views. As outlined in the Response to Comment G-95-27 above, this is a programmatic EIR, future discretionary approvals will require additional CEQA analysis, and the City would require landscaping plans to effectively screen buildings from the freeway during their discretionary review process. See Response to Comment F-8-3 for text of new MM 4.1.6.2B to assure views will be effectively shielded from existing residential (only top quarter of the buildings can be visible under the revised measure).

Response to Comment G-95-33. The commenter wants more specificity regarding the landscaping buffer to be consistent with Policy 2.10.11. As outlined in the Response to Comment G-95-27, this is a programmatic EIR, future discretionary approvals will require additional CEQA analysis, and the City would require landscaping plans to effectively screen buildings from adjacent uses, consistent with this policy, during their discretionary review process. The ultimate decision on consistency will be made by the City Council.

Response to Comment G-95-34. The commenter is concerned about landscaping along the SR-60 Freeway. The reader should see Response to Comment G-95-10 and G-95-32 on this issue.

Response to Comment G-95-35. The commenter wants mitigation for a 200-foot no improvements buffer. The established 250-foot setback is to provide a horizontal separation between existing sensitive land uses adjacent to the project and the proposed buildings and truck yards. In general terms there will be at least 40 feet of landscape area behind the closest street right of way. Future project level approvals such as plot plans will demonstrate adherence to these requirements and will be further conditioned to comply. MM 4.1.6.1A identifies the appropriate buffer for the project/residential interface which will have extensive landscaping, walls and berms to provide

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

effective visual screening. The commenter has not indicated why a different buffer definition is needed. See also Response to Comment G-95-15 for additional information in this regard.

Response to Comment G-95-36. The commenter was concerned about 2:1 slopes for landscaping. Once the landscaping is established, the variation in ground cover itself will provide relief to the topography of the 2:1 slopes.

Response to Comment G-95-37. The commenter said the special landscaping would simply highlight there were industrial buildings nearby. The special edge treatment discussed in the specific plan (2.5) illustrates a landscape treatment that is residential in nature as compared to the internal street treatments proposed within the WLC.

Response to Comment G-95-38. This comment raises several issues. Section 4.1.6.4 of the EIR discusses the potential light impact of the project, and MMs 4.1.6.4A and B contain specific requirements for lighting impacts to be measured, evaluated and mitigated to minimize light spillage into the San Jacinto Wildlife Area (SJWA). The plot plan process is the best possible measure to evaluate the specific impacts of specific buildings when they are proposed, particularly as it relates to the screening of buildings from adjacent land uses. The light levels proposed for projects within the WLCSP will be designed to specifically address the needs of each individual building, its users, its operating hours and operating characteristics. Lighting plans will be a required part of each plot plan application to allow these details to be evaluated.

The commenter asks for additional screening of onsite improvements under MM 4.1.6.3A, and also has several comments about night lighting. It must be remembered this is a programmatic EIR and additional discretionary review will occur when specific development plans are submitted in the future. The WLC Specific Plan already requires that onsite improvements be screened (WLCSP Section 5.2.12) and the City requires screening during its standard development review process. Therefore, additional mitigation is not necessary regarding onsite screening.

The commenter asked that “white light” on the project be restricted per the Mt. Palomar Zone B requirements. Relative to onsite lighting and dark sky requirements, future development will be required to comply with the City’s lighting ordinance. MM 4.1.6.3A requires the WLCSP will be consistent be consistent with the City’s new lighting ordinance 851 (Moreno Valley Municipal Code Section 9.08.100). More information on “white light” spillage and low pressure sodium lighting along the SJWA boundary is provided in Responses to Comments F-1-21 and G-95-43.

The commenter asked that the Specific Plan standards be reduced for parking lot lighting and timers or motion sensors be added to switch off parking lights when not needed. The City has the discretion to require these types of controls under their revised lighting Ordinance 851, with which MM 4.1.6.4A requires compliance.

Response to Comment G-95-39. The commenter wanted the heights of light poles and wall mounted lights limited. Between the guidelines contained in the Specific Plan (Section 4.3), MM 4.1.6.4A and the requirement for building specific plot plan reviews, including lighting, the potential impacts on residential neighborhoods can be fully evaluated and addressed. See also Response to Comment G-95-38 for additional information.

Response to Comment G-95-40. The commenter wants the placement of street lights specified in the Specific Plan. The streets within the WLC are public streets and they may be used by anyone at any time. The City of Moreno Valley will determine the lighting necessary for these roadways and the project will be required to install said lighting at such time as development occurs.

Response to Comment G-95-41. The commenter wants light pole heights and building lights limited so they won’t affect nearby residents. Future development will be required to comply with the City’s

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

revised lighting ordinance (MM 4.1.6.4A) which limits industrial lighting impacts on adjacent residential uses, including light pole heights and building light placement, consistent with the commenter's direction. Therefore, no additional mitigation is needed.

Response to Comment G-95-42. The commenter said solar panels should be used as shade covers in project parking lots. It is most likely solar panels will be roof-mounted installations to minimize intrusion of panels into developable space. While no parking lot solar panel assemblies are proposed at this time, such installations would be in keeping with the sustainable nature of the WLC project. Therefore, they would be considered on a case-by-case basis on future submittals. In addition, Aesthetics MM 4.1.6.4B was modified as follows:

4.1.6.4B ~~Prior to the issuance of any building permits for development under the WLCSP, the developer shall provide an analysis of any solar panels to be installed on the roof of the new building. The analysis shall demonstrate that, under "worst case" annual conditions, glare from the proposed panels will not leave the confines of the roof, based on building roof parapet design, and affect adjacent residential uses or public travelers along perimeter roadways. Design or construction modifications necessary to meet these requirements shall be implemented to the satisfaction of the City Planning Division.~~

4.1.6.4B Each Plot Plan application for development shall include an analysis of all proposed solar panels demonstrating that glare from panels will not negatively affect adjacent residential uses or negatively affect motorists along perimeter roadways. Design details to meet these requirements shall be implemented to the satisfaction of the Planning Official.

Response to Comment G-95-43. The commenter recommends low pressure sodium (LPS) lighting throughout the WLCSP area. MM 4.1.6.4C in the original DEIR stated..."Prior to the issuance of any building permit for development under the WLCSP, low pressure sodium (LPS) lighting shall be installed on the south sides of any building adjacent to the San Jacinto Wildlife Area (SJWA) to minimize "white" light spillage into the SJWA. This measure shall be implemented to the satisfaction of the City Planning Division based on consultation with the SJWA manager." However, the measure was eliminated due to low pressure sodium lights being prohibited in the City's new Ordinance 851 which amends City Municipal Code Section 9.08.100. The project will still need to minimize white light spillage into the adjacent SJWA and will comply with Ordinance 851. Light intensity levels will be maintained at levels outlined in that ordinance (i.e., prohibit lighting in excess of 0.25 foot candles within 5 feet of adjacent property lines). The reader should also see Response F-1-21 regarding low pressure sodium lighting.

Response to Comment G-95-44. The commenter states only the Specific Plan area should be evaluated using the (California) Land Evaluation and Site Assessments (LESA) model. The LESA analysis in the PB agricultural report (DEIR Appendix C-2) was rerun using just the new 2,610-acre area of the Specific Plan, and the LESA score goes from significant to less than significant. A second agricultural report was prepared by Cushman-Wakefield (Final EIR Volume 2, Appendix C-4) that supported this conclusion of a less than significant impact relative to the loss of agricultural land. However, additional mitigation for loss of agricultural land in the form of a conservation easement on offsite agricultural land to compensate for the loss of onsite unique farmland. The commenter is referred to Response to Comment F-7A-39 for wording of addition MM 4.2.6.1A.

Response to Comment G-95-45. The commenter again indicates only the Specific Plan area should be included in the LESA calculation. The LESA model was re-run to do this as outlined in the Response to Comment G-95-44.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-95-46. The commenter asks why middle of the property is excluded from the calculation as shown in Figure 4.2.2. The referenced map shows agricultural land as indicated by the State Farmland Mapping Program, it does not relate directly to the LESA calculation process, which did use the entire Specific Plan area, plus the state conservation land to the south in the original analysis (DEIR Appendix C-2). As outlined in the Response to Comment G-95-44, the LESA model was re-run using just the WLCSP property and determined loss of agricultural land was actually a less than significant impact – this conclusion was supported by a second independent report prepared by Cushman-Wakefield (Final EIR Volume 2 Appendix C-4).

Response to Comment G-95-47. The commenter again says the LESA model calculations should only apply to the specific plan area. The Response to Comment G-95-44 above addresses this concern, and the model has been re-run to address this concern.

Response to Comment G-95-48. The commenter states agriculture would no longer be an approved use under the Specific Plan. The commenter is correct, as the land transitions from agriculture to warehousing, those activities are not generally compatible due to dust, farm vehicles on local roads, etc. However, existing farming activities, which are currently on most of the project site, could continue until in an area until that area develops.

Response to Comment G-95-49. The commenter expresses concern about the visual mitigation in Section 4.2 of the DEIR. The commenter should note that MM 4.1.6.3A has been revised to allow for the preservation of two thirds of the vertical view of Mt. Russell, as outlined in Response to Comment F-8-3.

Response to Comment G-95-50. The commenter is concerned the project will take credit for existing state conservation land. The WLC project is not “taking credit” for the state conservation land included in the General Plan Amendment and Zone Change, the DEIR was trying to explain the relationship of the various areas within the WLC project. Section 4.4.1.16 explains the history of the state conservation areas south of the WLC development area.

Response to Comment G-95-51. The commenter mentions the right to farm ordinance only applies to existing agricultural uses on the property at present. That is correct, and the rationale for that is explained in the Response to Comment G-95-48 in this letter. The definition of the CDFW Conservation Buffer Area can be found in FEIR Volume 2 DEIR Section 4.4.

Response to Comment G-95-52. The commenter says MM 4.2.6.1A cannot be left to City staff to implement. However, this mitigation measure has been replaced with a new measure that requires the provision of an offsite agricultural conservation easement which is now considered the appropriate mitigation for the agricultural impacts of the WLC project (i.e., loss of 25 acres of Unique Farmland).

Response to Comment G-95-53. The commenter wonders if the state can run an agricultural mitigation bank. As outlined in the Response to Comment G-95-44, new MM 4.2.6.1A requires the developer to acquire a conservation easement on offsite farmland of equal productivity.

Response to Comment G-95-54. The commenter asks that a minor correction be made to page 4.2-18 in the DEIR regarding farming of the state conservation land to the south. This correction will be made in the revised DEIR (Final EIR Volume 2).

Response to Comment G-95-55. The commenter says the LESA Model SA score would be higher. In fact the LESA model was re-run per the commenter’s earlier suggestions and the score went from significant to less than significant as the SA score went below 20 (19.5 in one calculation, 18 in the other). For additional information, see the Response to Comment G-95-44.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-95-56. The commenter says the heritage farm will place a burden on the City. This mitigation measure has been replaced with a new measure MM 4.2.6.1A that requires the provision of an offsite agricultural conservation easement which is now considered the appropriate mitigation for the agricultural impacts of the WLC project (i.e., loss of 25 acres of Unique Farmland).

Response to Comment G-95-57. The commenter asks that a number be corrected in the cumulative agricultural impacts section. That correction will be made in made in the revised DEIR (Final EIR Volume 2).

Response to Comment G-95-58. The commenter asks why local farming options were not explored that would reduce greenhouse gas emissions. As outlined in Section 4.2.7, *Agricultural Resources – Cumulative Impacts*, continued farming on the project site is not economically feasible given the high cost of water and property taxes on the vacant land. Local groundwater, which could be available via several onsite agricultural wells, cannot be used to irrigate crops due to its high nitrate and salinity levels based on irrigation limits established by the Regional Water Quality Control Board and the Eastern Municipal Water District. At present, dry farming with its low planting and maintenance costs is the only economical agricultural activity on the project site, so keeping a large portion of the project site in agriculture to offset greenhouse gas emissions from new warehouses is not feasible given current economic conditions. In addition, Response to Comment F-7A-45 explains why local groundwater cannot be used to irrigate onsite crops.

The developer has indicated the farmers that utilize the WLC property try to market their winter wheat as close as possible to the City to minimize transportation costs, which is one of the main reasons to dry farm compared to raising irrigated crops (i.e., low cost). In addition, the Greenhouse Gas (GHG) analysis for the WLC project assumed no existing emissions from onsite activities to provide a worst case estimate of WLC emissions (i.e., only from new development) and also did not claim any credit for reductions of GHG from onsite absorption from onsite vegetation of local sales of onsite dry farmed crops. Such emissions would be a miniscule portion of the estimated tons of GHG emissions from the WLC project that such minor contributions, positive or negative, would have demonstrable effect on the outcome of the analysis.

Response to Comment G-95-59. The commenter asks for clarification for why over 1,000 acres of area not included in the development plan were evaluated in the Agricultural Resource Assessment. In the Original Agriculture Resources Assessment, the State conservation area was included in the calculations in an attempt to overestimate and not minimize potential impacts to the surrounding area. The agricultural assessment has been revised to exclude the State conservation area and the LESA model calculations were reanalyzed based on this smaller acreage. The smaller acreage caused the results of the LESA model calculations to change the level of significance to less than significant.

Response to Comment G-95-60. The commenter states that the limits of the WLCSP are incorrectly shown in the Agricultural Resource Assessment due to the inclusion an open space area which is only part of the GPA. The area that the commenter refers to is the CDFW Conservation Buffer Area which has been taken out of the Agricultural Resource Assessment (Appendix C-2 of the FEIR Volume 2) and the agricultural analysis of the project site has been revised.

Response to Comment G-95-61. The commenter states that the crop information in regard to citrus growth in the project is incorrect. The project area has supported a wide variety of agriculture, over the years including citrus. The commenter is referred to the Revised Agricultural Resources Assessment page 6-7 in Appendix C-2 of FEIR Volume 2 for additional information and references. According to historical records, and as outlined in Section 4.2.1 of the DEIR, the Moreno Valley has supported a number of agricultural crops over the years, including citrus. In fact, until recently, there were over 50 acres of citrus growing on a nearby property northwest of the WLC property (the ProLogis site just east of the auto center off of Auto Center Drive and the 60 Freeway. However, to be

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

responsive to the comment, the cited text will be changed to say the following... Historically one of the important crops in the region was irrigated citrus fruit.

Response to Comment G-95-62. The commenter requests an evaluation of using onsite well water for crop irrigation. As outlined in Responses to Comments G-95-58 above and F-7A-45, onsite groundwater cannot be used because it is too expensive and does not meet the water quality limits established by Eastern Municipal Water District for crop irrigation.

Response to Comment G-95-63. The comment states that an egg production ranch that used to be on the project site needs to be described in the agricultural assessment. The requested update has been made and the commenter is referred to the Revised Agricultural Resources Assessment page 7 in Appendix C-2 of FEIR Volume 2.

Response to Comment G-95-64. The commenter requests that the rainfall for the proposed project area be verified. As published by the Moreno Valley city website the annual rainfall for Moreno Valley is approximately 9.9 inches. The commenter is referred to the Revised Agricultural Resources Assessment page 8 in Appendix C-2 of FEIR Volume 2 for references.

Response to Comment G-95-65. The commenter wants a term changed to “man-made ponds and lakes” on page 14 of the agricultural report prepared by Parsons Brinckerhoff (revised December 2013). However, the commenter did not state what term should change and it is not clear to what term he was referring. It should be noted the PB agricultural report was revised based on a number of comments and changes in the WLC project. The commenter is encouraged to read the revised version of that document.

Response to Comment G-95-66. The commenter points out an inconsistency between the site elevations given in the DEIR and the Agricultural Resources Assessment. In response to this comment, the elevation in the Revised Agricultural Resources Assessment has been updated to reflect the correct project site elevations. The commenter is referred to the Revised Agricultural Resources Assessment page 8 in Appendix C-2 of FEIR Volume 2 for changes.

Response to Comment G-95-67. The commenter states that the Lake Perris Recreation area comprises less than the 50% of the Zone of Influence Area. The agricultural assessment has been revised based on revisions to the WLCSP and this comment. The revised assessment lists the recreation area as comprising less than 25% of the revised Zone of Influence.

The commenter also states that a six sided geometric shape should be used instead of a rectangle when determining the Zone of Influence. According to the *California Agricultural Land Evaluation and Site Assessment Model*, a rectangle with a 0.25 mile buffer from the project boundary is the prescribed shape that must be used when determining the Zone of Influence for a project area.

Response to Comment G-95-68. The commenter states that Section 3.4 of the Agricultural Resources Assessment is incorrect and needs to be reassessed. The agricultural assessment has been revised based on revisions to the WLCSP and this comment. The revised Agricultural Resources Assessment concludes that there is not a significant impact on farmland of local importance. The commenter is referred to the Revised Agricultural Resources Assessment page iv and 25 in Appendix C-2 of FEIR Volume 2 to see specific changes.

Response to Comment G-95-69. As shown on the Federal Emergency Management Agency Flood Insurance Rate (FIRM) Maps 06065C0760G, 06065C0770G, and 06065C0790G; none of the surrounding residential areas fall in the Zone A, 100-year flood plain. This does not mean that localized flooding does not occur. Existing conditions for the project are documented in the Master Plan of Drainage, Appendix J of the DEIR. In the existing condition, localized flooding does occur at Gilman Springs Road and the southwest corner of the property near Merwin Avenue. Watershed Area

**Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project**

“A”, shown in Figure 3, drains to this area. In a significant storm, runoff from Watershed Area “A” will sheet flow across the agricultural land to the southwest corner of the project at Alessandro Boulevard and Merwin Street. In the existing condition, flows leave the project boundary via a culvert under Alessandro Boulevard which outlets to an existing ditch. The capacity of the existing ditch south of Alessandro Blvd was evaluated and does not have the capacity to convey the 100-year storm in the existing conditions. In the proposed condition, flows leaving the project’s boundary will be mitigated to less than the existing flow with the construction of Detention Basin A1 shown on Figure 1, Proposed Storm Drains and Basins. Also, the ultimate Moreno Master Drainage Plan open channel facility from the Basin to Redlands Avenue will be constructed. These facilities will be designed to convey the 100-year storm and will reduce the risk of flooding.

Response to Comment G-95-70. The commenter recommended changes to the text on page 4.9-25 of the DEIR. This change has been made in the revised DEIR.

Response to Comment G-95-71. The commenter questions an inconsistency in housing figures on pages 4.13-2 and 4.13-3 in the DEIR. These figures has been made consistent in the revised DEIR.

Response to Comment G-95-72. The commenter points out various inconsistencies in employment and fiscal benefit figures in several places in the DEIR. These inconsistencies has been resolved in the revised DEIR.

Response to Comment G-95-73. The 24,642 employees noted in the DEIR is not a “worst-case” estimate, and is not cited as such in the document. The projection is simply an estimate based on the successful construction of 40.6 million square feet of logistics facilities and the expected number of direct, indirect and induced jobs anticipated from this square footage. Regarding infrastructure needs, while the number of roads and sewer and water facilities required by the project may be relatively static and not be impacted by relatively small changes in the number of jobs actually created within the WLC (and in fact will be entirely funded by the project), the magnitude of many public services and maintenance costs will be a direct function of the number of employees generated by the project. For example, the number of calls for fire and police protection services, the need for road maintenance and the garbage and sanitation service requirements of the project will all correlate to some extent with the number of employees who are generated. The implication that the generation of “only” 20,000 or 22,000 jobs will mean that the project is no longer beneficial to the City is incorrect. In reality, the benefits associated with significantly increased employment opportunities in a City that is as “job-poor” as Moreno Valley are significant, and outweigh minor increases in public costs per new job, should such increases even exist.

Response to Comment G-95-74. According to the 2010 U.S. Census, of the 56,429 employed persons residing in Moreno Valley in 2010, 17.6% were employed in production, transportation and material moving occupations, 14.9% were employed in service occupations and 11.3% worked in construction, extraction and maintenance occupations. Many of these 24,609 employed residents will find suitable employment in WLC, especially those residents that currently commute to Los Angeles or Orange Counties, or other parts of the Inland Empire, for work.

OCCUPATION	No. of Residents By Occupation	Pct. of Residents By Occupation
Management, professional, and related occupations	14,206	25.2%
Service occupations	8,408	14.9%
Sales and office occupations	17,328	30.7%
Farming, fishing, and forestry occupations	205	0.4%
Construction, extraction, and maintenance occupations	6,377	11.3%
Production, transportation, and material moving occupations	9,905	17.6%
Total	56,429	100.0%

**Source: Census Bureau. See Exhibit Q.*

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

In addition, there will be a significant number of sales and office workers employed in the WLC, as well as management staff, engineers and computer professionals, many of whom also currently reside in Moreno Valley. There is therefore considerable opportunity for current residents of Moreno Valley to find work in WLC.

Furthermore, the concept of workers from outside of Moreno Valley being attracted to jobs in WLC is not a valid argument against the construction of the project. First, many of these employees might seriously consider moving closer to work, thereby enhancing property values within the City and drawing in more businesses and services jobs to meet the needs of these new residents. In addition, it is to the benefit of the entire Inland Empire to provide more jobs in locations within its borders, as employees driving to Moreno Valley from Riverside, Perris and other local communities will no longer be clogging the roads to LA and Orange County, and will have more family time and an overall improved quality of life. Please refer to Response to Comment G-51 for a more detailed response to this item.

Response to Comment G-95-75. Note: The commenter refers to an example analysis in the response, but neglected to attach the document.

The intent of the fiscal impact analysis is to analyze the “fiscal balance” at build-out of the WLC, in terms of how the project will affect the City General Fund. Notably, the study does not address any cost of living increases or inflation as these projections would be speculative at best and hard to predict over a 20-year span. Similarly, on the revenue side, the concept of increasing real estate taxes from property appreciation, increasing sales taxes due to price inflation, increasing user charges, etc. are also not accounted for. Again, it would be speculative to assign rates of increase in potential revenue streams over a 20-year span, so as is the case for most fiscal impact analyses, the DEIR uses costs and revenues based on constant (2013) dollars. Fiscal issues aren’t CEQA issues, CEQA Guidelines Section 15131, but the City Council will consider all comments before deciding whether to approve the project.

Response to Comment G-95-76. The DEIR relied upon governmental sources (i.e. Bureau of Labor Statistics, Employment Development Department and the Census Bureau) for the applicable wage data within the logistics sector. Importantly, these numbers have been compiled from these data sources based on County and Metropolitan Statistical Area data pertinent to the WLC. Specifically, the analysis utilized a monthly wage for full-time equivalent employees working within the logistics industry taken from the U.S. Census Bureau and annualized that number. It would follow that even if employees are temporary, their monthly salary would be equivalent to that of a permanent worker, and as the Census figure represents full-time equivalent employees, a worker only employed for a portion of a month would only be counted within the Census data for the portion of the month that they were actually employed.

Response to Comment G-95-77. The economic impact report portion of the DEIR addresses the full-time equivalent job number of 16,395 one-time construction workers by acknowledging that since the actual construction will occur over a 10-year period, this figure is equivalent to approximately 1,700 jobs per year. The report also makes the assumption that half of the total indirect and induced jobs generated in the County will be realized within the City. In general, the impact realized within the City is determined using Impact Analysis for Planning (IMPLAN) zip code data that analyzes the economic activity allocated to each of the zip codes within the County.

Response to Comment G-95-78. The commenter states the revenue figure shown on page 4.13-14 of the DEIR is not consistent with the project economic report. The economic report has been revised based on changes to the Specific Plan, and this inconsistency will be corrected in the revised Draft EIR (Final EIR Volume 2).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-95-79. The commenter says the “loss” of the Moreno Highlands Specific Plan (MHSP) would also result in a loss of jobs from that land plan. It must be remembered CEQA does not allow a “plan to plan” comparison for the purposes of determining significance, but can only be used for comparison to show what could happen if existing conditions continue, as was done under the No Project – Existing General Plan Alternative examined in Section 6.3.5 of the DEIR. The estimate of jobs for the WLC project should not be “masked” by the paper comparison of jobs that might have been introduced if that land plan was developed instead of the proposed WLC project. However, it is at least interesting to note that the MHSP would indeed have introduced some small amount of new employment into this area, but on the order of approximately 24,000 jobs with a mixture of office and retail workers, based on the current land plan (DEIR Table 3.A and Figures 3-4 and 4.10-2).

The commenter is correct and the Section 6.3.2 of the revised Draft EIR (Final EIR Volume 2) has been revised to remove the land uses proposed for the subsequently approved CDFW Conservation Buffer Area land. That analysis shows reduced development-related impacts (e.g., traffic, air quality still does not meet the project objectives to nearly the same degree as the proposed WLC project because it is still largely residential and does not introduce a large amount of employment-generating uses.

Response to Comment G-95-80. The commenter says the job figures on page 5-5 are not consistent with the project economic study. This inconsistency has been corrected in the revised Draft EIR (Final EIR Volume 2).

Response to Comment G-95-81. The commenter says there are additional job and revenue figures on page 5-5 that are not consistent with the project economic studies. These inconsistencies have been corrected in the revised Draft EIR (Final EIR Volume 2).

Response to Comment G-95-82. Home values are often affected by a myriad of circumstances that are hard to predict, however, the construction of the project is expected to attract additional non-residential development that will provide services to the WLC, which in turn will draw more business to the City. While there is a possibility that the proximity of a warehouse and potential truck traffic could negatively affect the price of a home, it is also likely that the addition of employees wanting to live near their place of work will increase demand to residential communities, thereby driving up residential property values in other portions of the City, albeit not directly adjacent to the WLC. Finally, the WLC itself will improve the City's tax base as described above. CEQA is concerned with physical impact of urban blight and not mere decreases in value.

Response to Comment G-95-83. The commenter asked of the No Project – Existing General Plan alternative took into account the loss of 1000 acres for the land purchased by the state as conservation land. No project would mean no change. There is no “loss” of 1,000 acres.

The commenter is correct and the Section 6.3.2 of the revised Draft EIR (Final EIR Volume 2) will be revised to remove the land uses proposed for the subsequently approved CDFW Conservation Buffer Area. That analysis shows reduced development-related impacts (e.g., traffic, air quality still does not meet the project objectives to nearly the same degree as the proposed WLC project because it is still largely residential and does not introduce a large amount of employment-generating uses.

Letter G-96: Margie Breikreuz (April 8, 2013)

TO: Mark Gross
 City Planner

FROM: Margie Breitkreuz

DATE: April 8, 2013

RE: Response to DEIR – WLC Warehouse Project

This letter is written in response to the World Logistic Center warehouse project’s draft EIR. I appreciate the opportunity to provide my concerns with the project.

Air Quality

How will issues of air quality and diesel soot be addressed when Southern California, specifically the Inland Empire, already has the worst air quality in the nation? Adding 41.6 million square feet of warehouse space and associated diesel truck pollution will only exacerbate our current poor air quality.

The Clean Air Task Force website based on the 92555 area code states: “The *lifetime* cancer risk from *diesel soot* in our community exceeds the risk of all other air toxics tracked by EPA combined.

- The average lifetime diesel soot cancer risk for a resident of Riverside County is 1 in 3,917.
- This risk is 255 times greater than EPA's acceptable cancer level of 1 in a million.”

Pollution levels will greatly intensify with the WLC as our surrounding mountains act as a natural barrier and currently trap pollution blown in from Los Angeles County.

NRDC investigators found in a majority of cases the greatest concentration of diesel vehicles – at bus stops, distribution centers, and industrial facilities – were typically located in low-income communities. This pattern is consistent with numerous studies showing that a higher percentage of environmental hazards are concentrated in such areas.

The DEIR does not sufficiently address the airborne cancer risks of the number of diesel trucks servicing the WLC warehouse project.

Economic Impact

How will the financial burdens of the WLC are addressed in the following areas:

- The lack of mixed-use, diversified businesses; (many warehouses throughout the Inland Empire remain unoccupied).

- The impact of heavy truck traffic to our infrastructure.
- Low square footage to employment levels.
- The cost of monitoring unlawful truck parking, traffic patterns, and idling as currently exhibited in Mira Loma.
- The consensus that logistics/warehouses provide a relatively poor return on public investment and generally do not represent the highest and best use to which real-estate should be devoted. (O’Connell)
- The cost to the community for medical coverage for seasonal and part-time employees.
- The low tax base.

↑
— 2

Traffic Issues

The DEIR does not address the traffic issues such as:

- The lack of access to rail, airport and freeway accommodations increasing the driving time for diesel trucks.
- The impact of 24-hour/seven day a week businesses to traffic patterns and freeway capacity.
- Inadequate lanes on the 60 freeway to handle increased truck traffic.
- Increased commuter time due to inadequate freeway ingress/egress. Current improvements only address current needs. How will current freeway exits handle the increased truck traffic?
- The cost of monitoring unlawful truck parking, traffic patterns, and idling as currently exhibited in Mira Loma.

— 3

Livable Communities

How will the DEIR for the WLC address livable community resources?

- Reduced quality of life issues impacting home sales in Moreno Valley.
- The need to build sound walls to protect current neighborhoods from noise levels destroying city views.
- Reduced home values caused by clustered, mega-scale warehouse complexes.
- The impact to homes surrounded and bordered by the WLC.
- The impact 24-hour truck traffic will have on resident commute time impacting their participation in school and community events, parental supervision of children, cost of extended day care, etc.
- The impact of truck traffic noise and lights.
- The lack of job opportunities that provide adequate salaries, job security, and promotion opportunities.
- Few if any jobs for local residents.

— 4

Nature

How will the WLC protect Moreno Valley residents and the resources of the San Jacinto Wildlife Area from diesel and noise pollution?

— 5

RESPONSES TO LETTER G-96

Margie Breikreuz

Response to Comment G-96-1. The commenter indicates that the Draft Environmental Impact Report (DEIR) does not sufficiently address cancer risks of the number of diesel trucks servicing the World Logistics Center (WLC) project.

The health risk assessment contained in both the DEIR and the revised analysis provided detailed estimates of the project's diesel truck emissions and their resulting health risk and non-cancer hazards to nearly 5,000 individual receptor locations. The diesel emissions were estimated for on-road diesel vehicles that would travel on nearly 500 individual roadway segments from Palm Springs to the ports of Los Angeles and Long Beach, as well as support equipment that would operate on the project site, including emergency standby diesel generators, yard hostlers, and forklifts. The resulting cancer risks and non-cancer hazards were fully discussed therein.

Response to Comment G-96-2. (bullet points 1-7),

1. Please reference the Response to Comment G-95-24.
2. Please reference the Response to Comment G-57-1.
3. Please reference the Response to Comment G-53-2.
4. The City will enforce existing traffic laws to assure compliance by WLC traffic with these laws. The Traffic Impact Analysis prepared as part of the DEIR discusses these issues in further detail in Section 12C. Costs are covered because of net benefit to City revenues.
5. The highest and best use for property is determined based on the economic demand for a particular land use for a site in a given location. Based on the current demand for logistics facilities versus other uses in this portion of Moreno Valley, Applicant has determined that logistics is the highest and best use for its property.
6. Please reference the Responses to Comments for F-9A-40, F-9A-41, and F-11-21.
7. Per the Final Environmental Impact Report (FEIR), the assessed value (once the WLC is built-out) is expected to be approximately \$3.7 Billion, which will increase the City's tax base significantly. Please reference Response to Comment G-95-82.

Response to Comment G-96-3. The commenter requests that the Traffic Impact Assessment (TIA) analyze rail access, inadequate lanes on SR 60, and adequacy of the current freeway exits to handle increased truck traffic. Also the cost of monitoring unlawful truck parking, traffic patterns, and idling as currently exhibited in Mira Loma.

An additional section (Chapter 4, Section F) has been included in the TIA that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, and capacity constraints within the rail system.

The adequacy of SR-60 to handle the WLC traffic was fully analyzed in the TIA and needed mitigation measures were identified. As discussed in Chapter 4, Section B of the TIA the current freeway exits at Theodore Street are inadequate for the forecast WLC traffic volumes. Improvements to the Theodore Street Interchange are currently being studied by the City and Caltrans. The WLC developers will be required to pay their fair share of these improvements, as they paid for the earlier

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

improvements done in conjunction with the Skechers warehouse. See MM Trans-5, Chapter 11, Section G.

The cost of enforcing traffic local laws is covered by taxes. The WLC will be one of the largest taxpayers in Moreno Valley. The adequacy of the taxes paid by the WLC to cover the costs incurred by the City, including police costs, is discussed in the financial analysis.

Response to Comment G-96-4. The commenter expressed a variety of concerns regarding the project, as outlined below:

(1) reduced quality of life and home sales – the term quality of life is somewhat vague but the potential environmental impacts of the WLC project on both the natural and man-made environment were evaluated in the Draft EIR Sections 4.1 through 4.16, some of which the commenter would probably agree constitute quality of life (traffic, noise, views, etc.). The DEIR determined there would be significant impacts related to views, agriculture, air quality, climate change, land use, noise and traffic. California Environmental Quality Act (CEQA) does not require an analysis of economic impacts such as home prices or sales. However, to date there has been no empirical evidence or case studies presented that would demonstrate the WLC would result in fewer homes sales or lower property values in the City.

(2) Sound walls and loss of views – Section 4.12 of the DEIR does recommend a variety of sound walls to help reduce noise impacts along a number of City streets as a result of WLC passenger vehicle traffic contributing to increased noise levels in the future. It is likely that installation of some of these sound walls will reduce views from the affected residential lots, however, installation of the sound wall would be at the discretion of the affected property owner, and the City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project.

(3) decreased home prices – see response #1 above.

(4) 24-hour traffic affecting community activity – the revised traffic impact assessment (TIA) for the project indicated truck traffic from the WLC project would not have significant impacts on local schools, and there is no way to quantify or correlate project-related traffic to any changes in community activity participation, nor is there any reason to believe traffic in general affects decisions by parents or persons to participate in any activity outside of their residences.

(5) Trucks generating more noise and light – Section 4.12 of the DEIR examines potential noise impacts of the WLC project on local roadways, but it must be remembered that local traffic will be mainly passenger vehicles going to and from the project site because trucks will be limited to established truck routes and most project truck traffic will utilize Theodore, SR-60, and Gilman Springs Road. General lighting impacts of project development were evaluated in DEIR Section 4.1.6.5, however, lighting from vehicles traveling on roadways is not considered a significant impact. Onsite truck lighting is not considered significant due to the planned berms, landscaping, fencing, and other visual screening required of the project (see revised MM 4.1.6.2B related to project screening).

(6) lack of new jobs – the economic report (DTA 2014) indicates the WLC could generate over 20,000 new jobs in the community at a variety of income levels with both part-time and full-time conditions.

(7) few local jobs – As outlined in the Responses to Comments G-33-9 and G-74-5, a Local Hiring Program will provide City residents with information on construction or warehousing jobs within the World Logistics Center Specific Plan (WLCSP) before the information is advertised regionally.

Response to Comment G-96-5. The commenter asked how the WLC project would protect Moreno Valley residents and resources of the San Jacinto Wildlife Area from diesel and noise pollution.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The project will implement a number of project design features and mitigation measures to minimize its impacts to residents and the resources of the San Jacinto Wildlife Area. These measures and features include allowing only the cleanest diesel trucks to access the project, as well as several other measures discussed in Response to Comment Letter E-3-8. Other features include prohibition of truck travel along several roadways that are run through populated areas, such as Redlands Boulevard south of Eucalyptus Avenue and Cactus Avenue, minimum building setback of 250 feet from residentially occupied or zoned property, and special edge treatments along the Redlands/Bay/Merwin edge in the west and southwest portions of the project and along the San Jacinto Wildlife edge to the south that would prohibit buildings, truck courts, loading areas, truck circulation areas, or truck or trailer storage areas in these area (see the World Logistics Specific Plan for additional details).

Letter G-97: Otana Jakpor (April 8, 2013)

Mr. John Terell
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92553

Otana Jakpor
16941 Mockingbird Canyon Rd.
Riverside, CA 92504
April 8, 2013

Dear Mr. Terell:

I have long been concerned about air pollution, as I have grown up in Riverside and have seen firsthand how air pollution has affected people I care about. I am a volunteer for the American Lung Association and a student at the University of Southern California double-majoring in Global Health and Biology. I have previously interned with the USC-UCLA Southern California Environmental Health Sciences Center studying the goods movement industry and its impact on health. I received a Clean Air Award from the South Coast Air Quality Management District and was given the President’s Environmental Youth Award for EPA Region 9 by President Bush in 2008 for my research and public policy advocacy concerning air pollution.

As we look at goods movement, it is readily apparent that the key to minimizing the health impacts of goods movement is strategic placement of intermodal facilities and the use of greener technologies. The proposed location of the World Logistics Center, with no access to railroad for the possibility of “clean trains,” means a massive increase in diesel truck traffic. Please explain why such a massive warehouse complex with an associated massive increase in truck traffic would be situated in an area that is already in non-attainment according to federal and state air standards. The American Lung Association has given this region an “F” grade for air quality, and there could hardly be a worse area in the United States for situating a massive warehouse complex, as we already have some of the worst air quality in the country. I am glad that the World Logistics Center plans to use LED lights and become LEED certified, but I fail to understand how that will mitigate the effects of a massive increase in diesel truck traffic and its resulting pollution.

1

In my own research studies, I found several people to have asthma that had not been previously diagnosed. Even if people fail to recognize the impact of air pollution on their health, it does not mean that the poor air quality is not having an impact. In fact, we just need to look at published scientific studies to see that air pollution is having a huge impact on the health and economy of our region.

I believe that the draft environmental impact report failed to sufficiently evaluate the impact of the resultant increase in air pollutants upon pulmonary health. There was much focus on cancer risk, but insufficient focus on asthma, COPD, and the pulmonary development of children. The draft environmental impact report failed to even reference the landmark USC Children’s Health Study that found a stunted rate of lung function growth, particularly in Mira Loma—a nearby example of a “warehouse city.” The report also failed to calculate the economic costs from rising health impacts of increased air pollution. There has not been a true cost-benefit analysis of this project. The increased health costs would off-set some of the economic benefits of new jobs in Moreno Valley.

2

The draft environmental impact report also failed to address the impact of the increase in air pollutants on cardiovascular health. Particulate air pollution is associated with heart attacks and strokes. Please calculate this impact and the resulting economic cost of this impact. Such a large project as this could have a negative effect on life-expectancy in Moreno Valley.

3

I am strongly opposed to the building of the World Logistics Center which has a number of “significant and unavoidable impacts” on air pollution in this region, and therefore on the health and economy of this region.

Sincerely,

Otana Jakpor

RESPONSES TO LETTER G-97

Otana Jakpor

Response to Comment G-97-1. The entire South Coast Air Basin (SCAB) is in nonattainment. Air quality in the region has significantly improved in the past two decades, as discussed in the Draft Environmental Impact Report (DEIR) (Figure 4.3.1: Percent of Days Basin Exceeds Federal Ambient Air Quality Standards (AAQS); Figure 4.3.2: Exceedances of 1-Hour and 8-Hour Federal Standards; Figure 4.3.3: Number of Days per Month Federal Ozone Standard Exceeded, 1976–2000; Figure 4.3.4: NO_x, VOC, and Ozone Trends in the South Coast Air Basin; and Figure 4.3.5: Particulate Matter Trends in the South Coast Air Basin).

Further, a review of PM_{2.5} air quality trends in the Inland Empire including air monitoring data at Mira Loma, Fontana, San Bernardino, and Riverside Rubidoux have shown marked downward trends in the Inland Empire since 2001. PM_{2.5} is often used as a surrogate for airborne particulate matter such as diesel PM. These trends are evident despite the urban and logistics warehouse development during this time period. These trends are shown in Exhibit 2, Particulate Matter Trends and Emissions Forecast, contained in the revised analysis and shown in Master Responses in Letter C-3.

Section 4.F of the Traffic Impact Assessment (TIA) (FEIR Volume 2 Appendix L-1) analyzes the use of rail for the project. It is infeasible to ship cargo from the port to the WLC as it will actually have worse environmental impacts to the surrounding area, requires high fixed costs for handling rail cargo, and is physically impractical based on the topography of the area.

There is significant demand in Southern California for high-cube warehousing. In fact, the SCAG Warehouse forecast titled "Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities" estimates that the demand for warehousing in Southern California will exceed available land and that by 2035 there will be a shortfall of 228 million square feet in available warehouse facilities. If the project were not constructed at the proposed site, warehouses would likely be constructed elsewhere in the air basin. The policies of the region do not seek to attain compliance with ambient air quality standards through prohibiting growth. In fact, regional planning documents like the South Coast Air Quality Management Plans seek through the application of advanced emission control technology, which this project is implementing through measures such as requiring 2010-compliant trucks. All of the air quality improvements in the South Coast Air Basin over the 50 years have been achieved through the use of cleaner technologies, not prohibitions on development.

(http://www.valleyconnect.com/~valleyco/images/stories/Library/reports/SCAG_IndustrialSpaceInSouthernCalifornia.pdf)

The commenter wonders why there is no rail access for the project. An additional section (Chapter 4, Section F) has been included in the TIA that analyzes the potential for serving project trips by rail (FEIR Volume 2 Appendix L-1). The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, and capacity constraints within the rail system.

The commenter also wonders why the project is situated in a nonattainment area. The entire South Coast Air Basin is in nonattainment. If the project were not constructed in the proposed site, warehouses would likely be constructed elsewhere in the air basin. The policies of the region do not seek to attain compliance with ambient air quality standards through prohibiting growth. In fact, regional planning documents like the South Coast Air Quality Management Plans seek to reduce air emissions through the application of advanced emission control technology, which this project is implementing through measures such as requiring 2010-compliant trucks. All of the air quality

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

improvements in the South Coast Air Basin over the 50 years have been achieved through the use of cleaner technologies, not prohibitions on development.

Response to Comment G-97-2. The commenter indicated that the DEIR failed to sufficiently evaluate the impacts of the resultant increase in air pollutants on pulmonary (lung) health.

The health risk assessment contained in the DEIR addressed health impacts associated with both cancer risk and chronic (long-term exposures) non-cancer hazards. The chronic non-cancer hazards include reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system, birth defects, or other adverse environmental effects. Each toxic chemical has a unique chronic toxicological profile. Chemicals may affect the body through different mechanisms and target organs, and cause different chronic health effects. The assessment of chronic non-cancer hazards due to the project were estimated using the methodology recommended by the South Coast Air Quality Management District (SCAQMD). Using this methodology, the maximum chronic non-cancer hazards resulting from the project's emissions of diesel particulate matter (PM) were found to be less than the SCAQMD's significance threshold of 1.0.

Potential acute (short-term exposure) non-cancer hazards was expanded in the revised analysis to examine potential non-cancer hazards associated with both the total organic gas (TOG) emissions from gasoline- and diesel-fueled vehicles. Acute risks are non-cancer adverse health impacts, commonly associated with exposures to high concentrations of toxic air contaminants over short periods of time, as in minutes or hours. Typical symptoms of acute exposure may include headaches; dizziness; nausea; eye, nose, or throat irritation; and/or skin rash. Each toxic chemical has a unique acute toxicological profile. Chemicals may affect the body through different mechanisms and target organs, and cause different acute health effects. To estimate the project's acute non-cancer hazards, detailed estimates were made of the project's TOG emissions for both gasoline and diesel vehicles. The TOG emissions were then broken down into their major chemical components from which an estimate of the acute non-cancer hazards was made at over 2,500 receptor locations surrounding the project. On the basis of this assessment, the maximum acute non-cancer hazard was found to be 0.05, substantially less than the SCAQMD's significance threshold of 1.0.

The discussion of health effects of air pollution contained in the revised analysis has also been expanded to include a summary of the University of Southern California (USC) Children's Health Study, as discussed in Master Response-2: Heath Effects of Diesel Particulate Matter.

Response to Comment G-97-3. The commenter claims the DEIR fails to address the impact of the increase in air pollutants and cardiovascular health.

Both the DEIR and revised assessment contain a comprehensive evaluation of the health impacts from the project. Health effects from diesel pollution, for example, are discussed in Master Response-2: Health Effects of Diesel Particulate Matter (refer to Responses to Comment Letter C-3). Response to Comment G-49-8 discusses methodology and results of an estimation of the additional rate of premature deaths from heart disease, chronic lower respiratory disease, and stroke from the project's diesel PM. The results of this estimation show that there would be no substantial increase in mortality and morbidity as a result of the project.

Letter G-98: Hans and Barbara Wolterbeek (email) (April 17, 2013)

From: hww [<mailto:hww@roadrunner.com>]

Sent: Wednesday, April 17, 2013 10:22 AM

To: Mark Gross

Subject: Request

Dear Mr. Gross:

My wife and I recently had a chance to review the DEIR for the WLC. As a way of introduction, we are both long time residents of Moreno Valley and are now retired. We are both trained physicists and have spent our careers in technical and management areas in various industries. We feel that our background allowed us to make an objective and unbiased review of the document.

The DEIR is a good document, very well organized and written. The traffic analysis was very detailed. We were especially impressed by the fact that the trip generation rate was peer reviewed in Appendix T.

The WLC will have high cube warehouses. Very little data is available for such facilities. They tend to be efficient, require less employees, and may require fewer truck trips per KSF than smaller warehouses. The DEIR makes some very

big conclusions on very small data samples, which are sometimes based on contradictory data, or even erroneous data. For example, the trip generation rate of 1.68 was used in the DEIR (ITE edition 9). However, I agree with the argument in Appendix T that the 2011 NAIOP study makes a good case for the use of the smaller number 0.99 for traffic analysis. The use of the 0.99 number would greatly reduce the estimate of truck trips which would help reduce the estimate for the impact of the WLC on traffic density. However, what number should be used for air quality? It appears to us that no proper engineering estimate can be made at this time, by anyone, for the impact on air quality for high cubes. There is just not enough data available for anyone or any organization to make an evaluation of this parameter.

We also reviewed the fiscal and economic analysis in the DEIR. We were unable to duplicate various important parameters in this section of the document including the number of employees for the WLC and the wage information. A detailed review by us appears to indicate that the presented information is wrong. (In scientific and engineering circles, data that cannot be verified is suspect). In other areas, the wrong source data was used in the analysis. In addition, the document assumes 100% occupancy from day one and gives the impression that the city income will be \$5 million dollars by 2022; when in fact this is very unlikely, even in a positive economic cycle.

The discussion on construction is a self contradictory. For example, the label in Figure 3.19, seem to indicate that 20 MSF of warehouses will be built by 2017, and another 20 MSF will be built by 2022. The document elsewhere states that an average of 1700 FTEs will be employed to accomplish phases 1 and 2. These two data points give the impression that all 40 MSF will be completed by 2022. However, other sections of the document clearly indicate that the buildings will be customized, i.e. need to have a tenant before they will be built. There appears to be no probable and realistic schedule for building completion and building occupancy.

What is actually built, and when, pertains directly to the construction income to the city and fiscal responsibilities that come to the city when those buildings are completed. These statements will cause civic leaders to assume income from the WLC at an earlier date than can be reasonably expected, without having a clear understanding of the timeline for the city's future responsibilities.

No realistic cost/benefit analysis can be prepared by anyone at this time.

I believe that our findings in some of these areas are of definite interest to you before you make any recommendations to the city council on general plan modifications. We are not against the project at this time; but we have specific recommendations for you regarding modifications to planned changes to the General Plan.

We would appreciate the chance to meet with you to discuss some of these findings. I have a couple of suggestions that we feel you may be interested in.

Thank you for considering my request.

Sincerely , Hans and Barbara Wolterbeek

RESPONSES TO LETTER G-98

Hans and Barbara Wolterbeek

Response to Comment G-98-1. See Response to Comment G-90-7. The commenter repeats the statement from Comment Letter G-90 that the trip generation rate in the (Traffic Impact Analysis (TIA) (the Institute of Transportation Engineers (ITE) trip generation rate of 1.68) will probably result in an over-estimation of traffic impact. The comment also repeats his earlier suggestion that there is insufficient data to analyze air quality impacts.

The trip generation rate used in the TIA study for high-cube warehouses (1.68 vehicular trips per thousand square feet per day (VT/KSF/day)) is purposefully conservative to ensure that there would be no under-estimation of the project traffic impacts.

The air quality analysis relied on the results of the TIA using the ITE trip generation rate of 1.68 VT/KSF/day. In providing a conservative estimate of project-related trips, it also provides a conservative basis for the calculation of air quality impacts. Since the majority of air quality impacts, particularly with regard to operation, is the result of mobile sources, therefore it can be assured that air quality impacts have also not been underestimated.

Mitigation Measure Trans-1, described in Chapter 11 of the TIA, includes successive analyses of traffic conditions as the project builds out. This would include new traffic counts and level of service (LOS) analyses to determine whether the increases in the capacity of the road network was kept pace with the growth in traffic.

**RE: World Logistics Center Project Draft
Environmental Impact Report (SCH #2012021045)**

Dear Mr. Gross:

My husband and I object to the City's approval of the World Logistics Center Specific Plan, General Plan, Amendments and Development Argeement because of the environmental and property value issues. There are three schools in our area where the children would be breathing the toxins from the trucks roaring down the streets.

We also have a lot of seniors in our area. We moved to Moreno Valley because it was a nice quiet place to live. It will not remain so if the warehouses that Mr. Benzeevi wants to build are allowed.

We would like to be placed on the mailing list for future notices regarding this project. (lbkilday@msn.com)

*Suzetta & William
Kilday*

RESPONSES TO LETTER G-99

Loretta and William Kilday (April 19, 2013)

Response to Comment G-99-1. None of the comments apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-100: Mary Coil (email) (May 13, 2013)

Subject: In Favor of World Logistic Center Warehouse Proposal

Our family is in favor of the World Logistic Center Warehouse proposal. We live north of the 60 freeway between Moreno Redlands Boulevard and Moreno Beach Drive. There is no difference in our neighborhood with the arrival of the Skechers Warehouse than before it was built. And Skechers Warehouse is very tastefully situated and eye-catching as you drive along the freeway. In considering the alternatives - homes and or retail centers - the pollution and congestion probably outweigh the WLC proposal. The average person does not take into consideration the amount of cars and trips per day factored in to each proposed new house, or the congestion caused by the Walmart and Target Centers.

We were approached a few years ago by a lady who lives in our area and is against the warehousing at the City's 4th of July celebration. She had a declaration petition against the warehouse development which we declined to sign. She said she wanted to see a "Hospitality Lane" type development. This is not the area for that. I discussed the alternatives - housing and retail centers - along with the amount of trips per car per day for these and she said it gave her something to think about. I think the problem may lie in the fact that these people against the WLC do not like the developer for some reason. We are fairly new to Moreno Valley/Rancho

Belago, moving here 8 years ago from Orange County, but we specifically selected Moreno Valley and we love our area and our home. Our grown children have even moved here and live on the next street over from us.

There is a lot to be considered, but overall we are in favor of the World Logistic Center Warehouse proposal.

Mary Coil

RESPONSES TO LETTER G-100

Mary Coil

Response to Comment G- 100-1. The commenter made various comments about how well the Skechers project was done and her neighbor was fighting against the current project. This does not contain any comments on the World Logistics Center (WLC) project or Environmental Impact Report (EIR), and will not be responded to here. The City Council will consider all comments and responses on the project and EIR before taking action on the WLC project.

Subject: World Logistics Center's Draft EIR (SCH#2012021045) and
Planning Cases PA 12-0011, 0012, 0013, 0014 and 0015

I/we, the undersigned, are homeowners in the City of Moreno Valley at the address listed below. We want to make sure that the World Logistics Center has as little impact on our neighborhood as possible. We ask that you incorporate the following mitigation measures:

- Please move all truck traffic off Merwin Street. Relocate Streets D and E as shown on the World Logistics Center Site Plan 500 to 1000 feet east of Merwin Street. Remove all truck traffic from Merwin street. | 1
- Please require all security lights to use cutoff luminaires and be located on buildings no higher than 25 feet off the ground. | 2
- Please require a 100 foot wide greenbelt area between the residential neighborhoods and the World Logistics Center buildings or streets. | 3
- |

Sincerely,

Subject: World Logistic Center DEIR

Dear Mr. Gross,

I would like to make the following comments concerning the DEIR for the World Logistic Center.

Agriculture :

The agriculture land that surrounds the San Jacinto Wildlife Area (SJWA) contributes enormously to the success of the SJWA. The loss of thousands of acres of farmland will have a significant negative effect on the SJWA. The DEIR does not adequately address this issue. The DEIR needs to study the effects of the loss of this agriculture land to the wildlife within and surrounding the SJWA. This existing agriculture land provides food and habitat which is different from that found in the SJWA. What effects will the loss of several thousand acres of Ag land have on the wildlife in this area? In  lity, the DEIR has almost no designated open space within the project. It would be good to have a portion of this agriculture land used as an "open space" Ag buffer between the World Logistic Center and the SJWA. These agriculture open space areas should become conservation easements under the oversight of a local entity with authority to accept conservation easements.

1

Open Space:

It is totally unacceptable to designate land outside of the jurisdiction of the developer as open space. The 1000+ acres of the SJWA should in no way be discussed as open space for this development. The DEIR needs to be revised to discuss adequate open space areas within the development itself.

2

Biology:

There are several large, deep drainage channels located within this project. These areas have, over the years, become habitat for many species of plants and animals. The larger drainage channels should be preserved in their existing condition, and a vegetative buffer of 50 feet or more should be placed on each side of the channel to protect this habitat and prevent erosion. These buffer areas should be fenced and planted with native vegetation to attract wildlife and reduce irrigation requirements. Detention basins should be placed near these channels to capture storm runoff and filter the water before it enters these channels. These channel/buffer areas could help this project meet its open space requirements, and serve as a visual screen to the numerous industrial buildings in the project.

3

Ownership:

How can this developer justify such a large project when a considerable amount of the property within the Specific Plan does not belong to the developer, and is not under his control? The DEIR map shows that close to half of the land within the proposed specific plan is not owned by the developer. Changing the zoning on the land not under the developer's control should not be allowed without the permission of all of those property owners. The DEIR needs to explain how it can justify a project without either owning the property or having an option to buy on all of the property within the Specific plan.

4

Sincerely,

Robert S. Hewitt
42913 Johnston Ave.
Hemet, Ca. 92544

RESPONSES TO LETTER G-103

Robert Hewitt

Response to Comment G-103-1. The commenter is concerned about loss of agricultural land/open space and its impact on the San Jacinto Wildlife Area (SJWA). Section 4.4.6.4 of the Draft Environmental Impact Report (DEIR) determined that impacts to raptors and other avian resources of the SJWA would be potentially significant but that payment of the (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) fee and its eventual acquisition of conservation land in western Riverside County would help offset regional loss of raptor foraging habitat (additional information in DEIR Sections 4.4.1.13 and 4.4.1.17). In addition, a new mitigation measure has been added, in response to many similar comments, to acquire offsite farmland for the loss of unique farmland on the World Logistics Center (WLC) property.

Response to Comment G-103-2. The commenter says the 1,000 acres of SJWA property should not be designated open space under the proposed project. The commenter misunderstands the relationship of the state conservation land south of the WLCSP property. The 1,000 acres south of the World Logistics Center Specific Plan (WLCSP) property was purchased from or out of the Moreno Highlands Specific Plan (MHSP) property. The minutes from the Wildlife Conservation Board action at that time specifically says it will act as a buffer from planned urban development (i.e., at that time the rest of the MHSP)(DEIR Section 4.4.1.16). The existing state conservation land is being rezoned as part of the discretionary actions requested by the WLC project because at present those lands are still zoned for a golf course and various residential uses under the MHSP (refer to Response to Comment F-8-3).

Response to Comment G-103-3. Drainage 9 will be preserved and a 25-foot buffer area along each side of the drainage will be enhanced to promote local wildlife travel (see Section 4.4.6.3A of the DEIR). Portions of Drainage 12 will be realigned and enhanced for flood control purposes (See Section 4.4.6.3 of the DEIR and Section 1.3 in this FEIR Volume 1). An updated wetland delineation report (FCS-MBA 2013) was prepared to address concerns regarding regulatory agency jurisdiction over the drainage features within the WLCSP as outlined in the original DEIR in 2013.

All identifiable and potentially jurisdictional drainages on the site were mapped and included in the revised DEIR and the draft wetland delineation. The applicant shall secure a jurisdictional determination with the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies if needed prior to initiation of construction as discussed in MMs 4.4.6.3A and 4.4.6.3B.

Jurisdictional features will be avoided and unavoidable impacts will be mitigated through the construction of compensatory wetland. Compensatory wetland mitigation will be provided at an appropriate ratio (no less than 1:1 replacement wetland to impacted wetland) to ensure no net loss of wetlands or aquatic resources. Wetland mitigation will be provided concurrent with or prior to impacts and will be provided on-site, if feasible. Significant impacts to jurisdictional drainage features may also be compensated by off-site mitigation or purchase of habitat in an authorized in-lieu fee program, if necessary. For each individual project as it is designed, a Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the USACE/USEPA's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the USACE's Standard Operating Procedure for Determination of Mitigation Ratios as discussed in MM 4.4.6.3A.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-103-4. The commenter points out that the developer does not own all of the property within the WLCSP boundary. Highland Fairview currently owns or controls development rights on 1,754 acres or 67 percent of the total 2,610 acres within the WLCSP. The remainder of the project area property is owned by private individuals or entities such as the San Diego Gas & Electric Company, Southern California Gas Company, Metropolitan Water District, and California Department of Fish and Wildlife. Figure 3.5 in the DEIR depicts the property ownership within the WLC project area (see FEIR Volume 2 Figure 3.5 in Section 3.3.1, Project Description).

State law allows a City to designate areas within their jurisdiction as a Specific Plan if that plan would provide a comprehensive land plan that may be different from but have advantages over the existing zoning on the property. In this case, the existing zoning is the Moreno Highlands Specific Plan which was a mixed residential master planned community. At this time, the economy would not support development of such a large residential project, and over the years the City of Moreno Valley has found it does not have enough land zoned for employment-generating uses (i.e., it is a housing rich but jobs poor area).

Re: World Logistics Center Project

Dear Mr. Gross:

Please note that many of us who live in the Inland Empire object to the city's approval of the World Logistics Center Specific Plan, General Plan Amendments and Development Agreement because: The pollution factor alone makes us cringe along with the stress put on our freeways and streets caused by the multitude of trucks that will be drawn into our area should this project go forward. Shame on you if it does.

1

Sincerely,

Maureen Clemens

Re: World Logistics Center Project Draft Environmental Impact
Report
(SCH # 2012021045)

Dear Mr. Gross:

"I object to the City's approval of the proposed World Logistics Center
Specific Plan, General Plan Amendments, Zone Changes and
Development
Agreement because"

severe traffic complications will be the result, along with increased
risk of Cancer from deadly air pollution.

"I wish to be placed on the mailing list for all future notices regarding
this
project. Please mail all notices to me at the address listed above (via
email)
at runnergreg@yahoo.com

Greg Brown

RESPONSES TO LETTER G-105

Greg Brown

Response to Comment G-105-1. The commenter is concerned about traffic, cancer risks, and wants to be notified of future actions. Sections 4.3 and 4.15 of the Draft Environmental Impact Report (DEIR) addressed air quality and traffic, and determined project impacts were significant even with recommended mitigation. The Final Environmental Impact Report (FEIR) includes revised traffic and air studies, and the revised DEIR (FEIR Volume 2) includes revised analyses for all these topics. The reader is referred to those EIR sections and revised studies for additional information on these topics. Public notice will be given regarding future hearings by the Planning Commission and City Council regarding the World Logistics Center (WLC) project and EIR. The commenter will be notified as part of the City's California Environmental Quality Act (CEQA) process regarding action on this project as well.

Item G-106: Oral Comment – Unknown Source

Excerpt from Viola Hamner's "In the Beginning", a history of life in Moreno Valley (Hamner 2003)

G-106

Moreno Valley, California In The Beginning

"The glittering speculations which promised so much and performed so little brought disappointment to so many"

(Moreno Valley Voice, March 16, 1895)

By

VIOLA F. HAMNER

2003

Chapter 14

ORIGINAL STREET NAMES AND THEIR NAMESAKES

In 1890 the Bear Valley and Alessandro Development Company bought 25,000 acres in what is now Moreno Valley and went to work in a "vigorous, systematic and intelligent manner" to develop it into a "magnificent colony."

Working with a blank canvas, so to speak, the company plotted the undisturbed land into ten-acre parcels, carefully laid out the streets and avenues in a grid pattern and then named them in alphabetical order. They recorded their subdivision map in San Bernardino County on November 3, 1890 (SBC Map Bk. 11 p. 10).

On the original subdivision maps of our valley, two wide boulevards were dedicated—Alessandro and Redlands. Both with a width of 120 feet. Alessandro Boulevard, so named because it was the main thoroughfare from the railroad town of Alessandro to the new city of Moreno.

Redlands Boulevard was given that name as it was the main route between Redlands and the town of Moreno. Grading and clearing of vegetation for the two boulevards was the company's first intrusion into our pristine and peaceful valley.

Historic Alessandro Boulevard, our best known byway, has been extended over the years and now stretches seventeen miles from Gilman Springs Road westerly into the City of Riverside. On November 11, 1988, it was designated a City of Moreno Valley landmark (Resolution CPAB 88-2). It has been, over the years, a San Bernardino County road, a Riverside County road, a California State highway, part of the transcontinental U.S. Route 60, part of the old "Jack Rabbit Trail" and lastly, a city boulevard.

Another city resolution, CPAB 89-3 dated December 7, 1989, gave landmark status to the other historic avenue and street names. This was to protect them from change and thus preserve an important part of Moreno Valley history.

The tract was designed with a half mile between streets and a quarter mile between avenues. Residents and travelers, if they knew the system, could easily figure out how far it was from one point to another by knowing the alphabet. They could then calculate how long it would take to get to a destination if walking, riding a horse, traveling by horse and buggy, or peddling a bicycle.

Avenues north of Alessandro Boulevard were given tree names. Those south of Alessandro were given other botanical names.

The avenues were dedicated as eighty feet in width, running east and west, and a quarter of a mile apart. Alessandro Boulevard was used as the "A" street in the alphabetical listing.

Avenues North of Alessandro

Bay
Cottonwood
*Dracaea
Eucalyptus
Fir

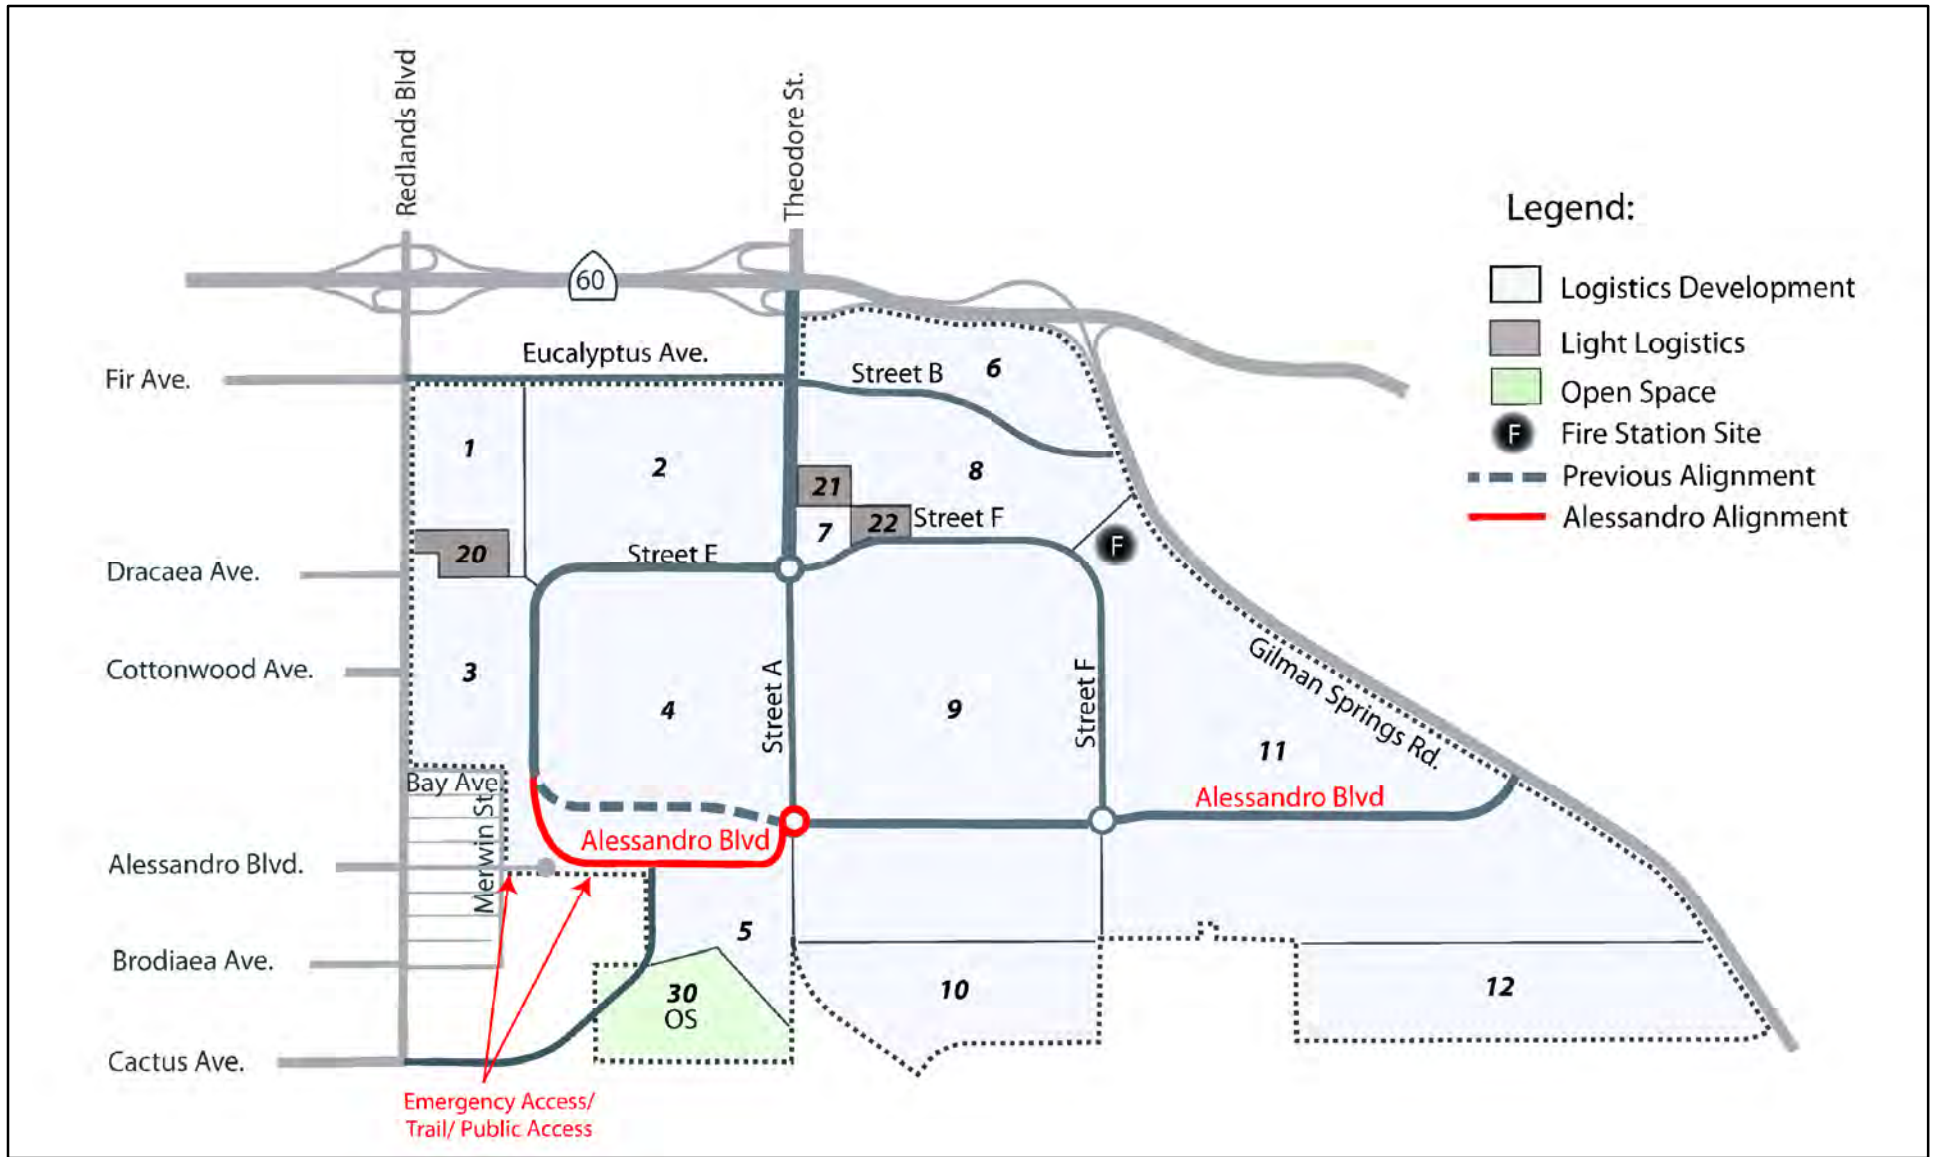

Avenues South of Alessandro

Brodiaea
Cactus
Delphinium
*Eschscholtzia
Filaree

RESPONSES TO ITEM G-106 ORAL INFORMATION

Unknown Source

Response to Information G-106. This information was provided subsequent to the circulation of the DEIR. Although not a written comment submitted on the DEIR, this information appropriately describes how in 1988 the Cultural Preservation Advisory Board (CPAB) of the City of Moreno Valley designated the entire length of Alessandro Boulevard as a City Historical Landmark (Resolution CPAB 88-2). At that time, the CPAB made the alignment, right-of-way, and name of Alessandro part of the historical designation. In response to this information, various portions of Section 4.05, Cultural Resources, in Volume 2 of the Final EIR (the Revised Draft EIR) have been revised. Additional background on the historic characteristics of Alessandro Boulevard has been provided in DEIR Section 4.5.3.1, Phase 1 Research. In addition, language has been added to DEIR Section 4.5.6.2, Historic Resources, describing how the revised project design accommodates the historic nature of Alessandro Boulevard. Based on this information, the alignment of Alessandro Boulevard (formerly referred to as Streets C and E) have been realigned to follow the historical alignment of Alessandro (see Figure G-106, and the east-west portion of this roadway will be called Alessandro Boulevard. It should be noted that a short segment of the historical alignment, just east of Merwin Street, will not be connected to Alessandro west of Merwin Street so that WLC project traffic, including trucks and passenger vehicles, will not travel through the existing residential neighborhoods east of Redlands Boulevard along Alessandro Boulevard. The eastern end of Alessandro Boulevard will also intersect Gilman Springs Road at approximately the same location and orientation as its historical alignment. With these project changes, the WLC project will not have a significant impact on the historical landmark designation of Alessandro Boulevard.

3.0 MITIGATION MONITORING AND REPORTING PROGRAM

3.1 INTRODUCTION

This Mitigation Monitoring and Reporting Program (MMRP) has been prepared for use in implementing mitigation for the:

World Logistics Center

The program has been prepared in compliance with State law and the Environmental Impact Report (EIR) (State Clearinghouse No. 2012021045) prepared for the project by the City of Moreno Valley.

The California Environmental Quality Act (CEQA) requires adoption of a reporting or monitoring program for those measures placed on a project to mitigate or avoid adverse effects on the environment (Public Resource Code Section 21081.6). The law states that the reporting or monitoring program shall be designed to ensure compliance during project implementation.

The monitoring program contains the following elements:

- 1) The mitigation measures are recorded with the action and procedure necessary to ensure compliance. In some instances, one action may be used to verify implementation of several mitigation measures.
- 2) A procedure for compliance and verification has been outlined for each action necessary. This procedure designates who will take action, what action will be taken and when, and to whom and when compliance will be reported.
- 3) The program has been designed to be flexible. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program. As changes are made, new monitoring compliance procedures and records will be developed and incorporated into the program.

This Mitigation Monitoring and Reporting Program includes mitigation identified in the FEIR.

3.2 MITIGATION MONITORING AND RESPONSIBILITIES

As the Lead Agency, the City of Moreno Valley is responsible for ensuring full compliance with the mitigation measures adopted for the proposed project. The City will monitor and report on all mitigation activities. Mitigation measures will be implemented at different stages of development throughout the project area. In this regard, the responsibilities for implementation have been assigned to the Applicant, Contractor, or a combination thereof. If during the course of project implementation, any of the mitigation measures identified herein cannot be successfully implemented, the City shall be immediately informed, and the City will then inform any affected responsible agencies. The City, in conjunction with any affected responsible agencies, will then determine if modification to the project is required and/or whether alternative mitigation is appropriate. The following table presents the MMRP.

implemented to the satisfaction of the City Planning Division and Riverside County Resource Conservation Agency ("RCA").						
<p>4.4.6.3A Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.</p>	City Planning Division and Land Development Division Manager	Once prior to issuance of grading permits	Prior to the issuance of grading permits	Written verification of USACE approval of jurisdictional determination and Clean Water Act Section 404 permit. Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
protected bird nests (non-listed), 250 feet from passerine birds, or 100 feet for sensitive or protected songbird nests. All construction activity within the vicinity of active nests must be conducted in the presence of a qualified biological monitor. Construction activity may encroach into the buffer area at the discretion of the biological monitor in consultation with CDFW. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, mitigation measure 4.4.6.4B shall also apply. This measure shall be implemented to the satisfaction of the City Planning Division.				construction buffer zone of a minimum from an active listed species or raptor nest, 300 feet from other sensitive or protected bird nests (non-listed), or 100 feet for sensitive or protected songbird nests		
4.4.6.4B If it is determined that project-related grading or construction will affect nesting migratory bird species, no grading or heavy equipment activity shall take place within the limits established in Mitigation Measure 4.4.6.4A until it has been determined by a qualified biologist that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. This measure shall be implemented to the satisfaction of the City Planning Division.	City Planning Division	Once Before Construction and onsite inspection	Prior to disturbance of site	On-site inspection		Issuance of a Stop Work Order
4.4.6.4C The loss of foraging habitat for golden eagle and white-tailed kite will be mitigated by payment of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) fee and the creation of a landscaped buffer area adjacent to the San Jacinto Wildlife Area property (SJWA). First, the payment of the Western Riverside County Multiple species Habitat Conservation Plan fee will be required on a project-by-project basis. Second, a 250-foot setback as described in Mitigation Measure	City Planning Division	Once before issuance of grading permits	Prior to disturbance of site	Written verification of payment of MSHCP fees		Withdraw Grading Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
permits for development in Planning Areas 9-12 adjacent to the natural gas compressor plant, the applicant shall prepare a risk assessment report analyzing safety conditions relative to the existing compressor plant and planned development. The report must be based on appropriate industry standards and identify the potential hazards from the compressor plant (e.g., fire, explosion) and determine that the distance from the plant to the closest planned buildings in Planning Areas 9-12 is sufficient to protect the safety of workers from accidents that could occur (see Final EIR Volume 2 Figure 4.1.6B) at the compressor plant. This measure shall be implemented to the satisfaction of the City Building and Safety Division and the Fire Prevention Bureau.	Fire Marshal	issuance of discretionary permits for development within Planning Areas 9-12	issuance of discretionary permits for development within Planning Areas 9-12	approval of a risk assessment		Discretionary Permit
4.8.6.1D Prior to the issuance of any grading permit, the developer shall inform the City of any existing solid waste materials within the development area. In conjunction with grading activities, all solid waste matter within the development area shall be removed by a licensed contractor and disposed of in an approved landfill. A record of the removal and disposal of any waste materials, in compliance with applicable laws and regulations, shall be submitted to the City prior to the issuance of any building permits.	Recycling Coordinator/Public Works	Once before issuance of grading permits	Prior to issuance of grading permits	Applicant will inform the City in writing of any existing solid waste materials within the development area		Withhold Grading Permit
4.9 Hydrology and Water Quality						
4.9.6.1A Prior to issuance of any building permit within the Specific Plan area, the developer shall construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) within each proposed watershed, as outlined in the project hydrology plan, to mitigate	Land Development/Public Works	Prior to Occupancy	Prior to issuance of any development permit	Review and approval of construction documents Field Inspection		Withhold Building Permit

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term “construct” shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow such that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment</p>

transported through the project boundary so that the existing sediment carrying capacity is maintained.						
<p>4.9.6.1B The bioretention areas and detention/infiltration basins shall be designed to assure infiltration rates. The monitoring plan will follow the guidelines presented by the California Storm Water Quality Association (CASQA) in the California Storm Water Best Management Program (BMP) Handbook, Municipal, January 2003 Section 4, Treatment Control Best Management Programs Fact Sheets TC-11 Infiltration Basin and TC-30 Vegetated Swale). For the Bioretention areas, as needed maintenance activities shall be conducted to remove accumulated sediment that may obstruct flow through the swale. Bioretention areas shall be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. The maintenance activities should occur when sediment on channels and culverts builds up to more than 3 inches (CASQA 2003). The swales will need to be cultivated or rototilled if drawdown takes more than 72 hours.</p> <p>For the detention/infiltration basins, a 3-5 year maintenance program shall be implemented mainly to keep infiltration rates close to original values since sediment accumulation could reduce original infiltration rate by 25-50%. Infiltration rates in detention basins will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. If cumulative infiltration rates of all detention basins drops below the minimum required rates, then the detention basins will be reconditioned to improve infiltration capacity by</p>	City Engineer	Once before issuance of grading permits	Prior to issuance of grading permits	Review and approval of a monitoring plan for the detention/infiltration basins		Withhold Grading Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
runoff for later non-potable uses. Site-specific Water Quality Management Plans have not been prepared at this time as no site-specific development project has been submitted to the City for approval. When specific projects within the project are developed, Best Management Practices will be implemented consistent with the goals contained in the Master Water Quality Management Plan. All development within the project will be required to incorporate on-site water quality features to meet or exceed the approved Master Water Quality Management Plan's water quality requirements identified previously.						
4.9.6.3B The Property Owners Association (POA) and all property owners shall be responsible to maintain all onsite water quality basins according to requirements in the guidance Water Quality Management Plan and/or subsequent site-specific Water Quality Management Plans, and established guidelines of the Regional Water Quality Control Board. Failure to properly maintain such basins shall be grounds for suspension or revocation of discretionary operating permits, and/or referral to the Regional Water Quality Control Board for review and possible action. This measure shall be implemented to the satisfaction of the City Land Development Division, in consultation with the City Engineer, and Regional Water Quality Control Board.	City Land Development Division	As Needed	Ongoing	Onsite inspections		Revocation of Discretionary or Operating Permits
4.9.6.3C Prior to issuance of future discretionary permits for any development along the southern boundary of the World Logistics Center Specific Plan (WLCSP), the project developer of such	Land Development Division	Annually	Prior to issuance of discretionary permits for any	Evidence of Annual Water Quality Monitoring Plan fund		Withhold Discretionary Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>sites, in cooperation with the Property Owners Association (POA), shall establish and annually fund a Water Quality Mitigation Monitoring Plan (WQMMP) to confirm that project runoff will not have deleterious effects on the adjacent San Jacinto Wildlife Area (SJWA). This program shall include at least quarterly sampling along the southern boundary of the site (i.e., at the identified outlet structures of the project detention basins) during wet season flows and/or when water is present, as well as sampling of any dry-season flows that are observed entering the San Jacinto Wildlife Area property from the project property, including Drainage 9, which is planned to convey only clean off-site flows from north of the World Logistics Center Specific Plan site across Gilman Springs Road. The program shall also include at least twice yearly sampling after completion of construction, and a pre-construction survey must be completed to determine general water quality baseline conditions prior to and during development of the southern portion of the World Logistics Center Specific Plan. This sampling shall be consistent with and/or comply with the requirements of applicable Storm Water Pollution Prevention Plans (SWPPPs) for the development site.</p> <p>The project developer of sites along the southern border of the World Logistics Center Specific Plan shall be responsible for preventing or eliminating any toxic pollutant (not including sediment) found to exceed applicable established public health standards. In addition, the discharge from the project shall not cause or contribute to an exceedance of Receiving Water Quality Objectives for the potential pollutants</p>			development along the southern boundary of the WLCSP

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
perimeter of the property that faces any residential areas. The 12 foot noise barrier may be a soundwall, berm, or combination of the two. The height shall be measured relative to the pad of the warehouse. This requirement shall be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (Leq) will not be exceeded at the residential zone. This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, "All manufacturing and industrial uses adjacent to residential land uses shall include a buffer zone and/or noise attenuation wall to reduce outside noise levels" (per Noise Study MM N-10, pg.62).						
4.12.6.4A Prior to the issuance of building permits for projects within 1,300 feet of the Southern California Gas Company (SCGC) and San Diego Gas and Electric (SDG&E) blow-down facilities, documentation shall be submitted to the City confirming that sound attenuation devices and/or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events are available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund all sound attenuation improvements to the blow-down facilities required by this measure. It shall also be the responsibility of the developer to coordinate with San Diego Gas and Electric and/or Southern California Gas Company regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the San Diego Gas and Electric compressor station or the Southern California Gas Company pipelines. This measure	City Land Development Division	Once before Permitting	Prior to the issuance of building permits for projects within 1,300 feet of the SCGC and SDG&E facilities	Review and Approval of documentation confirming sound attenuation device		Withhold Building Permits

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
subsequent building, with payments for each due at the time of issuance of the certificate of occupancy. As a result, while each building individually would not produce a significant impact, and therefore would not be required to pay any mitigation fees if considered by itself, the total amount of the payments for all of the buildings would be equal to the fair share payment for the entire World Logistic Center to the extent that the responsible jurisdiction has chosen to adopt a fair share contribution funding program consistent with Mitigation Measure 4.15.7.4F.						
4.15.7.4F The Applicant shall pay a portion of the fair share of the cost of traffic improvements identified in the Transportation Impact Analysis for those significantly impacted road segments and intersections for each warehouse building within the World Logistics Center if the impacted jurisdiction has established a fair share contribution program prior to the approval of a building-specific plot plan. The City shall determine whether a fair share program exists in the impacted jurisdiction and, if one does exist, require that the appropriate fees are paid by the Applicant, consistent with the requirements below, prior to the issuance of a certificate of occupancy for the building in question. If no fair share program exists or if the existing programs are not consistent with the requirements below, then no payment of fees shall be required. The impacts are to be determined on a road segment or intersection basis. Nothing in this condition requires the payment of a traffic impact fee imposed by another jurisdiction which covers improvement to facilities where the project does not have a significant impact. Fair-share	City Engineer	Once prior to issuance of building permits for individual buildings.	Prior to issuance of occupancy permits	Written verification of payment of fair-share fees		Withhold Occupancy Permits

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>4.16.1.6.1B All buildings shall include water-efficient design features outlined in Section 4.0 of the World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development Division/Public Works. These design features shall include, but not be limited to the following:</p> <ul style="list-style-type: none"> • Instantaneous (flash) or solar water heaters; • Automatic on and off water faucets; • Water-efficient appliances; • Low-flow fittings, fixtures and equipment; • Use of high efficiency toilets (1.28 gallons per flush [gpf] or less); • Use of waterless or very low water use urinals (0.0 gpf to 0.25 gpf); • Use of self-closing valves for drinking fountains; • Infrared sensors on drinking fountains, sinks, toilets and urinals; • Low-flow showerheads; • Water-efficient ice machines, dishwashers, clothes washers, and other water-using appliances; • Cooling tower recirculating system where applicable; • Provide information to the public in conspicuous places regarding indoor water conservation; and • Use of reclaimed water for wash down if it 	Land Development Division/Public Works	Once before issuance of Building Permit	Prior to issuance of any building permit	Review and Approval of Building Plans		Withhold Building Permit

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
becomes available.						
4.16.1.6.1C Prior to approval of a precise grading permit for each plot plan, irrigation plans shall be submitted to and approved by the City demonstrating that the development will have separate irrigation lines for recycled water. All irrigation systems shall be designed so that they will function properly with recycled water if it becomes available. This measure shall be implemented to the satisfaction of the City Planning Division and Land Development Division/Public Works.	City Planning Division Land Development Division/Public Works	Prior to the approval of a building permit	Prior recordation of Final Map	Review and Approval of Irrigation Plans		Withhold Grading Permit
4.16.1.6.2A Each Plot Plan application for development shall include a concept grading and drainage plan, with supporting engineering calculations. The plans shall be designed such that the existing sediment carrying capacity of the drainage courses exiting the project area is similar to the existing condition. The runoff leaving the project site shall be comparable to the sheet flow of the existing condition to maintain the sediment carrying capacity and amount of available sediment for transport so that no increased erosion will occur downstream. This measure shall be implemented to the satisfaction of the City Land Development Division/Public Works.	Land Development Division/Public Works	Once Concurrent with Plot Plan review and approval.	Prior to issuance of grading permit.	Review and Approval of Grading and Drainage Plans		Withhold Grading Permit.
4.16.4.6.1A Each application for a building permit shall include energy calculations to demonstrate compliance with the California Energy Efficiency Standards confirming that each new structure meets applicable Building and Energy Efficiency Standards. The plans shall also ensure that buildings are in conformance with the State Energy Conservation Efficiency	City Building and Safety Division and Planning Division	Once prior to issuance of building permit. Once during on-site inspection	Prior to issuance of building permit.	Review of construction documents and on-site inspection		Withhold Building Permit. Or Withhold Occupancy Permit

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>Standards for Nonresidential buildings (Title 24, Part 6, Article 2, California Administrative Code). This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions. Plans shall show the following:</p> <p>Energy-efficient roofing systems, such as “cool” roofs, that reduce roof temperatures significantly during the summer and therefore reduce the energy requirement for air conditioning.</p> <p>Cool pavement materials such as lighter-colored pavement materials, porous materials, or permeable or porous pavement, for all roadways and walkways not within the public right-of-way, to minimize the absorption of solar heat and subsequent transfer of heat to its surrounding environment.</p> <p>Energy-efficient appliances that achieve the 2008 Appliance Energy Efficiency Standards (e.g., EnergyStar Appliances) and use of sunlight-filtering window coatings or double-paned windows.</p>						
<p>4.16.4.6.1B Prior to the issuance of any building permits within the World Logistics Center Specific Plan, each project developer shall submit energy calculations used to demonstrate compliance with the performance approach to the California Energy Efficiency Standards to the Building and Safety and Planning Divisions that shows each new structure meets the applicable Building and Energy Efficiency Standards. Plans may include but are not necessarily limited to implementing the following as appropriate:</p>	City Building and Safety Division and Planning Division	Once prior to issuance of building permit.	Prior to issuance of building permit.	Review of construction documents and on-site inspection		Withhold Building Permit.

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>High-efficiency air-conditioning with electronic management system (computer) control.</p> <p>Variable Air Volume air distribution.</p> <p>Outside air (100 percent) economizer cycle.</p> <p>Staged compressors or variable speed drives to flow varying thermal loads.</p> <p>Isolated High-efficiency air-conditioning zone control by floors/separable activity areas.</p> <p>Specification of premium-efficiency electric motors (i.e., compressor motors, air handling units, and fan-coil units).</p> <p>Use of occupancy sensors in appropriate spaces.</p> <p>Use of compact fluorescent lamps in place of incandescent lamps.</p> <p>Use of cold cathode fluorescent lamps.</p> <p>Use of Energy Star exit lighting or exit signage.</p> <p>Use of T-8 lamps and electronic ballasts where applications of standard fluorescent fixtures are identified.</p> <p>Use of lighting power controllers in association with metal-halide or high-pressure sodium (high intensity discharge) lamps for outdoor lighting and parking lots.</p> <p>Use of skylights (may conflict with installation of solar panels in some instances).</p>

1.0 EXECUTIVE SUMMARY

1.1 INTRODUCTION

The Draft Environmental Impact Report (EIR) (~~State of California Clearinghouse No. 2012021045~~) for the World Logistics Center Project (proposed project) has been prepared to inform the decision-makers and the public of the environmental effects associated with implementation of the proposed project.

The Draft EIR was circulated for public review and comment on February 4, 2013. The comment period on the Draft EIR closed on April 8, 2013, however the City has continued to receive and accept letters and comments through April 2014. The comments and written responses are contained in Volume 1 of this document.

This EIR is a program EIR. A program EIR is an EIR that may be prepared on a series of actions that can be characterized as one large project, and are related either:

- Geographically,
- As logical parts in the chain of contemplated actions,
- In connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program, or
- As individual activities carried out under the same authorizing statutory or regulatory authority, and having generally similar environmental effects which can be mitigated in similar ways.

The use of a program EIR can provide the following advantages. The program EIR can:

- Provide an occasion for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action,
- Ensure consideration of cumulative impacts that might be slighted in a case-by-case analysis,
- Avoid duplicative reconsideration of basic policy considerations,
- Allow the lead agency to consider broad policy alternatives and program wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts.

The project is considered regionally significant according to criteria set forth in CEQA Guidelines Section 15206(b). The EIR was prepared in accordance with the California Environmental Quality Act¹ (CEQA) and Sections 15120 through 15131 and 15161 of the *Guidelines for California Environmental Quality Act*,² which regulate the preparation of EIRs. The DEIR (State of California Clearinghouse No. 2012021045) has been prepared by LSA Associates, Inc. on behalf of the City of Moreno Valley (City) to: 1) identify the proposed project's impacts on the environment; 2) to discuss alternatives to the proposed project; and 3) to propose mitigation measures that will offset, minimize or otherwise avoid significant environmental impacts. ~~This EIR has been prepared in accordance with~~

¹ *California Environmental Quality Act*, as of January 1, 2014, §§21000–21178, 21189.3, Public Resources Code, State of California.

² *Guidelines for California Environmental Quality Act*, as amended of January 1, 2014, §§15000–15387, California Code of Regulations, Title 14, Chapter 3, State of California.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

the California Environmental Quality Act¹ (CEQA) and Sections 15120 through 15131 and 15161 of the *Guidelines for California Environmental Quality Act*,² both of which regulate the preparation of EIRs. Based on the potential impacts of the proposed project, including cumulative impacts, the City determined that an EIR should be prepared to analyze potential impacts of the proposed project with respect to the following environmental issues. The referenced environmental issues below are individually addressed in the *Environmental Analysis* Section 4.0, of this report:

- ~~• Aesthetics;~~
 - ~~• Agricultural and Forest Resources;~~
 - ~~• Air Quality;~~
 - ~~• Biological Resources;~~
 - ~~• Cultural Resources;~~
 - ~~• Geology and Soils;~~
 - ~~• Greenhouse Gas Emissions and Global Climate Change;~~
 - ~~• Hazards and Hazardous Materials;~~
 - ~~• Hydrology and Water Quality;~~
 - ~~• Land Use and Planning;~~
 - ~~• Mineral Resources;~~
 - ~~• Noise;~~
 - ~~• Population, Housing, and Employment;~~
 - ~~• Public Services including Recreation;~~
 - ~~• Traffic and Circulation; and~~
 - ~~• Utilities and Service Systems.~~
- Aesthetics;
 - Agricultural and Forest Resources;
 - Air Quality;
 - Biological Resources;
 - Cultural Resources;
 - Geology and Soils;
 - Greenhouse Gas Emissions and Global Climate Change;
 - Hazards and Hazardous Materials;
 - Hydrology and Water Quality;
 - Land Use and Planning;
 - Mineral Resources;
 - Noise;
 - Population, Housing, and Employment;
 - Public Services including Recreation;
 - Traffic and Circulation; and
 - Utilities and Service Systems.

¹ *California Environmental Quality Act*, as of January 1, 2011, §§21000–21178, Public Resources Code, State of California.

² *Guidelines for California Environmental Quality Act*, as amended January 1, 2008, §§15000–15387, California Code of Regulations, Title 14, Chapter 3, State of California.

1.2 PROJECT LOCATION AND SETTING

1.2.1 Project Site

The World Logistics Center Specific Plan, it does not have a site plan showing actual building locations, so the EIR will be programmatic rather than project-level. In addition, this project is considered regionally significant according to criteria established by the Southern California Association of Governments (SCAG). The proposed project site is located in Rancho Belago, the eastern portion of the City of Moreno Valley, in northwestern Riverside County. As shown in Figure 1.1, the project site is immediately south of State Route 60 (SR-60), east of between Redlands Boulevard west of and Gilman Springs Road (the easterly city limit), extending to the southerly city limit. The major roads that currently provide access to the project site are Redlands Boulevard, Theodore Street, Alessandro Boulevard, and Gilman Springs Road. The project site slopes gently (approximately 2%) from north of the San Jacinto Wildlife Area to south, with elevations ranging from approximately 1,760 feet above mean sea level (amsl) at the northeast corner to 1,480 feet amsl at the southeast corner.

1.2.2 City of Moreno Valley

Moreno Valley is Riverside County's second largest city with a population of nearly 200,000 people encompassing more than 46 square miles. Over the years, Moreno Valley has remained overwhelmingly residential in character with only 9 percent of its land allocated for job-producing uses. Today, Moreno Valley has one of the lowest jobs-to-housing ratios in the region (0.47), representing about one-third of the rate of its neighboring City of Riverside (1.41). As a result of limited job opportunities in the City, a large number of Moreno Valley's residents commute great distances to jobs outside the City, with an average daily commute of 76 minutes. Long commutes result in more time in traffic, more time breathing polluted air, more stress, less time at home, and less time with families.

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Under current municipal financial conditions, residential development does not “pay its way” in that property taxes and other revenues generated by residences do not cover the costs of municipal services for those residences. During times of rapid residential development, the City relied mainly on residential development fees to support its operations. In the early 1990s, when residential development slowed, revenues from development fees declined dramatically. This decline was exacerbated by reduced assessed valuations and property taxes, and Sacramento’s decision to take a greater share of property tax revenues from cities. These factors resulted in the City becoming financially overextended. To provide the funds necessary for the City to continue to meet its obligations, a temporary Utility Users Tax was enacted by the voters in 1991. With no significant improvement to its financial condition, this tax was made permanent in 1996. The City has become dependent on this tax which now represents approximately \$16 million or 20 percent of the City’s budgeted revenue. The City does not currently have a sufficient tax base to fully fund its operations and provide the levels of service expected by its citizens. This has been a recurring challenge in the City for more than 20 years.

According to the U.S. Census Bureau, the per capita income in Moreno Valley is nearly 40 percent below the State of California average. Nearly 20 percent of the population in Moreno Valley is living below the national poverty level. Moreno Valley has one of the highest high-school drop-out rates in the County with over 50 percent having a high school education or less. Only 15 percent of the residents have completed a Bachelor’s Degree or higher. The majority of the population, 77 percent, does not have a college degree. Unemployment in Moreno Valley remains among the highest in the region at 9.7 percent and median house prices are among the lowest in the Inland Empire.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

To address these conditions, in 2010 the City of Moreno Valley developed an Economic Development Strategy focused on creating job opportunities in the City, which are responsive to the education and skill level of its residents. The logistics and healthcare industries were identified as the two primary areas of opportunity. In April 2011, the City held public hearings on its proposed Economic Development Action Plan which was then adopted by the Moreno Valley City Council. The Action Plan focused on five geographic areas within the City and established key initiatives for each. The eastern portion of the city was identified in the Action Plan as being a prime area for logistics development. In April 2012 an application was filed for the development of the World Logistics Center which was developed consistent with the City's Economic Development Action Plan. A Notice of Preparation was filed in February 2012 for The World Logistics Center project. In 2013, the City adopted a 3-year Economic Development Action Plan based upon the adopted 2011 Economic Development Strategy. See DEIR Section 3.6.1 for 2011 and 2013 Economic Development Action Plan Objectives related to the WLC.

According to the Inland Empire Economic Partnership January 2014 Quarterly Economic Report, "Logistics has been the fastest growing sector in the Inland Empire's economic base." The logistics industry offers an opportunity for upper mobility for workers providing access to skill ladders leading to the middle class. With 84 percent of its jobs not requiring a college degree and opportunities of an annual median income level of \$43,583 the logistics industry is the number one contributor to job growth and upward mobility for the area's workers at this education level.

1.3 EXISTING SITE DESCRIPTION

The project area is largely vacant agricultural land, with seven occupied single-family homes and associated ranch/farm buildings in various locations on the property. In the 1920s, several farm buildings and related houses were constructed on the property and, in the 1940s, a stock farm operated on a portion of the site that was later expanded into a commercial horse farm and training facility that operated until the mid-1990s. The overall project site has been farmed by a variety of owners since the early 1900s and has supported dry (non-irrigated) farming, livestock grazing, and limited citrus groves. Much of the site continues to be used for dry farming today.

San Diego Gas & Electric (SDG&E) operates a natural gas compressor plant, known as the Moreno Compressor Station, on 19 acres in the south-central portion of the site. The Southern California Gas Company (SCGC) operates a metering and pipe cleaning station on two separate parcels (totaling 1.5 acres) in the south-central portion of the site south of Alessandro Boulevard along existing Virginia Street. The site contains a variety of overhead and underground utility lines associated with oil, natural gas, and electrical service. At present, the project site contains a number of unimproved drainage features, but it does not contain any improved flood control facilities.

1.4 PROJECT DESCRIPTION

The proposed project is a master planned business park designed to support the logistics operations of large global companies that will be implemented through the adoption of the World Logistics Center Specific Plan. Although it is called a Specific Plan, it is not intended to depict individual building projects, but rather, provide a guide for the development of infrastructure and building projects within the Project area. The Specific Plan will establish the zoning for the project site and include a land use plan, designation of planning areas, design and landscaping guidelines, and development standards for the development. As shown in Figure 3.8 – *Specific Plan Land Use* and reflected in Table 1.A, *Land Use Summary* below, the World Logistics Center Specific Plan will consist of the following land uses:

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- **Logistics Development (LD):** Approximately 2,382.8 acres of the Specific Plan Area are planned for development of logistics-oriented land uses to provide high-cube logistics warehouse uses consisting of buildings of 500,000 square feet or greater. Warehousing and logistics activities consistent with the storage and processing of manufactured goods and materials prior to their distribution to other facilities are permitted within this category along with facilities for the outdoor storage of trucks, trailers and shipping containers. Ancillary office, employee services and property management facilities are permitted in connection with primary uses. A permitted use within the LD category will include “logistics support” to provide fueling facilities and limited service commercial uses in support of the World Logistics Center.
- **Light Logistics (LL):** Approximately 37.1 acres of the project site are planned for development of Light Logistics land uses to provide warehouse uses less than 500,000 square feet in size, including self-storage and vehicle storage uses.
- **Open Space (OS):** Approximately 74.3 acres of the project site are planned for permanent open space to preserve the southwestern portion of the site, which is a portion of Mt. Russell.

1.5 ACTIONS COVERED BY THE EIR

The proposed project covers ~~3,918818~~ 3,844714 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,844714~~ 104 acres of land which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,844714~~ 3,74170 acres, which redesignates approximately 7470 percent of the area (~~2,740610~~ 2,930 acres) for logistics warehousing and the remaining 2930 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use), Circulation, Parks, Recreation, and Open Space, Safety, Conservation, and the General Plan Goals and Objectives

A new Specific Plan will be adopted to govern development of the 2,610-acre World Logistics Center (WLC) ~~for the 2,710 acres that will be governed by the Specific Plan.~~ A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City’s Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering a 1,539-acre site (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

THIS PAGE INTENTIONALLY LEFT BLANK

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.

1.31.6 SUMMARY OF ENVIRONMENTAL ISSUES

The following presents a short summary of the analysis conducted as part of this environmental assessment. It is intended to give the reader an easy to read summary of the analytical approach and results. It is not intended to be a comprehensive listing of project impacts or mitigation measures. For complete accounting of any analysis, please refer to the appropriate section of Chapter 4 of this EIR.

The EIR also includes an analysis of alternatives to the proposed project and found that no other reasonable alternative could feasibly achieve the basic objectives of the project. A detailed comparison of Alternatives and a comparison of the Environmentally Superior Alternative to the Project Objectives can be found in Tables 1.C and 1.D later in this section.

1.6.1 Aesthetics

The EIR evaluated potential impacts to Aesthetics (Section 4.1). Potential impacts to Scenic Vistas, Scenic Resources and Scenic Highways, Existing Visual Character and Surroundings, and Cumulative Aesthetics Impacts were analyzed and found that the proposed project has the potential to result in substantial adverse effects in these areas even after all feasible mitigation is applied. Conversely, it was found that the project's impact to light and glare could be mitigated to a level of less than significant. Mitigation Measures to address aesthetics impacts include a 250-foot setback from residential property lines, landscaping, berms and or fencing to screen views of the project from existing residents, the dedication of 74.3 acres of open space, restriction on building heights to preserve views of Mt. Russell from SR-60, and restrictions on lighting and solar panels to protect existing resident from excess light and glare. Mitigation measures for each of these areas are listed in Table 1.B.

The Specific Plan contains extensive design guidelines to ensure a uniform architectural theme throughout the project. Similarly, landscape design standards are established project-wide. A process for the discretionary review of each proposed building is included in the Specific Plan which requires staff to evaluate all aesthetic aspects of each proposed building prior to its approval by the City. The Plot Plan review process is described in Section 11.3.2 of the Specific Plan. A related process regarding Administrative Variances is contained in Section 11.3.3.1 of the Specific Plan. These reviews are subject to public review and comment including provisions for appeals to the Planning Commission and City Council. The Specific Plan also provides for the preparation and approval of Concept Plans for the western, southern and eastern edges of the project to ensure that those edges are designed to be compatible with adjacent residential and open space uses.

1.6.2 Agriculture and Forestry Resources

The EIR evaluated potential impacts to Agricultural and Forestry Resources (Section 4.2) and found that impact to forest land zoning, loss or conversion of forest land, and existing zoning for agricultural use or a Williamson Act contract were less than significant and do not require mitigation. Mitigation is required for the loss of 25 acres of land designated as "Unique Farmland" through the provision of a conservation easement over comparably productive land.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

The EIR contains an analysis of the state of the agriculture industry in the Inland Empire in Appendix C which concluded that the agriculture industry will continue to decline in the Inland Empire for three main reasons: 1) the more affordable housing market in the region compared to Los Angeles and Orange Counties, 2) the competition for cheaper farm labor from areas like the South Central Valley, and 3) lower water allocations to agriculture because of the growing urban population that receives priority for the water. The combination of the small size of the Inland Empire's agricultural industry and the three key economic constraints caused this study to conclude that the agriculture industry in the Inland Empire is in decline and that the agriculture industry within the Inland Empire will become less competitive and continue to decline regardless of whether or not this project is developed.

An additional study was prepared focusing specifically on the World Logistics Center property by Cushman & Wakefield in 2013 which concluded the project impact was not considered significant based on the results of the LESA Model.

1.6.3 Air Quality

An air quality and health effects assessment examined emissions from construction and operation of the World Logistics Center from both mobile and stationary sources. Broadly, the analysis of project-related emissions examined the (1) total amount of emissions generated, (2) the resulting concentrations of criteria (regulated) pollutants in the vicinity of the project area, and (3) the health effects of project-related emissions over a sub-regional area. A detailed discussion of the methodology approach can be found in Section 4.3.3 of the EIR.

1.6.3.1 Emissions

The total daily emissions from the project were analyzed in the air quality assessment. The analysis considered emissions of volatile organic compounds (VOCs), oxides of nitrogen (NO_x), carbon monoxide (CO), particulate matter (PM₁₀ and PM_{2.5}), and oxides of sulfur (SO_x). Emissions from construction and operation of the proposed project were compared to South Coast Air Quality Management District's (SCAQMD) significance threshold separately and combined for those years that construction and operation overlap. For all pollutants, with the exception of SO_x, the daily emissions exceeded SCAQMD's significance thresholds after mitigation.

1.6.3.2 Localized Concentrations of Criteria (Regulated) Pollutants

Consistent with SCAQMD guidelines, localized concentrations of certain criteria pollutants in the vicinity of the project were also analyzed. The analysis considered the project's impacts on ambient concentrations of CO, NO_x, PM₁₀, and PM_{2.5}. The analysis considered multiple scenarios, including conservative assumptions that all work would be completed in 2012 and in multiple years when construction and operation overlap. After mitigation, the proposed project would exceed the localized significance thresholds at the existing residences located within the project boundaries for PM₁₀ in five different analysis scenarios that are described in detail in Section 4.3.6.3. After mitigation, the proposed project would exceed the localized significance thresholds at the existing residences located within the project boundaries for PM_{2.5} in an analysis scenario that is described in detail in Section 4.3.6.3. The project's localized impacts would not exceed any significance thresholds for receptors located outside of the project boundaries.

1.6.3.3 Health Effects

CEQA requires public disclosure of reasonably foreseeable impacts. Six metrics were used to evaluate the project's air quality health impacts: 70-year exposure residential cancer risk; 40-year exposure

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

occupational cancer risk; 9-year exposure school cancer risk; acute non-cancer hazard index; chronic hazard index; and cancer burden.

Although it is not representative of reasonable or foreseeable impacts, a 70-year exposure period has been utilized in this EIR to evaluate residential cancer risk. A 70-year exposure for residential cancer risk assumes that a person will be continually exposed to a project at the location of their residence but outdoors, for 24-hours a day, 350 days a year for 70 continuous years. According to the U.S. EPA, the majority of people are indoors for 18–20 hours a day (at their place of employment or home) and people do not stay outdoors of their residence in the same location for a 70 continuous years, 24 hours a day, 350 days a year.

According to U.S. Census American Community Survey 2011, only 9% percent of the U.S. population resides at the same home for 30 years or more, while 63% of the population stays in the same residence for 9 years or less. Thus, the health risk assessments utilizing a 70 year exposure duration overestimates the risk of cancer associated with diesel PM exposure. These are assumptions that are not replicated or reflected in the real world. While it is not reasonable or foreseeable to assume a typical person would remain stationary at their residence and be continuously exposed to this project for 24 hours per day, 350 days per year for 70 years, nevertheless, the cancer risk assessment in this EIR uses the 70-year exposure duration to determine significance.

For informational purposes, data on the 30-year exposure residential cancer risk and the 25-year exposure occupational cancer risk are provided in Section 4.3.

An additional analysis of exposure duration of 30 years is added to the EIR for informational comparative purposes. The 30-year exposure period is based on data that found that 91 percent of Californians live in their home for 29 years or less (see figure below). Since a 30-year exposure scenario assumes that a person will remain outdoors at their home continuously for 24 hours per day, 350 days per year over those 30 years, the scenario is also unlikely but is more realistic than the assumptions of 70 year exposure duration.

Based on a continuous 70 year exposure scenario, the cancer risk would exceed the threshold of 10 in a million on site, areas immediately adjacent to the project and along State Route 60. When utilizing a 30-year exposure period, the maximum cancer risks for existing sensitive/residential receptors outside of the project boundaries would not exceed the cancer risk significance threshold.

The cancer burden calculation attempts to estimate the number of cancers a given population would experience at a specified exposure level. Cancer burden is calculated by multiplying the number of people within a defined area of influence by the cancer risk. The cancer burden for the proposed project is 5.1 persons based on the 70-year exposure scenario and a defined area of influence, which encompasses 1,800,000 people. The cancer burden for the proposed project would exceed SCAQMD's significance threshold of 0.5 persons. The cancer burden for the proposed project represents an increase of 0.00069 percent in the background cancer burden in the area.

Analyses for 40-year and 25-year worker exposure durations are provided, and the more conservative 40-year exposure duration is used to determine significance in this analysis. The estimation of cancer risk for both durations assumes that the individual is exposed in an outdoor work setting 245 days per year, 8 hours per day. Studies for both California and the United States demonstrate that over 95 percent of all workers remain on the same job for 25 years or less, let alone at the same job location. Less than 1 percent of employees remain at their job for 40 years or more. A 25-year exposure period has been used over the last several years in various reports and studies prepared by the United States Environmental Protection Agency, the California Environmental Protection Agency, Department of Toxic Substances Control and the California Office of Environmental Health Hazard Assessment.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

As shown above, there is substantial evidence to support the use of a 25-year exposure duration. This project, however, uses a 40-year exposure duration to determine significance. Based on exposure duration of 40 years, impacts for off-site workers are less than the 10 in one million significance threshold and are less than significant. Additionally, the cancer risk impacts are less than the threshold of 10 in a million for school children under the 9-year exposure scenario.

No significant impacts were found for occupational cancer risk, acute non-cancer impacts, or chronic impacts.

1.6.3.4 Mitigation

The proposed project would incorporate a number of mitigation measures to reduce the project's impacts on air quality. Those mitigation measures are detailed in Table 1.B in the Executive Summary and throughout Section 4.3 in this EIR. Among the many mitigation measures (MM) is MM 4.3.6.3B, which requires that all trucks using the World Logistics Center meet U.S. EPA 2010 emissions standards, the most stringent heavy-duty truck emissions standards ever imposed by the U.S. or California. The trucks that would serve the proposed project would be 90 percent cleaner than the typical truck on the road today.

U.S. Emission Standards – Heavy Duty Trucks

In addition to requiring clean trucks, the proposed project would require low emission construction equipment, limit vehicle idling to three minutes or less, prohibit trucks from residential areas, require that all on-site equipment will be powered by non-diesel fuels, provide electrical hook-ups for the future use of electric vehicles, and require the development of an alternative fuel station to encourage the use of non-diesel vehicles at the World Logistics Center.

1.6.4 Biological Resources

The project area has been the subject of numerous professional biological studies since 2005, with the most recent evaluations conducted in 2012 and 2013 in connection with the preparation of this EIR. These reports are included in the appendices of this EIR and are discussed in detail in Section 4.4 in this EIR. The biological studies show that the vast majority of the project area (97.4%) is disturbed by human activity, mostly dry-land farming, with less than 3 percent of the area consisting of native plant communities. These conditions are discussed in depth in Section 4.4 of this EIR.

The biological studies evaluated the project area for the presence of wildlife and specifically any threatened or endangered species. The reports conclude that the project area is not located within any United States Fish and Wildlife Service (USFWS) designated Critical Habitat area and no threatened or endangered species were observed within the project site during any of the field surveys. Further, no evidence of any California State endangered, threatened or protected wildlife species was found in the project area.

Suitable habitat was identified in the project area for the burrowing owl and the Los Angeles Pocket Mouse (both species of special concern) and mitigation measures are included to require site-specific biological evaluations to address these species prior to any site grading.

Impacts to jurisdictional waters/wetlands and to habitat fragmentation/wildlife movement were found to be less than significant. Impacts to endangered and threatened species may be significant and mitigation is included. The project has the potential to result in significant impacts to riparian habitat and sensitive natural communities and may require subsequent permits from various resource agencies depending on the details of each site-specific development proposal.

Other mitigation measures require the establishment of building setbacks along the boundary with the San Jacinto Wildlife Area (SJWA), a runoff management plan and a Biological Resources Management Plan for the SJWA edge, payment of MSHCP fees, prohibition of invasive plant species, and compensation for riparian habitat. A complete list of mitigation measures is included in Table 1.B in this Executive Summary.

More than 900 acres of the SJWA was purchased by the state in 2001 to serve as a buffer from future development to the north. This development area is being planned as the World Logistics Center and the 900+ acres will continue to serve that buffer purpose. Additionally, the WLC property is more than 4,000 feet (more than ¾ of a mile) from the closest sensitive habitat on SJWA property with the intervening property being used for disked farmland as it has for many decades.

The Specific Plan provides for a continuous buffer along the SJWA property that will include native landscaping, an extensive network of landscaped drainage facilities, trees and shrubs specifically selected to accommodate and support local wildlife, all of which will contribute to an environmentally-sensitive interface between the WLC and the SJWA property.

1.6.5 Cultural and Paleontological Resources

A thorough cultural resources study was conducted for the project area in connection with the project EIR and is discussed in Section 4.6. The area includes several known cultural (Native American) resources as well and other potential historical resources. This topic is discussed in Section 4.6.

The project has been designed to avoid any of the known Native American resources; designating sensitive areas as Open Space, realigning a proposed trail around the existing resources, and protecting the resources from disturbance. Further evaluations will be conducted in connection with site-specific project proposals prior to the issuance of any grading permits.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Consultations between Native American tribal groups and the City have been initiated pursuant to SB 18 and are ongoing.

Impacts to archaeological resources were determined to be potentially significant and mitigation measures are included to reduce the impacts. Mitigation measures include historical evaluations of all project sites, archaeological/paleontological monitoring of all project grading. Native American representatives will be invited to monitor all grading activities.

1.6.6 Geology and Soils

A detailed geotechnical evaluation was conducted for the project area in connection with the preparation of this EIR. The report evaluated faulting and seismicity, soils and geologic and seismic hazards affecting the property. Impacts due to landslides and rockfalls, soil erosion or loss of topsoil, septic tanks, and seismic-related ground failure were considered less than significant and no mitigation is required. Impacts due to fault rupture, ground shaking and unstable soils were considered to be potentially significant and mitigation measures are included to reduce the significance of the identified impacts. Mitigation measures include preparation of site-specific design-level geotechnical investigations and application of all applicable code standards and requirements prior to the issuance of any grading or building permits.

1.6.7 Greenhouse Gas Emissions, Climate Change and Sustainability

An evaluation of the World Logistics Center's greenhouse gas impact and contribution to global climate change was conducted and is presented in Section 4.7. Greenhouse gas emissions were quantified for both direct emissions (e.g., motor vehicles) and indirect emissions (e.g., electricity generation and water delivery). In the past few years, the State of California has changed the way it regulates greenhouse gases. Under Assembly Bill 32, the Global Warming Solutions Act of 2006, the California Air Resources Board (CARB) has established a cap-and-trade program which. The cap-and-trade program differentiates between emissions that fall under the AB 32 restrictions and those that do not. Those emissions that fall under the restrictions of the cap include those emissions that derive from electricity generation, transportation fuels, natural gas use, and large industrial sources. This differentiation, explained in more detail in Section 4.7 and Appendix D, was used as part of the greenhouse gas analysis.

Greenhouse gas emissions were segregated between capped and uncapped emissions. The state has created a comprehensive regulatory program that determines the future allowable emissions that fall under the cap-and-trade cap. Significance was determined by comparing uncapped emissions to SCAQMD's significance threshold of 10,000 metric tons of CO₂ equivalent (CO₂e, or carbon dioxide equivalent, is a standard unit for measuring carbon footprints. It expresses the impact of each different greenhouse gas in terms of the amount of CO₂ that would create the same amount of warming). Examples of project emissions that fall under the cap include greenhouse gas emissions from transportation sources (trucks and cars), electricity use (from offsite power generation), and water use (from off-site power generation to convey water). Examples of project emissions that fall outside the cap include waste generation from landfill emissions caused by waste generated onsite and the use of refrigerants.

Mitigation for the proposed project includes increased waste diversion requiring 75 percent of all waste to be diverted to landfills and increased energy efficiency by exceeding California's Title 24 requirements (California's energy efficiency standards) by at least 10 percent. Additionally, the Specific Plan requires that on-site solar systems be provided to offset the demand of office space in the WLC, estimated at 13 megawatts of power at buildout. This is the equivalent amount of power used by over 1,700 homes. After mitigation, the remaining emissions from the proposed project have

a less than significant impact. A complete listing of mitigation measures can be found in Section 4.7 and Table 1.B in this Executive Summary.

1.6.8 Hazards and Hazardous Materials

An evaluation of Hazards and Hazardous Materials are further discussed in Section 4.8 of the EIR. Historic land uses for the project area have included agricultural activities, two dairies, a chicken ranch, and scattered residential uses. Currently, nearly the entire site is used for dryland farming, which typically does not apply pesticides or other agricultural chemicals. The Phase 1 reports did not find significant residual pesticides in the project area and revealed no evidence of recognized environmental conditions on, at, in, or to the project area.

Sempra Energy operates a natural gas compressor facility near the WLC project. The EIR assessed the potential impacts of the facility on the future development of WLC property and found that compliance with existing safety regulations applicable to the Sempra plant plus the Specific Plan's requirement for a 1,000-foot setback between Sempra buildings and future WLC buildings reduced any potential impact to a less than significant level and no mitigation is required.

In addition, a fueling station is required to be constructed within the WLC project area. The EIR assessed the potential impacts of such a facility and found that with the application of a mitigation measure requiring preparation of a risk assessment prior to any project approvals, potential impacts would be reduced to a less than significant level.

1.6.9 Hydrology, Drainage, and Water Quality

The EIR evaluated potential impacts to hydrology, drainage, and water quality (Section 4.9) and found that environmental impacts in these areas were less than significant and do not require mitigation. Potential impacts from construction-related water quality impacts, operation-related water quality impacts, and drainage capacity-related impacts could be mitigated to a level of less than significant. The proposed project would incorporate a number of mitigation measures to reduce these impacts which are detailed in Table 1.B. Among the mitigation measures is MM 4.9.6.1A, which requires the management of flow rates, velocities, and volumes at pre-project levels and the maintenance of historic groundwater recharge (water balance) rates. The proposed project would also be required to implement a Storm Water Pollution Prevention Plan (SWPPP), a Water Quality Management Plan (WQMP), and development of an ongoing Water Quality Sampling Program (WQSP) to protect the San Jacinto Wildlife Area.

1.6.10 Land Use and Planning

The EIR evaluates the WLC project's impact on current on-site and adjacent land uses as well as the project's impacts on existing City land use policies (Section 4.10). The WLC project will replace the present Moreno Highlands Specific Plan, a largely residential, mixed-use project that included 7,700 residential units and 600+ acres of business park and mixed-use designations, with a project proposing 40.6 million square feet of logistics uses.

The EIR concludes that the WLC project is consistent with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) and is generally consistent with SCAG's Regional Comprehensive Plan, Compass Plan and Regional Transportation Plan.

The WLC project would incorporate a number of mitigation measures to reduce the project's impacts on the existing residents. Those mitigation measures are detailed in Table 1.B of the Executive Summary. Among the many mitigation measures is MM 4.3.6.3B, which requires that all trucks using

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

the World Logistics Center meet U.S. EPA 2010 emissions standards, the most stringent heavy-duty truck emissions standards ever imposed by the U.S. or California.

Additional requirements include clean construction equipment, limited vehicle idling to three minutes, non-diesel powered on-site equipment, electrical hook-ups for the future use of electric vehicles, and development of an alternative fuel station to encourage the use of non-diesel vehicles at the World Logistics Center.

The project is consistent with the City's Economic Development Action Plan which encourages the development of job-producing land uses in the eastern portion of the City. See DEIR Section 3.6.1 for 2011 and 2013 Economic Development Action Plan Objectives related to the WLC.

1.6.11 Mineral Resources

The EIR evaluated whether the project site contained any significant mineral resource areas, defined by the State as Mineral Resources Zone 2 areas. See Section 4.11 for the detailed analysis.

Lands within the City of Moreno Valley are designated MRZ-3 and MRZ-4, pursuant to the Surface Mining and Reclamation Act of 1975. These zones are not defined as significant mineral resource areas. No sites have been designated as locally-important mineral resource recovery sites on any local plan.

The EIR concluded that the development of the WLC project would not result in a loss of statewide, regional or locally important mineral resources and will not have any significant impact regarding such resources. No mitigation is required.

1.6.12 Noise

Project noise impacts were analyzed and the results are described in Section 4.12. As part of the analysis, existing noise levels were measured. Estimates of future noise levels as a result of the project and increases in background noise levels were assessed to determine where significant noise impacts would occur. Generally, project-related noise impacts occur as a result of two types of activity: construction noise and traffic noise occurring as a result of increased project-related vehicle trips. Several measures have been identified that impose operational controls during construction activities to reduce noise impacts or require noise abatement, such as sound walls to reduce impacts from project operation. Examples of operational controls to reduce noise impacts include maintaining minimum distances from homes during nighttime grading activities and limiting the hours of offsite construction.

Examples of noise abatement mitigation measures include the construction of sound walls at various locations and the requirement for noise barriers located along the perimeter of property that faces any residential areas. While most noise impacts were able to be mitigated to a less than significant level, there are a few areas where significant impacts remain, either as a result of construction activities or the infeasibility of mitigation such as sound walls in specific locations, such as where residential access would be blocked. Section 4.12 details the location specific noise impacts and mitigation measures that have been identified for the proposed project. The majority of noise impacts from the WLC in residential areas are the result of passenger vehicles, not trucks. The WLC design directs all truck traffic away from residential areas. Other potential land uses for the project site could generate similar or greater noise impacts. For instance, the current Moreno Highlands Specific Plan would result in significantly more vehicle trips than the proposed World Logistics Center. As a result, Noise impacts would be expected to be higher under that scenario.

1.6.13 Population, Housing and Employment

The EIR evaluated potential impacts to Population, Housing and Employment (Section 4.13) and found impacts to population growth, displacement of housing/people, and cumulative impacts to population and housing were less than significant and did not require mitigation.

An economic study of the Project prepared by David Taussig and Associates (DTA) concluded that the WLC Project could generate approximately 20,307 new on-site jobs within the City. In addition to the projected on-site job creation, the DTA study estimates the WLC Project could generate new off-site jobs (i.e., indirect/induced employment) in all industries of the economy. The DTA study estimated that an additional 7,386 indirect/induced jobs could be created in the County, of which 3,693 jobs were projected to be within the City as a result of Project implementation. While the specific location of the potential additional indirect/induced jobs created within the County cannot be specifically determined, it is reasonable to assume that some percentage of these jobs will be support service jobs and are likely to be located in the WLC Project vicinity, and therefore the City. A stronger jobs base can support improved property values and the general economic well-being of the City.

The WLC project is directly consistent with the City's adopted Economic Development Action Plan, which calls for focused efforts to create more jobs-related land uses, specifically logistics uses in the eastern portion of the City. See DEIR Section 3.6.1 for 2011 and 2013 Economic Development Action Plan Objectives related to the WLC.

The Fiscal and Economic Impact Study prepared by DTA concluded that the WLC project could generate approximately \$11,257,000 in annual revenues while causing the City to annually incur approximately \$5,557,000 in costs resulting in an annual surplus of almost \$5,700,000 once the project is fully built out. These surplus funds could be used to fund police, fire, health and senior programs and services throughout the City. Additional funding surpluses were identified relative to the Moreno Valley Fire Tax which is estimated to generate an additional \$1,800,000 from WLC development for other fire-related needs elsewhere in the City. Including the projected Fire Tax surplus, the build out of the WLC is expected to raise the projected tax surplus to the City of approximately \$7,500,000.

1.6.14 Public Services and Facilities

The EIR evaluated the project's impact on police services, fire protection, schools and parks. See Section 4.14 for the complete analysis. The EIR concluded that as a result of the project's obligation to pay all applicable City development impact fees and the project's commitment to provide a fire station site within the project area, that the WLC project will not have a significant impact on the City's ability to provide these public services and facilities.

The EIR's Fiscal and Economic Impact Study (Appendix O) shows that the projected build out of 40.6 million square feet of building will generate more than \$4.7 million for police facilities and more than \$10 million for fire facilities from the Development Impact Fee (DIF) program (using 2013 rates) and more than \$19 million in school fees. In addition, the study estimates that the WLC will generate more than \$11 million every year in taxes, fees, licenses, etc. while requiring \$5.7 million in services, resulting in an annual surplus of nearly \$6 million to the General Fund. A complete analysis is included in the Fiscal and Economic Impact Study.

Notably, the WLC will generate additional funding for fire services through the Moreno Valley Fire property tax that is separate from General Fund revenue sources. The Moreno Valley Fire property tax averages 5.54 percent of the total property taxes levied in the Center, which yields a total of \$1.8 million in recurring annually surplus that can be spent on fire services in other parts of the City.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Adding this \$1.8 million in Moreno Valley Fire property tax surplus to the \$5.7 million General Fund surplus is estimated to yield a total annual recurring surplus of \$7.5 million generated by the WLC.

The EIR concluded that the project will not have a significant impact to Public Services and Facilities. No mitigation measures are proposed.

1.6.15 Traffic and Circulation

A comprehensive Traffic Impact Analysis (TIA) was prepared to evaluate the WLC’s impacts within Moreno Valley and throughout the region and is discussed in Section 4.15. The traffic analysis encompasses road segments spanning from the project site 75 miles to the west, all the way to the Ports of Los Angeles and Long Beach, 30 miles to the east beyond the City of Banning, 20 miles to the south and 15 miles to the north.

As indicated in the table to the right below, 80 percent of the traffic would be generated from Passenger Cars, 12 percent of the traffic generated by the project would be classified as Heavy-duty Trucks, and about 8 percent of the traffic would be generated by Light and Medium Duty Trucks.

Type of Vehicle	Number of Daily Trips
Passenger Cars	54,714
Light-duty Trucks (2-axle)	2,385
Medium-duty Trucks (3-axle)	3,181
Heavy-duty Trucks (4-axle)	8,440
Total Daily Trips	68,720

The total number of daily trips generated by the project is 68,720. As shown in the chart above to the left, this represents a **61% reduction**, or 100,000 less daily trips generated, compared to the City’s General Plan/zoning designations for the project area (i.e., the Moreno Highlands Specific Plan).

Located at the eastern end of the City, the WLC will result in a reverse commute travel pattern. The traffic analysis indicates that many residents currently head west out of Moreno Valley for jobs. With thousands of job opportunities created as a result of the project in the eastern portion of the city, future employees may travel east where there is much less traffic. Those who remain in the morning westbound commute will have less traffic to deal with as some that are now or would be headed westbound would be diverted in the eastbound direction.

1.6.16 Utilities and Service Systems

The EIR evaluated potential impacts to Utilities and Service Systems (Section 4.16) and found that impacts to these systems were generally less than significant and do not require mitigation. Potential

impacts to storm water drainage requirements, adequate water supply, and electrical and natural gas facilities were able to be mitigated to a level of less than significant.

The World Logistics Center emphasizes water conservation, and the landscape program is designed to achieve the project's landscape goals while consuming as little water as possible. This approach represents a significant departure from conventional development strategies, particularly in a large-scale master-planned logistics campus setting. Most of the project will be designed without mechanical irrigation, relying instead on maximizing the collection and harvesting of runoff to be directed to landscape areas. Mitigation measures include use of drought tolerant landscaping, using "dry" cleaning equipment, use of weather-based automatic irrigation controllers, use of irrigation systems primarily at night or early morning, use of recirculation system for any outdoor water feature, use of low-flow sprinkler heads, use of reclaimed water for irrigation if it becomes available. Additional mitigation measures include use of flash water heaters, automatic on/off water facets, water efficient appliances, exceedance of the energy-conservation requirements of title 24 (2008) by 10 percent, LEED Certification, and solar panels to offset the power demand for office space in each building. Mitigation Measures for each of the affected areas are listed in Table 1.B.

1.7 PUBLIC INVOLVEMENT

The EIR process for the proposed project has involved input from the public and affected agencies at several steps. A Notice of Preparation (NOP) was issued on February 26, 2012, to notify state agencies and the public that an EIR was going to be prepared for the WLC project. The NOP was circulated for 30 days as required by CEQA. The distribution list, Notice of Public Scoping Meeting, and response letters are included in Appendix A of the Draft EIR. As of the close of the 30-day NOP public review period, ten responses to the NOP had been received from public agencies, four from conservation organizations, and 14 responses from members of the public.

On March 12, 2012, the City held a public scoping meeting to solicit input on concerns the public had about the project and issues that should be addressed in the EIR. There were 33 individual speakers including one agency (SCAQMD); 33 letters and comment cards were submitted during or subsequent to the scoping meeting.

The Draft EIR ~~will be~~was circulated for a ~~minimum~~60-day public review period, at which time agencies and the public ~~can~~were invited to comment on the technical studies and analysis of environmental issues in the EIR. The Draft EIR was circulated between February 5 and April 8, 2013; a total of 63 days. All written comments on the Draft EIR ~~will~~received written responses, and the City ~~will~~carefully evaluated all available information on the project ~~prior to taking action~~. A more thorough discussion of input from the public and affected agencies is presented in Section 2.0, *Introduction*. Table 2.A, in the next section, summarizes the comments received regarding the NOP.

1.8 AREAS OF CONTROVERSY AND ISSUES TO BE RESOLVED

The EIR discusses impacts that would occur to on-site and off-site uses as a result of implementation of the proposed project. This EIR also includes proposed mitigation measures that have been identified to reduce or avoid significant effects that would result from the construction and operation of the proposed on-site uses. *CEQA Guidelines* Section 15123(b)(2) requires that areas of controversy known to the Lead Agency (City of Moreno Valley) be stated in the EIR summary. The following discussion identifies issues raised by other agencies and the public during the 30-day public comment period of the NOP, as well as comments received during the public scoping meeting for the proposed project.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Local residents indicated they understood the desire of the City to add employment during these economic times, but also expressed concerns about the following potential impacts associated with the industrial warehouse uses proposed by the WLC project:

- Loss of views from SR-60 and Gilman Springs Road. This issue is discussed in Section 4.1, *Aesthetics*, of this EIR.
- Short-term and long-term air pollutant emissions including dust, diesel particulates, and health risks from truck exhaust that could negatively affect nearby residential uses. These issues are discussed in Section 4.3, *Air Quality*, of this EIR.
- Indirect impacts on wildlife utilizing the San Jacinto Wildlife Area south of the site. This issue is discussed in Section 4.4, *Biological Resources*, of this EIR.
- Potential loss of cultural (archaeological) resources by grading and development of the site, and suggestions to consult with local Native American tribes per SB 18. These issues are discussed in Section 4.4, *Biological Resources*, and 4.5, *Cultural Resources*, of this EIR.
- Concerns about several geologic faults that cross the project site. This issue is discussed in Section 4.6, *Geology and Soils*, in this EIR.
- In addition to air quality impacts, concerns were expressed about the project emitting large quantities of greenhouse gases and their influence on global climate change. These impacts are addressed in Section 4.7, *Greenhouse Gases and Global Climate Change*, in the EIR.
- Potential water-related impacts (drainage and water quality of runoff from the project) are addressed in Section 4.9, *Hydrology and Water Quality*, in the EIR.
- Loss of affordable housing once identified ~~on~~ in the Moreno Highlands Specific Plan currently approved for the project site. This issue is discussed in Section 4.10, *Land Use and Planning*, and Section 4.13, *Population, Housing, and Employment*, of this EIR.
- Short-term and long-term noise impacts that could affect nearby residential uses. These issues are discussed in Section 4.12, *Noise*, of this EIR.
- Project truck traffic causing congestion on local roads, intersections, and freeway ramps, primarily on Redlands Boulevard, and impacts to vehicular, bicycle, and pedestrian safety. These issues are discussed in Section 4.15, *Traffic and Transportation*, of this EIR.

1.59 SIGNIFICANT IMPACTS

The project will have significant adverse impacts even following adoption of all feasible mitigation measures. The following significant environmental impacts have been identified in the EIR and will require mitigation but cannot be mitigated to a level of insignificance. Sections 4.1 through 4.16 of the EIR identify the following significant impacts of the WLC project after mitigation:

- Aesthetics: Loss of views, scenic highways, and Scenic Vistas.
- Aesthetics: Scenic Resources and Scenic Highways.
- Aesthetics: Substantial degradation of the existing visual character or quality of the site and its surroundings.
- Agriculture: Loss of unique and locally important farmland;
- Air Quality: Short-term emissions of NO₂, PM_{4.0}, and PM_{2.5} in excess of SCAQMD daily limits during construction;
- Air Quality: Long-term emissions of CO, VOC, NO_x, PM_{4.0}, and PM_{2.5} resulting from increased vehicular trips and operation of the proposed on-site uses;

- Aesthetics: Cumulative Aesthetic Impacts.
 - Air Quality: Construction Air Pollutant Emissions.
 - Air Quality: Architectural Coating Emissions.
 - Air Quality: Inconsistent with AQMP due to change in land uses from existing General Plan; Operational Air Pollutant Emissions.
 - Air Quality: Health risks in excess of 10 in 1 million for both on-site uses and on a cumulative basis in the surrounding region;
 - Climate Change: Project contributions to cumulatively considerable greenhouse gas emissions in excess of recommended SCAQMD standard;
 - Air Quality: Consistency with Air Quality Management Plan (AQMP).
 - Air Quality: Cumulative Air Pollutant Emissions.
 - Air Quality: Cancer Burden.
 - Land Use : Impacts to onsite and Planning: Divide an Existing Neighborhood (impacts on existing residences) from adjacent warehouse development that cannot be effectively mitigated;
 - Noise: Short-Term Construction Noise.
 - Noise: Long-Term Traffic Noise.
 - Noise: Cumulative Noise Levels.
- Transportation: Project contributions to cumulatively considerable impacts to local facilities
- (outside Off-Site Impacts to TUMF Facilities.
- Transportation: Off-Site Improvements to Roads Outside the Jurisdiction of the City of Moreno Valley and state-controlled transportation facilities and Not Part of the TUMF Program.

1.6 ALTERNATIVES TO THE PROPOSED PROJECT

In compliance with *CEQA Guidelines* (Section 15126.6), an EIR must describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the project objectives, and would avoid or substantially lessen significant effects of the project. The EIR need not consider every conceivable alternative; rather it must consider a reasonable range of potentially feasible alternatives. This EIR evaluates a “No Project/No Build” as well as a “No Project” alternative (i.e., development according to the General Plan and zoning) in order to allow decision-makers to compare the effect of approving the project to the effect of not approving the project. A more detailed description of each project alternative as well as an analysis of the potential environmental impacts associated with the construction and operation of each is provided in Section 6.0. It should be noted that, for all of the alternatives, the 1,085 acres owned by the California Department of Fish and Wildlife and San Diego Gas & Electric would be designated as Open Space in the City’s General Plan, similar to the proposed project.

1.6.1 No Project/No Development

CEQA requires an analysis of the environmental effects of not developing the proposed project. This allows the reviewer to see what the results of not developing the project site would be and also outlines existing or baseline conditions on the site. With the No Development Alternative, no development would occur and the majority of the site would remain in dry farming, with a small amount in rural residential uses.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

1.6.2 No Project/Existing General Plan Alternative

~~Pursuant to CEQA (§15126.6[e][2]), this No Project Alternative discusses what would reasonably be expected to occur on the site based on current plans and consistent with available infrastructure and community services in the foreseeable future. This alternative would result in development of the project with the land uses currently shown in the City's General Plan (i.e., the Moreno Highlands Specific Plan or MHSP). The approved 3,038-acre MHSP is a master planned, mixed-use community, consisting of up to 7,763 residential dwelling units on approximately 2,435 acres and approximately 603 acres of business, retail, institutional, and other uses. The 1,085 acres owned by the CDFW are currently designated as Residential, Public Facilities, and Open Space in the City's General Plan and would be designated as permanent Open Space under this alternative, similar to the proposed project.~~

1.6.3 Alternative 1: Reduced Density

~~This alternative would develop approximately 29 million square feet of logistics warehousing (approximately 30% less than under the proposed project) on the 2,710 acres of land under the Specific Plan, including 75 acres for open space. The 1,085 acres owned by the CDFW would be designated as Open Space in the City's General Plan, similar to the proposed project.~~

1.6.4 Alternative 2: Mixed Use A Alternative

~~This alternative would result in development of the entire property with a mix of 1,410 acres of logistics warehousing (22 million square feet), 1,000 acres of light manufacturing, assembly, or business park uses (20 million square feet), 50 acres of retail commercial uses (500,000 square feet), 100 acres of professional or medical office uses (1 million square feet), and 150 acres of open space. The 1,085 acres owned by the CDFW would be designated as Open Space in the City's General Plan, similar to the proposed project.~~

1.6.5 Alternative 3: Mixed Use B Alternative

~~This alternative would develop the project site similar to the land use plan of the MHSP but with 10 million square feet of logistics warehousing on the 603 acres proposed for business, retail, institutional, and other uses under the MHSP.~~

1.6.6 Alternative Sites

~~This alternative would relocate development under the proposed project to another site in the surrounding region. This analysis included potential sites in nearby cities and several unincorporated sites in the general project area. Due to the size and nature of the project, no feasible alternative sites were found in any of the eleven (11) jurisdictions evaluated.~~

1.10 IMPACTS, MITIGATION, AND LEVEL OF IMPACTS SUMMARY TABLE

Table 1.AB provides a summary of the proposed project impacts, proposed mitigation measures, and the level of significance of each impact following the application of identified mitigation measures. While Table 1.A provides a summary of the mitigation measures, Table 1.B includes the complete text for each mitigation measure recommended in Sections 4.1 through 4.16 of the EIR.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

NOTE TO READER: The mitigation measure summaries have been removed from Revised DEIR Table 1.B World Logistics Center Project Environmental Impact Summary and replaced with the revised mitigation measures in their entirety. For this reason, Original DEIR Table 1.B List of All Mitigation Measures has also been deleted.

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
4.1 Aesthetics		
LESS THAN SIGNIFICANT IMPACTS		
None	Not applicable	Not applicable
SIGNIFICANT IMPACTS		
Impact 4.1.6.1 Scenic Vistas	<p>4.1.6.1A Each Plot Plan application for development along the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing or planned residential zoned uses) shall include a minimum 250-foot setback measured from the City/County zoning boundary line and any building or truck parking/access area within the project. The setback area shall include landscaping, berms, and walls to provide visual screening between the new development and existing residential areas upon maturity of the landscaping materials. The existing olive trees along Redlands Blvd. shall remain in place as long as practical to help screen views of the project site. This measure shall be implemented to the satisfaction of the Planning Official.</p> <p>4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residences upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.</p> <p>4.1.6.1C Prior to the issuance of a certificate of occupancy for buildings adjacent to the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing residences at the time of application) the screening required in Mitigation Measure 4.1.6.1A shall be installed in substantial conformance with</p>	Significant and Unavoidable

Issues/Impacts	Mitigation Measures	Level of Significance
<p>riparian/riverine areas.</p>	<p><u>confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources: Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.</u></p> <p><u>The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.</u></p> <p><u>Mitigation will consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat will be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat will be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of</u></p>

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
	<p><u>offsite. All projects within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (as outlined in MM 4.9.6.2B). Regarding the 250-foot setback area, pedestrian and vehicular access to areas of riparian/riverine habitat will be prohibited except for controlled maintenance access. Finally, no grading shall be permitted within conserved riparian/riverine habitat areas except for grading necessary to establish or enhance habitat areas (DBESP MM 6, 7, 9, and 10).</u></p> <p>4.4.6.4H <u>As outlined in Mitigation Measure 4.4.6.1A, development adjacent to the 250-foot open space setback shall have a six-foot chain link fence or similar barrier to help separate human activity and the buffer area. Any chain link fencing installed on any properties adjacent to the 250-foot buffer area shall have metal mesh installed below and above ground level to prevent animals from accessing new development areas.</u></p> <p>4.4.6.4I <u>The individual property owner and/or Property Owners Association (POA) as appropriate shall be responsible for maintaining the various onsite landscaped areas, open improved or natural drainage channels, and detention or flood control basins in a manner that provide for fuel management and vector control pursuant to standards maintained by the City Fire Marshall and County Department of Environmental Health- Vector Control Group. This measure requires the individual owner or Property Owners Association (POA) to manage vegetation in and around these areas or improvements so as to not represent a fire hazard as defined by the City Fire Department through the substantial buildup of combustible materials. This measure also requires the individual owner or Property Owners Association to manage vegetation and standing water in drainage channels and basins such that they do not encourage or allow vectors to occur (primarily rats and mosquitoes). Runoff shall not be allowed to stand in channels or basins for more than 72 hours without treatment or maintenance to prevent establishment of mosquitoes per published County vector control guidelines and "Best Management Practices for Mosquito Control on California State Properties" which is available from the California West Nile Virus website at http://www.westnile.ca.gov/resources. This measure shall be implemented by the Property Owners Association in consultation with the City Fire Department and Riverside County Department of Environmental Health – Vector Control Group.</u></p> <p>4.4.6.4J <u>A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the World</u></p>

Issues/Impacts	Mitigation Measures	Level of Significance
4.5 Cultural Resources		
LESS THAN SIGNIFICANT IMPACTS		
Human Remains		
<p>There is no evidence that the site has been utilized for human burials, and there is state law dealing with human remains that are found during grading or excavation.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>
SIGNIFICANT IMPACTS		
Impact 4.5.6.1 Archaeological Resources		
<p>Most of the site has been previously surveyed, and previously identified resources have been surveyed and retrieved according to required protocols. Nine on-site rural residential properties (designated "Light Logistics") have not been previously surveyed and would need to be surveyed prior to development.</p> <p>The City has conducted SB 18 Consultation with local Native American tribes and the Pechanga and Soboba tribes have expressed a desire to consult.</p>	<p>4.5.6.1A Prior to the approval of any grading permit for any of the "Light Logistics" parcels, the parcels shall be evaluated for significance by a qualified archaeologist. A Phase 1 Cultural Resources Assessment shall be conducted by the project archaeologist and an appropriate tribal representative(s) on each of the "Light Logistics" parcel to determine if significant archaeological or historical resources are present.</p> <p>A Phase 2 significance evaluation shall be completed for any of these sites in order to determine if they contain significant archaeological or historical resources. Cultural resources include but are not limited to stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. All resources determined to be prehistoric or historic shall be documented using DPR523 forms for archival research/storage in the Eastern Information Center (EIC). If the particular resource is determined to be not significant, no further documentation is required. If prehistoric resources are determined to be significant, they shall be considered for relocation or archival documentation. If any resource is determined to be significant, a Phase 3 recovery study shall be conducted to recover remaining significant cultural artifacts. If prehistoric archaeological/cultural resources are discovered during the Phase 1 survey and it is determined that they cannot be avoided through site design, they shall be subject to a Phase 2 testing program. The project archaeologist in consultation with appropriate tribal group(s) shall determine the significance of the resource(s) and determine the most appropriate disposition of the resource(s) in accordance with applicable laws, regulations and professional</p>	<p>Less than Significant and Unavoidable with Mitigation</p>

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
	<p><u>pg.74).</u> Should it be determined through a future project-level EIR analysis that prehistoric cultural resource sites CA-RIV-2993 and/or CA-RIV-3347 shall be directly impacted by future construction, these sites must be Phase 2 tested for significance (per Cultural Report MM CR-4, Table 3, pg.74).</p> <p>4.5.6.1C Prior to the issuance of any grading permits a qualified archaeologist shall be retained to monitor all grading and shall invite tribal groups to participate in the monitoring. Project-related archaeological monitoring shall include the following requirements per Cultural Report MM CR-6, MM CR-8, Table 3, pg.74):</p> <ol style="list-style-type: none"> 1. All earthmoving shall be monitored to a depth of ten (10) feet below grade by the Project Archaeologist or his/her designated representative. Once all areas of the development project that have been cut to 10 feet below existing grade have been inspected by the monitor, the Project Archaeologist may, at his or her discretion, terminate monitoring if and only if no buried cultural resources have been detected; 2. If buried cultural resources are detected, monitoring shall continue until 100 percent of virgin earth within the specific project area has been disturbed and inspected by the Project Archaeologist or his/her designated representative. 3. Grading shall cease in the area of a cultural artifact or potential cultural artifact as delineated by the Project Archaeologist or his/her designated representative. A buffer of at a minimum 25 feet around the cultural item shall be established to allow for assessment of the resource. Grading may continue in other areas of the site while the particular find are investigated; and 4. If prehistoric cultural resources are uncovered during grading, they shall be Phase 2 tested by the Project Archaeologist, and evaluated for significance in accordance with §15064.5(f) of the CEQA Guidelines. Appropriate actions for significant resources as determined by the Phase 2 testing include but are not limited to avoidance or capping, incorporation of the site in green space, parks, or delineation into open space. If such measures are not feasible, Phase 3 data recovery of the significant resource will be required, and curation of recovered artifacts and/or reburial, shall be required. A report associated with Phase 2 testing or Phase 3 data recovery must be delivered to the City and, if necessary, the museum

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<u>Impact 4.7.6.2 Greenhouse Gas Plan, Policy, Regulation Consistency</u>		
The proposed project could be potentially inconsistent with established Greenhouse Gas plans, policies, or regulations.	Implementation of previously referenced Mitigation Measures 4.3.6.3B, 4.3.6.4A, 4.3.6.3C, 4.3.6.3D, 4.7.6.1A, 4.16.1.6.1A, 4.16.1.6.1B, 4.16.1.6.1C, 4.16.4.6.1A, 4.16.4.6.1B, and 4.16.4.6.1C will help reduce project-related GHG emissions	Less than Significant with Mitigation
Cumulative Greenhouse Gas Impacts		
The proposed project will emit substantial quantities of greenhouse gases during project operation, mainly related to truck emissions, that will exceed recommended SCAQMD thresholds for greenhouse gases. These emissions are considered cumulative in terms of global climate change.	Project-specific energy conservation, air quality, and greenhouse gas Mitigation Measure 4.7.6.1A will help reduce project greenhouse gas emissions, but the project will <u>not</u> make a significant cumulative contribution to greenhouse gas emissions.	Less than Significant and Unavoidable
4.8 Hazards and Hazardous Materials		
LESS THAN SIGNIFICANT IMPACTS		
Within Two Miles of a Private Airport, Airport Land Use Plan, or Public Airport		
The nearest airport is 7 miles away so, the development of the WLC project area as proposed would not result in airport safety hazards for people working in the WLC project area.	No mitigation is required.	No Impact
Existing or Proposed School		
There are no existing planned schools on or within a quarter mile of the project site.	No mitigation is required.	Less than Significant
Routine Transport, Use, or Disposal of Hazardous Materials and Reasonable Foreseeable Upset and Accident Conditions		
The transport, use, handling, or disposal of hazardous materials is regulated by various local, state, and federal standards, ordinances, and regulations that would ensure that potential impacts associated with environmental and health hazards related to an accidental release of hazardous materials are less than	No mitigation is required.	Less than Significant

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>Fire Hazard Area. The project allows the construction of warehouse buildings which have a low fire potential, and the project will add a new roadway network to facilitate access for fire protection vehicles and services.</p> <p>Fire Station #58 is relatively close to the project site, but future development will generate a need for an additional fire station on the site.</p> <p>New structures will have to comply with current Fire and Building Code regulations.</p>		

SIGNIFICANT IMPACTS

On-site Conditions Involving Hazardous Materials

A number of Phase 1 Environmental Site Assessments (ESAs) prepared for various portions of the site indicate that the site does not contain pesticides or other hazardous materials. However, the existing rural residences on site have not been surveyed as yet for hazardous materials.

4.8.6.1A

Prior to demolition of any existing structures on the project site, a qualified contractor shall be retained to determine if asbestos-containing materials (ACMs) and/or lead-based paint (LBP) are present. If asbestos-containing materials and/or lead-based paint are present, prior to commencement of demolition, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. In addition, onsite soils shall be tested for contamination by agricultural chemicals. If present, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any asbestos-containing materials, lead-based paint, or agricultural chemical residue in conformance with all applicable regulations.

4.8.6.1B

Prior to the issuance of any discretionary permits associated with the proposed fueling facility ("logistic support" site in the LD zone), a risk assessment or safety study that identifies the potential public health and safety risks from accidents at the facility (e.g., fire, tank rupture, boiling liquid, or expanding vapor explosion) shall be submitted to the City for review and approval. This study shall be prepared to industry standards and demonstrate that the facility will not create any significant public health or safety impacts or risks, to the satisfaction of the

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
	<p><u>properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow such that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.</u></p> <p>4.9.6.1B</p> <p><u>The bioretention areas and detention/infiltration basins shall be designed to assure infiltrations rates. The monitoring plan will follow the guidelines presented by the California Storm Water Quality Association (CASQA) in the California Storm Water Best Management Program (BMP) Handbook, Municipal, January 2003. Section 4, Treatment Control Best Management Programs Fact Sheets TC-11 Infiltration Basin and TC-30 Vegetated Swale).</u></p> <p><u>For the Bioretention areas, as needed maintenance activities shall be conducted to remove accumulated sediment that may obstruct flow through the swale. Bioretention areas shall be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. The maintenance activities should occur when sediment on channels and culverts builds up to more than 3 inches (CASQA 2003). The swales will need to be cultivated or rototilled if drawdown takes more than 72 hours.</u></p> <p><u>For the detention/infiltration basins, a 3-5 year maintenance program shall be implemented mainly to keep infiltration rates close to original values since sediment accumulation could reduce original infiltration rate by 25-50%. Infiltration rates in detention basins will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. If cumulative infiltration rates of all detention basins drops below the minimum required rates, then the detention basins will be reconditioned to improve infiltration capacity by scraping the bottom of the detention basin, seed or sod to restore groundcover, aerate bottom and dethatch basin bottom (CASQA 2003).</u></p>

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>Cumulative Hydrology and Water Quality</p> <p>The drainage system for the proposed WLC project would maintain post-development runoff at pre-development levels for off-site downstream properties. Therefore, the proposed WLC project will not make a significant contribution to any cumulatively considerable impacts related to drainage or water quality.</p>	<p><u>potential pollutants associated with the project as identified in Table 4.9.J. Once development is complete, the developer shall retain qualified personnel to conduct regular (i.e., at least quarterly) water sampling/testing of any basins and their outfalls to ensure the San Jacinto Wildlife Area will not be affected by water pollution from the project site. This measure shall be implemented to the satisfaction of the City Land Development Division Manager based on consultation with the project developer, Eastern Municipal Water District, the Regional Water Quality Control Board-Santa Ana Region, and the Mystic Lake Manager.</u></p>	<p>Less than Significant</p>
<p>4.10 Land Use and Planning</p> <p>LESS THAN SIGNIFICANT IMPACTS</p> <p>Conflict with Applicable Land Use Plans, Policies, or Regulations</p> <p>The land uses per se of the project are not consistent with SCAG growth projections and some Compass Plan policies because they are not residential in nature. However, the project will substantially improve the City's job/housing balance which is consistent with these regional plans. The WLC project is consistent with the City General Plan upon approval of the requested General Plan Amendment. The project is consistent with the City's Housing Element. <u>Therefore, the project is consistent with both regional and local land use plans, policies, and regulations.</u></p>		
<p>No mitigation is required.</p>	<p>Previously referenced Mitigation Measures 4.9.6.1A, 4.9.6.1B, 4.9.6.2A and 4.9.6.2B, and 4.9.6.3A through 4.9.6.3C. No additional mitigation is required.</p>	<p>Less than Significant</p>

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
Conflict with any Applicable Habitat or Natural Community Conservation Plan		
The project will be required to comply with the requirements of the County's MSHCP and pay its development impact fee.	Previously referenced Mitigation Measures 4.4.6.1A through 4.4.6.1C, 4.4.6.2A and 4.4.6.2B, 4.4.6.3A and 4.4.6.3B, and 4.4.6.4A through 4.4.6.4F related to Biological Resources will be implemented, and no additional mitigation is required.	Less than Significant
Cumulative Land Use and Planning Impacts		
The WLC project would not have significant project-related impacts related to dividing an established community, conflicting with applicable land use plans, policies, or regulations, or conflicting with an approved habitat conservation plan. While the WLC project would represent a shift in land use policy, this policy shift does not represent a significant CEQA impact.	No mitigation is required.	Less than Significant
SIGNIFICANT IMPACTS		
Physically Divide an Established Community		
The WLC is located in the eastern end of the City, so its development would not physically divide an established community. However, development could adversely affect seven existing rural residences onsite, and the land plan cannot accommodate residences within logistics warehousing areas.	No feasible mitigation is available.	Significant and Unavoidable
4.11 Mineral Resources		
LESS THAN SIGNIFICANT IMPACTS		
Loss of Statewide, Regional, or Locally Important Mineral Resources		
The project site and surrounding area do not contain any identified regional or local mineral resources, nor are there any ongoing mineral resource extraction activities in the project area.	No mitigation is required.	No impact

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>Impact 4.12.6.2 Long-Term Traffic Noise</p> <p>Project operations will create significant long-term noise impacts on site and along a number of off-site roadways. Not all off-site impacts can be mitigated to less than significant levels by installing sound-attenuation improvements.</p>	<p>4.12.6.1H <u>All material stockpiles in connection with any grading operations shall be located at least 1,200 feet from existing residences (per Noise Study MM N-5, pg. 52).</u></p> <p>4.12.6.1I <u>All project-related off-site construction shall be limited to 6 a.m. and 8 p.m. on weekdays only. Construction during weekends and City holidays shall not be permitted (per Noise Study MM N-6, pg. 53) to the satisfaction of the Land Development Division/Public Works.</u></p> <p>4.12.6.1J <u>Prior to issuance/approval of any grading permits, off-site construction activities adjacent to residential uses shall provide for installation of 12-foot temporary sound barriers for construction activities lasting more than one month. The sound barrier will reduce noise levels by approximately 10 dB. The temporary sound barrier may be constructed of plywood with a total thickness of 1.5 inches, or a sound blanket wall may be used. If sound blankets are used, the curtains must have a Sound Transmission Class (STC) rating of 27 or greater. No off-site construction is permitted during weekday nighttime hours (8 p.m. to 6 a.m.) or during weekends and City holidays except for emergencies (per Noise Study MM N-7, pg. 53).</u></p>	<p>Significant and Unavoidable</p>
	<p>4.12.6.2A <u>When processing future individual buildings under the World Logistics Center Specific Plan, as part of the City's approval process, the City shall require the Applicant to take the following three actions for each building prior to approval of discretionary permits for individual plot plans for the requested development:</u></p> <p><u>Action 1: Perform a building-specific noise study to ensure that the assumptions set forth in the FEIR prepared for the programmatic level entitlement remain valid. These procedure used to conduct these noise analyses shall be consistent with the noise analysis conducted in the programmatic FEIR and shall be used to impose building-specific mitigation on the individually-proposed buildings.</u></p> <p><u>Action 2: If the building-specific analyses identify that the proposed development triggers the need for mitigation from the proposed building, including all preceding developments in the specific plan area, the Applicant shall implement the mitigation identified in the WLC FEIR. Prior to implementing the mitigation, the Applicant shall send letters by registered mail to all property owners and non-owner occupants of properties that would benefit from the proposed mitigation asking them to provide a position either in favor of or in opposition to the proposed noise abatement mitigation within 45 days. Each property shall be entitled to one vote on behalf of owners and one vote per dwelling on behalf of</u></p>	<p>Significant and Unavoidable</p>

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
	<p><u>non-owner occupants.</u></p> <p><u>If more than 50% of the votes from responding benefited receptors oppose the abatement, the abatement will not be considered reasonable. Additionally, for noise abatement to be located on private property, 100% of owners of property upon which the abatement is to be placed must support the proposed abatement. In the case of proposed noise abatement on private property, no response from a property owner, after three attempts by registered mail, is considered a no vote.</u></p> <p><u>At the completion of the vote at the end of the 45 day period, the Applicant shall provide the tentative results of the vote to all property owners by registered mail. During the next 15 calendar days following the date of the mailing, property owners may change their vote. Following the 15-day period, the results of the vote will be finalized and made public.</u></p> <p><u>Action 3: Upon consent from benefited receptors and property owners, the Applicant shall post a bond for the cost of the construction of the necessary mitigation as estimated by the City Engineer to ensure completion of the mitigation. The certificate of occupancy permits shall be issued upon posting of the bond or demonstration that 50% of the votes from responding benefited receptors oppose the abatement or, if the abatement is located on private property, any property owners oppose the abatement (per Noise Study MM N-8, pg.53).</u></p> <p>4.12.6.2B</p> <p><u>Prior to issuance/approval of any building permits, the centerline of Cactus Avenue Extension will be located no closer than 114 feet to the residential property lines along Merwin Street. An alternative is to locate the roadway closer to the residences and provide a soundwall along Cactus Avenue Extension. The soundwall location and height should be determined by a Registered Engineer, and the soundwall shall be designed to reduce noise levels to less than 65 CNEL at the residences. The Engineer shall provide calculations and supporting information in a report that will be required to be submitted to and approved by the City prior to issuing permits to construct the road (per Noise Study, pg. 51, Cactus Avenue Extension, ID #50).</u></p> <p>4.12.6.2C</p> <p><u>Prior to the approval of any discretionary permits, cumulative impact areas shown in the WLC EIR Noise Study shall be included in the soundwall mitigation program outlined in Mitigation Measures 4.12.6.2A and 4.12.6.2D (per Noise Study MM N-9, pg. 62).</u></p>

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>4.12.6.2D</p>	<p>Prior to issuance of a building permit, the applicant shall demonstrate that the development maintains a buffer with soundwall for noise attenuation at residential/warehousing interface (i.e., western and southwestern boundaries of the project site). To keep the noise levels at nearby residential areas less than typical ambient conditions, the warehousing property line shall be located a minimum of 250 feet from the residential zone boundary, and a 12-foot noise barrier shall be located along the perimeter of the property that faces any residential areas. The 12 foot noise barrier may be a soundwall, berm, or combination of the two. The height shall be measured relative to the pad of the warehouse. This requirement shall be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (Leq) will not be exceeded at the residential zone. This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, "All manufacturing and industrial uses adjacent to residential land uses shall include a buffer zone and/or noise attenuation wall to reduce outside noise levels." (per Noise Study MM N-10, pg.62).</p>	
<p>Impact 4.12.6.3 Long-Term Operational Noise</p> <p>Potential long-term stationary noise impacts would primarily be associated with operations at logistics facilities within the WLCSP area. With implementation of a minimum 250-foot setback from residential uses, potential long-term operational noise impacts would be less than significant.</p>	<p>4.12.6.4A</p> <p>Prior to the issuance of building permits for projects within 1,300 feet of the Southern California Gas Company (SCGC) and San Diego Gas and Electric (SDG&E) blow-down facilities, documentation shall be submitted to the City confirming that sound attenuation devices and/or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events are available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund all sound attenuation improvements to the blow-down facilities required by this measure. It shall also be the responsibility of the developer to coordinate with San Diego Gas and Electric and/or Southern California Gas Company regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the San Diego Gas and Electric</p>	<p>Less than Significant with Mitigation</p>
<p>Impact 4.12.6.4 Long-Term Utility Noise</p> <p>Noise generated by SCGC blow-down events has the potential to cause permanent hearing loss in persons in the developed area of the project. This is a significant impact and mitigation is required.</p>	<p>4.12.6.4A</p> <p>Prior to the issuance of building permits for projects within 1,300 feet of the Southern California Gas Company (SCGC) and San Diego Gas and Electric (SDG&E) blow-down facilities, documentation shall be submitted to the City confirming that sound attenuation devices and/or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events are available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund all sound attenuation improvements to the blow-down facilities required by this measure. It shall also be the responsibility of the developer to coordinate with San Diego Gas and Electric and/or Southern California Gas Company regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the San Diego Gas and Electric</p>	<p>Less than Significant with Mitigation</p>

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
units, and the project is consistent with the City's current Housing Element.		
SIGNIFICANT IMPACTS		
None	Not applicable	Not applicable
Cumulative Population, Housing, and Employment Impacts		
Implementation of the proposed WLC project would improve the City's jobs/housing ratio by creating thousands of new construction and permanent jobs in the City. Therefore, it will not result in cumulatively considerable impacts to population or housing.	No mitigation is required.	Less than Significant
4.14 Public Services and Facilities		
LESS THAN SIGNIFICANT IMPACTS		
Police Protection		
As development under the WLCSP, the need for police services will increase. Future projects will pay applicable development impact fees and contribute property taxes to fund needed police services.	No mitigation is required.	Less than Significant
Fire Protection		
As development under the WLCSP, the need for fire services will increase. Under the WLCSP, a new fire station site will be contributed to the City. Future projects will pay applicable development impact fees and contribute property taxes to fund needed police services.	No mitigation is required.	Less than Significant
Schools		
Future industrial development will contribute no new students to local	No mitigation is required.	Less than Significant

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>schools. Payment of the school impact fees to the MVUSD and SJUSD will reduce potential impacts to school services and facilities to less than significant levels.</p>		
<p>Parks, Recreation, Trails</p>		
<p>Development under the WLCSP is logistics warehousing which will not generate new City residents who require additional parks and trails. The WLCSP proposes trail connections to Redlands Boulevard, Cactus Avenue, and the State-owned land to the south, plus a loop trail through the WLCSP site.</p>	<p>No mitigation is required.</p>	<p>Less than Significant</p>
<p>New or Physically Altered Recreation and Park Facilities</p>		
<p>Development under the WLCSP is logistics warehousing which will not generate new City residents who require additional or altered parks.</p>	<p>No mitigation is required.</p>	<p>Less than Significant</p>
<p>Cumulative Public Services and Facilities Impacts</p>		
<p>As development occurs, the need for public services will incrementally increase. Anticipated property tax increases and payment of DIF fees to the City will effectively mitigate potential cumulative impacts to public services.</p>	<p>No mitigation is required.</p>	<p>Less than Significant</p>
<p>SIGNIFICANT IMPACTS</p>		
<p>None</p>	<p>Not applicable</p>	<p>Less than Significant</p>

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
4.15 Traffic and Circulation		
LESS THAN SIGNIFICANT IMPACTS		
Air Traffic Patterns		
The project site is not within two miles of a public airport or private airstrip, and there are no major air traffic patterns over or in the immediate vicinity of the project site.	No mitigation is required.	Less than Significant
Design Hazard Features		
The project site is currently vacant agricultural land with only two major roadways (Theodore Street and Alessandro Boulevard). Under the WLCS, a complete arterial circulation network will eventually be constructed that will allow full truck access and minimize road-related hazards.	No mitigation is required.	Less than Significant
Emergency Access		
The project site is currently vacant agricultural land with only two major roadways and minimal need for emergency services. Development under the WLCS will eventually result in the construction of a complete arterial circulation network which will allow full access for emergency vehicles and services.	No mitigation is required.	Less than Significant
Alternative Transportation Policies, Plans, or Programs		
The proposed project will create a complete roadway circulation network, install a loop trail system, have Class II bikeways and sidewalks on all internal arterial streets, and streets can accommodate bus turnouts when needed by the local transit agency.	Carpooling is required under Air Quality Mitigation Measure 4.3.6.4A. No additional mitigation is required.	Less than Significant

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>SIGNIFICANT IMPACTS</p> <p>Impact 4.15.6.1 Existing (2012) With Phase 1 Conditions Traffic and Level of Service</p> <p>Existing baseline (year 2012) with Phase 1 intersection levels of service for the study area intersections include 15 study intersections where Phase 1 of the project would have a significant impact. Twelve of these intersections already exceed the threshold of significance under existing conditions and would therefore be considered cumulative impacts and mitigation is required. Phase 1 of the project would cause a direct project impact at the other three intersections and mitigation is required.</p>	<p>4.15.7.4A A traffic impact analysis (“TIA”) conforming to the guidelines for traffic impact analysis adopted by the City shall be submitted in conjunction with each Plot Plan application within the World Logistics Center Specific Plan. Prior to the approval of the Plot Plan, the City shall review the traffic impact analysis to determine if any of the traffic improvements listed in Final EIR Volume 2 Tables 4.15.AV through 4.15.BA (TIA Tables 74 through 79) of the traffic impact analysis prepared for the Program Environmental Impact Report are required to be completed prior to the issuance of a certificate of occupancy for each building. If the City determines that any of the improvements within Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated into insignificance, then the completion of construction of the improvements prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. Construction of improvements within the City shall be subject to credit/reimbursement agreement for those DIF and/or TUMF eligible costs. If the City determines that any of the improvements outside Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated to a less than significant level, then the payment of any necessary fair share contribution as prescribed in Mitigation Measure 4.15.7.4G prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. If the City determines that the traffic impacts which will result from the construction or operation of a building will be significantly more adverse than those shown in the Program Environmental Impact Report, further environmental review shall be conducted prior to the approval of the Plot Plan pursuant to Public Resources Code § 21166 and CEQA Guidelines § 15162 to determine what additional mitigation measures, if any, will be required in order to maintain the appropriate levels of service.</p> <p>4.15.7.4B As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require the dedication of appropriate right-of-way consistent with the Subdivision Map Act for frontage street improvements contained within the World Logistics Center Specific Plan Circulation Map, as shown in this Program EIR Figure 3-10 for</p>	<p>Significant and Unavoidable</p>

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
	<p><u>Figure 22 in the TIA prepared for this Program EIR). Required dedications shall be made prior to the issuance of occupancy permits for the requested development.</u></p> <p>4.15.7.4C <u>As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the Development Impact Fee (DIF) as set forth in Municipal Code Chapter 3.42. Required DIF payments shall be made prior to the issuance of occupancy permits for the requested development.</u></p> <p>4.15.7.4D <u>As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the requisite Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Sections 3.55.050 and 3.55.060. Required TUMF payments shall be made prior to the issuance of occupancy permits for the requested development.</u></p> <p>4.15.7.4E <u>In order to ensure that all of the Project's traffic impacts are mitigated to the greatest extent feasible, the Applicant shall contribute its fair share of the cost of the needed traffic improvements that are not within the City as identified in the World Logistic Center Specific Plan Traffic Impact Analysis (i.e., under the jurisdiction of other cities, the County of Riverside or Caltrans, pursuant to Mitigation Measure 4.15.7.4F). As used in this mitigation measure, the Applicant's "fair share" has been determined in compliance with the requirements of the Fee Mitigation Act, Government Code § 66000 et seq., and, pursuant to § 66001(g), does not require that the Applicant be responsible for making up for any existing deficiencies.</u></p> <p><u>For example, the intersection of Martin Luther King Blvd. and the I-215 northbound ramps (Intersection 85) in the City of Riverside was identified as a place where the World Logistic Center contributes to cumulatively significant impacts, and where the fair share contribution of the World Logistic Center project as a whole was computed to be 6.2%. If the City of Riverside establishes a fair share contribution program consistent with this Mitigation Measure 4.15.7.4F to improve that intersection, then when a certificate of occupancy is to be issued for a 2-million square feet high-cube warehouse in the World Logistic Center (approximately 5% of the entire World Logistic Center project) the amount of the fair share payment due from the Applicant to the City of Riverside would be computed as follows:</u></p>

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
control the timing of improvements required at locations outside of the City of Moreno Valley.		
Impact 4.15.6.3 Year 2047-2022 with Project (Phase 1) Conditions Traffic and Level of Service Impacts		
The project will contribute significant amounts of traffic onto roadways and at intersections in the City of Moreno Valley and other cities, and area freeways, during Phase 1 development (approx. 2013 to 2047-2022).	Implementation of previously identified Measures 4.15.7.4A through 4.15.7.4G as they apply to development that occurs from project opening until Year 2022 (considered to be Phase 1).	Significant and Unavoidable
Impact 4.15.6.3 Year 2022-Cumulative With Project-Conditions Traffic and Level of Service Impacts		
The project will contribute significant amounts of traffic onto roadways and at intersections in the City of Moreno Valley and other cities, and area freeways, during Phase 2 development (approx. 2047 to 2022).	Implementation of previously identified Measures 4.15.7.4A through 4.15.7.4H as they apply to development that occurs from 2017 to 2022 (considered to be Phase 2).	Significant and Unavoidable
Impact 4.15.6.4 Cumulative Impacts - General Plan Buildout (Year 2035) With Project Conditions Traffic and Level of Service Impacts		
The project will contribute significant amounts of traffic onto roadways and at intersections in the City of Moreno Valley and other cities, and area freeways, after completion of development under the WLCSP (i.e., after 2022).	Implementation of previously identified Measures 4.15.7.4A through 4.15.7.4G for development as it occurs during development under the WLCSP.	Significant and Unavoidable
4.16 Utilities and Service Systems		
LESS THAN SIGNIFICANT IMPACTS		
Construction or Expansion of Water Treatment Facilities		
The project can connect to the existing water supply and will not require the construction of any new water storage or treatment facilities.	No mitigation is required.	Less than Significant

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
Cumulative Water Supply		
The EMWD has determined that it will be able to provide adequate water supply to meet the potable water demand for the project area, including existing and future users, when planned groundwater storage improvements are completed.	No mitigation is required.	Less than Significant
Wastewater Treatment Requirements		
Expected wastewater flows from the proposed WLC project will not exceed the capabilities of the serving treatment plant.	No mitigation is required.	Less than Significant <u>No Impact</u>
Wastewater Treatment Capacity and/or New or Expanded Wastewater Facilities		
The proposed WLC project would not require the construction of new wastewater treatment facilities or expansion of existing facilities, which could cause significant environmental effects.	No mitigation is required.	Less than Significant
Cumulative Wastewater Treatment		
The proposed project, in conjunction with planned and future development within the service area, will incrementally increase the need for wastewater treatment over the long-term. However, the project itself would not require the construction of new wastewater treatment facilities or expansion of existing facilities.	No mitigation is required.	Less than Significant
Solid Waste Facilities		
Adequate daily surplus capacity exists at the receiving landfill, so project development would not significantly impact current operations or the expected lifetime of the landfill serving the project area.	No mitigation is required.	Less than Significant

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>Solid Waste Reduction</p> <p>The project would be required to comply with applicable elements of AB 1327, Chapter 18 (California Solid Waste Reuse and Recycling Access Act of 1991) and other applicable local, state, and federal solid waste disposal standards, thereby ensuring that the solid waste stream to the Badlands Sanitary Landfill is reduced in accordance with existing regulations.</p>	<p>Implementation of previously identified Air Quality Mitigation Measure 4.3.6.4B will help reduce long-term production of solid waste from the site, and no additional mitigation is required.</p>	<p>Less than Significant</p>
<p>Cumulative Solid Waste</p> <p>The proposed project, in conjunction with planned development in the surrounding region, will contribute increased volumes of solid waste to local landfills. However, these volumes will not exceed the capabilities of the County's waste management system. Consequently, cumulative impacts associated with solid waste within the City would be considered less than significant.</p>	<p>Implementation of previously identified Air Quality Mitigation Measure 4.3.6.4B will help reduce long-term production of solid waste from the site.</p>	<p>Less than Significant</p>
<p>Cumulative Energy Facilities and Consumption</p> <p>The WLC project, in conjunction with planned development in the region, will increase energy consumption as development occurs. The project will adhere to Title 24 and the California Green Building Code, and will exceed Title 24 energy consumption guidelines by at least 10 percent. Therefore, the project will not make a significant contribution to energy facilities or consumption.</p>	<p>Implementation of project as designed (i.e., with sustainability outlined in WLCSP) and allowance for future "solar ready" buildings (PV installations), plus implementation of Mitigation Measures 4.16.4.6.1A and 4.16.4.6.4B1C will reduce project's contribution to cumulative energy consumption to less than significant levels.</p>	<p>Less than Significant</p>
<p>SIGNIFICANT IMPACTS</p>		
<p>Impact 4.16.1.6.1 Adequate Water Supply</p>		
<p>The Water Supply Assessment prepared</p>	<p><u>4.16.1.6.1A</u> Prior to approval of a precise grading permit for each plot plan for development</p>	<p>Less than</p>

World Logistics Center Project**

Table 1.B: World Logistics Center Project Environmental Impact Summary

Issues/Impacts	Mitigation Measures	Level of Significance
<p>adequate treatment capacity is available, so the proposed WLC project would not make a significant contribution to any cumulatively considerable impacts on water supply or infrastructure.</p>		<p><u>Mitigation</u></p>
<p>Cumulative Impacts to Wastewater Facilities</p>		
<p>As the wastewater from all development within the service area of the MWRW RF would be similarly treated under the NPDES, no cumulatively significant exceedance of Santa Ana RWQCB wastewater treatment requirements would occur.</p>	<p>Mitigation not required</p>	<p>Less than Significant</p>
<p>Impact 4.16.4.6.1 Construction or Expansion of Electrical and Natural Gas Facilities</p>		
<p>Based on calculations contained Tables 4.16.I and 4.16.J, the proposed WLC project would consume approximately 376,426 megawatt-hours (MWh) of electricity and almost 14.6 million cubic feet of natural gas per year. Therefore, the proposed project may induce the need to construct new electrical and natural gas facilities. This is a significant impact that requires mitigation.</p>	<p>4.16.4.6.1A Each application for a building permit shall include energy calculations to demonstrate compliance with the California Energy Efficiency Standards confirming that each new structure meets applicable Building and Energy Efficiency Standards. The plans shall also ensure that buildings are in conformance with the State Energy Conservation Efficiency Standards for Nonresidential buildings (Title 24, Part 6, Article 2, California Administrative Code). This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions. Plans shall show the following: <u>Energy-efficient roofing systems, such as “cool” roofs, that reduce roof temperatures significantly during the summer and therefore reduce the energy requirement for air conditioning.</u> <u>Cool pavement materials such as lighter-colored pavement materials, porous materials, or permeable or porous pavement, for all roadways and walkways not within the public right-of-way, to minimize the absorption of solar heat and subsequent transfer of heat to its surrounding environment.</u> <u>Energy-efficient appliances that achieve the 2008 Appliance Energy Efficiency Standards (e.g., EnergyStar Appliances) and use of sunlight-filtering window coatings or double-paned windows.</u></p> <p>4.16.4.6.1B Prior to the issuance of any building permits within the World Logistics Center Specific Plan, each project developer shall submit energy calculations used to</p>	<p>Less than Significant with <u>Mitigation</u></p>

Issues/Impacts	Mitigation Measures	Level of Significance
	<p><u>that each building has implemented the following:</u></p> <ol style="list-style-type: none"> 1) <u>Install solar panels with a capacity equal to the peak daily demand for the ancillary office uses in each warehouse building.</u> 2) <u>Increase efficiency for buildings by implementing either 10 percent over the 2008 Title 24's energy saving requirements or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict; and</u> 3) <u>Require the equivalent of "Leadership in Energy and Environmental Design Certified" for the buildings constructed at the World Logistics Center based on Leadership in Energy and Environmental Design Certified standards in effect at the time of project approval.</u> <p><u>This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions.</u></p>	

1.11 ALTERNATIVES TO THE PROPOSED PROJECT

In compliance with CEQA Guidelines (Section 15126.6), an EIR must describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the project objectives as listed in Table 1.C and would avoid or substantially lessen significant effects of the project. The EIR need not consider every conceivable alternative; rather it must consider a reasonable range of potentially feasible alternatives. This EIR evaluates a “No Project/No Build” as well as a “No Project” alternative (i.e., development according to the General Plan and zoning) in order to allow decision-makers to compare the effect of approving the project to the effect of not approving the project. A more detailed description of each project alternative as well as an analysis of the potential environmental impacts associated with the construction and operation of each is provided in Section 6.0 Alternatives. It should be noted that, for all of the alternatives, the 1,084 acres owned by the California Department of Fish and Wildlife (CDFW) and San Diego Gas & Electric (SDG&E) would be designated as Open Space in the City’s General Plan, similar to the proposed project.

1.611.1 No Project/No Development

CEQA requires an analysis of the environmental effects of not developing the proposed project. This allows the reviewer to see what the results of not developing the project site would be and also outlines existing or baseline conditions on the site. With the No Development Alternative, no development would occur and the majority of the site would remain in dry farming, with a small amount in rural residential uses.

1.611.2 No Project/Existing General Plan Alternative

Pursuant to CEQA (§15126.6[e][2]), this No Project Alternative discusses what would reasonably be expected to occur on the site based on current plans and consistent with available infrastructure and community services in the foreseeable future. This alternative would result in development of the project with the land uses currently shown in the City’s General Plan (i.e., the Moreno Highlands Specific Plan or MHSP). The approved 3,038-acre MHSP is a master planned, mixed-use community, consisting of up to 7,763 residential dwelling units on approximately 2,435 acres and approximately 603 acres of business, retail, institutional, and other uses. The 1,084 acres owned by the CDFW and SDG&E are currently designated as Residential, Public Facilities, and Open Space in the City’s General Plan and would be designated as permanent Open Space under this alternative, similar to the proposed project.

1.11.3 Alternative 1: Reduced Density

This alternative would develop approximately 29 million square feet of logistics warehousing (approximately 30% less than under the proposed project) on the 2,610 acres of land under the Specific Plan, including 74.3 acres for open space. The 1,084 acres owned by the CDFW and SDG&E would be designated as Open Space in the City’s General Plan, similar to the proposed project.

1.11.4 Alternative 2: Mixed Use A Alternative

This alternative would result in development of the entire property with a mix of 1,410 acres of logistics warehousing (22 million square feet), 1,000 acres of light manufacturing, assembly, or business park uses (20 million square feet), 50 acres of retail commercial uses (500,000 square feet), 100 acres of professional or medical office uses (1 million square feet), and 150 acres of open space.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The 1,084 acres owned by the CDFW and SDG&E would be designated as Open Space in the City's General Plan, similar to the proposed project.

1.116.5 Alternative 3: Mixed Use B Alternative

This alternative would develop the project site similar to the land use plan of the MHSP but with 10 million square feet of logistics warehousing on the 603 acres proposed for business, retail, institutional, and other uses under the MHSP.

1.116.6 Alternative Sites

This alternative would relocate development under the proposed project to another site in the surrounding region. This analysis included potential sites in nearby cities and several unincorporated sites in the general project area. Due to the size and nature of the project, no feasible alternative sites were found in any of the eleven (11) jurisdictions evaluated.

1.11.7 Comparison of Project Alternatives

The following discussion compares the impacts of each alternative with the impacts of the proposed project, as detailed in Section 4.0 of this EIR. Table 1.C compares the impacts of the alternatives with those of the proposed project. This table identifies whether the alternative results in (1) a reduction of the impact; (2) a greater impact than the project; or (3) the same impact as the project.

Table 1.C: Comparison of Alternatives to the Proposed Project

Proposed Project

NI: No Impact

LTS: Less than Significant Impact

LTS/mit: Less than Significant Impact with Mitigation

SIG: Significant Impact with or without Mitigation

Project Alternatives

≡ Compared with the proposed project, no change in the significance of impact will occur.

➔ Compared with the proposed project, the significance of the impact is increased.

← Compared with the proposed project, the significance of the impact is reduced.

+ Compared with the proposed project, a new impact has been identified.

←SIG Compared with the proposed project, the volume or extent of the impact is reduced, yet still significant.

1.11.8 Environmentally Superior Alternative

As shown above in Table 1.C, the No Project/Existing General Plan Alternative has mixed impacts relative to the proposed project; it reduces aesthetic impacts to less than significant levels but worsens the jobs/housing ratio by introducing more housing than employment-generating uses. The Reduced Density Alternative incrementally reduces a number of impacts of the proposed project (e.g., traffic, air quality, and noise) but cannot reduce them to less than significant levels even with mitigation. The Mixed Use A Alternative substantially increases traffic and related impacts compared to the project impacts, but it does not create any additional significant impacts. The Mixed Use B Alternative would incrementally increase traffic and would not improve the jobs/housing balance. It would incrementally reduce health risks to existing residents along Redlands Boulevard (i.e., approximately 30 percent less warehousing), but could create health risks for new residents depending on the ultimate location of warehouses and new residences. In addition, this alternative would also worsen the jobs/housing ratio of the City by allowing the construction of many more homes than job-creating land uses. Regarding air quality impacts (criteria pollutants), development of any land uses would likely exceed SCAQMD thresholds mainly due to the size of the proposed project site.

The *CEQA Guidelines* (Section 15126.6 (e[2])) requires that an environmentally superior alternative be identified in the EIR. Based on the analysis in Section 6.0 *Alternatives* and the summary contained in Table 1.C, Alternative 1 – Reduced Density – is the only alternative that reduces traffic, air quality, and related impacts by reducing the total square footage of warehousing by approximately 30 percent. Alternative 3 - Mixed Use B - is the only alternative that would reduce a significant impact of the proposed project (i.e., aesthetics – views). However, it could create health risks for future residents of the project, and would worsen the jobs/housing balance of the City over the long term. For these reasons, Alternative 1 – Reduced Density - has been deemed to be environmentally superior to the proposed project. However, none of the alternatives achieves the objectives of the project to nearly the same degree as the proposed project.

Table 1.D compares Alternative 1 to the project objectives and indicates that Alternative 1 does not meet most of the major goals of the proposed project mainly because of the reduced total square footage by 30 percent, which also reduces the amount of new employment and property tax revenues generated to the City.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Note: The objectives outlined in this table did not correspond to the Project Objectives outlined in the Project Description of the DEIR, therefore, they are being corrected at this time. In addition, some numerical changes result from the changes to the Specific Plan area.

Table 1.D: Comparison of the Environmentally Superior Alternative to the Project Objectives

Project Objectives	Degree to Which Alternative 1 Satisfies the Project Objectives
<u>Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.</u>	Not to the Same Degree as the Proposed Project. This alternative would provide only 16,797 new employees compared to 24,000 from the proposed project (30% less).
<u>Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.</u>	Not to the Same Degree as the Proposed Project. The alternative introduces substantially less employment-generating uses on the site which is not consistent with the City's Economic Strategic Plan.
<u>Create a major logistics center with good regional and freeway access.</u>	Not to the Same Degree as the Proposed Project. The alternative would allow 28 MSF of logistics warehousing near the SR-60 Freeway but it would be less attractive as a major regional logistics center compared to the proposed project.
<u>Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.</u>	Meets Objective. Development of the project area under this alternative would most likely proceed under some form of specific plan, which would help ensure future development was consistent with a comprehensive plan for the area.
<u>Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.</u>	Meets Objective. The alternative would develop a smaller amount of logistics warehousing compared to the proposed project, but it would still be master planned, most likely under a specific plan.
<u>Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.</u>	Not to the Same Degree as the Proposed Project. The alternative would allow 28 MSF of logistics warehousing vs. 40.6 MSF for the proposed project.
<u>Create a project that will provide a balanced approach to the City's fiscal viability, economic expansion, and environmental integrity.</u>	Not to the Same Degree as the Proposed Project. The alternative would not provide nearly as much new warehouse capacity to form a regional port-oriented logistics center compared to the proposed project.
<u>Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.</u>	Not to the Same Degree as the Proposed Project. The alternative would produce 30% less employment than under the proposed project, and would also provide less property tax revenue and be able to pay for less public improvements and infrastructure compared to the proposed project.
<u>Encourage new development consistent with regional and municipal service capabilities.</u>	Not to the Same Degree as the Proposed Project. It is unclear if a substantially reduced logistics warehousing project could afford to provide the necessary infrastructure to support the planned development compared to the proposed project.
<u>Significantly improve the jobs/housing balance and help reduce unemployment within the City.</u>	Not to the Same Degree as the Proposed Project. This alternative would provide only 16,797 new employees compared to 24,000 from the proposed project (30% less).
<u>Provide thousands of construction job opportunities during the project's buildout phase.</u>	Not to the Same Degree as the Proposed Project. The alternative would not provide as much work for as many construction workers compared to the proposed project.
<u>Provide appropriate transitions or setbacks between on-site and off-site uses.</u>	Meets Objective. A smaller logistics warehouse project may be able to provide equal or greater transitions and buffers from existing off-site residential uses compared to the proposed project.

NOTE TO READERS

The Programmatic Draft Environmental Impact Report (DEIR) for the World Logistics Center Specific Plan (WLCSP) was originally circulated for public review from February 4 to April 8, 2013. Since that time, a number of changes have been made to the WLCSP. The original DEIR has also been revised to account for the changes to the WLCSP and to respond to the many comments received on the DEIR.

The primary change in the WLC Project is the total Specific Plan area has been reduced from 2,710 acres to 2,610 acres and the proposed development reduced from 41.6 million to 40.6 million square feet (both a 3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. In addition, the Specific Plan land use plan was divided into sixteen (16) Planning Areas based on traffic impact zones which allows for more accurate estimates of potential traffic and air quality impacts of the WLC Project. The revised Specific Plan (September 2014) also now shows a specific location for a “Clean Fueling” facility in Planning Area (PA) 7 at the northeast corner of Theodore Street and Eucalyptus Avenue. In the original WLCSP, a trail was proposed along the edge of the Open Space area in the southwestern portion of the site to connect to existing trails along Redlands Boulevard and Cactus Avenue to the west and planned trails within the San Jacinto Wildlife Area and Mystic Lake to the south. In response to changes to the proposed project and concerns expressed by Native Americans, the trail in the revised WLCSP has been moved away from the northern boundary of the Open Space area (now Planning Area 30) to reduce potential impacts to the Mt. Russell foothills. The WLCSP phasing plan or schedule was also revised or extended from 10 to 15 years, so that Phase 1 runs from 2015 to 2022 and Phase 2 runs from 2023 to 2030. Please refer to FEIR Volume 1 Section 1.4 and Section 3.0, Project Description, in this revised DEIR for a more detailed description of changes to the WLC project.

The technical studies that supported the analysis of environmental impacts in the DEIR were also modified to address changes in the WLCSP and in response to the many comments on the EIR and technical studies. The following studies were revised: agriculture, air quality, biology, cultural resources, greenhouse gases, hydrology/water quality, noise, economic and fiscal impacts, traffic, and utilities. An additional study on agricultural resources was prepared as an independent assessment of onsite resources using the state LESA model (see Section 4.2 in this document). For details on the changes to the technical studies, please refer to FEIR Volume 1 Section 1.6 and the introductory paragraphs of each environmental analysis section of this revised DEIR (Sections 4.1 through 4.16).

In summary, the WLCSP DEIR has been revised based on changes to the WLC project, technical studies, and the many comments received on the DEIR and its related technical studies. Changes to the DEIR document are shown in double underline if they are additions to the original text, and shown as ~~strikeout~~ if they are deletions to the original text.

2.0 INTRODUCTION AND PURPOSE

This Programmatic Environmental Impact Report (EIR) has been prepared to evaluate the environmental impacts associated with the proposed World Logistics Center Project (“proposed project” or “project”) in Rancho Belago, the eastern portion of the City of Moreno Valley (“City”), and to identify mitigation measures to avoid or minimize significant environmental impacts. The City is the “public agency which has the principal responsibility for carrying out or approving the project” and, as such, is the “Lead Agency” for this project under the California Environmental Quality Act (CEQA) of 1970 (*CEQA Guidelines* section 15367). CEQA requires the Lead Agency to consider the information contained in the EIR prior to taking any discretionary action. The EIR is also a public disclosure document available to agencies and the public for review and comment prior to the consideration of the proposed project by the City, and is intended to serve as an informational document to be considered by the City, Responsible Agencies, and Trustee Agencies during deliberations on the proposed project. The project approvals associated with the proposed project are described in Section 3.0.

This section of the EIR outlines the document’s format; describes the purpose of the EIR; summarizes public review of the EIR; describes the Mitigation Monitoring and Reporting Program (MMRP); identifies the environmental issues discussed in the EIR; and defines the parameters and data to be used in the analysis of cumulative impacts.

2.1 DOCUMENT FORMAT

To assist the reader’s review of the document, the following describes the format of this EIR.

- Section 1.0 Executive Summary* provides a summary of the EIR document and (in Table 1.B) identifies potentially significant impacts, mitigation measures, and the level of significance of each impact following mitigation.
- Section 2.0 Introduction and Purpose* outlines the EIR document’s format including technical appendices; describes the purpose of the EIR including the legal purpose of CEQA, the intended use of EIR, and the EIR’s incorporated documents and referenced technical reports; summarizes the public review of the EIR to date; describes the role of the MMRP to be provided in the Final EIR; identifies the sixteen environmental issues that are discussed; and defines the cumulative analysis provided in the EIR.
- Section 3.0 Project Description* provides a detailed description of the geographical setting, project location, project setting, City of Moreno Valley General Plan designations, World Logistics Center Specific Plan land use designations, zoning designations, project characteristics, project objectives, and discretionary actions required to implement the proposed project. This section also explains the other areas in addition to the Specific Plan that are part of the proposed project (i.e., off-site improvement areas, California Department of Fish and Wildlife property, and public facilities lands).
- Section 4.0 Existing Setting, Impacts, and Mitigation Measures* evaluates the impacts associated with the proposed project. This section is organized by sixteen issue areas with each following the framework:
- *Existing Setting.* Information in the existing setting contains a discussion of the local and regional environment conditions (environmental and man-made) in existence at the time this EIR was prepared. Existing setting information provides the reader with the “baseline” from which future impacts are analyzed, and provides a standard against which to measure these impacts.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

- *Existing Policies and Regulations.* Regulatory requirements and policies (federal, state, and local) applicable to the issue area are summarized.
- *Methodology.* A brief summary of the methods and resources utilized in the preparation of the environmental analysis.
- *Thresholds of Significance.* Determinations regarding the significance of potential impacts resulting from implementation of the proposed project are provided. These thresholds represent the criteria used in this programmatic EIR to determine whether identified impacts are significant.
- *Less than Significant Impacts.* Potential issues for which the proposed project was determined to have no impact or a less than significant impact are identified. For these issues, either no mitigation would be required or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.
- *Significant Impacts.* Potential impacts from implementation of the proposed project are identified. Each of these issues contains an impact analysis, mitigation measures, and significance after mitigation discussion.
 - *Impact Analysis.* An analysis of potential programmatic impacts of the proposed project is presented in this section. This discussion focuses on the impacts of implementation of the proposed project, and includes potential short-term/long-term and direct/indirect project impacts, and consistency with applicable planning documents or regulations.
 - *Project Design Features.* Characteristics of the WLC Specific Plan or other aspects of the WLC project that help reduce potential environmental impacts.
 - *Mitigation Measures.* The measures proposed to mitigate any potential impacts of the proposed project are identified.
 - *Level of Significance after Mitigation* provides a conclusion as to whether implementation of the proposed project will reduce the project-related and cumulative impacts to a level that is less than significant.
- *Cumulative Impacts.* This discussion focuses on the potential environmental effect of the proposed project combined with the effects of reasonably foreseeable cumulative projects within the project study area.

Section 5.0 *Other CEQA Topics* contains discussions of additional topics required by CEQA, including effects found not to be significant, unavoidable effects of the proposed project, and significant irreversible environmental changes. The proposed project's consistency with regional plans (discussed in Section 4.10) and potential to induce growth (discussed in Sections 4.13) are summarized in this section.

Section 6.0 *Alternatives* contains discussion of alternatives to development of the proposed project. As allowed by CEQA, the impacts of these alternatives are evaluated at a more general level than the analyses of the proposed project that is contained in Section 4.0. This section also evaluates the proposed effects of the No Project Alternative and identifies the environmentally superior alternative.

Section 7.0 This section lists the organizations and persons consulted in preparation of the EIR.

Section 8.0 This section contains all the references cited in the EIR, acronyms and abbreviations used in the document, and definitions of terms used, including those specific to the proposed WLC project.

Appendices The Appendices contain a copy of the NOP, NOP mailing list, NOP comment letters and responses, public scoping meeting information, all of the various technical studies that support the EIR analysis, referenced materials, and other relevant correspondence received during the course of the analysis of the proposed project.

2.2 PURPOSE OF CEQA AND THE ENVIRONMENTAL IMPACT REPORT

According to Section 15002 of *CEQA Guidelines*, the basic purposes of CEQA are to:

- Inform government decision-makers and the public about the potential significant environmental effects of proposed activities;
- Identify ways that environmental damage can be avoided or significantly reduced;
- Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governing agency finds the changes to be feasible; and
- Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

CEQA requires that a project be reviewed to determine the environmental effects that would result if the project were approved and implemented. The City has the responsibility for preparing, processing, and determining whether to approve the proposed project and certify this EIR. As Lead Agency, the City has the authority to make decisions regarding discretionary actions relating to implementation of the proposed project.

2.2.1 Program EIR

This EIR will serve as a Program EIR pursuant to the *State CEQA Guidelines* Section 15168, which states that a Program EIR is appropriate for a project that involves "... a series of actions that can be characterized as one large project and are related either:

- (1) Geographically;
- (2) A logical parts in the chain of contemplated action;
- (3) In connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program, or
- (4) As individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways."

Section 15168 of the *CEQA Guidelines* explains how a Program EIR relates to future activities within the project area:

"(c) Use with Later Activities. Subsequent activities in the program must be examined in the light of the program EIR to determine whether an additional environmental document must be prepared.

- (1) If a later activity would have effects that were not examined in the program EIR, a new Initial Study would need to be prepared leading to either an EIR or a Negative Declaration.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- (2) If the agency finds that pursuant to Section 15162, no new effects could occur or no new mitigation measures would be required, the agency can approve the activity as being within the scope of the project covered by the program EIR, and no new environmental document would be required.
 - (3) An agency shall incorporate feasible mitigation measures and alternatives developed in the program EIR into subsequent actions in the program.
 - (4) Where the subsequent activities involve site-specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.
 - (5) A program EIR will be most helpful in dealing with subsequent activities if it deals with the effects of the program as specifically and comprehensively as possible. With a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required.
- (d) Use with Subsequent EIRs and Negative Declarations. A program EIR can be used to simplify the task of preparing environmental documents on later parts of the program. The program EIR can:
- (1) Provide the basis in an Initial Study for determining whether the later activity may have any significant effects.
 - (2) Be incorporated by reference to deal with regional influences, secondary effects, cumulative impacts, broad alternatives, and other factors that apply to the program as a whole.
 - (3) Focus an EIR on a subsequent project to permit discussion solely of new effects which had not been considered before.
- (e) Notice with Later Activities. When a law other than CEQA requires public notice when the agency later proposes to carry out or approve an activity within the program and to rely on the program EIR for CEQA compliance, the notice for the activity shall include a statement that:
- (1) This activity is within the scope of the program approved earlier, and
 - (2) The program EIR adequately describes the activity for the purposes of CEQA.”

2.2.2 World Logistics Center EIR

As previously noted, CEQA requires the Lead Agency to consider the information contained in the EIR prior to taking any discretionary action on a project. This EIR provides information to the Lead Agency and other public agencies, the general public, and decision-makers regarding the potential environmental impacts from the construction and operation of the proposed project. The purpose of the public review of the EIR is to evaluate the adequacy of the environmental analysis in terms of compliance with CEQA. Section 15151 of the *CEQA Guidelines* states the following regarding standards from which adequacy is judged:

“An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the

EIR should summarize the main points of disagreement among experts. The courts have not looked for perfection but for adequacy, completeness, and a good faith effort at full disclosure.”

An EIR is the most comprehensive form of environmental documentation identified in CEQA and the *CEQA Guidelines*, and provides the information needed to assess the environmental consequences of a proposed project. EIRs are intended to provide an objective, factually supported, full-disclosure analysis of the environmental consequences associated with a proposed project that has the potential to result in significant, adverse environmental impacts.

Under CEQA (PRC Section 21002.1[a]):

“The purpose of an environmental impact report is to identify the significant effects on the environment of a project, to identify alternatives to the proposed project, and to indicate the manner in which those significant effects can be mitigated or avoided.”

Note: The following revisions are based on project changes outlined in the WLC Specific Plan.

This programmatic EIR has been prepared to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the proposed 44-~~6~~ 40.4 million square feet of logistics warehouse facilities (i.e., the World Logistics Center), as well as its associated infrastructure, designation of the CDFW property as permanent open space, and designation of the Natural Gas Compressor Plant as Public Facility, along with related entitlements. As permitted under the *CEQA Guidelines* (Section 15084[d-e]), LSA Associates, Inc. (LSA) has prepared the EIR under the direction of professional City planning staff. However, prior to certification, the Planning Commission and the City Council must independently review the methodologies used, and conclusions reached in the EIR. The City is undertaking an independent review of this EIR by having City planning staff work with LSA on the EIR, and by employing a third-party consultant to independently review the EIR. If certified by the City, the information included in and the conclusions reached in the EIR will therefore represent the City’s independent judgment.

This programmatic EIR has been prepared utilizing information from City planning and environmental documents, applicant-provided technical studies, and other publicly-available data. Alternatives to the proposed project are also discussed and mitigation measures that would offset, minimize, or otherwise avoid significant environmental impacts from the proposed project have been identified. This EIR has been prepared in accordance with CEQA, California Public Resources Code §21000 *et seq.*; the *Guidelines for California Environmental Quality Act* (California Code of Regulations, Title 14, Chapter 3); and the rules, regulations, and procedures for implementing CEQA as adopted by the City. The objective of the EIR is to inform City decision-makers, representatives of other affected/responsible agencies, the public, and other interested parties of the potential environmental consequences that may be associated with the approval and implementation of the proposed project.

2.3 REGIONALLY SIGNIFICANT PROJECT

When an EIR is prepared for any project that is considered to be of statewide, regional, or area-wide significance, as defined by *CEQA Guidelines* Section 15206, then the Draft EIR must be submitted to the State Clearinghouse and the appropriate metropolitan area council of governments for review and comment. A project is considered to be of statewide, regional, or area-wide significance if it meets any of the following criteria:

- (1) A proposed local general plan, element, or amendment thereof for which an EIR was prepared.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- (2) A project has the potential for causing significant effects on the environment extending beyond the city or county in which the project would be located. Projects of this nature would include:
 - (a) A proposed residential development of more than 500 dwelling units.
 - (b) A proposed shopping center or business establishment employing more than 1,000 persons or encompassing more than 500,000 square feet of floor space.
 - (c) A proposed commercial office building employing more than 1,000 persons or encompassing more than 250,000 square feet of floor space.
 - (d) A proposed hotel/motel development of more than 500 rooms.
 - (e) A proposed industrial, manufacturing, processing plant, or industrial park planned to employ more than 1,000 persons, occupying more than 40 acres of land, or encompassing more than 650,000 square feet of floor area.
- (3) A project which would result in cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965 (Williamson Act) for any parcel of 100 or more acres.
- (4) A project for which an EIR has been prepared that is located in and would substantially affect areas of critical environmental sensitivity.
- (5) A project which would substantially affect sensitive wildlife habitats and habitats for endangered, rare, or threatened species.
- (6) A project that would interfere with the attainment of regional water quality control standards as stated in the approved area-wide waste treatment management plan.
- (7) A project that would provide housing, jobs, or occupancy for 500 or more persons within 10 miles of a nuclear power plant.

The World Logistics Center Project, as proposed, would be considered a “project of statewide, regional or area-wide significance” per criteria 2(e). In addition, the Southern California Association of Governments (SCAG) indicated in its NOP letter that this project was regionally significant. Therefore, the NOP, Draft EIR, and NOC will be transmitted to the State Clearinghouse and the appropriate metropolitan area council of governments, which in this case is the Western Riverside Council of Governments (WRCOG), for review and comment.

2.4 INCORPORATED DOCUMENTS

CEQA (§15150) permits the incorporation by reference of all or portions of other documents that are generally available to the public. Any document incorporated by reference shall be made available to the public for inspection at a public place or public building and requires that the EIR state where the incorporated documents will be made available for public inspection. The following documents have been incorporated by reference:

- *City of Moreno Valley General Plan, various elements*, adopted by City Council Resolution No. 2006-83, July 11, 2006, and last updated October 2006.
- City of Moreno Valley General Plan Final Environmental Impact Report, certified July 2006.
- City of Moreno Valley General Plan Land Use Map, last updated August 2010.
- City of Moreno Valley Zoning Atlas, last updated November 2011.
- City of Moreno Valley Municipal Code (various chapters), last updated February 2012.
- Moreno Highlands Specific Plan EIR, adopted 1992.

2.5 TECHNICAL REPORTS

Various technical or project-related reports have been prepared to assess specific issues that may result from the construction and operation of the proposed project. As relevant, information from the following documents and technical reports has been integrated into the EIR as appendices.

- “The World Logistics Center Specific Plan” (Highland Fairview) original dated January 30, 2013, revised dated September 2014.
- “An Agricultural Industry Analysis of the Inland Empire” (Andrew Chang & Co.), original dated March 2012, revised September 2014.
- “Agricultural Resources Assessment for the WLCSP” (Parsons Brinckerhoff), original dated March 2012, revised December 2013.
- “Agricultural Assessment for the WLCSP” (Cushman and Wakefield) new report dated December 20, 2013 (prepared for Final EIR in response to comments).
- “Air Quality, Greenhouse Gas, and Health Risk Assessment for the WLCSP” (MBA), original dated January 2013, revised April 2015.
- “Habitat Assessment, MSHCP Consistency Analysis, and JPR Review” (MBA), original dated December 20, 2012, revised September 2014.
- “Delineation of Jurisdictional Waters and Wetlands” (MBA), original dated November 2012, revised September 2014.
- “Phase I and Phase II Cultural Resources Assessment” (MBA), original dated May 2012, revised September, 2014.
- “Preliminary Geotechnical Investigation” (Leighton), original dated March 23, 2012, revised September 2014.
- “Supplemental Geotech Assessment for Offsite Improvements Related to the WLCSP” (Leighton), original dated March 23, 2013, revised September 2014.
- “Phase 1 Environmental Site Assessments” (various dates, LOR Geotechnical) (not revised).
- “Draft Master Plan of Drainage Study” (CH2MHill) original dated November 2012, revised dated September 2014.
- “Preliminary Water Quality Management Plan” (CH2MHill) original dated November 2012, revised September 2014.
- “Noise Assessment for the WLCSP” (Mestre Greve Associates) original dated January 2013, revised September 2014.
- “Traffic Impact Assessment (TIA) for the WLCSP” (Parsons Brinckerhoff) original dated January 2013, revised September 2014.
- “NAIOP Assessment of Available High-Cube Trip Generation Rates” (Kunzman Associates), December 20, 2011.
- “Water Supply Assessment for the WLCSP” (Eastern Municipal Water District), March 21, 2012.
- “Highlands Water Budget” (CH2MHill), original dated December 2012, revised September 2014.
- “Water System Modeling Results” (CH2MHill), original dated December 2012, revised dated October 22, 2013.
- “Sewer and Reclaimed Wastewater Memorandum” (CH2MHill), original dated April 25, 2012, revised September 2014.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- “Dry Utilities – Technical Memorandum” (Utility Specialists), original dated December 20, 2012, revised September 2014.
- “Electrical System Forecast of Utility Infrastructure” (MVU Engineering), original dated December 2012, revised September 2014.
- “Fiscal and Economic Impact Study for the World Logistics Center” (David Taussig and Associates), original dated January 15, 2013, revised September 2014.

In addition to their inclusion in their entirety as appendices to this EIR, these documents are available for review at the following location:

Moreno Valley City Hall
Community & Economic Development Department
Planning Division
14177 Frederick Street
Post Office Box 88005
Moreno Valley, California 92552
Phone: (951) 413-3238
~~Monday–Friday–Thursday~~ 7:30 a.m.– 5:30 p.m.
Friday 7:30 a.m. – 4:30 p.m.

2.6 PUBLIC REVIEW OF THE DRAFT ENVIRONMENTAL IMPACT REPORT

This EIR was distributed to responsible and trustee agencies, other affected agencies, and interested parties. Additionally, in accordance with Public Resources Code Section 21092(b)(3), the EIR ~~has been~~ was provided to all parties who ~~have~~ previously requested copies. The Notice of Completion (NOC) and Notice of Availability (NOA) of the EIR ~~have been~~ was distributed as required by CEQA ~~During the 45~~ for a 63-day public review period in excess of the 45 days typically suggested by CEQA. During the public review period, the EIR and technical appendices ~~have been~~ were made available for review.

Written comments regarding this EIR were addressed to:

John Terrell, Richard Sandzimier, Planning Official
and
Mark Gross, Senior Planner
~~Community & Economic Development Department~~
~~Planning Division~~
14177 Frederick Street
Post Office Box 88005
Moreno Valley, California 92552
Phone: (951) 413-3206
Email: ~~JohnT@moval.org~~ RichardSa@moval.org
Markg@moval.org

After the ~~45-day~~ public review period, written responses to all significant environmental issues raised ~~will be~~ were prepared and included in the Final EIR Volume 1 – Response to Comments. These responses will be available for review for a minimum of 10 days prior to the public hearings before the City of Moreno Valley Planning Commission and City Council, at which time the certification of the Final EIR will be considered. The Final EIR (which includes the Draft EIR, the public comments and

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

responses to the Draft EIR, and findings) will be included as part of the environmental record for consideration by the City decision-makers. The City will respond as appropriate to comments made at public hearings on the WLC Project and EIR.

2.6.1 Notice of Preparation

The City initiated the environmental process without completion of an Initial Study. The City determined that, due to the nature and size of the proposed project, all environmental topics warranted further environmental review in an EIR. The City circulated over 40 copies of the Notice of Preparation (NOP) for the World Logistics Center EIR to state, regional, and local agencies, and nine copies to owners of adjacent properties on February 26, 2012, for a 30-day review period.¹ The NOP was distributed to the State Clearinghouse, as well as agencies and organizations that may provide comment on the proposed project as well as the potential environmental impacts that may result from the construction and operation of the proposed on-site uses.

Comments received regarding the NOP were used to help identify impacts that could result from implementation of the proposed project. The City received 27 comment letters to the NOP and six comment cards from the public Scoping Meeting. In addition, 30 individuals spoke at the Scoping Meeting. The NOP and comment letters received regarding the NOP are included in Appendix A of the EIR. Table 2.A provides a brief summary of NOP comment letters, Table 2.B lists City-identified issues from the scoping process, and Table 2.C lists Senate Bill (SB) 18 Native American consultation contacts.

Table 2.A: Notice of Preparation Comments Received

Agency/ Organization/ Individual	Date	Comments*	Addressed in Section(s) of the EIR
Governor's Office of Planning and Research	2/22	Scott Morgan. This letter acknowledges receipt of the NOP and identified the 30-day review period (2/22–3/22). OPR issued State Clearinghouse No. 2012021045	(2.0) Introduction
California Department of Transportation (Caltrans)	2/29	Daniel Kopulsky. Must prepare a traffic impact study according to the Caltrans' Guide for the Preparation of Traffic Impact Studies. Also must prepare a drainage study and identify impacts to state drainage facilities. Existing capacity of the state drainage systems cannot be exceeded.	(4.15) Traffic
California Native American Heritage Commission (NAHC)	3/7	Dave Singleton. NAHC Sacred Lands File did not identify any resources within project area, but did list the following local tribes: Pechanga Band; Ramona Band; Santa Rosa Band; Morongo Band; San Manuel Band; Serrano Nation; Cahuilla Band; and Soboba Band (see Table 2.C).	(4.5) Cultural
Morongo Band	2/22	Franklin Dancy. Tribe indicated site was in its traditional use area and requested to be notified if human remains are found and the Morongo Band is determined to be the Most Likely Descendant, or if Native American artifacts are found during excavation/grading. They also requested that they be consulted if a Treatment Plan is needed for significant cultural resources on site.	(4.5) Cultural
Pala Tribe	3/8	Shasta Gaughen, Ph.D. Determined project was outside of traditional tribal area.	(4.5) Cultural
California	3/22	Jeff Brandt. EIR should address County's MSHCP, the San	(4.4) Biology

¹ The Notice of Preparation 30-day public review period was from February 25 to March 26, 2012. City of Moreno Valley.

Agency/ Organization/ Individual	Date	Comments*	Addressed in Section(s) of the EIR
			Housing (4.14) Services
Ned and Dawn Newkirk	3/21	What will happen to existing homes on site and what will be the traffic impacts?	(4.10) Land Use (4.15) Traffic
Scott Simpson	3/26	Concerned about water use, loss of views, air quality, increased lighting, recreation, biological impacts on SJWP, and economics to City.	(4.1) Aesthetics (4.3) Air Quality (4.4) Biology (4.10) Land Use (4.13) Population & Housing (4.14) Services (4.16) Utilities
Ron Roy	ND	Actual jobs (Skechers did not provide the jobs promised). Lease terms, amount of automation, no rail available for logistics, City mostly residential—do we need so much of one kind of employment? Gas costs for freight, traffic impacts (SR-60), changes to job base, visual impacts and loss of open space, and change in City identity.	(3.0) Project Description (4.1) Aesthetics (4.10) Land Use (4.13) Population & Housing (4.15) Traffic
Tom Thornsley	3/25	Air quality, aesthetics, drainage into SJWP, energy and conservation, water quality, land use, population, housing, employment changes, recreation, transportation, utilities, alternatives, and economic impacts.	(4.1) Aesthetics (4.3) Air Quality (4.4) Biology (4.9) Hydrology (4.10) Land Use (4.13) Population & Housing (4.14) Services (4.15) Traffic (4.16) Utilities (6.0) Alternatives
D. and M. Moreno	3/21	Fix local roads, project will reduce property values, air quality, and noise impacts.	(3.0) Project Description (4.1) Aesthetics (4.3) Air Quality (4.12) Noise (4.15) Traffic
Scoping Meeting Comment Cards			
Jaeger Jones	3/12	HF track record proves this project will not benefit City.	
Sandra Williams	3/12	Should consider less polluting projects within the City that still bring jobs; should not count on only warehouses.	(4.3) Air Quality (4.10) Land Use (6.0) Alternatives

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 2.A: Notice of Preparation Comments Received

Agency/ Organization/ Individual	Date	Comments*	Addressed in Section(s) of the EIR
Amber Reilly	3/12	Concerned about traffic, air quality, and local owls	(4.3) Air Quality (4.4) Biology (4.15) Traffic
Peggy Hadaway	3/12	Concerned about actual number of new jobs that will be created and air pollution. Need more variety of new jobs, not just warehousing.	(4.3) Air Quality (4.10) Land Use
George Hague (local Sierra Club representative)	3/12	EIR must look at viable alternatives that reduce impacts on SR-60. What will be transitional uses along the project boundaries to minimize impacts on adjacent residents? Need to clearly define “high cube” and project objectives. Scoping meeting is premature before Specific Plan is ready for the public to review. Does developer control all the land within the SP area? Will there be a truck stop and what would be the impacts of that facility? What level of LEED will be achieved? Project will displace not replace 7,700 housing units so this must be analyzed in EIR (i.e., where those units will be transferred to within the City). EIR must look at toxic diesel particulates in addition to “diesel vapors” (term undefined).	(3.0) Project Description (4.1) Aesthetics (4.3) Air Quality (4.10) Land Use (4.15) Traffic (6.0) Alternatives
“Residents for a Livable Moreno Valley” Scoping handout from local residents (at meeting)	3/12	Concerned about relocation of existing jobs rather than creating new jobs here, and not very many new jobs as compared to other uses. Existing zoning would generate more jobs, more sales, and higher property taxes. Displacement vs. replacement of 7,700 housing units. East end of Moreno Valley does not have infrastructure to support this amount of new warehouses. Air pollutant impacts to sensitive receptors. Why change zoning here when General Plan and regional planners anticipates new warehouses in southwest portion of City near I-215?	(4.3) Air Quality (4.10) Land Use (4.13) Population & Housing
Arturo Benitez	3/14	Very concerned about the process and that everything be transparent and “published” so all can participate.	(2.0) Introduction
Charles Robinson	3/15	Need to make provisions to hire local employees (i.e., City residents) on a prioritized basis.	(3.0) Project Description (4.13) Population & Housing
Scoping Meeting Comments (in order of presentation)			
Kenny Bell	3/12	EIR needs to show accurate estimate of job creation, not like the Skechers project.	(4.13) Population & Housing
Susan Nash	3/12	State land south of site must be protected. CDFW open space land within project should not count toward open space requirements for project.	(4.4) Biology
Mike McCoy	3/12	Concerned about seismic safety (Casa Loma and San Jacinto Faults nearby). Impacts of warehouses vs. housing vastly higher, global reductions in logistics due to Panama Canal widening and railroad expansions.	(4.6) Geology
Tom Thornsley (2x)	3/12	Should bring railroad spur into site, should not just rely on trucks, no plans to widen SR-60, would take 10–20 years to complete such a widening. Need accurate economic assessment. Localized flooding and project needs buffers for existing residents.	(4.1) Aesthetics (4.9) Hydrology (4.13) Population & Housing

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 2.A: Notice of Preparation Comments Received

Agency/ Organization/ Individual	Date	Comments*	Addressed in Section(s) of the EIR
			(4.15) Traffic
Cathy Godfree	3/12	Need buffers, open space, zero runoff, reduce flooding, so much more asphalt, Skechers did not take care of flooding on Redlands Boulevard as promised. Trucks get off at Redlands Boulevard and try to enter at Eucalyptus Avenue. Trucks park on Redlands Boulevard waiting to enter project block traffic. Will there be a truck stop? Will need big setbacks to not block views off Merwin Street and Bay Avenue	(4.1) Aesthetics (4.9) Hydrology (4.15) Traffic
Andrew Jones	3/12	Skechers is a nice project, new ones should also be attractive, low water use and runoff.	(4.1) Aesthetics (4.9) Hydrology
Nanette Bartenee	3/12	On board of "Friends of San Jacinto Valley" SJWP is world-famous raptor habitat. Need good alternatives analysis for regional impacts.	(4.4) Biology (6.0) Alternatives
Frank Wright	3/12	Need more jobs but this project will generate a lot of traffic and will need to widen freeways.	(4.13) Population & Housing (4.15) Traffic
Ian McMillian (SCAQMD)	3/12	Works for SCAQMD. Project represents 25% of all planned warehouse space in region, big concern about diesel particulates and other pollutants. He would like to work with developer regarding alternative fuels for trucks.	(4.3) Air Quality (4.7) Greenhouse Gases
Rick Tendell (2x)	3/12	Need environmental design studies (compressed natural gas, hydrogen fuel cells, solar, etc.). Maybe even fuel trucks.	(4.7) Greenhouse Gases
Jim Randonoth	3/12	Skechers laid off 600 people in Ontario when it opened, what will all these projects do to regional employment?	(4.13) Population & Housing
Peggy Hadaway	3/12	Our Quality of Life will deteriorate from more warehouses. Need to bring in more varied employment and is concerned about air pollution.	(4.3) Air Quality (4.13) Population & Housing
Dave Slawson	3/12	Air quality, traffic, groundwater, noise	(4.3) Air Quality (4.9) Hydrology (4.12) Noise (4.15) Traffic
John Escobell	3/12	Need to offer some program for local hiring first.	(4.13) Population & Housing
Cody Muser	3/12	Project needs to be Gold LEED certified.	(4.7) Greenhouse Gases
Tom Thornsley	3/12	SP needs to come out with EIR. Need building plans to be able to estimate impacts to local residents.	(2.0) Introduction
Deanna Reader	3/12	Need an unbiased evaluation of impacts. Traffic will be massive, Skechers was poor first example. Keep traffic on Theodore. Panama Canal expansion will change west coast logistics needs, port at capacity.	(2.0) Introduction (4.13) Population & Housing (4.15) Traffic

Table 2.C: SB 18 Native American Consultation Contacts

Agency/Tribe	Date ¹	Comments	Desire to Consult?
California Native American Heritage Commission (NAHC)	2/28	City notified NAHC that they would be contacting local tribes that may have an interest in this project. City has contacted these tribes and awaits reply during the SB 18 consultation period (90 days – ends May 30 - see Appendix A).	—
	3/7	NAHC sent letter requesting City contact local tribes and provided tribal contacts.	
	4/9	NAHC sent a second letter with a list of tribes and tribal representatives to contact.	
Cahuilla Tribe	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	4/19	Tribe sent letter requesting consultation.	
Los Coyotes office	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	—	No response from tribe within the 90-day noticing period.	
Morongo	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	2/22	Tribe sent letter providing information to be included in the EIR but did not request consultation.	
	10/2	City sends additional letter regarding consultation.	
Pala Band	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	3/8	Tribe sent letter indicating site was outside of Traditional Tribal Area and deferred to tribes in closer proximity.	
Pechanga	2/29	City letter asking if tribe wished to consult on the WLC project.	Yes
	3/16	Tribe sent letter providing information on cultural resources in the area, suggested mitigation language for EIR, and requested consultation on the project.	
	5/30	City met on site with tribe to consult regarding project activities.	
	10/2	City sends additional letter on consultation and EIR process.	
Ramona Band	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	4/19	City sent consultation notification reminder to tribe. No response received from tribe within the 90-day noticing period.	
Rincon Band of Luiseño Indians	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	3/23	Tribe sent letter indicating site was not within the historic boundaries of the tribe, and referred the City to the Soboba Band of Luiseno Indians for further comment.	
San Manuel	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	4/19	City sent consultation notification reminder to tribe. No response received from tribe within the 90-day noticing period.	
Santa Rosa	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	4/19	City sent consultation notification reminder to tribe. No response received from tribe within the 90-day noticing period.	
Serrano Nation	2/29	City letter asking if tribe wished to consult on the WLC project.	No
	4/19	City sent consultation notification reminder to tribe. No response received from tribe within the 90-day noticing period.	
Soboba	2/29	City letter asking if tribe wished to consult on the WLC project.	Yes
	4/16	Tribe sent letter with input on EIR regarding cultural resources.

World Logistics Center Project**

Table 2.C: SB 18 Native American Consultation Contacts

Agency/Tribe	Date ¹	Comments	Desire to Consult?
	4/19	City sent follow-up letter again to verify tribe's desire to consult.	
	4/30	Tribe sent follow-up letter again requesting consultation.	
	10/2	City sends letter discussing consultation and EIR process.	
	10/8	Tribe wants to be present during ground disturbing activities.	
	11/27	City met on site with tribe consult regarding project activities.	

Source: City Planning Department 2012 records on tribal correspondence (see DEIR Appendix A)

¹ NOP notices mailed February 21 so some tribes were responding to that notice before they received official SB 18 notice.

SB 18 Consultation. It should be noted that the city met with the Pechanga Tribe on May 30, 2012, and with the Soboba Tribe on November 27, 2012. No other Native American entities requested a government-to-government consultation meeting.

2.6.2 Public Scoping Meeting

A public Scoping Meeting was held at the City of Moreno Valley City Hall in the City Council Chambers on March 12, 2012, 6:00 p.m. There was one agency staff representative (from the Air Quality Management District) and over 150 individual members of the public in attendance. City staff and the developer briefly described the project, and then comments from the public were solicited. Local residents brought up essentially every major environmental concern, including traffic, truck traffic, air quality, noise, loss of views, and impacts to the nearby wildlife area. Copies of the written scoping comment forms are included in Appendix A and a list of commenters is provided as part of previously referenced Table 2.A.

2.7 MITIGATION MONITORING AND REPORTING PROGRAM

A Mitigation Monitoring and Reporting Program (MMRP) will be prepared for this EIR to comply with the requirements of State law (Public Resources Code Section 21081.6). When mitigation measures are required to avoid or reduce the severity of significant impacts, State law requires the adoption of an MMRP. The monitoring program is intended to ensure compliance during implementation of the program. An MMRP will be adopted by the City Council concurrent with certification of the Final EIR for the proposed WLCSP project. A copy of the MMRP, revised to reflect all changes in the DEIR that resulted from changes in the project description, technical studies, and response to comments on the DEIR, is included in the Final EIR Volume 1 Response to Comments.

2.8 POTENTIAL IMPACTS OF THE PROJECT DISCUSSED IN THE EIR

This EIR focuses on the areas of concern identified in the NOP and comments submitted regarding the NOP. The following sixteen environmental topics are addressed in this EIR:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality, including Human Health
- Hydrology, and Water Quality
- Land Use and Planning
- Mineral Resources

- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions, Energy Conservation, and Global Climate Change
- Hazards and Hazardous Materials
- Noise
- Population, Housing, and Employment
- Public Services and Facilities
- Transportation and Traffic
- Utilities and Service Systems

2.9 EFFECTS FOUND NOT TO BE SIGNIFICANT

As required under CEQA (Section 15128), an EIR is to contain a statement supporting the Lead Agency's determination that some of the possible effects of a project are not significant and, therefore, are not discussed in detail in the EIR. In this case, the proposed project is not consistent with the City's General Plan or the currently approved Moreno Highlands Specific Plan and the respective EIRs prepared for each. Due to the size and scope of the project, the City determined that all potential environmental issues outlined above would be evaluated in this EIR. Section 4.0 of the EIR determined that only mineral resources and forest resources would not be significantly affected by the proposed project.

2.10 CUMULATIVE IMPACTS

2.10.1 Definition of Cumulative Impact

CEQA defines cumulative effects as "two or more individual effects that, when considered together, are considerable or which compound or increase other environmental impacts." (*State CEQA Guidelines* Section 15130). The *Guidelines* further state that the individual effects can be the various changes related to a single project or the changes involved in a number of other closely related past, present, and reasonably foreseeable future projects (Section 15335). Substantial changes are anticipated to occur as the result of warehousing and employment growth of the proposed project, as well as growth in population, housing, and employment from development of other projects in the City of Moreno Valley and the surrounding region. Section 15130 of the *State CEQA Guidelines* requires that an EIR include a discussion of the potential cumulative impacts of a proposed project. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the development when added to the impacts of other closely related past, present, and reasonably foreseeable or probable future developments. Cumulative impacts can result from individually minor, but collectively significant, developments taking place over a period of time.

With respect to the analysis of cumulative impacts, CEQA generally requires the following:

- (a) *Cumulative impacts shall be discussed when the project's incremental effect is cumulatively considerable.*
- (b) *The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided of the effects attributable to the project. The discussion should be guided by the standards of practicality and reasonableness.*

Pursuant to *CEQA Guidelines*, Section 15130, the assessment of cumulative impacts contained in EIRs is typically based on either: (i) past, present, and probable future projects, which are either approved or being considered for approval by the City or other municipalities (or anticipated to be

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

submitted for consideration, including projects in the design phase or under construction); or (ii) growth projections set forth in regional plans, including regional modeling plans.

Due to the size of the proposed project and its potential future new land use and employment implications for the City, the cumulative analysis for this EIR will use the City’s General Plan growth projections. It is expected that the cumulative impact analysis set forth in this EIR will be conservative and would tend to overstate (rather than understate) cumulative impacts.

The significance of a cumulative impact may be greater than the effects resulting from the individual actions if the effects of more than one action are additive. Thus, as set forth above, this section evaluates the proposed project together with (i) the reasonably foreseeable potential effects of other closely related past, present, and reasonably foreseeable or probable future development in the area of the project, and (ii) growth projections set forth in regional plans.

Criteria for evaluating the significance of adverse effects are identified for each environmental issue in Section 4.0. These criteria, which are based on resource sensitivity, quality, and quantity, are also instructive when evaluating whether the environmental effect resulting from implementation of a particular project is cumulatively considerable. The timing and duration of each activity is also an important consideration for evaluating the potential cumulative effects of activities that may occur only for a limited period. In such cases, a cumulative effect may occur only when two or more of the activities are occurring simultaneously.

Because of the nature of individual environmental factors, the cumulative “universe” for every issue addressed in this EIR will not be identical. For example, the cumulative universe for air quality impacts is reasonably assumed to be the entire South Coast Air Basin, which is much larger than the cumulative universe for public service impacts (i.e., the service area of the various service providers.) The individual cumulative areas for the issues addressed in this EIR are provided within the cumulative impacts discussion in the respective impact sections, but range from the City of Moreno Valley to the County to the entire SCAG region when necessary.

To summarize, in determining the cumulative impacts of a proposed project with other area projects, the *CEQA Guidelines* provide that an EIR may either consider a list of past, present, and probable future projects, or it may consider a summary of projections method. This EIR utilizes the summary of projections method due to the size of the project and its growth implications for the City as a whole.

2.10.2 City of Moreno Valley Growth Projections

The Moreno Valley General Plan establishes policies to guide future development within the City and its implementation is long-term in nature. The Regional Growth Projections Method is the appropriate methodology in evaluating cumulative impacts because it provides general growth projections for the region and considers long-term growth. Table 2.D summarizes the cumulative growth information from the Final Program EIR for the City General Plan Update from July 2006 (Section 7, *Cumulative Impacts*). Table 2.D shows that the City expects to grow at an average annual rate of 2–3 percent from 2000 to 2030, with a population at that point of 238,703 persons and 71,619 households. The City will comprise approximately 7 percent of the County’s population and housing stock at that time.

Table 2.D: General Plan Growth Projections for Moreno Valley (2000–2030)

Jurisdiction	Population		Households	
	2000	2030	2000	2030
City of Moreno Valley	142,655	238,703	39,264	71,619

Sources: SCAG, 2008 RTP Growth Forecast, Table 7-1, General Plan Final EIR, Section 7.0, Cumulative Impacts.

2.10.3 Regional Growth Projections

The SCAG estimates regional growth for the Riverside County area for the purposes of planning and public policy development. The most recent set of growth projections are provided in the most recent *Regional Transportation Plan (RTP) Growth Forecast*, based on extensive analyses of the regional economic and demographic conditions. The *Draft 2012 RTP Growth Forecast* provides estimates and forecasts of employment, population, and housing for the period between 2011 and 2035. Consistent with the projections shown in previously referenced Table 2.D, Table 2.E shows that the population, housing, and employment of the City are expected to increase consistent with overall regional trends for that period (i.e., approximately 2–3% per year).

According to SCAG projections, the population of Moreno Valley is expected to increase by about ~~59,984~~ 60,749 persons or approximately ~~30.7~~ 31.2 percent between 2011 and 2035 to approximately 255,200 persons. By comparison, the population of Riverside County is projected to increase by 1.1 million persons or approximately 50 percent between 2011 and 2035 to approximately 3,324,000 persons. The number of households is estimated to increase approximately 30.9 percent in Moreno Valley and 35.7 percent in Riverside County over this same time period.

The number of jobs in Moreno Valley is estimated to increase by approximately ~~44.5~~ 45.6 percent from 2011 to 2035. Over this same time period, jobs in Riverside County are expected to increase by ~~44.2~~ 45 percent. At present, Moreno Valley has a relatively low jobs-to-housing ratio of ~~0.54~~ 0.45 compared to the overall regional ratio of 1.14 (i.e., 1.14 jobs for each 1 housing unit). SCAG’s Compass Blueprint Plan and the Regional Transportation Plan encourages “bedroom” communities (i.e., those with more housing than jobs) to encourage jobs growth instead of housing growth, which will eventually help balance these factors across the region and help reduce commuter traffic. These plans forecast that the City’s ratio of jobs to housing will increase in the future but will still be less than 1.0 (estimated 0.89 by 2035), compared to a projected ratio of 1.14 for the County and 1.29 for the entire SCAG area. The City’s jobs/housing ratio is expected to still be less than 1.0 by 2035, but to achieve that ratio, the City would need to attract over 34,000 jobs in the next 20 years, compared to attracting 17,000 new houses during that same period.

Table 2.E: Regional Population, Housing, and Employment Forecasts through 2035

Forecast Category	2011	2020	2035
Population			
City of Moreno Valley	194,451 ⁶	213,700	255,200

2.10.4 Analysis of Cumulative Impacts

The analysis of each environmental issue or topic (EIR Sections 4.1 through 4.16) also discusses the cumulative impacts of the proposed project. Implementation of the mitigation measures identified in each specific section of this EIR will reduce the cumulative impact of the project to the extent feasible. In many cases, the mitigation measures result in reducing the project’s cumulative impact to a less than significant level. For other impacts, the implementation of the identified mitigation measures will not avoid a significant cumulative impact. The sixteen subsections of Section 4.0 (i.e., 4.1 through 4.16) identify those significant, unavoidable cumulative impacts that will not be reduced to a less than significant level by implementation of the identified mitigation measures presented in each of those sections. In addition, the analyses indicate to what degree the project makes a significant contribution to cumulatively considerable impacts for each environmental issue (air quality, biological resources, etc.).

It should be noted that the project Traffic Impact Assessment developed an extensive list of cumulative projects to more accurately estimate potential traffic impacts over time on local roadways and intersections (see Section 4.15, *Transportation*).

NOTE TO READERS. *A number of comments were raised on the Draft EIR about the validity of the growth projections used as the basis for the assessment of cumulative impacts of the WLC project. Some comments referred to a number of General Plan Amendments the City had approved since the last General Plan Update. In addition, some comments stated that the General Plan did not account for recent approvals of several warehouse projects, both within the City and in other nearby jurisdictions. However, the City’s General Plan was updated in 2006, and SCAG’s Regional*

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Transportation Plan (RTP) was last updated in May 2008, although the Growth Forecasts that accompany the RTP were last updated in 2012 (Draft 2012 RTP Growth Forecast, Southern California Association of Governments, March 15, 2012). Both of these do constitute current applicable local and regional planning documents upon which to base the analysis of cumulative impacts in the programmatic WLCSP EIR. Therefore, there are no changes to the growth projections that are the basis for the cumulative impact analysis in this EIR.

THIS PAGE INTENTIONALLY LEFT BLANK

NOTE TO READERS: *The original Specific Plan was prepared in December 2012 and was analyzed in the Programmatic Draft EIR that was circulated for public review from February 4 to April 8, 2013. In response to comments received on the public review of the DEIR, the Specific Plan was revised to change the Specific Plan boundary resulting in a loss of 100 acres and 1 million square feet of potential development. In addition, the phasing was extended from ten to fifteen years so Phase 1 is from 2015 to 2022 and Phase 2 is 2023 to 2030 instead of the project completing development in 2022 as analyzed in the original DEIR. Changes to the Project Description are shown in double underline for added text and in strikeout for text to be deleted, plus notes about the reasons for the various changes. The revised figures are included in this section rather than the original figures to provide the most accurate project information for the reader.*

3.0 PROJECT DESCRIPTION

The project description is provided in this section of the EIR in conformance with *CEQA Guidelines* Section 15124. It discusses the geographic setting, project location, project setting, City of Moreno Valley General Plan designations, World Logistics Center (WLC) Specific Plan designations, zoning designations, project characteristics, project objectives, and discretionary actions required to implement the proposed project. The project description is used as the basis for analyzing the proposed project's impacts on the existing physical environment in Section 4.0 of the EIR.

The term "World Logistics Center Project" refers to all related development and planning activities currently proposed by Highland Fairview in the Rancho Belago area of the eastern end of the City of Moreno Valley. The WLC property is generally located south of SR-60, east of Redlands Boulevard, west of Gilman Springs Road, and north of Mystic Lake and the San Jacinto Wildlife Area. The terms "Project Site" or "Project Area" refer to the entire ~~3,918-acre~~ 3,714-acre area covered by the project entitlements, which encompasses: (a) the General Plan Amendment and the Zone Change (including the revised WLC Specific Plan Area (~~2,740~~ 2,610 acres); (b) the CDFW Conservation Buffer Area (910 acres); and (c) the Public Facilities Lands area (194 acres). Additional acreage that was evaluated in the EIR but that is not in the Project Area is the Off-site Improvement Area of 104 acres. See Section 3.4 for more details on these specific areas.

3.1 PROJECT LOCATION

The project is located in "Rancho Belago," the eastern portion of the City of Moreno Valley, in northwestern Riverside County. The project site is immediately south of SR-60, between Redlands Boulevard and Gilman Springs Road (the easterly city limit), extending to the southerly city limit. Figure 3.1 depicts the location of the proposed project within the region and the City of Moreno Valley. The major roads that currently provide access to the project site are Redlands Boulevard, Theodore Street, Alessandro Boulevard, and Gilman Springs Road.

The WLC project area is located in portions of Sections 1, 12, and 13 of Township 3 South, Range 3 West; and portions of Sections 6, 7, 8, 9, 16, 17, 18, 19, 20, and 21 of Township 3 South, Range 2 West, as depicted on the U.S. Geological Survey (USGS) 7.5-minute series *Sunnymead* and *El Casco, California* quadrangles. Figure 3.2 depicts the proposed project boundary on the applicable USGS quad sheets.

3.2 PROJECT SETTING AND HISTORY

3.2.1 Project Setting

The project site slopes gently (approximately 2%) from north to south, with elevations ranging from approximately 1,760 feet above mean sea level (amsl) at the northeast corner to 1,480 feet amsl at the southeast corner. Soils within the proposed project consist of disturbed top soil and natural soils, with a mixture of various silty clays, sandy silts, silty sands, and sands.

3.2.2 On-site Land Uses

The project area is largely vacant undeveloped marginal agricultural land, with seven occupied single-family homes and associated ranch/farm buildings in various locations on the property. In the 1920s, several farm buildings and related houses were constructed on the property and, in the 1940s, a stock farm operated on a portion of the site that was later expanded into a commercial horse farm and training facility that operated until the mid-1990s. The overall project site has been farmed by a variety of owners since the early 1900s and has supported dry (non-irrigated) farming, livestock grazing, and limited citrus groves. Much of the site continues to be used for dry farming today.

San Diego Gas & Electric (SDG&E) operates a natural gas compressor plant, known as the Moreno Compressor Station, on 19 acres in the south-central portion of the site. The Southern California Gas Company (SCGC) operates a metering and pipe cleaning station on two separate parcels (totalling 1.5 acres) in the south-central portion of the site south of Alessandro Boulevard along existing Virginia Street. The site contains a variety of overhead and underground utility lines associated with oil, natural gas, and electrical service.

At present, the project site contains a number of unimproved drainage features, but it does not contain any improved flood control facilities. As Figure 3.3 illustrates, the project vicinity is largely vacant agricultural land with scattered utility facilities and seven rural residential properties.

3.2.3 Surrounding Land Uses

Developed properties in the vicinity include a logistics building to the northwest (Skechers) and several residential neighborhoods along Redlands Boulevard along the western boundary of the project site. An area of the City known as “Old Moreno” is situated near the southwest portion of the project site, around the intersection of Redlands and Alessandro Boulevards. The homes along Bay Avenue, Merwin Street, and Redlands Boulevard constitute the closest off-site “sensitive receptors” to the project site (i.e., they are across the street from the property). Figure 3.3 shows the ~~seven on-site residences as well as other~~ land uses on and around the project site.

The major roadways that currently provide access to the project area are SR-60 to the north, Redlands Boulevard to the west, Alessandro Boulevard (which traverses the site east-west), Gilman Springs Road to the east, and Theodore Street (which traverses the site north-south). Redlands Boulevard and Theodore Street are north-south arterial roadways that intersect with SR-60. Alessandro Boulevard is an east-west thoroughfare that runs through Moreno Valley from Interstate 215 (I-215) on the west to Gilman Springs Road on the east. Gilman Springs Road runs northwesterly-southeasterly connecting SR-60 to the Hemet-San Jacinto area.

Highland Fairview Corporate Park (HFCP) is located northwest of the project area between Redlands Boulevard and Theodore Street. It is currently under development and the first phase was completed in late 2011 (i.e., the Skechers logistics warehouse). The area north of SR-60 is largely undeveloped with clusters of low-density residential development.

THIS PAGE INTENTIONALLY LEFT BLANK

Near the southwest boundary of the project site is an existing residential neighborhood at the intersection of Redlands Boulevard and Alessandro Boulevard; a small market and a post office are also located near this intersection. This area is referred to as “Old Moreno.” The Moreno Valley Ranch and Golf Club residential community is approximately one mile southwest of the project area.

There is little development adjacent to the east and south boundaries of the project area. The area east of the project site across Gilman Springs Road is commonly referred to as the Badlands, a rugged area that separates the City of Moreno Valley from San Timoteo Canyon and the City of Beaumont. Due to its steep slopes and canyons, the Badlands area has experienced little development; however, there are approximately ten single-family homes in the area east of Gilman Springs Road near the project site. The Badlands Sanitary Landfill, operated by the County of Riverside Waste Management Department, is located approximately 1.5 miles northeast of the project area.

Immediately south of the proposed project is the San Jacinto Wildlife Area (SJWA), which includes an “Upland Game Hunting Area,” and Mystic Lake, ~~and the Lake Perris State Recreation Area.~~ These lands are state-owned and access to these areas is restricted. ~~The Lake Perris State Recreation Area is west of the SJWA is owned and operated by the California Department of Fish and Wildlife (CDFW) and contains approximately 20,000 acres of restored wetland and ponds. The Lake Perris State Recreation Area~~ is owned and operated by the California State Parks Department and contains approximately 6,000 acres of open space land, which is used both for recreation and preservation of the natural southern California landscape.

The closest large-scale commercial development is located on the south side of SR-60 at Moreno Beach Drive, approximately 1.25 miles to the west of the proposed project. This shopping complex includes a Walmart and Target along with restaurants and ancillary commercial and service uses, and the Moreno Valley Auto Center. The central core of Moreno Valley, which includes residential neighborhoods and more extensive commercial activity, is located approximately three miles west of the project area.

March Air Reserve Base (MARB) is located approximately seven miles southwesterly of the proposed project. The MARB is under the authority of the March Joint Powers Authority (MJPA), which acts as the land use authority as well as the March Inland Port Airport Authority for reuse of the former March Air Force Base.

3.2.4 Local History

In 1774, the Spanish explorer Juan Bautista de Anza traveled through this area, passing by Mystic Lake and traveling around the Mount Russell Range on his exploration of Alta California.

The project area was first developed in the late 1890s; prior to this, the property had been part of the *San Jacinto Nuevo y Potrero Rancho*. This Rancho, a subdivision of the massive San Jacinto Rancho (originally 8 square leagues in size or more than 50 square miles) lay vacant during the Spanish era and was not part of any rancho until 1842. Once defined, the old road from Temecula to San Jacinto was expanded such that a road was established between San Jacinto and the Box Springs area of the City of Riverside and points beyond. This road probably ran along the track now covered by Gilman Springs Road, headed to Box Springs across what is now Moreno Valley, thence to Riverside and points west. Because of the lack of reliable water, it is unlikely that the project area was used during the early historic period for anything except springtime grazing of sheep and cattle.

During the historic era, most of the parcels in the project area have been used sporadically for dry-land crops and the occasional irrigated farming plots. Horses were raised on one farm in the northwest corner of the site. Although plans were made to bring water from Big Bear to the project

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

area as part of a regional California land boom scheme (circa 1891), the plan was never completed because the issue of water rights was adjudicated in favor of the City of Redlands.

The Moreno Valley area supported numerous military facilities from the early 1900s to today, with the March Air Reserve Base still functioning near I-215 on the west side of town. From the 1970s through the 1990s, Moreno Valley was one of the fastest-growing residential communities in the nation, and incorporated in 1984. In 1992, the City approved a master planned, mixed-use community called “Moreno Highlands Specific Plan” on most of the project site, but no uses within this community were ever built.

3.3 GENERAL PLAN AND ZONING DESIGNATIONS

3.3.1 Designations on the Project Site

The Community Development Element of the City’s General Plan currently designates the project area as a mix of residential, commercial, business park, and open space land uses. The currently approved 3,038-acre Moreno Highlands Specific Pan (MHSP) proposes a master planned, mixed-use community consisting of up to 7,763 residential dwelling units on approximately 2,435 acres and approximately 603 acres of business, retail, institutional, and other uses. Table 3.A is a summary of land uses of the MHSP. Figure 3.4 depicts the City General Plan land use designations for the area.

Table 3.A: Moreno Highlands Specific Plan (Current Land Use Designations)

Land Use	Acreage
Residential Community	
Residential (7,283 763 du)	1,359.3
Parks and Open Space	701.9
Neighborhood Commercial	10.0
Cemetery	16.5
Public Facilities	347.7
Planned Business Center	
Business Park	360.8
Mixed Use	80.5
Community Commercial	16.0
Parks and Open Space	77.9
Public Facilities	67.4
Project Total	3,038.0

Adopted by City Council March 17, 1992

As a result of a variety of factors, the Moreno Highlands Specific Plan has not been implemented.

The City’s 2006 Housing Element identified the Moreno Highlands Specific Plan as a potential source of vacant land that could accommodate possible future residential growth in the City. In 2011, the City updated its Housing Element and anticipated possible land use changes from mixed use and residential to jobs producing warehouses in the eastern part of the City. The 2011 Housing Element concluded that redesignating the entire land area east of Redlands to the eastern City border for warehouse uses would not impede the City’s Housing Element Objectives. The State Department of Housing and Community Development certified the City’s Housing Element as being in compliance with State law on February 22, 2011. The proposed project is consistent with the City’s current Housing Element.

Highland Fairview currently owns or controls development rights on 1,754 acres or 46 percent of the total ~~3,814~~ 3,714 acres within the WLC project area and 67 percent of the WLCSP area. The remainder

of the project area property is owned by private individuals or entities such as the San Diego Gas & Electric Company, Southern California Gas Company, Metropolitan Water District, and California Department of Fish and Wildlife. Figure 3.5 depicts the property ownership within the WLC project area.

An 85-acre parcel located on the west side of Gilman Springs Road near Alessandro Boulevard is within an unincorporated area of Riverside County and within the City Sphere of Influence adopted in 1985. The project will request a pre-annexation General Plan land use designation and zoning of Logistics Development (LD) within a Specific Plan for this parcel, and this EIR will be the environmental documentation used by the Local Agency Formation Commission (LAFCO) to complete the annexation action. The County's land use designation currently applicable to this parcel is W-2-2½. The W-2 area allows single-family residential and light agriculture (the suffix indicates minimum parcel size in acres) and the City's current General Plan land use designation for the site is Business Park (BP) under the MHSP.

The MHSP General Plan Amendment and Zone Change includes approximately 910 acres of land owned by the CDFW that are part of the San Jacinto Wildlife Area (SJWA). Much of this property is designated for residential development in the MHSP. The CDFW parcels were acquired by the State beginning in 1992 to act as a buffer from future development to the north (the MHSP) and to further the CDFW goal of eventually preserving approximately 20,000 acres of restored wetlands and ponds. The land around Mystic Lake was originally purchased as mitigation for habitat loss as a result of construction of the state water project.

The SJWA was the first state wildlife area to utilize reclaimed water to create and enhance wetlands, and improvements are ongoing. Waterfowl, wading birds, and quail are among the many animals found in this area. It also supports a number of private hunting clubs around its northwestern perimeter.

The following information was added at the request of the Metropolitan Water District of Southern California (Letter C-2) regarding the Inland Feeder.

The figure showing the location of the Inland Feeder can be found at the end of comment Letter C-2 from the Metropolitan Water District of Southern California.

"Metropolitan owns property and owns and operates facilities on and adjacent to the site of the proposed project. As shown on the attached map, Metropolitan's irregularly shaped fee-owned property (APN 422-040-009 and 422-040-015), Inland Feeder Tunnel, and appurtenant tunnel access structure are located within the proposed specific plan area. In addition, Metropolitan's 145-inch-inside-diameter Inland Feeder pipeline and appurtenant structures extend through the specific plan area in the street rights-of-way for Eucalyptus Avenue, Theodore Street, and Davis Road. Metropolitan also has a 110-foot-wide easement along Davis Road."

3.3.2 Existing Conditions and Land Use Designations in Surrounding Areas

3.3.2.1 South of SR-60/East of Redlands Boulevard

Existing Conditions. This area is currently used mainly for dry farming, with several scattered rural residences. The only major improvements are several natural gas facilities and two local roadways (Alessandro Boulevard and Theodore Street).

Existing Land Use Designations. The Highland Fairview Corporate Park (HFCP) project is currently under development and Phase 1 (Skechers' North American Operational Headquarters) was completed in late 2011. HFCP is located immediately northwest of the project area, on the north side of Eucalyptus Avenue between Redlands Boulevard and Theodore Street. The HFCP project was

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

approved by the City of Moreno Valley in 2009. The City General Plan land use designation for the site is a mixture of Commercial (C) and Business Park/Light Industrial (LI).

3.3.2.2 North of SR-60

Existing Conditions. This area is relatively rural at present with mixed light industrial uses along the freeway and scattered residences farther away from the freeway.

Existing Land Use Designations. The land located on the north side of SR-60 and westerly of Theodore Street is within the City of Moreno Valley and has a land use designation of Office (O) and Residential (R1—density of one dwelling unit per acre). The area easterly of Theodore Street is in an unincorporated area of Riverside County with land use designations of Scenic Highway Commercial (C-P-S) and Controlled Development Area (W-2). The W-2 area allows single-family residential and light agriculture (the suffix indicates a 2-acre minimum parcel size); and the C-P-S district allows certain wholesale and retail commercial uses. This county territory is within the City's Sphere of Influence; the City land use designation for the area is Rural Residential (RR) and Residential (R1).

3.3.2.3 East of Gilman Springs Road

Existing Conditions. This area currently contains scattered rural residences east and a golf course southeast of the WLC project area.

Existing Land Use Designations. The Badlands area, lying easterly of Gilman Springs Road, is within the jurisdiction of the County of Riverside and has a land use designation of Controlled Development Area (W-2, W-2-1, and W-2-20). Allowed uses include single-family residential and light agriculture (the suffix indicates minimum parcel size in acres). A portion of this county territory is within the City's Sphere of Influence. The City land use designation for the area is Rural Residential (RR).

3.3.2.4 Southern Boundary

Existing Conditions. All the land south of the WLC project site is part of the Mystic Lake/San Jacinto Wildlife Area property, and currently provides various open space uses related to the presence of wildlife around the lake.

Existing Land Use Designations. The lands south of the project are within the San Jacinto Wildlife Area and the Lake Perris State Recreation Area, and are designated either Open Space (OS) or public facilities (PF).

3.3.2.5 West of Redlands Boulevard

NOTE: The following change has been made to update the DEIR with the most current information.

Existing Conditions. The land north of Eucalyptus Avenue (currently Fir Avenue) was recently approved for industrial warehousing (West Ridge Project) but the City approval of an EIR for that project had been challenged in court; ~~a decision is still pending as~~. As of the printing of this EIR the court challenge has been settled and the project sold. The new owners are currently processing a plot plan with the City. The land south of Fir Avenue is planned for suburban residential uses. There are

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

residential neighborhoods along the west boundary of the project site, west of Redlands Boulevard south of Eucalyptus Avenue, and east of Redlands Boulevard south of Cottonwood Avenue.

Existing Land Use Designations. The City land use designations for the residential areas west of Redlands Boulevard are Residential R2 and R3 (maximum density of 2 and 3 dwelling units per acre, respectively). Residential areas southerly of the site along Alessandro Boulevard are subject to City land use designations of R2 and R5 (maximum density of 2 and 5 dwelling units per acre respectively).

Table 3.B summarizes on-site and adjacent land uses for the project site.

Table 3.B: On-site and Adjacent Land Use Designations

Location	Jurisdiction	Current Land Uses	General Plan Land Uses	Zoning Designations
On site	City of Moreno Valley	Agriculture/dry farming, rural residential	Moreno Highlands Specific Plan	Moreno Highlands Specific Plan
North	County and City of Moreno Valley	SR-60, rural residential north of freeway	County W-2, C-P-S City RR, R1	County W-2, C-P-S City O, R1
South	County and State of California	Agriculture, San Jacinto Valley Wildlife Area	MHSP and OS (City and County)	MHSP and OS (City and County)
East	Riverside County	Gilman Springs Road, rural residential	RR (City)	W-2, W-2-1 and W-2-20 (County)
West	City of Moreno Valley	Residential, Industrial ¹	R2, R3, R5, and LI	R2, R3, R5, and LI

¹ approved Westridge project

3.4 PROJECT CHARACTERISTICS

The ~~project~~ Specific Plan being evaluated in this EIR covers ~~3,918~~ 2,610 acres and proposes a maximum of ~~41.4~~ 40.4 million square feet of “high-cube logistics” warehouse distribution uses classified as “Logistics Development” (LD) and 200,000 square feet (approximately 0.5%) of warehousing-related uses classified as “Light Logistics” (LL). The lands within the WLC Specific Plan that are designated LL are existing rural lots, some containing residential uses, that will become “legal, non-conforming uses” once the WLC Specific Plan is approved. In addition, the LD designation includes ~~20,000 square feet of land for Logistics Support (LS) for vehicle fueling~~ land for two special use areas: a fire station and a “logistics support” facility for vehicle fueling and sale of convenience goods (3,000 square feet is assumed for planning purposes for the “logistics support”). The components of the proposed project are discussed below and are shown in Figure 3.6.

THIS PAGE INTENTIONALLY LEFT BLANK

3.4.1 Project Terms

The following terms and areas are defined here for the purposes of analysis in the EIR:

- **World Logistics Center Project:** The term refers to all related development and planning activities currently proposed by Highland Fairview in the Rancho Belago area of the eastern end of the City of Moreno Valley. The WLC property is generally located south of SR-60, east of Redlands Boulevard, west of Gilman Springs Road, and north of Mystic Lake and the San Jacinto Wildlife Area.
- **Project Site or Project Area:** This term refers to the entire ~~3,948~~ 3,818 acre area covered by the EIR encompassed by: (a) the Specific Plan Area (~~2,740~~ 2,610 acres); (b) the CDFW Conservation Buffer Area (910 acres); (c) the Public Facilities area (194 acres); and (d) the Off-site Improvement Area on 104 acres.
- **CDFW Conservation¹ Buffer Area:** This term refers to a 910-acre parcel owned by the State of California as part of the San Jacinto Wildlife Area (SJWA). This land is within the City of Moreno Valley and is included in the approved Moreno Highlands Specific Plan. That plan designates this property for a broad mix of urban uses including suburban residential, schools, parks, and roads. This land was purchased by the State in 1991 as additional upland habitat for the SJWA and also to act as a buffer between the sensitive biological resources of the SJWA and the future urban development under the Moreno Highlands Specific Plan. This land has been actively farmed for many decades and most of it remains in active production. The southwestern portion contains areas of non-native grasslands, although aerial photographs show that this area has been intermittently tilled over the last 80 years. This property is included in the General Plan Amendment and the Zone Change to replace the current urban land uses that are permitted and to replace them with Open Space and Public Facility designations. This property is **not** within the proposed World Logistics Center Specific Plan (i.e., not in the area planned for development). This Conservation Buffer Area is a large part of the “Other Project Areas” described herein.
- **Other Project Areas:** The San Diego Gas & Electric Company (SDG&E) and the Southern California Gas Company (SCGC) own a total of 194 acres of land immediately south of the Specific Plan site. These properties are included in the proposed General Plan Amendment and the Zone Change to designate them for Open Space and Public Facilities uses. These designations are consistent with present uses. These properties are not within the proposed World Logistics Specific Plan. Approximately 174 acres of the land owned by SDG&E will be designated as Open Space. Nineteen acres of SDG&E land and one acre of SCGC land will be designated as Public Facilities.
- **Off-site Improvement Areas:** Development under the Specific Plan will require construction of a number of off-site infrastructure improvements covering approximately 104 acres of land adjacent to the Specific Plan Site including, but not limited, to the following facilities (see Figure 3.7):
 - Debris basins easterly of Gilman Springs Road;
 - Water reservoirs and access roads located northeast, north, and west of the project site;
 - SR-60 interchange improvements; and
 - Roadway, water, sewer, drainage, and utility improvements extending north and west from the project.

¹ Although there were many comments suggesting the term “buffer” be removed from the name of this area, it accurately reflects the purpose of its purchase by the State Conservation Board. However, it should be noted that this land is, and will remain, part of the SJWA.

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 3.7

THIS PAGE INTENTIONALLY LEFT BLANK

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- **Specific Plan Site:** Approximately ~~2,740~~ 2,610 acres of the project area are included in the proposed WLC Specific Plan, located generally south of SR-60, east of Redlands Boulevard, west of Gilman Springs Road, and north of the San Jacinto Wildlife Area.
- **WLC Specific Plan:** The revised WLC Specific Plan proposes a master-planned logistics campus to include up to ~~4440.4~~ million square feet of high-cube logistics warehousing, up to 200,000 square feet of light logistics uses, ~~a site for “logistics support” uses (LS designation and 7574.3~~ acres of Open Space in the southwest corner of the site. The Specific Plan includes extensive development standards, design guidelines, and review procedures for all development within the project.
- **Annexation Area:** This term refers to an 85-acre parcel located adjacent to Gilman Springs Road that is to be annexed into the City of Moreno Valley. The parcel is already within the City’s Sphere of Influence, adopted on November 21, 1985.
- **Tentative Parcel Map Area:** A Tentative Parcel Map is being processed to subdivide 1,539 acres of the project for financing purposes only. This property is owned by the project applicant. Approval of the map will confer no development rights to the property.
- **General Plan Amendment:** One of the proposed entitlements is a General Plan Amendment (GPA) that will permit the establishment of logistics land uses on ~~3,814~~ 3,487 acres of property located east of Redlands Boulevard and south of SR-60. The following General Plan Elements will be amended: Community Development; Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and General Plan Goals and Objectives. The GPA will replace the current Moreno Highland Specific Plan/General Plan Designations with the following land use designations: (a) ~~2,383606~~ acres for high cube logistics development; (b) 1,084 acres of Open Space; and (c) 20 acres for Public Facilities. The General Plan land use designation for the site would become Business Park/Light Industrial (BP).
- **Zone Change:** The project includes a Zone Change covering, ~~3,714814~~ acres, which will designate 1,084 acres of land for Open Space (CDFW and SDG&E properties), 20 acres for Public Facilities (SDG&E and SCGC properties), and ~~2,610740~~ acres for the World Logistics Center Specific Plan. The specific land use zones would be Logistics Development (LD) and Light Logistics (LL).
- **State Lands:** Refers to lands owned by the State of California and includes the San Jacinto Wildlife Area (SJWA) located south of the Specific Plan Site, and the Lake Perris State Recreation Area (LPSRA) located southwesterly of the Specific Plan Site.
- ~~**Off-site Analysis Zone:** This term refers to an approximately 1,000-foot wide zone adjacent to the south and east boundaries of the Specific Plan area that was studied by Michael Brandman Associates (MBA) as part of the assessment of potential impacts on biological resources. It covers approximately 1,637.5 acres.~~
- ~~**Moreno Highlands Specific Plan (MHSP):** This term refers to the currently approved Specific Plan that covers 3,038 acres of the project area. This Specific Plan permits the development of a master planned, mixed-use community consisting of up to 7,763 residential dwelling units and approximately 603 acres of business, retail, institutional, and other uses. This development will be replaced with the World Logistics Center Specific Plan and 1,104 acres of Open Space and Public Facilities uses.~~

NOTE: Several commenters indicated that any mention of the current MHSP land plan should include the loss of 1,000 acres of land in the south end of that property that was purchased by the state for conservation as part of the SJWA, which is referred to in this document as the State Conservation Buffer Area.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- **Proposed Project or World Logistics Center Project:** General term applied to all of the entitlements outlined above that are addressed in this EIR, including:
 - WLC Specific Plan ~~2,710~~ 2,610 acres
 - General Plan Amendment..... ~~3,814~~ 3,714 acres
 - Zone Change ~~3,814~~ 3,714 acres
 - Tentative Parcel Map 1,539 acres
 - Annexation 85 acres
 - Off-site improvements 104 acres

3.4.2 Logistics Warehousing Development

Logistics warehouses are used primarily for the storage and/or consolidation of manufactured goods (with no manufacturing) prior to their distribution to secondary retail outlets. These facilities consist of large buildings typically larger than 500,000 square feet in size, often subdivided for multiple tenants, with typical ceiling heights of 24 feet or more, and can be characterized by highly automated material handling systems supported by truck activities frequently during off-peak hours, and good freeway access. Goods imported through the Ports of Long Beach and Los Angeles as well as other locations are delivered via truck to the proposed distribution centers and distributed via truck to both in and out of state locations, thus benefiting both local and interstate commerce.

High-cube warehouse and logistics facilities include ancillary office and maintenance space along with the outdoor storage of trucks, trailers, and shipping containers. High cube-logistics warehouses provide businesses with a centralized location to sort, organize, and often transfer products from one shipping process to another where multiple forms of transport are available.

High-cube logistics warehouses are generally constructed with vertical-lift dock-high roll up doors to allow access for the loading and unloading of products from truck/trailers. Building interiors are typically large and open to accommodate the temporary storage and consolidation of the products to be distributed. Parking is provided for trucks and trailers in addition to parking for passenger vehicles in accordance with local standards.

3.4.3 Open Space Properties

The California Department of Fish and Wildlife (CDFW) owns 910 acres of vacant open space land within the project area. This area is the most northerly end of the ~~6,000-acre~~ San Jacinto Wildlife Area and all of it is being actively farmed. Section 4.4, *Biological Resources*, explains the importance of the SJWA in more detail, but generally supports a diversity of birds and other wildlife in and around Mystic Lake. This land was purchased by the State as a “buffer” between Mystic Lake and approved development under the Moreno Highlands Specific Plan within the City of Moreno Valley. This land is currently actively farmed and provides raptor foraging habitat in the northern portion of the SJWA. This land is designated as permanent open space on the proposed General Plan Amendment and Zone Change.

SDG&E owns and maintains 174 acres of open space around its 19-acre Moreno Compressor Station plant. The WLC project proposes this land be designated as permanent Open Space under the City General Plan and zoning.

The Specific Plan includes ~~75~~74.3 acres of land designated as open space in the southwest corner of the property. It should be noted that Mount Russell and the Mount Russell Range are immediately southwest of the project area, along with the Lake Perris State Recreational Area. No development is proposed for the ~~75~~74.3 acres designated as Open Space within the Specific Plan.

3.4.4 Moreno Compressor Plant and Public Facilities

SDG&E operates a regional natural gas compression-transmission facility on 19 acres in the south-central portion of the site. This site is bounded on three sides by the CDFW property identified in Specific Section 3.4.3. The project proposes to designate this facility as “Public Facility” under the City General Plan and zoning, and does not propose or anticipate any further development of this site. Any proposal to expand the existing facilities at the site would require separate evaluation under CEQA.

A one-acre natural gas facility operated by SCGC is located just north of the Moreno Compressor Facility. It is also proposed to be designated as “Public Facility” as part of the project.

3.4.5 Annexation Area

Approximately 85 acres of land within the project area are within an unincorporated area of Riverside County and within the City’s Sphere of Influence. The proposed project includes the completion of the annexation process for this land. This property is located just west of Gilman Springs Road and north of Alessandro Boulevard and is currently dry farmed similar to the land surrounding it. The project includes approval of a pre-annexation General Plan and zoning land use designations of Logistics Development (LD) within the Specific Plan for this parcel. This EIR will be the environmental documentation used by the LAFCO to complete the annexation action, which commenced when the property was included in the City’s Sphere of Influence in 1985. The County’s land use designation currently applicable to this parcel is W-2-2½, which allows single-family residential and light agriculture, while the City’s current General Plan land use designation for the site under the MHSP is Business Park (BP).

3.4.6 World Logistics Center Specific Plan

The proposed project includes a Specific Plan to implement the new General Plan Amendment and to set forth comprehensive land use regulations governing the proposed project. The Specific Plan is a master plan for the future development of up to ~~44~~40.6 million square feet of building area on ~~2,710~~610 acres, providing for mainly high-cube logistics and distribution facilities. This programmatic EIR provides a streamlined environmental review process for future development projects in the WLC Specific Plan area, including site-specific subdivisions and development entitlements that are consistent with the overall plan. Subsequent projects that the City determines to be within the scope of the EIR may be approved pursuant to the procedures set forth in *CEQA Guidelines* Sections 15162 and 15177.

The following sections provide a summary of key elements of the Specific Plan, and Table 3.C provides a summary of the land uses of the Specific Plan and other areas addressed by the project.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 3.C: WLC Project Characteristics (updated September 2014)

Area/Land Use	Original Project		Revised Project	
	Acres	Square Footage	Acres	Square Footage
World Logistics Center Specific Plan (WLCSP)				
LD Logistics Development ¹	2,606	41,400,000	2,382.8	40,400,000
LL Light Logistics	29	200,000	37.1	200,000
OS Open Space	75	—	74.3	—
ROW ²	—	—	115.8	—
WLCSP Total	2,710	41,600,000	2,610.0	40,600,000
Other Project Areas				
California Department of Fish and Wildlife	910	—	910	—
San Diego Gas and Electric – Open Space	174	—	174	—
San Diego Gas and Electric – Facility	19	—	19	—
Southern California Gas Company – Facility	1	—	1	—
Other Areas Total	1,104	—	1,104	—
Off-site Improvement Areas	104	—	104	—
TOTAL WLC PROJECT AREA	3,918	41,600,000	3,818	40,600,000
Floor Area Ratio (FAR)³	NA	0.352	NA	0.357

¹ Included in LD zone is 0.5 acres and 20,000 3,000 square feet of “logistics support” (LS) in Planning Area 22 at northeast corner of Theodore and Eucalyptus.

² Right-of-Way included in each land use category

³ Floor Area Ratio (FAR) is gross building area divided by gross site area

NOTE: The following changes are due to revisions to the Specific Plan size, land plan, and phasing.

3.4.6.1 Land Use Plan/Planning Areas

The WLC Specific Plan is a master plan for the development of up to 4140.6 million square feet of development emphasizing modern high-cube logistics distribution facilities. The following information summarizes Section 2.0, *Land Use Plan*, of the WLC Specific Plan (see Appendix B), including three proposed land use designations, as shown in Figure 3.8.

High Cube-Logistics Development (LD). The WLC Specific Plan project proposes to develop approximately 2,606 2,383 acres with up to 41.4 40.4 million square feet of high cube logistics warehouse space. This represents approximately 99.5 percent of the total building area of the WLC Specific Plan project. Land uses allowed under this classification include high cube logistics warehouse buildings of 500,000 square feet or greater. High cube logistics warehouses are characterized by a high level of automated material handling systems and typical truck activities outside of the peak hour. High cube logistics warehouses are generally used for the storage of manufactured goods prior to their distribution to retail outlets (see Section 4.15 and Appendix J of this EIR). Warehouses permitted in the LD portion of the WLC would be no smaller than 500,000 square feet, with a maximum height of 80 feet. The Specific Plan prohibits buildings over 60 feet in height along the western, northern, and southern boundaries of the site (see Figure 3.9).

Warehousing and logistics activities consistent with the storage and processing of manufactured goods and materials prior to their distribution to other facilities and retail outlets will be permitted throughout the Specific Plan. Refrigerated warehouse space is not an allowed use within the Specific

Plan area (see Mitigation Measure 4.3.6.3E). Ancillary office and maintenance space is included along with the outdoor storage of trucks, trailers, and shipping containers. LD land uses provide a location for businesses to sort, organize, and transfer products from one shipping process to another.

THIS PAGE INTENTIONALLY LEFT BLANK

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Special Uses Alternative Fueling. Two “special use” areas are proposed within the land designated LD within the WLCSP. The first special use is at least one City fire station in Planning Area 11 east of Street F and west of Gilman Springs Road, although the City Fire Chief has not determined the specific site yet. The second special use area is for “logistics support” which will provide alternative fueling services for onsite users. The WLCSP encourages the development of warehousing that uses trucks powered by non-diesel fuels such as natural gas. The Specific Plan requires that smaller on-site service vehicles associated with these same buildings will use non-diesel fuels such as compressed natural gas (CNG) (WLCSP Section 4.2.212.3). The use of LNG/CNG will substantially reduce vehicular emissions from the WLC project, including diesel particulate matter (DPM) and other diesel-related pollutants.

Logistics Support Uses (LS). An alternative fueling station is proposed at the northeast corner of Theodore Boulevard and Eucalyptus Avenue in Planning Area 22. This facility will include a maximum of approximately 20,000 3,000 square feet of building area for diesel and LNG/CNG fuel sales, and for a small convenience store on a minimum of a 1 acre plot. This facility will be located a minimum of 250 feet away from any residential uses (see Specific Plan Section 2.4.32.2.5 and Specific Plan Figure 2-4, Land Use Plan for more information on this facility). Other permitted uses within the “logistics support” area include construction yards within, or immediately adjacent to approved construction sites, cellular transmission facilities and structures and public utility uses and structures.

NOTE: Diesel Emissions and Project Operation Restrictions. All medium-heavy duty trucks and heavy-heavy duty trucks entering logistics sites will be required to meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025 or be powered by natural gas, electricity, or other diesel alternative. Year 2010 diesel engines are generally considered to be as “clean” in terms of emissions compared to natural gas engines. Facility operators must maintain a log of all trucks entering the facility to document that on average, the daily truck fleet meets the emission standards contained in this mitigation. This log shall be available for inspection by City staff at any time. All service yard trucks (hostlers, yard goats, etc.), pallet jacks, forklifts, and other on-site equipment used during operation shall be powered by electricity, natural gas, and/or propane and/or 100 percent biodiesel fuel. Electrical power sources shall be provided for service equipment.

Light Logistics Uses (LL). This category provides for the storage of materials such as general warehouse, self-storage, or vehicle storage uses, and would also include related office and/or maintenance areas. The WLC Specific Plan applies this designation to approximately 29 37 acres of existing lots that are not large enough for LD buildings (minimum 500,000 square feet). Buildout of these areas could support up to 200,000 square feet of building area or 0.5 percent of the planned development of the site. Some of these lots are currently improved with residential uses and/or agricultural uses. Under the Specific Plan, the residential and agricultural uses would become legal, non-conforming uses.

Open Space (OS). Approximately 75 74.3 acres in the southwest corner of the project area is designated for open space use in the Specific Plan. This property is adjacent to Mount Russell and the Lake Perris State Recreational Area. The Specific Plan restricts this property to passive open space and recreation uses. According to the WLC Specific Plan Section 2.4 the entire Open Space in Planning Area 30 will be offered for dedication in fee to the State of California for expansion of its adjacent ownership, or other public or private conservation organizations (see DEIR Section 4.1.6.1 for details). It should be noted that the only improvement planned for this area is the extension of Cactus Avenue.

Planning Areas. The Specific Plan land use plan is divided into sixteen (16) Planning Areas based on traffic impact zones which allows for more accurate estimates of potential traffic and air quality impacts of the WLC Project. The specific land use of each planning area is outlined in Table 3.D. Planning Areas (PA) 1-12 are designated as Logistic Development (LD), PA 20-22 are designated as

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Light Logistics (LL), PA 7 has been specified as an alternative fueling station (refer to DEIR Section 3.4.7.5 for more information), and PA 30 is Open Space (OS). The previous Figure 3.8 shows the locations of the new planning areas for the WLCSP on the revised land use plan.

NOTE: The following table and figure have been added to show planning areas in the Specific Plan.

Table 3.D: WLC Project Land Uses by Planning Areas (all new from original DEIR)

Planning Area (PA)	Land Use Designation	Area (acres)	Building (square feet)
Logistics Development (LD)			
1	LD	77.8	1,100,000
2	LD	193.5	4,200,000
3	LD	120.3	1,600,000
4	LD	301.5	5,600,000
5	LD	64.2	600,000
6	LD	115.3	500,000
7	LD	10.3	50,000
8	LD	142.9	2,150,000
9	LD	485.8	10,400,000
10	LD	139.9	2,200,000
11	LD	500.0	8,000,000
12	LD	231.3	3,500,000

3.4.6.2 Circulation System

The revised General Plan Circulation Element (as amended by the proposed WLC project) and the Specific Plan's Circulation Plan (Specific Plan Section 3.1) provides for the movement of vehicles in and around the World Logistics Center area. It provides the details of the road/street designations, right-of-way design, and road improvement thresholds. This section addresses the interface of the planning area with existing roadways as defined in the City General Plan.

Four key roadways will provide access to the proposed project: Theodore Street, Eucalyptus Avenue (between Redlands Boulevard and Theodore Street), Gilman Springs Road, and Alessandro

Boulevard (between Gilman Springs and the proposed extension of Cactus Avenue), as depicted in previously referenced Figure 3.6. The Specific Plan identifies five points of access for project traffic: (1) Eucalyptus Avenue at Redlands Boulevard; (2) Theodore Street at SR-60; (3) Street B at Gilman Springs Road; (4) Street C at Gilman Springs Road; and (5) Street D – Cactus Avenue Extension extended to Cactus Avenue (no trucks, passenger vehicles only). Primary vehicular access to the project would be from SR-60 at Theodore Street and interchange improvements are planned to accommodate the increase in traffic volumes.

The ~~Specific Plan~~ Traffic Section of the DEIR provides that Transportation Management Plans (TMPs) may be included with each future building-specific project proposal in order to address project parking requirements in order to support “green building” or sustainable concepts. The number of required parking spaces may be modified subject to the approval of a TMP based on the provision of carpooling, van pools, staggered work hours or other facilities and programs. TMP applications would be processed in connection with future project-specific development applications.

Street Improvements. The following roadways lie on the project perimeter. Future improvements to project-affected roadways will be completed in accordance with City General Plan standards. Figure 3.10 provides the WLCSP Circulation Plan and Figure 3.11 shows the typical street cross-sections.

- **State Route 60.** SR-60 is a State freeway that currently has two mixed-flow lanes in each direction. Future improvements are planned by Caltrans to add a separate truck lane eastbound on the freeway through the Badlands including a dedicated truck lane in the future. SR-60 provides primary access to the project area.
- **Redlands Boulevard.** Redlands Boulevard is a designated truck route between SR-60 and Eucalyptus Avenue only; therefore, truck travel would be prohibited on Redlands Boulevard south of Eucalyptus Avenue. The ultimate street section is a 4-lane Divided Arterial.
- **Eucalyptus Avenue (west of Theodore Street).** Eucalyptus Avenue is a 4-lane Divided Arterial within an ultimate right-of-way of 110 feet. Improvements on the north side of the street (two westbound lanes, a raised median, and one eastbound lane) were recently completed by the HFCP project.
- **Cactus Avenue (extension east of Redlands Boulevard).** This is proposed to be a 4-lane undivided north-south roadway connecting existing Cactus Avenue with the westerly internal loop street (Street "E"). The intersection with Street "E" and would be designed to prohibit large trucks from using Cactus Avenue Extension to prevent their travel through adjacent residential neighborhoods. Special design features and signage will reinforce this restriction.
- **Gilman Springs Road.** At project opening year 2013, Gilman Springs Road will remain in its current condition (i.e., a two-lane undivided roadway) and future improvements would occur based on demand. The ultimate street section is a Divided Major Arterial with six through lanes and a raised median. Gilman Springs Road is a City-designated truck route. However, because Gilman Springs Road is partially a Riverside County facility and is thus partially outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made outside of its jurisdiction.

The following roadways within the Specific Plan are classified as Arterials (see Figure 3.11). Access rights and intersections with other streets or highways are limited:

- **Theodore Street (Street A).** Theodore Street is a north/south Arterial and is the primary truck route to and from SR-60. The ultimate street section is a four- to six-lane Divided Arterial within a 144-foot right-of-way including a landscaped median. Traffic roundabouts are proposed at the two key intersections along Theodore Street within the project.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- **Street B (Eucalyptus Avenue east of Theodore Street).** This roadway will ultimately extend through the project from Theodore Street to Gilman Springs Road. The proposed street section is currently a four-lane Divided Arterial with a 122-foot right-of-way and a standard median.
- **Streets C and E.** The WLCSP circulated for public review with the Draft EIR showed these roadways would be four-lane Minor Arterials each within a 112-foot right-of-way with no median. Traffic roundabouts were proposed at key intersections within the project to facilitate efficient movement of trucks. However, these streets have been realigned northward to maintain the local historical landmark designation of Alessandro Boulevard (see below).
- **Alessandro Boulevard.** Alessandro Boulevard currently runs through the WLC site in an east-west direction, connecting to Gilman Springs Road on the east and traveling through Moreno Valley to the west. The WLCSP circulated for public review with the Draft EIR showed Alessandro Boulevard realigned as Streets C and E (see below). However, this roadway has been designated a City historical landmark, so the WLCSP circulation plan has been modified to retain the name, ROW width, and current alignment of Alessandro Boulevard as an undivided roadway running east-west through the World Logistics Center, still intersecting with Gilman Springs Road on the east and the Cactus Avenue Extension on the west. An existing section of Alessandro Boulevard between Merwin Street and the Cactus Avenue Extension will be closed to vehicular traffic except for emergency vehicles and bicycles and pedestrians access. This is to prevent project traffic, both trucks and passenger vehicles, from traveling through the existing residential neighborhoods to the west.

The smaller roadways within the Specific Plan (Streets F through H) would convey truck and other vehicle traffic in and around the project site. These two-lane roadways will have an ultimate right-of-way of 88 feet.

As Figure 3.10 shows, the Specific Plan proposes traffic roundabouts at the three internal intersections (Theodore Street/Streets E & F, Theodore Street/Alessandro Boulevard ~~Streets E & C~~, and Street C/Street F.

Planned Improvements. As part of the analysis of project traffic impacts, it is important to note that development within the WLCSP will make a number of roadway and intersection improvements that are within or adjacent to project property (i.e. onsite improvements). As outlined in the project TIA, these improvements include but are not limited to:

- Gilman Springs/Alessandro Boulevard Intersection;
- Gilman Springs/Eucalyptus Avenue Intersection;
- SR-60 Westbound Ramp/Theodore Street Intersection;
- Redlands Boulevard/Eucalyptus Avenue Intersection;
- Theodore Street/Eucalyptus Avenue Intersection;
- Eucalyptus Avenue from Redlands Boulevard to Theodore Street (south side);
- Extension of Cactus Avenue east onto the WLC property; and
- Internal Streets A through F shown on WLCSP Circulation Plan (DEIR Figure 3-10).

THIS PAGE INTENTIONALLY LEFT BLANK

LSA FIGURE 3.11

THIS PAGE INTENTIONALLY LEFT BLANK

Mobility. Section 3.4, *Non-Vehicular Circulation*, of the Specific Plan indicates that the intent of the mobility, transit, and pedestrian movement section is to ensure that people are able to move from one destination to another with minimal delays, either by walking or using other means of non-motorized travel. This means separating vehicles from pedestrian pathways and incorporating shared modes of travel such as trucks, autos, and bikes in the same right-of-way area where feasible. Bicycles would be able to use the street right-of-way throughout the project area. The Specific Plan states that project site development will support alternative transportation options for employees through implementation of on-site bicycle storage, preferred parking for low-emitting and fuel-efficient cars, carpool high-occupancy vehicles, and access to public transit.

According to Section 3.4.3, *Bicycle Circulation*, the Specific Plan will provide Class II (on-street) bicycle access along all connecting project roadways (i.e., not cul-de-sac streets), as shown in Figure 3.12. These Class II bicycle lanes will be integrated into the City's Bikeway Plan as well as the WRCOG Non-Motorized Transportation Plan, with connectivity to Class II bicycle lanes in the City that are adjacent to the WLC project site.

The Specific Plan requires sidewalks along all project streets (Specific Plan Section 5.2.8). Pedestrian movement relies on sidewalks providing direct access from the street to entry points for properties and buildings. Sidewalks are required to be shown on project-specific plot plans submitted for review by the City. All public street improvement shall meet the standards set forth in Title 24.

Local bus service to the area is provided by the Riverside Transit Agency (RTA). Local bus routes will be extended into the project area when adequate demand is generated as determined by the RTA. All roadways within the WLC area will be designed to accommodate bus access. The need for bus stops, turnouts, etc. will be determined by the RTA during the review of subsequent project-specific applications.

In addition to public sidewalks provided adjacent to project streets, Section 3.3.14.2 of the Specific Plan, ~~*Pedestrian Circulation and Multi-Use Trails*~~, requires the construction of a trail connection between the Redlands Boulevard/Cottonwood Avenue intersection and the existing Cactus Avenue trail connection to the Lake Perris Recreational Area. This new trail will continue along Street E avoiding the Open Space area and connect to a new trail head and a potential trail (by others) to the San Jacinto Wildlife Area at the former Davis Road alignment (see Figure 3.12). Engineering details of the new trail will be provided with project-specific development applications in this portion of the project area.

3.4.6.3 Utilities and Services

The Utilities section of the Specific Plan (Section 3.5) describes the infrastructure systems needed to support the development of the project. This section identifies facilities for potable water, reclaimed water, wastewater, storm drain systems, power, natural gas, and telecommunications. This section also addresses the demand for general City services.

Potable Water. The Eastern Municipal Water District (EMWD) provides water service to the project area. EMWD obtains its water from Metropolitan Water District (MWD) and local groundwater wells.

The 2009 EMWD Water Facilities Master Plan (Master Plan) in conjunction with the Moreno Valley Water Pressure Zone Realignment Study (Realignment Study) evaluated the existing and future water needs and facilities required for the Moreno Valley water system. The Master Plan and Realignment Study analyzed the existing water system operating pressures and flows and recommended improvements to the system including realignment of the 1764 and 1900 pressure zones to 1764, 1860, and 1967 pressure zones. The area is currently served by existing pipelines in the 1764 and 1900 pressure zones that range in size from 8-inch to 21-inch diameter pipes (see Figure 3.13). The Master

THIS PAGE INTENTIONALLY LEFT BLANK

LSA

FIGURE 3.13

THIS PAGE INTENTIONALLY LEFT BLANK

Plan is included in Appendix M of this EIR. The Master Plan indicates that sufficient water is available for potable use and landscaping under expected conditions over a 20-year period.

The MWD owns and operates a 108-inch transmission line that runs north-south through the project area in Theodore Street, and then east-west in Eucalyptus Avenue, east of Theodore Street. Build-out of the proposed project site will require the construction of new water reservoirs to serve each of three water pressure zones (1967, 1860, and 1764). All three reservoir sites are located outside of the Specific Plan boundary. As development proceeds within the project area, new waterlines, ranging in size from 12 to 24 inches, will be constructed in the existing and future street rights-of-way to connect the future water tanks to the development area. The water system will require a new pump station at the 1764 reservoir and an upgrade to the existing EMWD pump station near Cottonwood Avenue and Redlands Boulevard.

All water facilities will be constructed to EMWD standards and will be subject to a Plan of Service approval by EMWD (Specific Plan Section 3.5.1). Previously referenced Figure 3.13 shows the new water system proposed for the project. The EIR will examine potential impacts of onsite and offsite water improvements including these reservoirs as outlined in Appendix M.

Reclaimed/Recycled Water. As stated in EMWD's Water Supply Assessment (Appendix M), EMWD policy recognizes recycled water as the preferred source of supply for all non-potable water demands, including irrigation of recreation areas, greenbelts, open space common areas, commercial landscaping, and aesthetic impoundment or other water features. The proposed project is near an existing recycled water line and EMWD has indicated that in the future, recycled water may be available for the project. If EMWD determines adequate recycled water supply is available, recycled water will be used on the proposed project to the greatest extent practical. The availability, feasibility, and reliability of recycled water use will be included in EMWD's evaluation of the Plan of Service for the project. Landscape irrigation may use potable water until recycled water facilities are in place. Information on reclaimed water is provided in Appendix N. "Purple" reclaimed water irrigation piping will be installed to certain landscaped areas as needed.

Wastewater. EMWD provides wastewater service to the project area at EMWD's Moreno Valley Regional Water Reclamation Facility (WRF) located in the southwestern portion of the City near Kitching Street and Mariposa Avenue. The WRF has the capacity to treat 16 million gallons per day (mgd) of wastewater. The analysis provided in Section 4.16, *Utilities and Service Systems*, indicates the WRF has a current excess capacity of 4.5 mgd and the proposed WLCSP would consume 0.3 mgd (6% of excess), so the WLC project does not by itself generate a need for new wastewater treatment facilities.

The primary trunk sewer line serving the project area is located within Redlands Boulevard. This trunk sewer line continues in a southerly direction within Cactus Avenue, JFK Drive, Iris Avenue, and Lasselle Streets conveying wastewater to the WRF (Specific Plan Section 3.5.2). The proposed sewer in Street A and all lines to the west of Theodore (Street A) are a gravity system and run generally southwest to a point of connection at Brodiaea Avenue and Redlands Boulevard. As demand requires, the segment of sewer line within Brodiaea Avenue that is west of Redlands Boulevard will be upsized from a 15-inch to a 21-inch line. The sewer system east of Theodore Street (Street A) will flow by gravity to a future sewer lift station at the southerly project boundary. From there, a force main will carry wastewater in a northwest direction, where it will join the gravity system west of Street A described above. Sewer lines will be located within public street rights-of-way to the greatest degree possible. Some of the buildings may require individual (private) lift stations due to

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

building lengths, location of buildings, and phasing of improvements. Future sewer lines will range in size between 8 and 21 inches, and will be constructed to EMWD standards and will be subject to a plan of service approval. Figure 3.14 shows the proposed sewer/wastewater system for the Specific Plan. Technical studies related to wastewater services are provided in Appendix N.

Storm Water Drainage. The project area is within the San Jacinto River watershed, which is part of the larger Santa Ana River watershed. The storm water runoff from the project generally flows in a southerly direction to the San Jacinto River at an average gradient of 1 to 2 percent. A topographic divide located west of Theodore Street (Street A) separates storm water flows to the San Jacinto River into two subareas. Runoff east of the divide flows through the San Jacinto Valley to the San Jacinto Wildlife Area and ultimately to the Gilman Hot Springs hydro-subarea. Runoff west of the divide flows to the Perris Valley Storm Drain and ultimately the Perris Valley hydro-subarea. Both hydro-subareas eventually flow to the San Jacinto River, approximately 10 miles south of the project site (Specific Plan Section 3.5.4).

The Riverside County Flood Control and Water Conservation District (RCFCWCD) is the responsible agency for the project area's regional flood control system. The westerly portion of the project site is located within the Moreno Master Drainage Plan (MMDP). An existing 12-foot by 8-foot reinforced concrete box (RCB) owned and maintained by RCFCWCD is located east of Redlands Boulevard. This facility collects storm water passing under SR-60 and outlets south of Eucalyptus Avenue where it flows through a spreading basin then across agricultural land. Farther south, the agricultural land drains to an RCFCWCD earthen channel at Redlands Boulevard flows to a greenbelt channel located south of Cactus Avenue and east of Redlands Boulevard and ultimately drains to the Perris Valley Storm Channel.

There is no master plan of drainage on the east side of the project site. The existing drainage facilities consist of open ditches along Theodore Street that convey runoff from adjacent areas and lands northerly of SR-60. A series of existing drainage culverts crosses Gilman Springs Road conveying the off-site runoff from the Badlands through the project site. Four of these culverts drain into natural drainage courses which drain to the south. Based on the latest Flood Insurance Rate Map (FIRM) published by the Federal Emergency Management Agency (FEMA), the project site is not located within a 100-year floodplain.

Development according to the Specific Plan will result in the placement of impervious surfaces on the project site, which would substantially increase the potential for runoff from the site. Post-development flows are required to be equal or less than pre-development flows, so the on-site storm water flows will be routed through a new system of underground drainage lines to a series of on-site detention basins. While the increase in impervious surfaces attributable to the proposed project would contribute to a greater volume and higher velocity of storm water flows, the hydrology report for the project indicates that the proposed detention basins would be designed to accommodate runoff and maintain off-site flows at pre-project conditions. Drainage improvements will be phased as needed to ensure that the peak flows at downstream discharge points at the southerly project boundary will not exceed the peak flows for the existing condition (Specific Plan Section 3.5.4). Figure 3.15 shows the proposed drainage system for the Specific Plan area. The drainage study is included in Appendix J.

Drainage from east of Gilman Springs Road flows southwest and south out of the Badlands and flows under Gilman Springs Road through corrugated steel pipe culverts. These culverts are relatively small, and during times of high flow, runoff often causes repeated localized flooding along the roadway. When Gilman Springs Road is improved to its ultimate width by the County, improvements will include the installation of larger culverts where needed to eliminate flooding along the roadway.

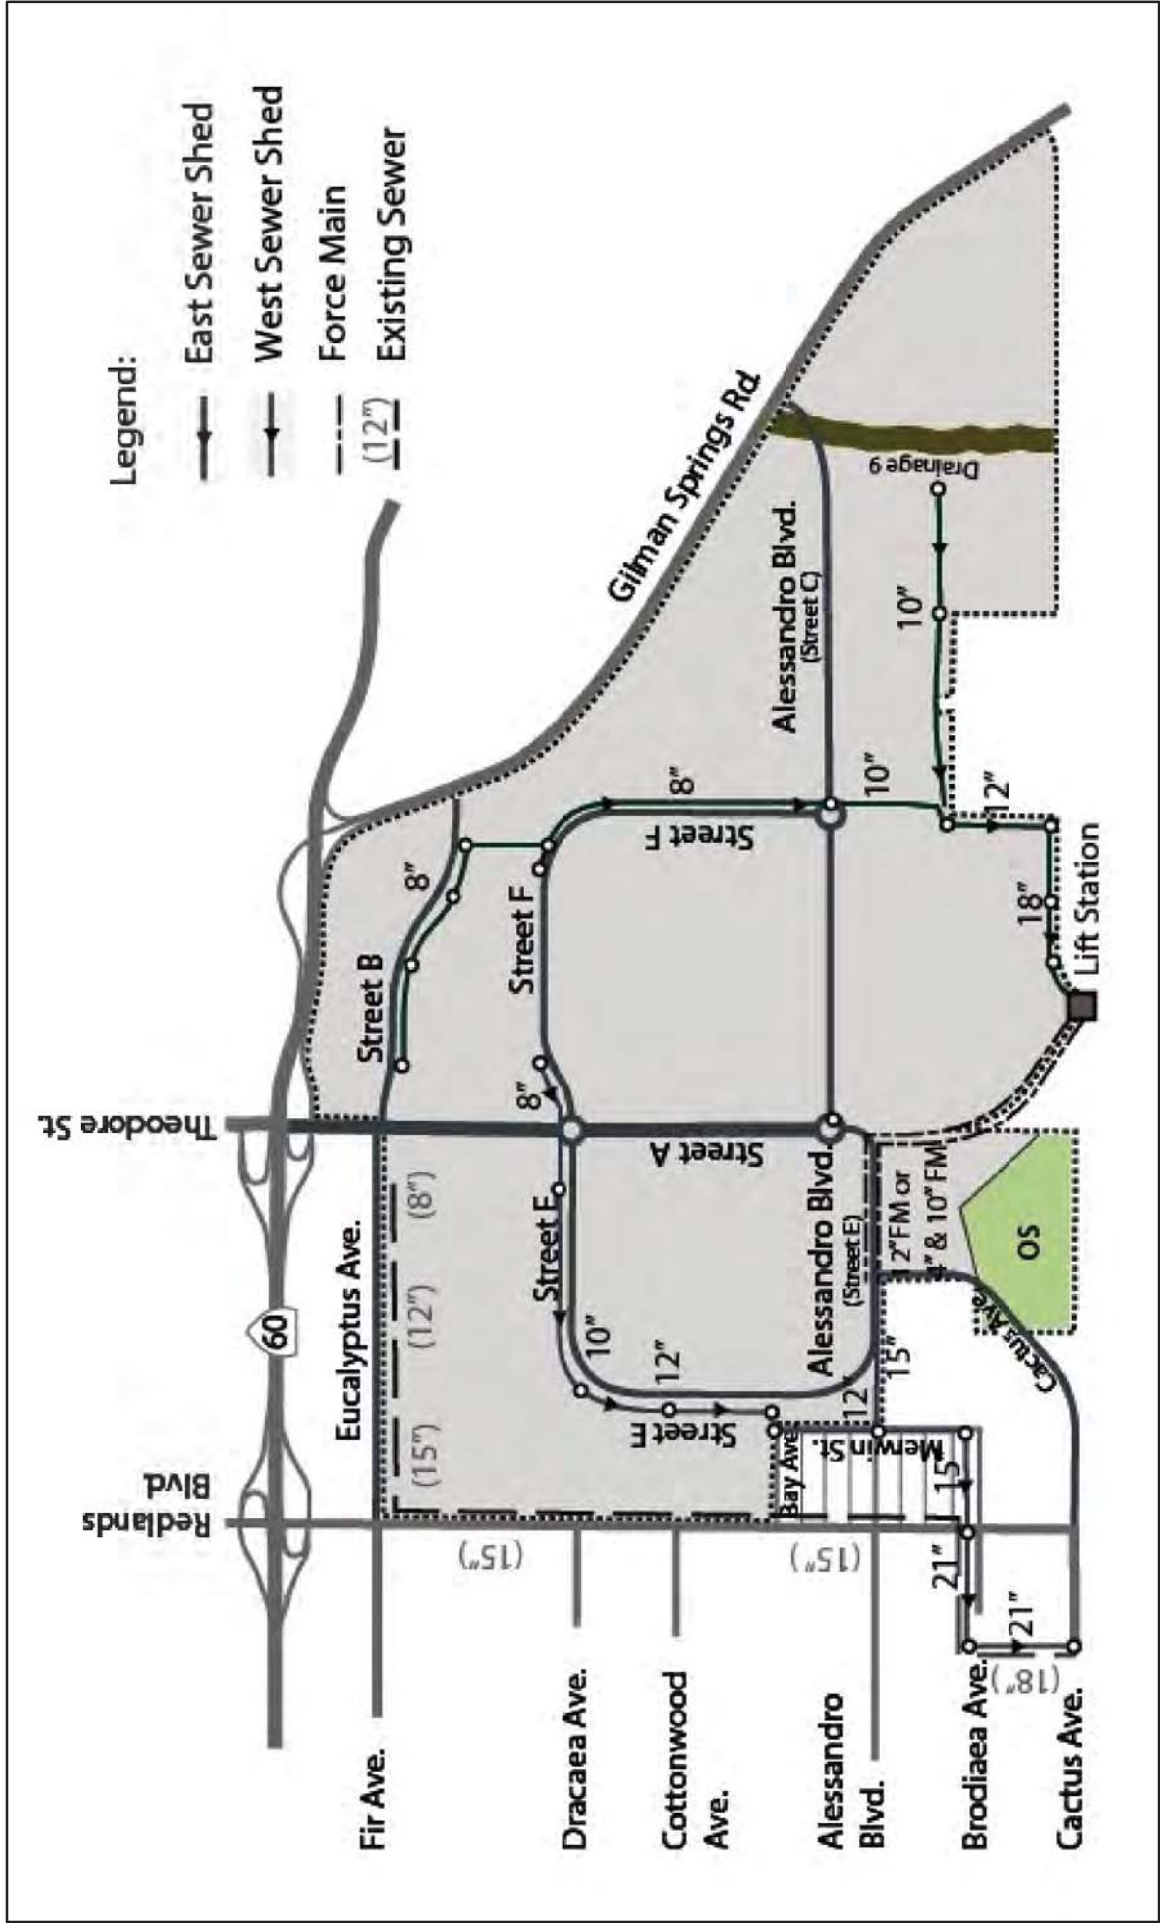

FIGURE 3.14

LSA

THIS PAGE INTENTIONALLY LEFT BLANK

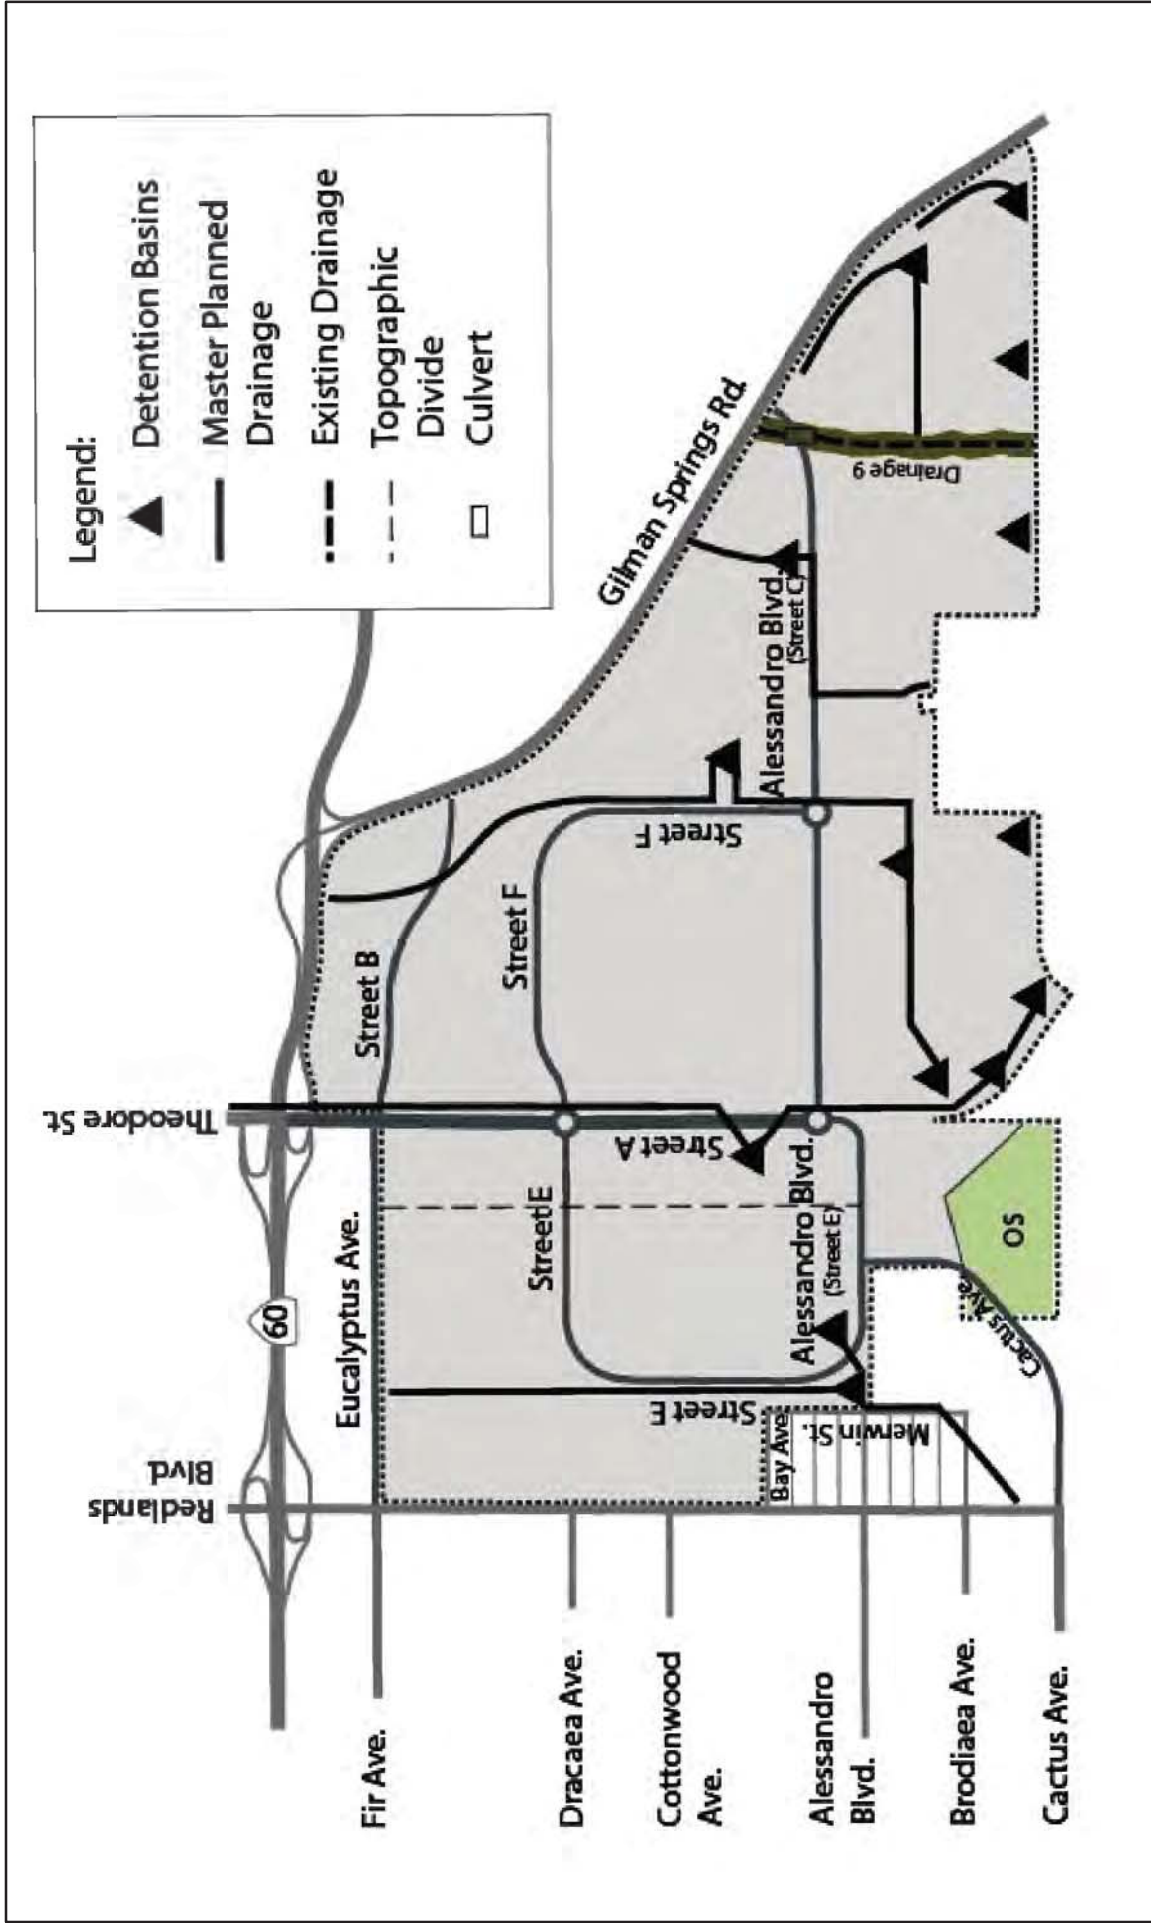

FIGURE 3.15

LSA

THIS PAGE INTENTIONALLY LEFT BLANK

Solid Waste. The Specific Plan encourages recycling and reducing waste generation. Examples of the recycling processes identified by the Specific Plan include:

- Support recycling programs to sort and store materials destined for landfills;
- Reuse and recycle construction and demolition waste as much as feasible during building construction;
- Encourage the City of Moreno Valley to support by either implementing or expanding recycling and composting programs for businesses;
- Extend the types of recycling services offered (e.g., to include food and green waste recycling);
- Provide public education and publicity about recycling services conducted at the World Logistics Center; and
- Promote recycling programs aimed at supporting sustainable certification programs such as LEED, CalGreen, or similar sustainability programs.

Energy. Moreno Valley Electric Utility (MVEU) is the electricity provider for the World Logistics Center. While it will not provide service within the Specific Plan area, Southern California Edison (SCE) has existing 12 kV and 115 kV overhead power lines throughout the project area. There are SCE 115 kV power lines along Gilman Springs Road, Eucalyptus Avenue east of Theodore Street, Theodore Street north of Eucalyptus Street, and along Brodiaea Avenue/Davis Road to the south. There are also SCE 12 kV power lines along Gilman Springs Road, Theodore Street, Alessandro Boulevard, Eucalyptus Avenue east of Theodore Street, and Redlands Boulevard. MVEU has an existing underground electrical system at the intersection of Dracaea Avenue and Redlands Boulevard. As the project builds out, the Moreno Beach Substation will be expanded to 112 MW and a new 60 MW substation will be constructed to serve the project. Many of the existing 115 kV and 12 kV lines will be relocated as the Specific Plan is built out. Electrical facilities are shown in Figure 3.16.

~~*Important Note:* The Specific Plan allows solar photovoltaic (PV) arrays to be installed on the project buildings to help offset the electrical power requirements of the proposed project (i.e., WLCSP buildings will be “solar ready”). It is possible the WLC project could become “energy neutral” and eventually generate all of the electricity needed for developed uses within the WLCSP project during daylight hours. If the project becomes energy neutral, some or all of the electrical utility improvements identified in the previous paragraph may not be needed, but there would still need to be a redundant supply system to supplement any solar systems during cloudy times or at night.~~

Solar Energy. The Specific Plan requires solar photovoltaic (PV) arrays to be installed on the project buildings to offset the electrical power requirements of the office portion of each proposed warehouse building (WLCSP Section 12.7, Solar Commitment).

The SCGC is the natural gas provider for the project. An existing 4-inch medium pressure service line is located within Redlands Boulevard. Low-pressure facilities serve the residential area located west of Redlands Boulevard and southwest of Merwin Street and Bay Avenue. Throughout the project, natural gas is transmitted through existing SDG&E underground pipelines serving the Southern California region that range in size from 16 inches to 36 inches. Two 30-inch diameter transmission pipelines run in an east-west direction north and south of Alessandro Boulevard. Three transmission pipelines, 16, 24, and 36-inch diameters run in a north-south direction along Virginia Street, south of Alessandro Boulevard. The 36-inch diameter line also extends east from Virginia Street parallel with the 30-inch line that runs south of Alessandro Boulevard. Figure 3.17 shows planned natural gas facilities.

THIS PAGE INTENTIONALLY LEFT BLANK

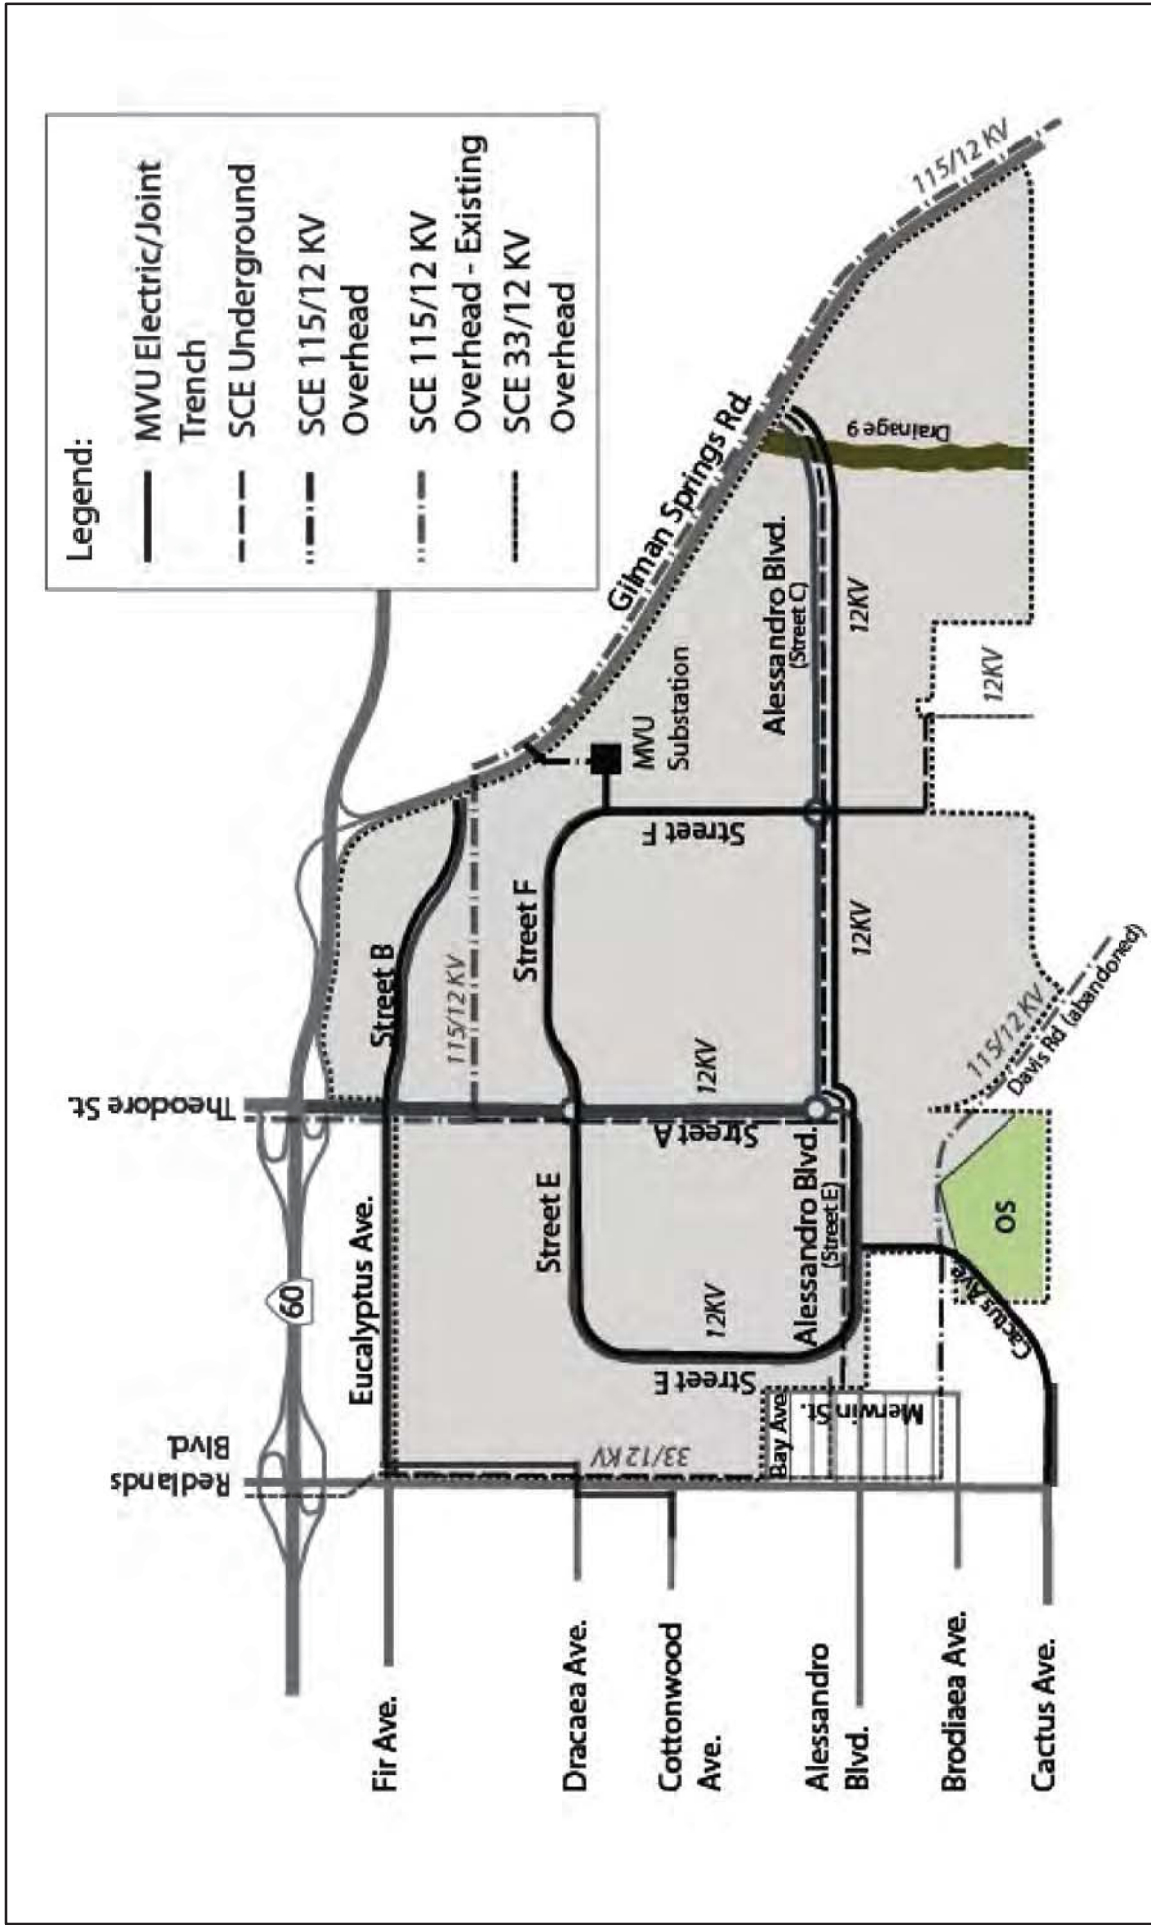

FIGURE 3.16

 I:\HFV1201\Reports\EIR\fig3-16_ElectricalFacilities.mxd (9/19/2014)

THIS PAGE INTENTIONALLY LEFT BLANK

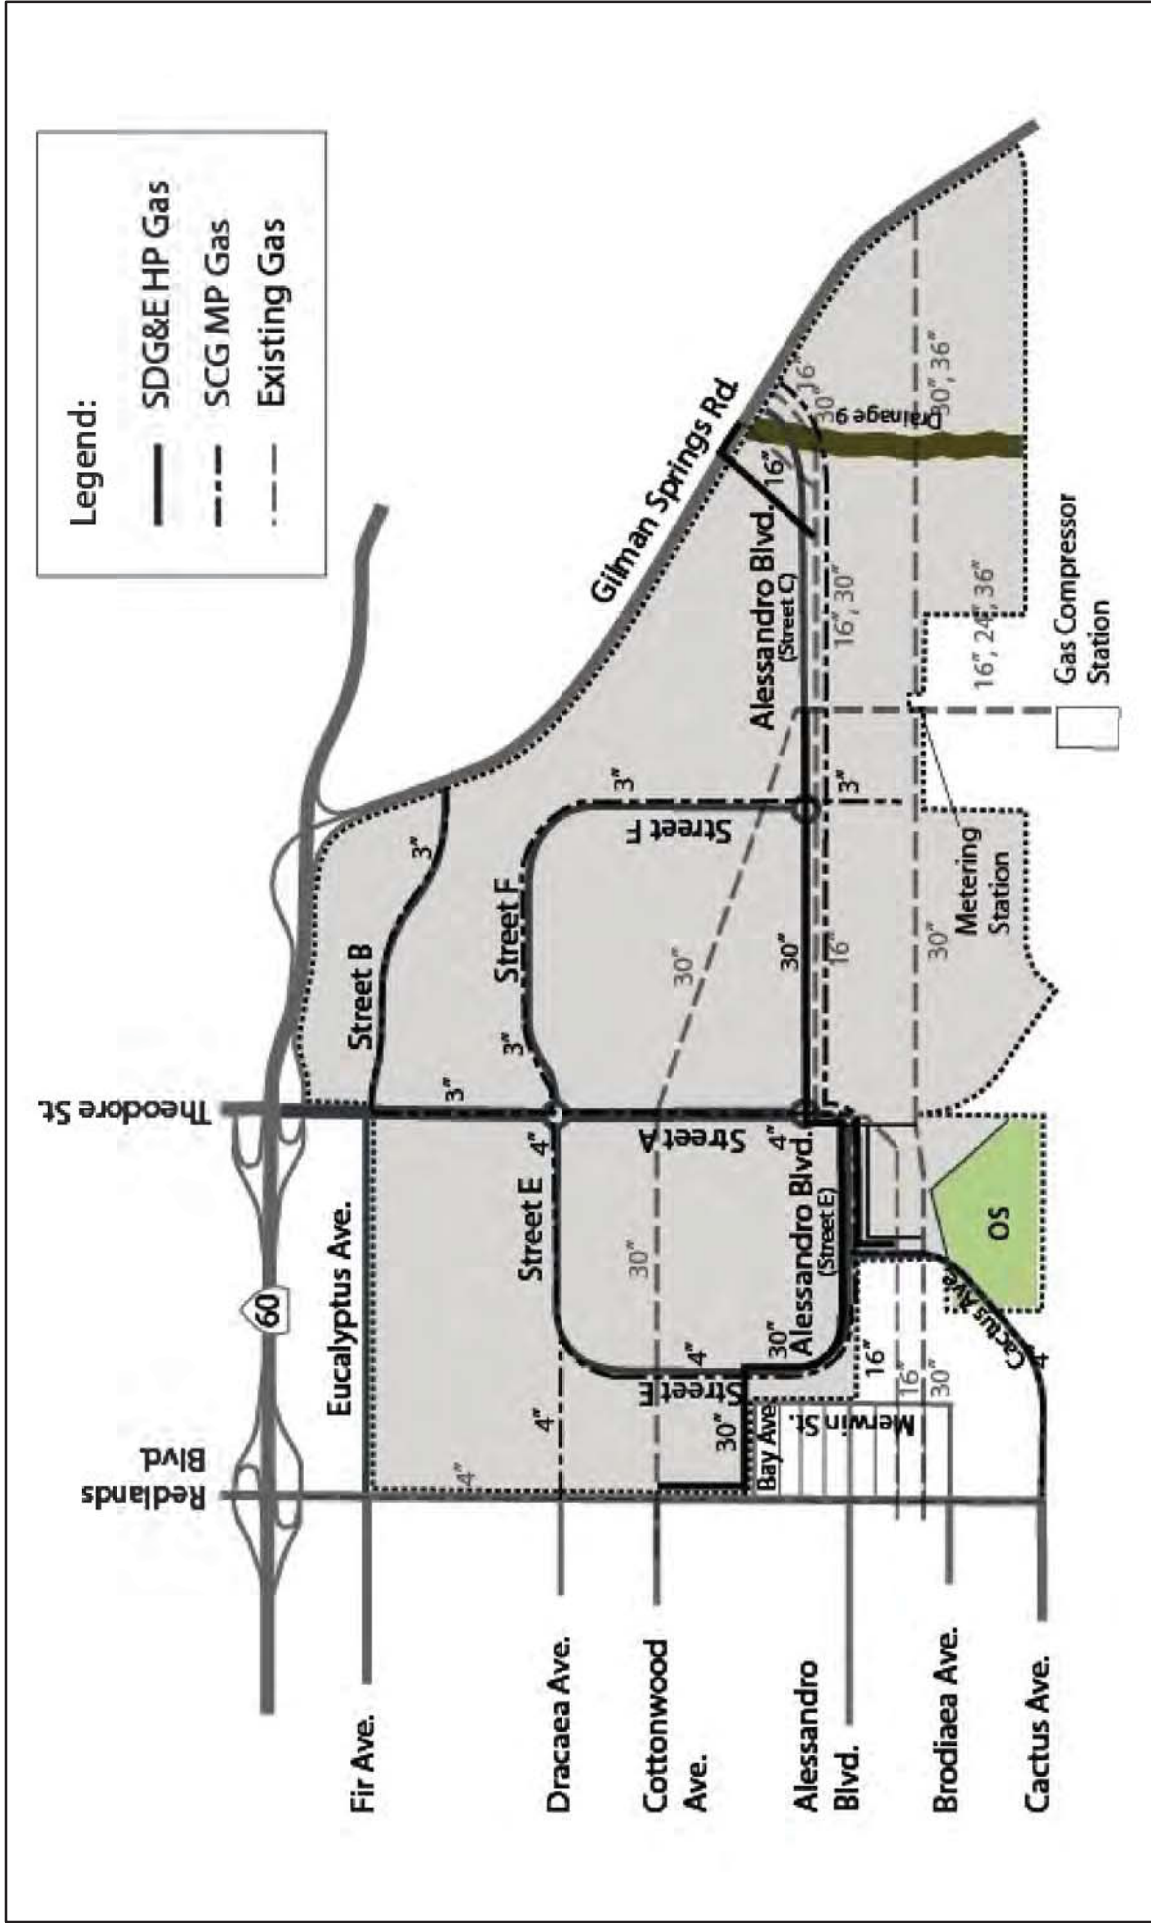

FIGURE 3.17

THIS PAGE INTENTIONALLY LEFT BLANK

SCGC transmission facilities in the Specific Plan area include a gas line blow-down facility and flow metering station at Alessandro Boulevard and Virginia Street. Farther south on Virginia Street, SDG&E operates the Moreno Compressor Station, which supplies gas to San Diego via 16, 30, and 36-inch transmission pipelines. In addition, Questar, a private utility company, has a 16-inch natural gas transmission line that runs within Alessandro Boulevard from Gilman Springs Road to Theodore Street, where it turns south to Maltby Avenue, and then turns west to Redlands Boulevard.

SCGC has indicated the 4-inch medium-pressure service line that runs in Redlands Boulevard will be extended into the area to service the development. Gas service will be installed in the public street right-of-way or easements as a joint trench with telephone, cable TV, and electrical services. In connection with the development of the property, relocation of some natural gas transmission lines into public street right-of-way or easements will be necessary. SDG&E's Moreno Compressor Station will remain in place.

3.4.6.4 Public Services

Fire protection services in the project area are provided by the Riverside County Fire Department under contract to the City of Moreno Valley. The Fire Department has an existing fire station located on Eucalyptus Avenue just east of Moreno Beach Boulevard. Response times to the project site from this station are approximately five (5) minutes. ~~The Fire Department has indicated it is considering future station locations near Redlands Boulevard. As development progresses, fire protection services within the Specific Plan area will continue to be evaluated through the plan development process, and additional facilities and/or services may be needed in the future. The Specific Plan indicates a new fire station will be located in the LD zone in the northeast portion of the site. At present, it is proposed in the north end of Planning Area 11, and the Specific Plan requires it to be built during Phase I. Placement of the fire station is subject to review and approval by the Fire Chief (Specific Plan Section 2.2.4 First Station Site). As development progresses, fire protection services within the Specific Plan area will continue to be evaluated through the plan development process, and additional facilities and/or services may be needed in the future.~~

Police service is provided to the project area by the Riverside County Sheriff's Department under contract to the City of Moreno Valley. At present, the City's main police station is at its design capacity, and additional capacity may be needed in the future. No new police facilities are planned on the project site at this time. ~~but the applicant and the City are discussing the need for future facilities.~~

Park facilities and programs are provided by the City of Moreno Valley. There are no local parks in or adjacent to the project site at present and none are planned with the project. The Lake Perris State Recreation Area is located southwest of the project site.

School facilities and services are provided by the Moreno Valley Unified School District. No school sites are existing in or adjacent to the project site and none are planned.

Library facilities and services are provided to local residents by the City of Moreno Valley. No library facilities are proposed to be included in the Specific Plan area.

3.4.7 Sustainability

Site and building design within the Specific Plan area will incorporate many sustainability and green building concepts. Green building is the practice of increasing building efficiency through site planning, water and energy management, material use, control of indoor air quality, and the use of

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

innovative design concepts. These practices help to improve building operational efficiency, conserve water, reduce waste, and lessen the heat island effect of development.

All buildings within the project will comply with the Title 24 California Building Code. Adopted in 1978 in response to the energy crisis of the 1970s and updated every five years by the California Energy Commission (CEC), California's Title 24 contains the strictest and most energy-efficient building code in the nation. The Title 24 Building Codes are called California's "Green Building" codes because they create energy efficiencies of up to 30 percent in some categories above and beyond the energy efficiencies achieved under the previous versions of Title 24.

The 2013 version of standards went into effect January 1, 2014. The CEC adopted the 2008 these changes to the Building Energy Efficiency Standards for a number of compelling the following reasons as follows:

1. To provide California with an adequate, reasonably-priced, and environmentally-sound supply of energy.
2. To respond to Assembly Bill 32, the Global Warming Solutions Act of 2006, which mandates California reduce its greenhouse gas emissions to 1990 levels by 2020.
3. To pursue California policy that energy efficiency is the resource of first choice for meeting California's energy needs.
4. To act on California's Integrated Energy Policy Report (IEPR) findings that Standards are the most cost-effective means to achieve energy efficiency, that the Building Energy Efficiency Standards will continue to be upgraded over time to reduce electricity and peak demand, and that the Standards will play a role in reducing energy related to meeting California's water needs and in reducing greenhouse gas emissions.
5. To meet the Executive Order in the Green Building Initiative to improve the energy efficiency of nonresidential buildings through aggressive standards.

The Specific Plan requires sustainable development standards so that new development within the project area minimizes energy consumption, conserves water, and uses recycled or sustainable building materials, where feasible. It provides developers with a specific framework for identifying and implementing a variety of practicable and measurable green building design, construction, operations, and maintenance. All new development within the project area will be required to be designed to meet the CEC standards in effect at the time construction commences (WLCSP Section 1.3.2). In addition, buildings within the Specific Plan will be designed to be "solar ready" (i.e., allow the installation of solar photovoltaic systems on the roof of each building) (WLCSP Section ~~12.7-Solar Commitment~~ 1.2.2, Green Building – Sustainable Development).

The sustainability guidelines for the World Logistics Center serve the following functions to:

- Assist in meeting California's greenhouse gas reduction targets as set forth through Executive Order S-3-05 and Assembly Bill 32 (also known as the Global Warming Solutions Act of 2006);
- Assist in the region's development of a sustainable communities strategy pursuant to Senate Bill 375;
- Assist in meeting other state and local goals and requirements, including Assembly Bill 1385, The Complete Streets Act;
- Establish practical and innovative solutions for the developer, business, and residential community to improve resource efficiency and reduce consumption of energy, water, and raw materials; and

- Support waste management reduction identified in AB 341.

3.4.7.1 Building Design and Construction

The Specific Plan requires sophisticated construction techniques that will provide pollution prevention and control such as noise, air quality, erosion, and sediment controls. Both site planning and future building design will require best practices for use of recycled materials and products, such as recycled steel, and crushed concrete and pavement materials.

Low-emitting volatile organic compound (VOC) building materials will be required to be used on site. Project design will allow the incorporation of alternative energy sources such as rooftop solar systems (i.e., “solar ready” buildings) or other technologies reasonably available at the time of development. Project design and construction techniques will be employed to reduce the heat island effect, which creates thermal gradient differences between developed and undeveloped areas. Such techniques will include the use of materials that have a low solar reflectance index such as white roofs and light-colored pavements.

All development within the Specific Plan will require the preparation of a waste management plan requiring the diversion of at least 50 percent of waste from landfill. This goal will be achieved through a comprehensive recycling and management program including storage and collection of recyclables, building and material reuse, and careful construction waste management.

The Specific Plan will incorporate the use of passive heating and cooling into the design or modification of the high-cube warehouse development (e.g., white building colors and roof insulation to minimize heat gain, and landscaping to help shade buildings).

Electrical power sources will be provided both indoors and outdoors to accommodate the use of electrical property maintenance equipment (Section 12.4 of the WLCSP).

3.4.7.2 Landscaping

The Specific Plan requires development to install xeriscape or drought-tolerant landscaping that requires minimal irrigation and to utilize on-site runoff into landscaped areas as much as possible for landscape irrigation.

3.4.7.3 Water Usage

Under the requirements of the Specific Plan, the project will employ water reduction and conservation principles, which will include advanced irrigation systems, drought-tolerant plants, the use of mulch, recycled and other permissible alternative sources of water, and turfless plantings with alternative landscaping materials such as rock and other materials that do not require potable water sources. The final design will be used to calculate the site’s water demand. The annual maximum allowable water budget (AMAWB) will be compared to the estimated annual water use (EAWU) to ensure that the design meets EMWD guidelines.

3.4.7.4 Storm Water Quality

Through implementation of the design standards in the Specific Plan, the project will incorporate storm water quality measures including infiltration basins, bioretention facilities, and extended detention basins to reduce pollutants in storm water (Specific Plan Section 4-95.1.8.5). Future

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

development projects will be required to implement a Water Quality Management Plan (WQMP) in accordance with the National Pollutant Discharge Elimination System (NPDES) Permit Board Order R8-2010-0033. The current approved Riverside County WQMP for Urban Runoff addresses the Municipal Separate Storm Sewer Systems (MS4) NPDES permit. The most recent WQMP for the Santa Ana Region of Riverside County addresses the latest MS4 NPDES permit requirements. Projects identified as a “Priority Development Project” will be required to prepare a project-specific WQMP. The MS4 Permit mandates a Low Impact Development (LID) approach to storm water treatment and management of runoff discharges. Site-specific projects will be designed to minimize imperviousness, detain runoff, and infiltrate, reuse, or evapotranspire runoff where feasible. LID design will be used to infiltrate, evapotranspire, harvest and use, or treat runoff from impervious surfaces, in accordance with the *Design Handbook for Low Impact Development Practices*.

The project should also ensure that runoff does not create any hydrologic conditions of concern. The Regional Water Quality Control Board (RWQCB) continuously updates impairments as studies are completed. The most current version of impairment data should be reviewed prior to preparation of the Preliminary and Final Project-Specific WQMP (WLC Specific Plan Section 4.95.1.8, Water Quality Site Design).

The WLC Specific Plan contains extensive site design, source control, and treatment control Best Management Practices (BMPs) that will be analyzed in detail in Section 4.9, *Hydrology and Water Quality* of this EIR.

3.4.8 Architectural Design Guidelines

Sections 4.1 and 5.3 of the Specific Plan contain the architectural and building design standards that will be applicable to all future off-site conditions and specific on-site development proposals. The design standards provide for attractive, functional, compatible contemporary designs, which can also minimize energy consumption and the production of greenhouse gases, helping to reduce the project’s contribution to global climate change. These Specific Plan sections include typical building elevations, cross-sections, and photographic renderings that illustrate how future development will appear. The architectural guidelines also address project details such as building setbacks, walls, fences, building materials, and colors.

Section 2.0 of the Specific Plan establishes building height limitations throughout the project, as shown in previously referenced Figure 3.9. Building heights are limited to 60 feet ~~at the perimeter of the project for buildings located along the north, west, and southern boundaries of the project~~ and 80 feet ~~on the interior. For buildings over 60 feet along Gilman Springs Road and in height only 20 percent of the building may exceed 60 feet~~ the interior. The WLC Specific Plan contains a provision that portions of buildings could be raised an additional 10 feet percent to accommodate interior facilities (i.e., elevator shafts) and architectural design elements, which may be approved through the administrative variance process.

3.4.9 Landscaping Design Guidelines

Sections 2.5, 4.2, and 5.34 of the Specific Plan provide landscaping guidelines for the project. The intent of these guidelines is to develop a landscape program that reduces the use of mechanical irrigation systems, maximizing the collection and use of rainfall to irrigate carefully designed landscape areas. The Specific Plan includes a plant palette specifically designed for the project site to consume significantly less water than conventional landscaping concepts. The Specific Plan contains an extensive palette of drought-tolerant plants.

The Specific Plan calls for a more substantial landscape treatment to be installed along the ~~western boundary perimeter~~ of the site. These special edge treatment areas will be along the western boundary of the project site, north along SR-60, east along Gilman Springs Road, and along the southern boundary of the project adjacent to the SJWA. near existing residences. These areas have been designed to provide an aesthetic buffer and soften views between the ~~housing surrounding land uses~~ and the planned warehouse buildings and truck activity areas. Further description of the special edge treatment areas can be found in the Section 2.5 of the WLCSP and DEIR Section 4.1.6 and in DEIR Figure 4.1.6A. For areas not along the ~~western boundary perimeter~~, landscaped areas would be grouped by water needs ~~and only utilize drip irrigation systems along Theodore Street and the perimeter of the project.~~ Irrigation systems would be designed to irrigate at no more than 70 percent² of the plant groups' reference evapotranspiration rate (minimum required water for the plant groups' survival), and would be designed to minimize water runoff onto sidewalks or streets. The project will direct runoff to landscaped areas and employ techniques to promote percolation and water capture at the root zone, reducing the need for mechanical irrigation.

Section 5.~~34.2~~ of the WLCSP requires future development to consider the following water conservation measures: macro and micro climates, solar exposure, prevailing wind conditions; site analysis of, seasonal temperature patterns, soils and drainage, grades, and slopes; use of historical evapotranspiration rates and weather station (CIMIS) data; use of planting zones coordinated according to plant type, climatic exposure, soil condition and slope to facilitate use of zoned irrigation systems; use of low water or drought-tolerant plant species in landscape areas served by potable water; audit of water use and certification by a licensed landscape architect that the irrigation system was installed and operates as designed; use of reclaimed water systems if available and practical, use of best available irrigation technology to maximize efficient use of water, including moisture sensors, multi-program electronic timers, rain shutoff devices, remote control valves, drip systems, backflow preventers, pressure reducing valves and matched output sprinkler heads; use of gate valves to isolate and shut down mainline breaks; design to meet peak moisture demand of all plant materials within design zones, while avoiding flow rates that exceed infiltration rate of soil; design to prevent overspray or discharge onto roadways, non-landscaped areas or adjacent properties; and timing of irrigation cycles to operate at night when wind, evaporation, and human activities are at a minimum.

3.4.10 Lighting Design Guidelines

Section 7.~~05.5~~ of the Specific Plan contains guidelines for site lighting within the Specific Plan. The regulations prohibit direct light spillage onto adjacent properties, especially the San Jacinto Wildlife Area to the south (Specific Plan Sections 4.3 and 5.5), while providing sufficient light for nighttime activities and project security. The project will incorporate the design standards adopted by Ordinance 851 which established stricter controls on outdoor lighting.

3.4.11 Off-site Improvements

Development within the Specific Plan will require various infrastructure improvements, some of them located off site. Local roadways and intersections affected by project traffic will be improved as outlined in the project Traffic Impact Analysis (TIA). Electrical service will be extended from the Moreno Beach substation to the project. Electric power lines along Gilman Springs Road will be relocated when that road is widened. Providing potable water to the site will require the construction of three new reservoirs, one north of SR-60 off of Theodore Street, one east of Gilman Springs Road near the northeast corner of the site, ~~and one west of the project site off of Cottonwood Avenue~~ one

² Per the California Code of Regulations, Title 23 Waters Division, Department of Water Resources, Ch. 2.7 Model Water Efficient Landscape Ordinance, the County of Riverside Water Efficient Landscape Requirements Ordinance No. 859, and the Eastern Municipal Water District (EMWD) 2010 Urban Water Management Plan, or current Urban Water Management Plan.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

in the northwestern portion of the project (see Figure 3.13). Street D will be extended off-site to the south to connect with the eastern end of Cactus Avenue. The Cactus extension will extend east through a portion of the Open Space area, then turn north to intersect with Alessandro Boulevard (see Figure 3.163.10), and a four-inch gas line will be constructed within this street extension (see Figure 3.163.10). A 21-inch sewer line will be extended to the west from the southwest corner of the site (see Figure 3.173.14) from D Street Cactus Avenue. The existing County drainage channel near the southwest corner of the site will be improved to handle increased flows from project runoff. At such time as traffic demand dictates, the Theodore Street interchange on SR-60 will be reconstructed to accommodate project traffic. All of the off-site improvements needed to support development of the Specific Plan are shown in previously referenced Figure 3.7. This EIR examines the impacts of these off-site improvements on approximately 104 acres of off-site land that they affect.

NOTE: The analysis of environmental impacts from the project, including biological resources, cultural resources, geotechnical constraints, air quality, greenhouse gases, noise, etc., also address development of these offsite improvement areas as well as development of the WLCSP property.

3.4.12 Grading and Excavation

Approximately 42 million cubic yards (cy) of cut and fill will be required to rough/mass grade the entire project site, including remedial grading and overexcavation. Earthwork will balance on site within the Specific Plan, eliminating the need to import or export dirt for the project. See Figure 3.18 for the conceptual grading plan.

3.4.13 Phasing

Development of the Specific Plan is planned over a period of ten years, from 2013 through 2022. Under this projected development schedule, the project will absorb an average of approximately 4 million square feet of new development each year from 2013 to 2022, with actual development phasing based on future market conditions. Section 2.2 of the Specific Plan, *Project Phasing*, suggests that development will likely occur in two large phases, starting in the western portion of the site south of Eucalyptus Avenue. This phasing concept is based on beginning construction where infrastructure presently exists and expanding southerly and easterly. Figure 3.19 shows the proposed phasing plan.

Development of the Specific Plan is planned over a period of fifteen years, from 2015 through 2030. Under this projected development schedule, the project will absorb an average of approximately 2.7 million square feet of new development each year from 2015 to 2030, with actual development phasing based on future market conditions. Section 8.0 of the Specific Plan, *Project Phasing*, suggests that development will likely occur in two large phases, starting in the western portion of the site south of Eucalyptus Avenue. This phasing concept is based on beginning construction where infrastructure presently exists and expanding southerly and easterly. It is anticipated that Phase 1 would be completed by 2022 and would contain approximately 50% of development or approximately 20,300,000 square feet of logistics warehouse uses. Phase 2 anticipates full development build-out by 2030. Figure 3.19 shows the proposed phasing plan.

As stated in the Specific Plan, project phasing predictions are conceptual. The actual amount and timing of development will be dependent upon numerous factors, many of which are outside the control of the City or the developer, including interest by building users, private developers and local, regional, and national economic conditions. These and other factors acting together will ultimately determine the location and rate at which development within the project area occurs.

World Logistics Center Project**

City adoption of the project will establish the framework for development of the area in accordance with the Specific Plan, which identifies the type and intensity of land uses permitted within the project. It is anticipated that development of the project would occur over time, as the result of the construction of multiple separate independent projects of varying sizes and configurations. Each of these future projects would be required to be consistent with the General Plan and zoning and would comply with all applicable regulations of the Specific Plan. Table 3.E provides an estimate of the rate at which the project area could be built out, consistent with the Specific Plan, and estimated levels of construction projected to occur during each phase of development. Table 3.E also includes the approximate amount of equipment anticipated to be used during construction of the project.

NOTE: The analysis of environmental impacts from the project, including biological resources, cultural resources, geotechnical constraints, air quality, greenhouse gases, noise, etc., addressed development of these offsite improvement areas as well as development of the WLCSP property.

5. Includes: dump truck, crane, fork lift

³ Two months a year

⁴ Four weeks a year

3.4.14 Construction Hours

Similar to the Highland Fairview Corporate Park, construction of warehousing buildings within the Specific Plan will occur on a 24 hour-a-day, 7 day-a-week basis. This is necessitated by the extensive use of poured concrete in the construction of building sites and the logistics buildings themselves. Major concrete pours are most efficiently and economically done in the cooler night and early morning hours. Additionally, the large number of concrete delivery trucks necessary for this construction has a minimal traffic impact in the nighttime hours.

The City's Municipal Code contains the following language regarding construction hours:

***Section 8.14.040 Hours of Construction.** Any construction within the city shall only be as follows: Monday through Friday (except for holidays which occur on weekdays), six a.m. to eight p.m.; weekends and holidays (as observed by the city and described in Chapter 2.55 of this code), seven a.m. to eight p.m., unless written approval is obtained from the city building official or city engineer.*

***Section 8.21.050 Time of Grading Operations.** Grading and equipment operations shall only be completed between the hours of seven a.m. and six p.m. Monday through Friday, excluding holidays and from eight a.m. to four p.m. on weekends and holidays. The city engineer may, however, permit grading or equipment operations before or after the allowable hours of operation if he or she determines that such operations are not detrimental to the health, safety, or welfare of residents or the general public. Permitted hours of operations may be shortened by the city engineer's finding of a previously unforeseen effect on the health, safety, or welfare of the surrounding community.*

If necessary, future developers within the WLCSP can apply to the City for extended hours of operation under the Municipal Code guidelines, as outlined in Condition of Approval #7 for the Highland Fairview Corporate Center (Skechers):

Construction and Demolition. No person shall operate or cause the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city engineer or designee.

3.4.15 Specific Plan Implementation

Although financial and economic parameters of a project are not typically included in an EIR, the size and complexity of the Specific Plan project dictate that a certain amount of this information be included in the EIR to demonstrate that the project is feasible and that the City will not incur undue risk relative to the installation of public infrastructure and other facilities and services (Specific Plan Section 11.0).

Funding for the transportation, infrastructure, and other improvements identified in the Specific Plan would be provided by a variety of sources. For example, Highland Fairview would construct certain backbone roads at the outset of project development; future development would install road connections and on-site improvements. All projects would contribute to the City's Development Impact Fee (DIF) program to help fund future roadway improvements in the immediate surrounding City area. In addition, future development would contribute to the County's Transportation Uniform Mitigation Fee (TUMF) program to fund identified regional improvements such as the SR-60 ramps at Redlands Boulevard. The Specific Plan contains a discussion of potential financing measures and

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

mechanisms the City would need to enact, adopt, or participate in for the proposed infrastructure improvements.

One of the available regional infrastructure funding mechanisms is the TUMF managed by the Western Riverside Council of Governments (WRCOG). The primary purpose of the TUMF program is to fund regional transportation improvements. The TUMF program has become a key way to ensure that growth does not create gridlock on regional and local thoroughfares. Under the TUMF program, Western Riverside County is divided into five zones, with the Specific Plan located in the “Central” zone. The TUMF is structured so that 48.7 percent of funds generated in each zone go back to that zone to be programmed for projects. Another 48.7 percent is allocated to regional inter-zone projects programmed by the Riverside County Transportation Commission (RCTC), and 2.6 percent is allocated for regional transit projects programmed by the RTA. TUMF-eligible roadways within the proposed project include Redlands Boulevard, Alessandro Boulevard, Gilman Springs Road, and freeway interchanges at Gilman Springs Road and Redlands Boulevard.

The City of Moreno Valley has implemented a Capital Improvement Program (CIP) that is closely linked to the City DIF program. According to the 2011–2012 CIP, the City has experienced a reduction in DIF as well as other development-related funding sources. The current CIP reflects the new projects that have been funded. DIF funding is collected for “Arterial Streets,” “Interchange Improvements,” and “Traffic Signals.” The CIP describes approximately \$1.66 billion in capital projects through build out of the City.

There are several identified CIP projects within the project area including traffic signals along Alessandro Boulevard at Redlands Boulevard, Sinclair Street, Theodore Street, Virginia Street, and Gilman Springs Road; Eucalyptus Avenue at Redlands Boulevard, Sinclair Street, Theodore Street, Virginia Street, and Gilman Springs Road; SR-60 eastbound ramps at Theodore Street, and westbound ramps at Theodore Street and Redlands Boulevard. Future street improvements within the project area include SR-60 interchanges at Redlands Boulevard and/or Theodore Street, and Gilman Springs Road; although these are included in the City CIP program, the funding sources are TUMF and private developer contributions. Other future CIP identified street improvements include Alessandro Boulevard through the project area, Eucalyptus Avenue, Gilman Springs Road (within the city limits), Theodore Street, and Virginia Street. Updates to the CIP program may include future streets within the WLC project.

3.5 GENERAL PLAN AMENDMENT

Approval of the project includes amendments to the following General Plan text and Elements to incorporate the many aspects of the WLC Specific Plan (also see Figures 3.20a-j):

1. Community Development Element

a. Revise Land Use Map (Figure 2-2) to include WLCSP land plan

~~b. Revise Section 2.1.1~~

~~... several City of Moreno Valley facilities, including city hall, the public safety building and the animal shelter. A major logistics center is planned southerly of SR-60 between Redlands Boulevard and Gilman Springs Road. There are two full service hospitals ... (page 2-1)~~

c. Revise Section 2.1.3

~~... intersection of Virginia Street and Gato del Sol. The acquisitions encompasses about one third of the land within the Moreno Highlands Specific Plan.~~

~~Neither of the aforementioned land purchases are likely to be developed as envisioned in the original specific plan, and are likely to remain substantially vacant. In that the Moreno Highlands Specific Plan Development Agreement precludes the City from making unilateral changes to the specific plan land use plan, no changes were recommended for the Moreno Highland Specific Plan as part of the General Plan Update.~~

GEOGRAPHIC INFORMATION SYSTEMS

The information shown on this map was digitized from GIS. The user bears full responsibility for the map. It is for display purposes only and should not be relied upon for any legal or other purposes. The City of Moreno Valley and Riverside County and City of Moreno Valley will not be held responsible for any claims, losses or damages resulting from the use of this information.

LOS D is applicable to intersections and roadway segments that are adjacent to freeway on/off ramps and/or adjacent to employment generating land uses. LOS C is applicable to all other intersections and roadway segments. Boundary intersections are assumed to be LOS D.

FIGURE 3.20

THIS PAGE INTENTIONALLY LEFT BLANK

2. Parks, Recreation and Open Space Element

- a. Revise Open Space Map (Figure 4-1) (page 4-2) to include WLCSP.
- b. Revise Future Parkland Acquisition Areas map (Figure 4-2) (page 4-6).
- c. Revise Master Plan of Trails (Figure 4-3) (page 4-13) to include WLCSP.

3. Circulation Element

- a. Revise discussion on Industrial Development (Section 5.3.2.2).

Industrial and business park development is concentrated in the southern part of the City, located south of Iris Avenue and north of San Michele Road to the Perris city limits, and in the eastern part of the City, generally between Redlands Boulevard and Gilman Springs Road. This development ... (page 5-7)

4. Safety Element (revise the following to incorporate WLCSP)

- ~~a. Revise section re: Fire and Emergency Services (Section 6.2)~~
- b. Revise Fire Stations map (Figure 6-1)(page 6-8) consistent with WLCSP.
- ~~c. Revise Geologic Faults and Liquefaction map (Figure 6-3).~~
- ~~d. Revise discussion on Flood Hazards (Section 6.8).~~
- e. Revise Flood Hazards map (Figure 6-4).
- f. Revise Build-Out Noise Contours map (Figure 6-52) to match WLCSP contours.

5. Conservation Element

- ~~a. Revise Scenic Resources section (Section 7.7) to incorporate references to WLCSP.~~
- b. Revise Major Scenic Resources map (Figure 7-2)(page 7-13) to incorporate WLCSP.

6. Goals and Objectives

- ~~a. Revise section on industrial uses to reference LD and LL categories consistent with WLCSP.~~
- ~~b. Revise Objective 2.5.~~

~~Policy 2.5.2: The primary purpose of the areas designated Logistics Development is to provide for large, high-cube logistics warehouse uses of a minimum size of 500,000 square feet with a minimum clear height of 30 feet to accommodate modern, highly-automated warehouse facilities. The properties so designated should be subject to a Specific Plan to establish design standards and architectural guidelines to guide the development of these specialized buildings. Development intensity should not exceed a Floor Area Ratio of 1.0.~~

~~Policy 2.5.3: Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses.~~

~~Policy 2.5.4: Screen manufacturing and industrial uses where necessary to reduce glare, noise, dust, vibrations, and unsightly views.~~

~~Policy 2.5.5: Design industrial developments to discourage access through residential areas.~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- c. ~~Revise Objective 2.8 to include non-residential land uses in description of “mixed-use” projects:~~
- d. Revise Circulation Plan (Figure 9-1)(page 9-26) to incorporate WLCSP circulation plan.
- e. Revise LOS Standards map (Figure 9-2)(page 9-28) consistent with WLCSP.
- f. Revise Bikeway Plan map (Figure 9-4)(page 9-29) consistent with WLCSP bikeway plan.
- g. ~~Revise section on scenic vistas (Objective 7.7.5 to reflect recommended mitigation in the EIR.~~

3.6 PROJECT OBJECTIVES

The purpose of the proposed project is to provide a new master-planned facility specializing in logistics warehouse distribution services. Section 1.3.1, *Development Goals*, of the WLC Specific Plan outlines the following overall objectives for the proposed WLC Specific Plan:

NOTE: *The indicated minor wording change was made so the objectives would more accurately regarding service to the port which will only represent a small fraction of project trips (see Section 4.15, Transportation).*

- Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.
- Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.
- Create a major logistics center ~~in Rancho Belage~~ with good regional and freeway access.
- Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.
- Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.
- Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.
- Create a project that will provide a balanced approach to the City's responsibilities of fiscal viability, economic expansion, and environmental integrity.
- Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.
- Encourage new development consistent with regional and municipal service capabilities.
- Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.
- Provide thousands of construction job opportunities during the project's build-out phase.
- Provide appropriate transitions or setbacks between on-site and off-site uses.

3.6.1 City's Economic Development Action Plan Objectives

In 2011, the City adopted an Economic Development Action Plan (EDAP) that outlined the following general objectives:

Objectives for Economic Development

- Create jobs locally and address City's high unemployment rate
- Address the Community's jobs to housing imbalance
- Strengthen and broaden the local economic foundation by attracting quality businesses
- Enhance City revenue generation from sources such as sales tax, property tax, transient occupancy tax, and utility tax – all aimed at improving quality of life in Moreno Valley

Eastern Moreno Valley–Rancho Belago

- Prime area of Community with large undeveloped areas.
- Skechers USA opening has generated interest by other prospective corporate users.
- Nearly 20-year old Moreno Highlands Specific Plan to expire in 2012
- Highest and Best land uses should be evaluated to address City's jobs to housing imbalance

Survey of Inland Region Industrial/Business Park Zoning

- Ontario 25.3%
- Perris 21.7%
- San Bernardino 18.0%
- Chino 17.1%
- Fontana 17.0%
- Rancho Cucamonga 15.3%
- Riverside 15.2%
- Corona 11.4%
- Moreno Valley 9.0%

In 2013, the EDAP was replaced and included the following specific objectives related to the World Logistics Center:

World Logistics Center at Rancho Belago

- Collaborate with Highland Fairview in the development of the World Logistics Center—a 41.6 million S.F. master planned corporate park proposed to be developed on 2,700 acres in the Rancho Belago area of eastern Moreno Valley.
- Process an Environmental Impact Report and preliminary development plans for the World Logistics Center in eastern Moreno Valley—south of SR 60 and east of Redlands Boulevard to Gilman Springs Road.
- Assist in the drafting of a Specific Plan that will guide the orderly development for of World Logistics Center.
- Cooperate with Highland Fairview in the formulation of a Development Agreement to create a public-private partnership to help facilitate the development of new public infrastructure in eastern

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Moreno Valley associated with the World Logistics Center including roads, trails, utilities, storm water protection and fire protection facilities.

- Work with Highland Fairview in branding the World Logistics Center as one of the largest e-commerce focused development projects in the U.S.

3.7 REQUIRED DISCRETIONARY ACTIONS AND PERMITS

3.7.1 City of Moreno Valley – Current Approvals

This Program EIR is intended to inform the City of Moreno Valley decision-makers and the general public of the environmental consequences of the proposed project. Entitlements being analyzed in this EIR include a General Plan Amendment, adoption of a Specific Plan, a Zone Change, a Development Agreement, a Tentative Parcel Map, and annexation of an 85-acre parcel along Gilman Springs Road. The City of Moreno Valley is the Lead Agency for the proposed project, but discretionary actions may also be required by other agencies (see Section 3.6.3).

The following discretionary actions are anticipated to be taken by the City of Moreno Valley as part of the proposed project:

3.7.1.1 Environmental Impact Report

Before taking action on the project, the City must certify that the EIR prepared for the project is adequate and represents the independent judgment of the City as the Lead Agency under CEQA.

3.7.1.2 General Plan Amendment

The General Plan Amendment proposes a revision to the City General Plan land use designations for 3,814,714 acres and ~~creates a new General Plan land use category for “Logistics Warehousing.”~~ to Business Park/Light Industrial (BP). The General Plan Amendment also includes amendments to several other elements, including the Community Development Element, the Parks, Recreation and Open Space Element, the Circulation Element, the Environmental Safety Element, and the Conservation Element to make them consistent with the proposed project (see previous Section 3.5, *General Plan Amendment*).

3.7.1.3 WLC Specific Plan

The proposed project includes a Specific Plan to implement the amended General Plan and to set forth comprehensive land use regulations governing the development of the proposed project. The World Logistics Center Specific Plan is a master plan for a ~~-2,710-610~~ acre site for the development of up to 4140.6 million square feet of modern high-cube logistics and related warehouse distribution facilities defined as Logistics Development and Light Logistics. The Specific Plan establishes the master plan of development for the project area, including development standards and use regulations, a master plan for circulation, infrastructure, architectural, landscape and design guidelines and sustainability goals - all of which will be applicable to all development within the area covered by the Specific Plan.

3.7.1.4 Change of Zone

The Change of Zone will establish the World Logistics Center Specific Plan, which will replace most of the Moreno Highlands Specific Plan and rezone several other contiguous properties. The new Specific Plan will become the regulatory land use document for the entire -2,740-610 acre Specific Plan area. The 910-acre CDFW property and the 174-acre SDG&E property will not be included in the Specific Plan but will be rezoned to Open Space to reflect the long-range plans for the properties. The 20 acres of land owned by SDG&E and SCGC that are used for natural gas facilities will be zoned for Public Utility use. The WLC property would then have two land use zones, Logistics Development (LD) and Light Logistics (LL).

3.7.1.5 Development Agreement

The project includes a Development Agreement between the project applicant, Highland Fairview, and the City of Moreno Valley in order to provide certainty for the future development of the project for those parcels owned by Highland Fairview (see Final EIR Appendix H for updated text).

3.7.1.6 Tentative Parcel Map

A Tentative Parcel Map (for financing purposes only) proposes the subdivision of a portion of the project site into large parcels. This map is for financing purposes only and does not create any development rights for the subdivided properties. Subsequent subdivision applications will be required prior to the development of any buildings on the site.

3.7.1.7 Annexation

The project includes the completion of the annexation process for an 85-acre parcel located on the north side of Alessandro Boulevard at Gilman Springs Road. The County has already taken the first step to make this parcel part of the City by including it in the City's Sphere of Influence in 1985. The proposed project includes pre-annexation General Plan land use designations and zoning for this parcel. This EIR will be the environmental documentation used by the Local Agency Formation Commission to complete the annexation process. This project proposes to incorporate this property into the World Logistics Center Specific Plan.

3.7.2 City of Moreno Valley – Future Approvals

"While building sizes, configurations and designs will vary, it is anticipated that between 15 and 30 logistics buildings will be developed within the WLC project. Each building may enclose from one to two million square feet and have multiple tenants. Each building will be subject to a discretionary Plot Plan process described in Section 11 of this Specific Plan."

Upon submittal of any site-specific development proposal within or related to the Specific Plan project, the City must determine whether the environmental effects of the proposal are within the levels of environmental effects analyzed in this programmatic EIR. In order to make this determination, the City may require the completion of an initial study (*CEQA Guidelines*, Appendix G Checklist). For each development proposal, the City will make one of the following determinations, as set forth under CEQA:

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

3.7.2.1 Categorical Exemptions (CE)

The City would adopt a categorical exemption under the following circumstances.

- 1) An assessment of the proposed action relative to the certified Program EIR determined there was no possibility of a significant environmental impact and the proposed action (utility improvements within rights-of-way, etc.) had already been evaluated in the EIR.

3.7.2.2 Negative Declaration (ND)

The City would adopt a negative declaration under the following circumstances.

- 2) If the initial study leads to the conclusion that the proposed project would have no significant environmental effects; or
- 3) If the initial study leads to the conclusion that the project may have potentially significant environmental effects, but all such effects are within levels that were fully reviewed, disclosed, and/or mitigated within this programmatic EIR.

Upon making a negative declaration, no further environmental analysis would be required.

3.7.2.3 Mitigated Negative Declaration (MND)

The City would adopt a mitigated negative declaration if the initial study leads to all of the following conclusions:

- 1) The proposed project could have a significant environmental effect; and
- 2) This potentially significant environmental effect may exceed levels that were fully reviewed, disclosed and/or mitigated within this programmatic EIR; and
- 3) The City, through a review of any associated studies that may accompany the completion of the initial study, concludes that these potentially significant effects can be fully mitigated with mitigation measures in addition to those identified in this programmatic EIR.

Upon making a mitigated negative declaration, no further environmental analysis would be required.

3.7.2.4 Supplemental EIR

A Supplemental EIR would be needed if the City concluded that the proposed project could have significant environmental effects exceeding the levels that were fully reviewed, disclosed, and/or mitigated within this program EIR and that further study is needed to determine if any feasible mitigation measures may be reasonable or prudent to address these environmental effects. Any Supplemental EIR(s) would only cover the environmental topic areas in which potentially significant impacts were identified in the initial study.

The initial study process outlined above will also help the City in determining if any proposed project within the project area qualifies for a partial or full exemption from any further environmental analysis. Specifically, some proposed projects may qualify for a statutory or categorical exemption, as outlined in Articles 18 and 19 of the *CEQA Guidelines*. Other provisions of California law limit the extent of further environmental review required in the case where a city has adopted a specific plan and certified an associated EIR, as would be the case for this project. Notwithstanding, the law also provides that in the event of changed circumstances in the project area or the identification of impacts

not previously considered or analyzed, subsequent environmental review (such as a mitigated negative declaration or supplemental EIR) may be required.

3.7.2.5 Subsequent EIR

CEQA Section 15162 requires a Subsequent EIR “If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration or EIR, the Lead Agency shall prepare a subsequent EIR if required under subsection (a). Otherwise, the Lead Agency shall determine whether to prepare a subsequent negative declaration, an addendum, or no further documentation.” Any changes to the Specific Plan will be subject to the criteria listed below. As required by Section 15162(a), a proposed change in a project will require preparation of a subsequent EIR if:

1. Substantial changes are proposed in the project which will require major revisions of the previous EIR or a negative declaration due to an involvement of new significant environmental effects, or a substantial increase in the severity of previously identified significant effects; or
2. Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects, or a substantial increase in the severity of the previously identified significant effects; or
3. New information of substantial importance, which was not known and could have not been known with the exercise of reasonable diligence at the time the previous EIR was certified, shows:
 - a. The project will have one or more significant effects not discussed in the previous EIR;
 - b. The significant effects previously examined will be substantially more severe than identified in the previous EIR;
 - c. Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or
 - d. Mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives.

If none of the above conditions is met, the preparation of a subsequent EIR is not required.

3.7.2.6 Addendum to WLC EIR

An Addendum to a previously approved EIR may be required if there are minor changes or additions to the previously analyzed project. An Addendum is used:

- To evaluate whether or not there are any new or more severe significant environmental effects associated with the proposed project;
- To review whether there is new information or circumstances that would require preparation of additional environmental documentation in the form of a subsequent or supplemental EIR, or if an Addendum is appropriate; and
- To evaluate the proposed project’s potential environmental impacts in the context of the questions posed in CEQA Section 15162(a).

3.7.3 Actions by Others

Although the City of Moreno Valley is the Lead Agency for the proposed project, a number of other Federal, State, or special purpose agencies may consult this EIR for their own decision-making and actions now or in the future. The following is a list of anticipated discretionary or non-discretionary actions by other agencies, however, it is not exhaustive and may include other agencies and processes in the future as appropriate:

- **County of Riverside**
 - Local Agency Formation Commission (LAFCO): Annexation of 85-acre parcel.
 - Flood Control and Water Conservation District: Amend Storm Drain Master Plan.
- **Other Affected Agencies**
 - Western Riverside Council of Governments: TUMF Contributions.
 - Eastern Municipal Water District: Water Service Agreements.
 - Developer will make “fair share” contributions to established development impact fee programs in the cities of Riverside, Perris, and Redlands for local road and intersection improvements identified in the programmatic Traffic Impact Assessment (TIA) included with the EIR (Final EIR Volume 2 Appendix L-1). This item is subject to review and approval by the City Transportation Division.
- **State of California**
 - Regional Water Quality Control Board: Water Quality Permitting.
 - Department of Transportation (Caltrans): Encroachment Permits for SR-60 and adopt fair share contribution programs for future development within the WLCSP to contribute funds for local road and intersection improvements identified in the programmatic Traffic Impact Assessment (TIA) included with the EIR (Final EIR Volume 2 Appendix L-1).
 - California Department of Fish and Wildlife: Streambed Alteration Agreements.
- **Federal Agencies**
 - U.S. Army Corps of Engineers: Clean Water Act Permitting.

NOTE TO READERS: *This section contains no major revisions based on changes to the WLC Project, revised technical studies, or in response to comments on the Programmatic Draft EIR. However, changes to the text in each section or sub-section will be noted in double underline (addition) and strikeout (deletion). In addition, the reason for the change will be noted in italics before the modified text as to the reason for the change (e.g., changes in the project description, technical studies, or in response to comments on the Draft EIR).*

4.0 ENVIRONMENTAL IMPACT EVALUATION

As stated previously, there are 16 environmental issue areas that are analyzed in this EIR with respect to the proposed project. These issues are:

- | | |
|--|--|
| 4.1 Aesthetics | 4.9 Hydrology and Water Quality |
| 4.2 Agriculture and Forestry Resources | 4.10 Land Use and Planning |
| 4.3 Air Quality | 4.11 Mineral Resources |
| 4.4 Biological Resources | 4.12 Noise |
| 4.5 Cultural Resources | 4.13 Population, Housing, and Employment |
| 4.6 Geology and Soils | 4.14 Public Services |
| 4.7 Greenhouse Gas Emissions, Energy Conservation, and Global Climate Change | 4.15 Transportation and Traffic |
| 4.8 Hazards and Hazardous Materials | 4.16 Utilities and Service Systems |

Within each subsection described in Section 4.0, the following information is presented relative to each environmental issue described:

- Description of the existing setting as it relates to the specific environmental issue;
- A summary of policies and regulations relevant to the specific environmental issue;
- Identification of the thresholds of significance;
- Evaluation of project-specific impacts and a determination of significance based on identified threshold levels;
- Description of design features of the Specific Plan that will help reduce potential impacts;
- Identification of mitigation measures;
- A determination of the level of significance after mitigation measures are implemented; and
- Cumulative impacts.

The environmental analysis provided in Sections 4.1 through 4.16 focuses on changes in the existing physical environment and identifies direct and indirect significant impacts associated with the proposed project. The cumulative impacts for each of the proposed project components are analyzed within the discussion of each component for each threshold.

TABLES

Table 4.1.A: Existing Viewsheds.....7
Table 4.1.B: Visual Intrusion Criteria74
Table 4.1.C: WLCSP Consistency with Community Development Element.....78

NOTE TO READERS. *This section has been revised based on changes to the WLC Specific Plan and in response to comments on the Programmatic DEIR regarding views.*

4.1 AESTHETICS

This section describes the existing aesthetic condition of the project area and analyzes potential impacts of the proposed WLC project relative to views, and light and glare based on the development characteristics outlined in the WLC Specific Plan (September 2014). Although there are no specific building locations or designs proposed at this time, the Specific Plan contains sufficient detail as to the general appearance and locations of buildings to evaluate the potential aesthetic impacts of development.

As a program-level CEQA document, this analysis will be based on the characteristics of buildings that can be built under the WLCSP. This analysis will look at the height, glare and lighting, visual impact, and viewshed impacts of the type of buildings authorized by the design standards and criteria set forth in Section 5.0 of the WLCSP. This section of the WLCSP creates comprehensive design and aesthetic guidelines. Section ~~4.3~~ 4.2.4 of the Specific Plan presents various line-of-sight cross-sections and photographic renderings showing views of various locations around the project site, which are illustrative of the massing and types of buildings authorized by the WLCSP.

Note: The following changes have been made due to revisions to the Specific Plan project area.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,918~~ 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately 70 percent of the area (~~2,710~~ 2,610 acres) for logistics warehousing (new LD and LL, ~~LS~~ zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan will be adopted to govern development of the World Logistics Center for the ~~2,710~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.

Information on visual characteristics, both on the site and in the vicinity of the project site, is presented in this section. Potential impacts to aesthetic visual resources and viewshed impacts resulting from the development of the proposed WLC project are based on analyses of site photographs, site reconnaissance, project data from the WLC Specific Plan, line-of-sight cross sections, and photographic renderings. The determinations in this section of the EIR are based, in part, on the City of Moreno Valley General Plan polices related to views and open space.

For the purposes of the following analyses, two general aesthetic terms are defined: scenic vistas and viewsheds.

- **Scenic Vistas.** A scenic vista can be categorized as either containing a panoramic view¹ or a focal view. Panoramic views are typically associated with publicly-accessible vantage points that provide a sweeping geographic orientation not commonly available (e.g., skylines, valleys, mountain ranges, or large bodies of water). Focal views are typically associated with views of natural landforms, public art/signs, and visually important structures, such as historic buildings. Aesthetic components of a scenic vista include three components: scenic quality, sensitivity level, and view access.
- **Viewsheds.** A viewshed is typically defined as the natural environment that is visible from one or more viewing points. CEQA documents most often define viewshed as what portions of the project viewers can see from surrounding areas. A viewshed can be divided into three distinct components: the foreground, midground, and background.

4.1.1 Existing Setting

NOTE: The following changes have been made due to revisions to the Specific Plan.

The approximately ~~3,814~~ 3,714-acre project site is located in Rancho Belago, the eastern portion of the City, and is situated on a gently sloping valley floor directly south of State Route 60 (SR-60) with the Badlands area to the east and northeast, the Mount Russell Range to the southwest, and Mystic Lake and the San Jacinto Wildlife Area to the southeast.

4.1.1.1 On-Site Conditions

Situated within northeastern Moreno Valley, the project site gently slopes to the south and elevations on-site range from 1,760 feet above mean sea level (amsl) near the northeast corner down to 1,480 feet amsl at the southeast corner. The site is largely vacant and supports mainly dry farm agriculture with little ornamental landscaping, lighting, or signage located within the project limits. At present, there are seven rural residences and associated farm structures in three areas on site: one on the east side of Redlands Boulevard in the west-central portion of the site and the others on either side of Theodore Street in the north-central portion of the site. The project site itself contains no scenic resources, although the large areas of agricultural fields do represent a kind of visual “open space” as vacant land and allow existing residences in the area to have unobstructed panoramic views. The site has significant views and scenic vistas of Mount Russell to the south, the Badlands to the north and east, Mount San Jacinto to the east, and the San Jacinto Wildlife Area to the south.

¹ A panoramic view consists of visual access to a large geographic area, for which the field of view can be wide and extend into the distance.

4.1.1.2 Adjacent Land Uses

Land uses adjacent to the project site include the Skechers logistics building to the northwest, and several suburban residential neighborhoods along Redlands Boulevard south of Cottonwood Avenue, and the “Old Moreno” commercial area at the intersection of Redlands Boulevard and Alessandro Boulevard. The closest residences are within 40 feet of the project property along Bay Street and Merwin Street. An additional residential neighborhood is located several hundred feet west of Redlands Boulevard, south of Eucalyptus Avenue. North of SR-60, there are several rural residences located between Redlands Boulevard and Theodore Street (refer to previously referenced Figure 3.3, *Existing Land Uses*). Much of the surrounding land is vacant and supports agriculture or open space (e.g., Badlands and Mount Russell). It should be noted that the General Plan makes reference to the “rural northeast portion of the City,” which refers to the land north of SR-60, not south of the freeway (J. Terrell, personal communication, November 2012).

4.1.1.3 Existing Viewsheds and Scenic Vistas

As illustrated in Figure 4.1.1, the proposed project site represents a large undeveloped area situated between the Badlands (northeast and east), the San Jacinto Wildlife Area (south), and the Lake Perris Recreational Area (southwest) ~~and the existing urbanized area to the west~~. Views across the site from SR-60 and from Gilman Springs Road are of vacant agricultural land forming the foreground, midground, and background. In the far background from these two roadways are Mystic Lake and the uplands surrounding Lake Perris. The major scenic resources for the project area, as documented in Figure 7-2 of the General Plan Conservation Element, are the Russell Mountains to the southwest, the Badlands to the east and northeast, Moreno Peak to the west, and the Reche Mountains to the far northwest. The existing agricultural fields provide a pleasant low relief foreground over which to view the three surrounding upland areas described above. The Conservation Element does not include the existing agricultural fields as a major scenic resource, although it does acknowledge that “Expanses of open land are found throughout the eastern portion of the study area. These tracts of land allow for uninterrupted scenic vistas from State Route 60, Gilman Springs Road, and other roadways and provide views of the San Jacinto Valley and the ephemeral Mystic Lake” (General Plan page 7-12).

Section 5.11, *Aesthetics*, in the City’s General Plan EIR, indicates the major scenic resources within the Moreno Valley study area are visible from SR-60, a City-designated local scenic road. As SR-60 travels through the eastern part of Moreno Valley, it approaches and eventually passes through the Badlands area. Characterized by steep and eroded hillsides, the Badlands provide a range of hills that act as a visual backdrop to the valley. Similarly, views afforded while traveling west through Rancho Belago, the eastern part of the City, include views of the Badlands to the north and south, and Mystic Lake and the Mount Russell Range to the far south. These resources are highlighted in General Plan EIR Figure 5.11-1, *Major Scenic Resources*. Table 4.1.A provides a summary of the existing viewsheds to and from the project site. Because of these resources, travelers on SR-60 and Gilman Springs Road are considered scenic routes since these visual resources are readily visible from these roadways.

The Conservation Element of the General Plan also states that, “The City of Moreno Valley has the opportunity to designate scenic routes as the basis for preserving outstanding scenic views. Special attention to the location and design of buildings, landscaping, and other features should be made to protect and enhance views from scenic roadways” (General Plan page 7-14). These statements indicate the City acknowledges the eventual conversion of the extensive agricultural fields and their replacement by buildings, but it emphasizes the importance of locating and designing the buildings to maintain existing scenic views (i.e., the surrounding uplands).

Source: LSA Associates, Inc. Site Survey, March 2012.

Views from the Project Site. Views to the north from the project site include the new Skechers logistics building and SR-60, while to the northeast, east and southeast, the rugged topography of the Badlands dominates the view. To the south, the view is of the San Jacinto Wildlife Area with partial views of Mystic Lake. To the southwest, views of Mount Russell and the Mount Russell Range predominate, with suburban residential uses visible to the far southwest and west. These views are experienced by travelers on Redlands Boulevard, Theodore Street, and Alessandro Boulevard, and residents of the rural residences on the project site. These represent significant visual resources; SR-60 and Gilman Springs Road are scenic routes because they have unobstructed views of these resources.

Views toward and across the Project Site. Views of the project site from the area north of SR-60 are limited by the SR-60 roadway and existing development. The skyline is dominated by views of the Badlands and of the Mount Russell Range. Views across the site from the northwest are from existing and/or planned non-residential uses. Current views of the site from these areas are of vacant agricultural land and the few scattered residences, and also the Skechers building near the northwest corner of the project site.

Foreground and midground views for the residences along the west and southwest boundaries of the project site are presently of vacant agricultural land, a windrow of olive trees along Redlands Boulevard, scattered palm trees, and scattered rural residences on site. Background views from these areas are of the Badlands, sweeping from the northeast to southeast. The Mount Russell Range dominates the southeasterly view from this area. Mystic Lake and the surrounding SJWA lands are not visible. These areas are also not visible from houses farther north along Redlands Boulevard as they are not elevated enough to see all the way to Mystic Lake, although there may be some limited views in that direction from second-story windows facing east that are not blocked by other residences.

Users of the SJWA south of the site have views of the existing agricultural lands on the project site. Finally, residents in the few homes on the east side of Gilman Springs Road have views of the agricultural lands on the project site.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Mount Russell, the Badlands, the SJWA, and Mystic Lake represent significant visual resources, and SR-60 and Gilman Springs Road are considered scenic routes because they have relatively unobstructed views of these resources.

This EIR analyzes the viewshed impacts of the project on (i) the residences along the west and southwest portions of the project site; (ii) the motoring public on SR-60 and Gilman Springs Road (designated scenic routes), Redlands Boulevard, Theodore Street, and Alessandro Boulevard; (iii) residences north of SR-60; and (iv) existing residences within the project area.

Figures 4.1.2 and 4.1.3A and B present a photographic key map and representative views of the project site.

4.1.1.4 Lighting and Visibility

The majority of the project area is currently very dark, with little or no ambient nighttime lighting other than from scattered rural residences and the SDG&E compressor facility. There is street lighting and general lighting along the western boundary of the site (i.e., along Redlands Boulevard) and from the Skechers warehouse building. The only other lighting comes from SR-60 along the northern boundary of the site. At present, Gilman Springs Road has no streetlights. Assuming “worst-case” conditions, current ambient light levels in the central and southern portions of the project site are assumed to be at or near zero foot-candles per square foot; this is the same unit of measurement used by professionals when referring to sky glow and nighttime light levels.

4.1.1.5 NOP/Scoping Comments

Many residents commented during the public scoping process that they were concerned about what the project would look like and about night lighting since the area is presently undeveloped and has no significant source of night lighting. Several commenters raised issues with future “night sky” impacts on the area.

4.1.2 Existing Policies and Regulations

4.1.2.1 City of Moreno Valley General Plan Policies

The following policies and goals pertain to aesthetics and are applicable to the proposed project:

Community Development

Objective 2.5 Promote a mix of industrial uses which provide a sound and diversified economic base and ample employment opportunities for the citizens of Moreno Valley with the establishment of industrial activities that have good access to the regional transportation system, accommodate the personal needs of workers and business visitors, and which meets the service needs of local businesses.

Policy 2.5.1 The primary purpose of areas designated Business Park/Industrial is to provide for manufacturing, research and development, warehousing and distribution, as well as office and support commercial activities. The zoning regulations shall identify the particular uses permitted on each parcel of land. Development intensity should not exceed a Floor Area Ratio (FAR) of 1.00 and the average FAR should be significantly less.

- Policy 2.5.2** Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses.
- Policy 2.5.3** Screen manufacturing and industrial uses where necessary to reduce glare, noise, dust, vibrations, and unsightly views.
- Policy 2.5.4** Design industrial developments to discourage access through residential areas.
- Objective 2.10** Ensure that all development within the City of Moreno Valley is of high quality, yields a pleasant living and working environment for existing and future residents, and attracts business as the result of consistent exemplary design.
- Policy 2.10.1** Encourage a design theme for each new development that is compatible with surrounding existing and planned developments.
- Policy 2.10.2** Screen trash storage and loading areas, ground and roof mounted mechanical equipment, and outdoor storage areas from public view as appropriate.
- Policy 2.10.3** Require exterior elevations of buildings to have architectural treatments that enhance their appearance.
- (a) A design theme, with compatible materials and styles, should be evident within a development project.
 - (b) Secondary accent materials, colors, and lighting should be used to highlight building features.
 - (c) Variations in roofline and setbacks (projections and recesses) should be used to break up the building mass.
 - (d) Industrial buildings shall include architectural treatments on visible façades that are aesthetically pleasing.
- Policy 2.10.4** Landscaping and open spaces should be provided as an integral part of project design to enhance building design, public views, and interior spaces, provide buffers and transitions as needed, and facilitate energy and resource conservation.
- Policy 2.10.5** Development projects adjacent to freeways shall provide landscaped buffer strips along the ultimate freeway right-of-way.
- Policy 2.10.6** Buildings should be designed with a plan for adequate signage. Signs should be highly compatible with the building and site design relative to size, color, material, and placement.
- Policy 2.10.7** On-site lighting should not cause nuisance levels or glare on adjacent properties.
- Policy 2.10.8** Lighting should improve the visual identification of structures.
- Policy 2.10.9** Fences and walls should incorporate landscape elements and changes in materials or textures to deter graffiti and add visual interest.
- Policy 2.10.10** Minimize the use and visibility of reverse frontage walls along streets and freeways by treatments such as landscaping, berming, and “side-on” cul-de-sacs.
- Policy 2.10.11** Screen and buffer non-residential projects from adjacent residential property and other sensitive land uses when necessary to minimize noise, glare, and other adverse effects on adjacent uses.
- Policy 2.10.12** Screen parking areas from streets to the extent consistent with surveillance needs (e.g., mounding, landscaping, low profile walls, and/or grade separations).
- Policy 2.10.13** Provide landscaping in automobile parking areas to reduce solar heat and glare.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Conservation Element

- Objective 7.7** Where practicable, preserve significant visual features, significant views, and vistas.
- Policy 7.7.3** Implement reasonable controls on the size, number, and design of signs to minimize degradation of visual quality.
- Policy 7.7.4** Gilman Springs Road, Moreno Beach Drive, and State Route 60 shall be designated as local scenic roads.
- Policy 7.7.5** Require development along scenic roadways to be visually attractive and to allow for scenic views of the surrounding mountains and Mystic Lake.

4.1.2.2 City of Moreno Valley Municipal Code

On September 11, 2012, the City Council adopted Ordinance 851, which amended various sections of the City Municipal Code, including Section 9.08.100 *Lighting* to address citywide night lighting standards. Among other things, it requires non-residential lighting to be fully shielded and directed away from surrounding residential uses. It also restricts non-residential lighting to not exceed 0.25 foot-candle of light measured from within five feet of any property line.

4.1.3 Methodology

Any evaluation of visual impacts is necessarily subjective; however, community aesthetic values can be used to evaluate changes in views within a particular community. These values are found in General Plan policies, zoning ordinances, and, where specific policies are absent, general design theory and visual analysis methods can be incorporated to evaluate aesthetic impacts. For the purposes of CEQA compliance, this analysis of visual impacts will focus on changes in the visual character of the project site that would result from the development of the proposed on-site uses, including the visual compatibility of on-site and adjacent uses, changes in vistas and viewsheds where visual changes would be evident, and the introduction of sources of light and glare. Impacts to the existing environment of the project site are to be determined by the contrast between the site's visual setting before and after the proposed development. In this analysis, emphasis has been placed on the transformation of the existing undeveloped conditions into urbanized uses. Although few standards exist to singularly define perceptions of aesthetic value, the degree of visual change can be measured and described in terms of visibility and visual contrast, dominance, and magnitude. Visual elevations and line-of-sight cross-sections from various vantage points around the project site are provided in Figures 4.1.4A-I, while computerized photographic renderings showing views of the site from different vantage points around the site are provided in Figures 4.1.5A-K.

NOTE: In Responses to Comments F-8-54 through -56 and G-51-40, the captions on several renderings were found to be incorrect and have since been corrected. In addition, several more renderings have been added to more fully illustrate potential views from areas surrounding the WLC site. These illustrations include one view toward Mt. Russell from SR-60 (traveling westbound on SR-60) and one additional view toward the Badlands and Mt. San Jacinto (traveling eastbound on SR-60).

Current residences southwest of the project site, as well as travelers along SR-60 and Gilman Springs Road are considered sensitive to the visual and aesthetic alteration of the project site. Where possible, the potential aesthetic impacts of the proposed project will be evaluated to determine if or the degree to which the project is consistent with applicable General Plan objectives and policies.

4.1.4 Thresholds of Significance

Appendix G of the *CEQA Guidelines* recognizes the following significance thresholds related to aesthetics. Based on these significance thresholds, a project would have a significant impact on aesthetic resources if it would result in:

- A substantial adverse effect on a scenic vista;
- Substantial damage to scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway;
- Substantial degradation of the existing visual character or quality of the site and its surroundings; and/or
- A new source of substantial light or glare that would adversely affect daytime or nighttime views in the area.

4.1.5 Less than Significant Impacts

Due to the size and location of the project, and due to the fundamental and permanent alteration of the aesthetic characteristics of the site, all aesthetic impacts were determined to be potentially significant.

4.1.6 Significant Impacts

4.1.6.1 Scenic Vistas

Impact 4.1.6.1: *The proposed project would have a substantial significant effect on a scenic vista.*

Threshold	Would the proposed project have a substantial adverse effect on a scenic vista?
-----------	---

The proposed project could have a substantial adverse effect on one or more scenic vistas, notably views of the Badlands, Mount Russell and the Mount Russell Range, and Mystic Lake/San Jacinto Wildlife Area. For the proposed project, the nearest sensitive permanent visual receptors would be the existing single-family residences to the west and southwest along Redlands Boulevard. In addition, the views of the motoring public along SR-60, Gilman Springs Road, Redlands Boulevard, Theodore Street, and Alessandro Boulevard would be significantly affected as well. At present, the Skechers building blocks views of the site for travelers on SR-60 who are immediately north of the Skechers building.

One of the development goals of the Specific Plan is to have the heights of the buildings along the north, west and south perimeter of the site, including SR-60, be ~~no taller than~~ approximately the same height as the existing Skechers building (i.e., approximately 55 feet above a ground elevation of 1,740 feet amsl). This means, as the site elevation decreases to the south, taller buildings theoretically could be built as long as they do not exceed 1,795 feet elevation (i.e., height above sea level, not building height above ground). This would result in seeing only the buildings adjacent to the freeway for eastbound travelers on SR-60, but it would adversely affect views from other locations around the WLC Specific Plan site regardless of the height comparison to the Skechers building. The motoring public heading westbound on SR-60 would experience impacts to their views of ~~Mystic Lake and Mount Russell.~~

Along Gilman Springs Road and away from the perimeter of the site, the Specific Plan allows warehouse buildings that may reach a height of 80 feet. These buildings would have a maximum altitude of 1,795 feet. The potential heights of project buildings, and possible viewshed impacts of

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

future development under the Specific Plan, are shown in previously referenced Figure 4.1.5, which provides computerized photographic renderings of the proposed project building and landscaping.

As stated previously, the project will allow a maximum of 60-foot tall warehouse buildings along the west, north, and south perimeters of the site, and 80-foot buildings on the “interior” portions of the site and along the eastern perimeter (i.e., Gilman Springs Road). Ground elevations range from 10 to 30 feet lower than Gilman Springs Road, which will help reduce visual impacts of warehouse buildings in the eastern portion of the site. The existing Skechers building at the northwest corner of the site can be seen from almost anywhere on the project site at present, and from surrounding off-site areas. Other warehouse buildings within the project will be at least that prominent when they are built.

Section 5.0 of the WLCSP contains architectural and design guidelines that will encourage the construction of attractive warehouse buildings and surrounding grounds. This is supported by the examples of building designs, materials, colors, and landscaping illustrations in the Specific Plan. The general development, setback, architectural design, and landscaping guidelines of the WLCSP require future development to provide attractive warehouse buildings with native plants and trees to help screen views of the lower portions of the buildings.

The Skechers building is mainly white, and the WLCSP indicates that future warehouse buildings on site will also be white or light colored to minimize energy consumption, provide architectural compatibility, and reflect heat to minimize the urban “heat island” effect (see also Section ~~6.0.5.3.13~~ Sustainability). Based on current views of the Skechers building, these new buildings will also be visible from various off-site locations (e.g., north of SR-60 and east of Gilman Springs Road). However, white or light-colored buildings, like Skechers, may be more visible at longer distances compared to darker or earth-toned buildings.

General View Impacts from Existing Residences. The Specific Plan establishes a minimum setback of 250 feet along the west boundary of the project site between sensitive receptors (i.e., houses) and buildings or parking/circulation areas within the WLCSP. The Specific Plan also includes specific landscaping and other design criteria for this buffer (see WLCSP Section 4.2, *Offsite Landscaping*). It should be noted that the width of the adjacent street outside of the WLC project boundaries (e.g., Redlands Boulevard, Bay Avenue, and Merwin Street) is included in the 250-foot buffer distance.

The line-of-sight exhibits and the photographic renderings help predict how the WLCSP project will appear as buildings are constructed. ~~Section 4.2 of the WLCSP~~ Figures 4.1.4A-E include typical cross-sections that show the 250-foot setback as measured from the ~~west right-of-way~~ center line of Redlands Boulevard and Merwin Street, and the south ~~right-of-way~~ center line of Bay Avenue. Not counting the existing street widths, the new landscaping setback/berm areas along the west side of the WLCSP will be approximately 150 feet wide (e.g., from the east side of Redlands Boulevard to the nearest truck activity area). These setbacks, and the proposed landscaping within the setback areas, are shown in previously referenced Figures 4.1.4A-E and 4.1.5A-F (Views 1-5). Section ~~5.34.2~~ of the Specific Plan describes and illustrates how the landscaping will appear both upon installation and at maturity (photographic renderings of these conditions are also shown in Section 4.2, *Offsite Design Standards—Landscaping*).

~~With~~ As development of the proposed project occurs, buildings, associated parking lots, and landscaping will be built on the project site. This will change existing views from virtually every point in and around the project site. Foreground and midground views would consist of trees, ornamental landscaping, and new warehouse buildings. Most background views will be affected as well with limited distant views of the Badlands, Mount San Jacinto, and Mount Russell remaining from some adjacent properties and roadways. Although the warehouse buildings and the single-family

residences would be separated by some distance, the proposed project will result in the reduction or elimination of existing background views.

Views from SR-60. The existing Skechers building can be used as a visual reference relative to future views involving the WLCSP. The average floor elevation of the Skechers facility is 1,740 feet amsl. Assuming an average building height of 55 feet, the Skechers building is at an elevation of 1,795 feet amsl compared to the elevation of SR-60 at 1,760 feet amsl adjacent to the Skechers building. This means a person driving on SR-60 cannot see much of the WLCSP property, or Mystic Lake while adjacent to the Skechers building, although the top of Mount Russell is visible from most locations.

Travelers in both directions on SR-60 will have views of the project site until the northernmost portion of the site is developed. As the site develops, the buildings would replace existing flat agricultural fields with industrial buildings, which may block foreground and midground views of travelers in both directions, depending on their locations. There are no site plans at present to show exact building locations or heights, so the determination of impacts must be based on the characteristics of buildings allowed under the Specific Plan. Buildings adjacent to the freeway would be approximately 60 feet in height, while buildings away from the northern perimeter (i.e., the south side of SR-60) could be up to 80 feet tall. If all of the future buildings along the south side of SR-60 block views to the same degree as the Skechers building, this would be a significant visual impact as it would reduce views of Mount Russell, and the Badlands south of SR-60 along Gilman Springs Road.

The height and location of buildings along this portion of the project will have to be designed to allow background views between and over them (i.e., so the mountains and Mystic Lake are not fully or largely obscured by buildings in the future). The conceptual landscape plans for the proposed project show trees will be planted along the south side of SR-60 to soften views of future buildings, but these will not fully obscure views of the buildings or parking areas, as the buildings may be taller than the trees will grow, and the buildings will extend farther into the midground and background views for many travelers. Even with the landscaping proposed by the WLC Specific Plan, development of this area will eventually replace the existing flat agricultural fields with tall industrial warehouse buildings that may completely or partially block views of the lower slopes of Mount Russell and the Badlands and Mystic Lake. If future buildings were to block views of these major scenic resources substantially (per GP Figure 7-2), the WLC project would result in significant visual impacts along SR-60. The simulated view from SR-60 is shown in Figure 4.1.5J and K (Views 8 and 9).

Views from Gilman Springs Road. Travelers in both directions on Gilman Springs Road will have extensive views across the project site until the easternmost portion of the site is developed. As the site develops, the buildings would replace existing flat agricultural fields with industrial buildings. Buildings constructed in the eastern portion of the site may block foreground and midground views for travelers in both directions, depending on the location of the building and the traveler. There are no site plans at present to show exact building locations or individual building size/mass or heights, so the determination of impacts must be based on the characteristics of buildings allowed under the Specific Plan. Buildings adjacent to the roadway would be approximately ~~60~~ 60-80 feet in height, while buildings away from the eastern perimeter (i.e., the west side of Gilman Springs Road) could be up to 80 feet tall. If all of the future buildings along the west side of Gilman Springs Road block views to the same degree as the Skechers building, this would be a significant visual impact as it would - ~~eliminate~~ reduce views of Mount Russell to the west and views of Mystic Lake to the south. The height and location of buildings along this portion of the project will have to be designed to allow background views between and over them (i.e., so the mountains and Mystic Lake are not fully or largely obscured by buildings in the future). The conceptual landscape plans for the proposed project show trees will be planted along the west side of Gilman Springs Road to soften views of future buildings,

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

but these will not fully obscure views of the buildings or parking areas, as the buildings may be taller than the trees will grow, and the buildings will extend farther into the midground and background views for many travelers. Even with the landscaping proposed by the WLC Specific Plan, development of this area will eventually replace the existing flat agricultural fields with tall industrial warehouse buildings, which may completely or partially block views of the lower slopes of Mount Russell and Mystic Lake. If future buildings block views of these major scenic resources substantially (per GP Figure 7-2), the WLC project would result in significant visual impacts along Gilman Springs Road. The simulated view from this vantage point is shown in Figure 4.1. ~~5J5G~~ (View ~~86~~).

On-site Views. As the WLC project is developed, views from the various rural residences on site will become increasingly blocked, depending on the relative locations and heights of buildings. Over time, these views will be blocked by new logistics warehouse buildings.

In addition to the cross-sections in the WLCSP, LPA Architects created photographic renderings at ~~ten~~ nine locations to illustrate existing and future views from various vantage points around the WLC site. The following analysis of views is organized by the corresponding rendering(s). These renderings used actual photographs of the sites and superimposed a rendering of potential future buildings within the WLCSP, consistent with Specific Plan development guidelines. These renderings represent possible architectural treatments under the WLCSP design guidelines.

Views from Residences Southwest of the Site. As the project develops, views of the project site from existing residences southwest of the site will fundamentally change from vacant agricultural land to an urbanized logistics campus with major warehouse buildings, roadways, landscaping, and signage. The change in views would be softened somewhat by landscaping, which will be subject to the architectural and landscaping design guidelines outlined in the Specific Plan. All building proposals will be subject to a discretionary plan review process by the City with the opportunity for the public input and comment.

The WLCSP restricts building heights to 60 feet along the perimeter of the project, with the exception of along Gilman Springs Road, and 80 feet for non-perimeter buildings. The WLCSP also allows for the building office entrances and corners to be slightly higher than the main portions of buildings. By comparison, single-family residences southwest of the proposed project have an approximate maximum height of 18 feet for single-story homes and 30 feet for two-story homes. It should be noted that there is an existing windrow of olive trees along the east side of Redlands Boulevard between Cottonwood Avenue north to 700 feet north of Dracaea Avenue (almost 1,800 feet or a third of a mile in total). This windrow would help soften views of the WLCSP site from the homes west of the windrow for as long as the windrow remains in place.

The WLCSP requires that a landscaped berm be installed along the Redlands Boulevard right-of-way to soften project views from residential areas to the west. The Specific Plan requires that all truck accessways and loading areas be at least 250 feet from residential properties along Redlands Boulevard, Bay Avenue, and Merwin Street. The Specific Plan includes renderings of potential future buildings, which illustrate that future buildings will be largely screened by the landscaped berm and other landscaping. While the Specific Plan requires the use of native, drought-tolerant species throughout the project site, the areas adjacent to residential uses along Redlands Boulevard, Bay Avenue, and Merwin Street will receive a more extensive landscape treatment (WLCSP Section 4.2.4 refers these as special edge treatment area). However, landscaping will take a number of years to mature to a height that would soften views from residential areas. Even with the setbacks, berms, walls, and landscaping required by the WLC Specific Plan, the proposed development will fundamentally change views generally available to the public in this area (i.e., area residents driving or walking along Redlands Boulevard, Bay Avenue, and Merwin Street). This is a significant impact

and requires mitigation. The photographic renderings for the project show proposed landscaping upon installation and at maturity (assumed to be approximately 15 years) for each rendered location (refer to Figures 4.1.5B-F, Views 1-5).

Views from the South. The existing view from the San Jacinto Wildlife Area north toward the Badlands will eventually be blocked by future buildings, resulting in visual impacts from this area. Buildings in this area will be setback from the SJWA boundary a minimum of 400 feet and limited in height to 60 feet, and the 250-foot landscaped buffer will set back the buildings from the SJWA boundary. Figure 4.1.6A shows the location of three special edge treatment areas. Cross section and line of site diagrams are shown for the edge treatments in Figures 4.1.4A through 4.1.4I. Additional information on the Southern Boundary is shown in Figure 4.1.6B.

Views from the East. Permanent views from existing residences east of Gilman Springs Road will fundamentally change. The views they now have of the agricultural fields on the project site will eventually be replaced by a view of an urbanized area consisting of warehouse buildings, parking areas, streets, and ornamental landscaping. The proposed buildings will not block views of the Mount Russell Range to the southwest but may block or partially block views of the Mystic Lake area.

Transient/Motorist Views along Gilman Springs Road. Transient views for travelers on Gilman Springs Road will fundamentally change over time, as future buildings within the WLCSP will be visible to travelers in both directions, replacing existing views of agricultural fields. Eventually buildings within the Specific Plan may block or partially block views of the lower slopes of the Mount Russell Range, as well as distant views of Mystic Lake for southbound drivers. This is a potentially significant impact requiring mitigation.

Transient/Motorist Views along SR-60. Transient views for travelers on SR-60 will fundamentally change over time, as future logistics buildings will be visible to travelers in both directions as development occurs in the project area, replacing existing views of agricultural fields. Eventually buildings within the Specific Plan may block or partially block views of the lower slopes of the Badlands and the lower slopes of the Mount Russell Range, as well as views of Mystic Lake southbound depending on the driver's location and viewing angle. When buildings are eventually built adjacent to the south side of SR-60, view across the valley floor and farther south toward Mystic Lake, may be completely blocked. Mystic Lake is not visible for travelers along SR-60; therefore buildings will not block views of the lake for those traveling along SR-60.

Views from the North. Permanent views for residences north of SR-60 will change, and the upper portions of some of the future logistics buildings closest to SR-60 may be visible above the freeway. For residences that are elevated, views across the freeway may be more extensive and residents may see more of the WLC project as it develops. The proposed buildings are not expected to block views of the Mount Russell Range to the south or the Badlands to the southeast, but may eventually completely or partially block distant views of the vacant agricultural land and of Mystic Lake.

THIS PAGE INTENTIONALLY LEFT BLANK

Views related to Off-site Improvements. Most project-related infrastructure improvements will not change existing views except for the future Theodore Street/SR-60 interchange improvements. When this interchange is rebuilt, views from some homes northwest of the intersection (i.e., looking southeast) may be incrementally affected by a larger, possibly higher bridge structure, depending on the ultimate design.

Construction of three off-site reservoir tanks will affect views of neighbors living near the new tanks. A new 1860 Zone tank southeast of SR-60/Gilman Springs Road and a new Zone 1967 tank just east of Theodore Street/Ironwood Avenue may be visible to some residents living northwest of Theodore Street/SR-60. In addition, a new 1764 Zone tank off of Cottonwood Avenue west of Redlands Boulevard may be visible to some residents living off of or driving along Cottonwood Avenue (see previously referenced Figure 3.13, *Water System*). However, views of a water tank are incremental and generally consistent with suburban areas, so these changes in views would not be considered significant.

General Plan Policies. These anticipated visual changes, while substantial, are generally consistent with General Plan Objective 7.7 in the Conservation Element regarding visual resources, which states, “Where practicable, preserve significant visual features, significant views, and vistas.” Based on the analysis in the preceding section, the WLCSP can preserve significant visual features, significant views, and vistas if the size and location of buildings developed under the WLCSP can be controlled so as to not substantially block views of Mount Russell, the Badlands, and Mystic Lake. The views from all areas surrounding the WLC site will fundamentally change as development occurs, but views of major scenic resources (i.e., Mount Russell, the Badlands, and Mystic Lake) may be largely preserved through careful limitations on the height and location of future buildings. The WLCSP outlines how future development will be made visually attractive and, through careful limitations on the height and location of future buildings, views of the surrounding mountains and Mystic Lake can be preserved through mitigation of individual buildings.

Impact Summary: Scenic Vistas. The implementation of the proposed project will obstruct and/or substantially affect scenic views for residents living within, or in the vicinity of, the project, and for travelers on SR-60, Gilman Springs Road, Redlands Boulevard, Theodore Street, and Alessandro Boulevard. Many of the views of the motoring public while on local roadways will fundamentally change instead of views of open agricultural land, these residents and motorists will view new logistics buildings and the associated parking areas, roadways, infrastructure, and landscaping. Therefore, the project will have a significant visual impact. The degree to which these buildings may block views of major scenic resources (i.e., Mount Russell, the Badlands, and Mystic Lake) will depend on the location and heights of buildings. This impact requires mitigation; however, this change in views, while substantial, is anticipated in the City’s General Plan, which allows development within the project area. At present, the General Plan allows development of a mixed-use residential community (i.e., Moreno Highlands Specific Plan), which would mainly be one-story and two-story buildings (approximate maximum height 35 feet). The WLCSP proposes to instead develop the site with logistics warehouse buildings (maximum height 60–80 feet), so this change in itself would represent a significant visual impact. In addition, the eventual change in views from existing (baseline) conditions is substantial and is considered a significant visual impact on scenic vistas.

Project or Specific Plan Design Features. The WLC Specific Plan contains design guidelines for architecture and landscaping within the site, which will guide the design of all project buildings toward attractive and visually appealing treatments. Section 2.0 of the Specific Plan indicates that warehouse uses will occur throughout the site, except for in the 74.3 acres at the southwest corner of the site designated for Open Space (OS). Section 5.0 of the Specific Plan outlines the design standards to be

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

applied to development within the project site, including Site Plan Guidelines (5.2), Architecture (5.3), Landscaping (5.4), and Lighting (5.5).

Specific Plan Section 5.1 indicates the project will utilize “Sustainable Design” to reduce pollution and conserve natural resources by considering renewable energy systems, minimizing the use of potable water, use atriums, skylights and internal courtyards to provide daylighting, orienting buildings to screen loading and service areas, collecting rainwater to irrigate drought-tolerant landscaping, providing landscaped outdoor plazas or entries, screening all truck yards from public view, etc.

Specific Plan Section 5.2 indicates building designs should “employ clean, simple, geometric forms and coordinated massing that produce overall unity, scale, and interest.” They should have appropriate façades, fenestration, glazing materials, roofs, colors, etc. Appropriate building design includes visible vertical support, visible structural base, functional and straightforward elements, columns integrated into the façade, and proper structural scale. The visual examples of what are appropriate and what are not also helps the reader to understand how the future buildings will appear.

NOTE: The following mitigation measures relative to views have been revised largely in Responses to Comments F-13-6 and F-13-21 in Letter F-13 from Johnson & Sedlack on behalf of the Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley, Responses to Comments G-57-13, G-95-6, G-95-9, G-95-20, G-95-21, G-95-41, and related comments by others.

Mitigation Measures. The sizes, heights, and general locations of buildings on the site are limited by the standards and guidelines contained in the Specific Plan. The following mitigation measures are recommended to reduce project impacts related to the potential loss of public viewsheds:

4.1.6.1A ~~Prior to the issuance of any discretionary permit for development along the western boundary of the WLCSP, a minimum 250-foot setback shall be verified from closest residential property line along Redlands Boulevard, Bay Avenue, and Merwin Street to any truck access area of the WLC project. Each Plot Plan application for development along the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing or planned residential zoned uses) shall include a minimum 250-foot setback measured from the City/County zoning boundary line and any building or truck parking/access area within the project. The setback area shall include landscaping, berms, planted and walls and landscaping sufficient to provide effective—visual screening between the new development and existing residential areas upon maturity of the landscaping materials. Prior to development of the portion of the WLC Specific Plan property adjacent to Redlands Boulevard, the The existing olive trees along Redlands Blvd. shall remain in place as long as practical to help screen views of the project site. This measure shall be implemented to the satisfaction of the City Planning Official Division.~~

4.1.6.1B ~~Prior to the issuance of any discretionary permit for development under the WLCSP adjacent to Redlands Boulevard, Bay Avenue, and Merwin Street, the developer shall provide a plot plan or site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that accurately illustrate the appearance of the proposed development. The renderings shall be sufficient to demonstrate that views of the buildings and trucks will be effectively screened from view by existing residents upon maturity of planned landscaping. The location and number of view presentations shall be at the discretion of the City Planning Division.~~

4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The

renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. “Effective” screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.

4.1.6.1C

Prior to the issuance of a certificate of occupancy for buildings adjacent to the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing residences at the time of application) the screening required in Mitigation Measure 4.1.6.1A shall be installed in substantial conformance with the approved plans to the satisfaction of the Planning Official.

4.1.6.1D

Prior to the issuance of permits for any development activity adjacent to Planning Area 30 (74.3 acres in the southwest portion of the Specific Plan), the entirety of Planning Area 30 shall be offered to the State of California for open space purposes. In the event that the State does not accept the dedication, the property shall be offered to Western Riverside County Regional Conservation Authority or an established non-profit land conservancy for open space purposes. In the event that none of these organizations accepts the dedication, the property may be dedicated to a property owners association or may remain in private ownership and may be fenced and access prohibited.

Level of Significance after Mitigation. After implementation of the proposed mitigation measure(s), adverse effects on scenic vistas would remain significant and unavoidable due to the fundamental change in public views for residents within and surrounding the project site, for travelers on SR-60, Gilman Springs Road, ~~Redlands Boulevard~~, Theodore Street, and ~~Alessandro~~Redlands Boulevard, and for users of the San Jacinto Wildlife Area.

4.1.6.2 Scenic Resources and Scenic Highways

Impact 4.1.6.2: *The proposed project would have a significant impact on the views of scenic resources for motorists traveling on SR-60 and Gilman Springs Road.*

Threshold	Would the proposed project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway and/or local scenic road?
-----------	---

The California Department of Transportation (Caltrans) Scenic Highway Program does not identify any State-designated scenic highways¹ near the project site². However, the City of Moreno Valley identifies SR-60 and Gilman Springs Road as local scenic roads.³ According to the City’s General Plan EIR, major scenic resources within the Moreno Valley study area are visible from SR-60 and Gilman Springs Road, both of which are City-designated local scenic roadways. It should be noted that Moreno Beach Drive, the other City-designated scenic route (per GP policy 7.7.4), is

¹ A State Scenic Highway is defined as any freeway, highway, road, or other public right-of-way, that traverses an area of exceptional scenic quality.
² *Eligible and Officially Designated Routes*, California Department of Transportation Scenic Highway Program, http://www.dot.ca.gov/hq/LandArch/scenic_highways/scenic_hwy.htm, website accessed April 4, 2012.
³ *Conservation Element, Figure 7-2 Major Scenic Resources*, City of Moreno Valley General Plan, adopted July 11, 2006.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

approximately one mile west of the project site. The proposed project would not be visible from Moreno Beach Drive, so it will not be analyzed further in this document. According to the City's General Plan, the built environment is equally important as natural landforms in terms of scenic values (e.g., buildings, landscaping, and signs).

Section 4.1.6.1 of this EIR determined that the proposed project could have a substantial adverse impact on one or more scenic vistas, including views of the Mount Russell Range and the Badlands for both residents and travelers on SR-60 and Gilman Springs Road.

The project is not required to provide a formal Visual Impact Assessment (VIA) to Caltrans since SR-60 is not a state-designated scenic highway; however, a cursory application of typical VIA requirements is useful in evaluating potential visual impacts of the project relative to travelers on SR-60 just north of the site. According to the Caltrans Handbook, a VIA is typically considered for projects that have the potential to change the "visual" environment. The level of assessment for the VIA can range from "no formal analysis" to a "complex analysis" and is determined by many factors such as numbers of viewer groups affected; existence of scenic resources; degree and totality of the proposed changes in the visual environment; local concerns or project controversy; and cumulative impacts along the transportation corridor.

In order to establish the need and level of study for a VIA, a preliminary evaluation is performed to determine if the project will cause any physical changes to the environment. This preliminary evaluation includes activities such as conducting a site visit to inventory the scenic resources of the project site, estimating potential changes to that character, and identifying viewer groups and public concerns or opposition to the proposal.

The following analysis of visual impacts of the project was conducted with the VIA criteria in mind. Even though a Caltrans VIA was not prepared, the following evaluation of potential impacts to visual resources is based on guidance from the following resource documents:

- Federal Highway Administration (FHWA) Technical Advisory T6640.8;
- FHWA Guidance HI-88-054: Visual Impact Assessment for Highway Projects;
- Title 23 U.S.C. 109 (h); and
- FHWA DOT-FH-11-9694: Visual Impact Assessment for Highway Projects, as published by the American Society of Landscape Architects.

Table 4.1.B provides the thresholds for a qualitative analysis as to what would be considered a minor, moderate, or major visual intrusion along scenic highways.

Table 4.1.B: Visual Intrusion Criteria

Type of Intrusion	Characteristics
Minor	Widely dispersed buildings; natural landscape dominates; wide setbacks and buildings screened from roadway; exterior colors and materials are compatible with environment; or buildings have cultural or historical significance.
Moderate	Increased number of buildings, but complementary to the landscape; smaller setbacks and lack of roadway screening; buildings do not degrade or obstruct scenic view.
Major	Dense and continuous development; highly reflective surfaces; buildings poorly maintained; visible blight; development along ridgelines; or buildings degrade or obstruct scenic view.

Source: *Scenic Highway Guidelines*, California Department of Transportation, March 1996; http://www.dot.ca.gov/hq/LandArch/scenic/guidelines/scenic_hwy_guidelines.pdf, site accessed April 27, 2012. Page 23.

The following analysis is generally based on the visual intrusion criteria from the Caltrans Guidelines for the Official Designation of Scenic Highways. These criteria, as identified in Table 4.1.B, provide for a qualitative analysis as to what would be considered a minor, moderate, or major visual intrusion along scenic highways. Existing views for motorists traveling eastbound and westbound on SR-60 consist of agricultural fields in the foreground and midground, and the Mount Russell Range and Badlands in the background. As previously identified in Figures 4.1.4 and 4.1.5, development of the proposed project would significantly alter the existing view by introducing large industrial buildings adjacent to the freeway. Existing eastbound and westbound views on SR-60 and Gilman Springs Road would be fundamentally altered with the future development of the proposed project. Views of the project buildings would occur for up to 112 seconds or almost two minutes when motorists are traveling at normal freeway speeds (approximately 9,000 feet or 1.7 miles @ 55 mph, Redlands Boulevard to Gilman Springs Road). Views would be even longer during rush hour or times of congestion when freeway speeds are below 55 mph, and shorter higher freeway speeds.

According to Figure 5-3 in the WLCSP (Building Height Plan, and Figure 3.9 in the Project Description of this EIR), the north, west, and south perimeter portions of the site will have buildings with heights up to 60 feet, and some of the buildings along the eastern perimeter and south of Street C (southeastern portion of the site but not adjacent to the San Jacinto Wildlife Area), would have heights of up to 80 feet. Since the Skechers building (roof height approximately 1,790 feet amsl) is already visible throughout the project site and from off-site areas to the east, south, and southwest, it is likely that most new buildings will be visible from these areas or possibly even farther away, depending on building heights and locations. The use of light colors and reflective surfaces such as glass and polished metal near office entrances and building corners, such as required in the WLC Specific Plan design guidelines, will enhance the visibility of these buildings.

The proposed sound walls and ornamental landscaping would soften the visual impacts of future buildings, but the proposed project would likely result in at least a partial obstruction of a portion of the Mount Russell Range for motorists traveling on SR-60, so the proposed buildings may obstruct the view of a major scenic feature from a City-designated scenic route. The proposed project meets criteria in both the moderate and major visual intrusion categories. Therefore, it is anticipated that the WLC Specific Plan design guidelines may create a major visual intrusion (i.e., significant impact) for motorists traveling on SR-60 and Gilman Springs Road.

General Plan Policies. These anticipated visual changes, while substantial, are generally consistent with the General Plan policies in the Conservation Element regarding visual resources and scenic routes, as outlined in Section 4.1.2.2 and excerpted below:

- Objective 7.7** Where practicable, preserve significant visual features, significant views, and vistas.
- Policy 7.7.4** Gilman Springs Road, Moreno Beach Drive, and State Route 60 shall be designated as local scenic roads.
- Policy 7.7.5** Require development along scenic roadways to be visually attractive and to allow for scenic views of the surrounding mountains and Mystic Lake.

Based on the analysis in the preceding section, the WLCSP can preserve significant visual features, significant views, and vistas if the size and location of buildings developed under the WLCSP can be controlled so as to not substantially block views of Mount Russell, the Badlands, and Mystic Lake. The views from SR-60 and Gilman Springs Road will fundamentally change, but their views of major scenic resources (i.e., Mount Russell, the Badlands, and Mystic Lake) may be preserved through careful limitations on the height and location of future buildings. The WLCSP outlines how future development along SR-60 and Gilman Springs Road will be made visually attractive and can maintain some view corridors of the surrounding mountains and Mystic Lake through careful limitations on the

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

height and location of future buildings. These are considered significant visual impacts on local scenic roads that will require mitigation.

Project or Specific Plan Design Features. As outlined in the previous section, the WLCSP contains architectural and design guidelines that require the construction of attractive warehouse buildings and surrounding grounds. The WLCSP provides examples of building designs, materials, colors, and landscaping that would be allowed (or not allowed) within the Specific Plan. Section 5.0 of the Specific Plan outlines the design standards to be applied to development within the project site, including Site Plan Guidelines (5.2), Architecture (5.3), Landscaping (5.4), and Lighting (5.5).

Specific Plan Section 5.2.3 indicates the project will utilize “Sustainable Design” to reduce pollution and conserve natural resources by considering renewable energy systems, minimizing the use of potable water, use atriums, skylights and internal courtyards to provide daylighting, orienting buildings to screen loading and service areas, collecting rainwater to irrigate drought-tolerant landscaping, providing landscaped outdoor plazas or entries, screening all truck yards from public view, etc.

Specific Plan Section 5.23.4 indicates building designs should employ clean, simple, geometric forms and coordinated massing that produce overall unity, scale, and interest. They should have appropriate façades, fenestration, glazing materials, roofs, colors, etc. Appropriate building design includes visible vertical support, visible structural base, functional and straightforward elements, columns integrated into the façade, and proper structural scale. The visual examples of what are appropriate and what are not also help the reader understand how the future buildings will appear.

However, even with the extensive design features of the Specific Plan, the resulting change in views from SR-60 and Gilman Springs Road will be significant, and mitigation is required.

Mitigation Measures. Construction of future logistics warehousing according to the development standards and design guidelines of the WLC Specific Plan will help soften building façades, and the installation of ornamental landscaping will help buffer the visual appearance of the buildings from SR-60, but the obstruction of local views will still be significant. Implementation of **Mitigation Measures 4.1.6.1A** through **4.1.6.1BD** will help reduce these impacts, but not to less than significant levels.

Level of Significance after Mitigation. Even with implementation of **Mitigation Measures 4.1.6.1A** through **4.1.6.1BD**, the loss of views from SR-60 and Gilman Springs Road will remain a significant and unavoidable visual impact, but one that is nonetheless consistent with the City’s applicable General Plan policies.

4.1.6.3 Existing Visual Character and Surroundings

Impact 4.1.6.3: *The proposed project will significantly degrade the existing visual character of the project site from open space to an urbanized setting by introducing large high cube logistics warehouse buildings.*

Threshold	Would the proposed project substantially degrade the existing visual character or quality of the site and its surroundings?
-----------	---

NOTE: The following changes have been made due to revisions made to the Specific Plan project size.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Visual impacts associated with changes to the general character of the project site (e.g., loss of open space), the components of the visual settings (e.g., landscaping and architectural elements), and the visual compatibility between proposed site uses and adjacent land uses would occur. The significance of visual impacts is inherently subjective as individuals respond differently to changes in the visual characteristics of an area. The project site is currently undeveloped with existing agricultural fields throughout the site. Development of the proposed industrial uses on the project site would include approximately 40.6 million square feet of warehouse distribution uses with associated parking areas, ornamental landscaping, and roadway and infrastructure on approximately 2,635 acres. Maximum building heights will range from 60 to 80 feet depending on location within the project (~~i.e., buildings around the perimeter of the project will be 60 feet in height~~) and will substantially change the views of both nearby residents and motorists on adjacent roadways.

The proposed project would also change views for travelers on the adjacent portion of SR-60 and Gilman Springs Road by introducing large industrial buildings in place of agricultural vacant land. The proposed buildings closest to the freeway would most likely have an average height of approximately 55 to 60 feet, although the maximum height may be increased by ~~40 feet which would exceed the existing height of the adjacent freeway by approximately 30 feet~~ up to 10 percent for portions of some buildings if necessary to accommodate interior facilities (i.e., elevator shafts) and architectural design elements, which would exceed the existing height of the adjacent freeway by approximately 30 feet. Such changes may be approved through the administrative variance process which provides for consideration of alternative standards, such as greater building heights, up to a maximum modification of 10%. The Administrative Variance process is provided in Section 11.3.3.1 of the Specific Plan.

Development of the proposed project would substantially and fundamentally change the existing character of the project site from open space to an urbanized setting with many large logistics buildings. The change in the character of the site would constitute a significant alteration of the existing visual character of the WLC project site, regardless of the architectural treatment and landscaping of the site. These impacts would be especially significant for residents of the existing residences on the project site, depending on the timing, location, and size of development in the future.

The proposed WLCSP includes a variety of architectural elements including façade accents such as corner treatments and roof trim. The project also provides variation in wall planes that serve to avoid an institutional appearance and break up the bulk of the buildings. This variation would create shadow lines at various times of the day.

The proposed warehouse buildings and ornamental landscaping would replace the widespread agricultural fields and scattered landscaping plants on the site. Landscaping would be provided in accordance with the Specific Plan Landscaping Guidelines.

The City recently approved an amendment to the Municipal Code requiring a 250-foot setback between industrial uses (i.e., the closest building and/or parking areas) and residential uses (i.e., Municipal Code Section 9.06). The Specific Plan design guidelines require specific setback distances. These required setbacks are shown in Section 4.2, *Offsite Landscaping*, of the Specific Plan. This section also includes a number of line-of-sight cross-sections and landscaping plans for the setbacks along the west side of the project. These setbacks provide a minimum 250 feet from existing residences to new proposed buildings or truck activity areas, consistent with the intent of Municipal Code Section 9.06.

In summary, the proposed setbacks, landscaping, berms, and walls outlined in the Specific Plan appear sufficient to provide adequate visual screening between proposed warehouse buildings and the existing residential uses. However, mitigation is required to ensure the actual design and

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

appearance of setback areas will effectively screen new development from existing residences and neighboring roadways.

Consistency with General Plan Policies. Sections 4.1.6.1 and 4.1.6.2 evaluated the WLC project relative to the General Plan objectives and policies in the Conservation Element. Table 4.1.C compares the WLCSP project to the General Plan objectives and policies in the Community Development Element:

Table 4.1.C: WLCSP Consistency with Community Development Element

General Plan Objective or Policy	Evaluation of WLCSP Consistency
<p>Objective 2.5: Promote a mix of industrial uses which provide a sound and diversified economic base and ample employment opportunities for the citizens of Moreno Valley with the establishment of industrial activities that have good access to the regional transportation system, accommodate the personal needs of workers and business visitors, and which meets the service needs of local businesses.</p>	<p>Consistent. The WLCSP provides high cube logistics industrial uses near SR-60.</p>
<p>Policy 2.5.1: The primary purpose of areas designated Business Park/Industrial is to provide for manufacturing, research and development, warehousing and distribution, as well as office and support commercial activities. The zoning regulations shall identify the particular uses permitted on each parcel of land. Development intensity should not exceed a Floor Area Ratio (FAR) of 1.00 and the average FAR should be significantly less.</p>	<p>Consistent. The WLCSP provides warehousing that is at FAR 0.5, which is much less than the maximum allowed.</p>
<p>Policy 2.5.2: Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses.</p>	<p>Consistent. The WLCSP provides setbacks and visual screening from neighboring residential and open space uses, and precludes project traffic through these areas as well.</p>
<p>Policy 2.5.3: Screen manufacturing and industrial uses where necessary to reduce glare, noise, dust, vibrations, and unsightly views.</p>	<p>Consistent. The WLCSP shows that the proposed warehouse buildings will be set back and screened from existing off-site residential uses.</p>
<p>Policy 2.5.4: Design industrial developments to discourage access through residential areas.</p>	<p>Consistent. WLCSP precludes project truck traffic through residential areas to the west and southwest, as outlined in the WLCSP circulation plan (see DEIR Figure 3.10).</p>
<p>Objective 2.10: Ensure that all development within the City of Moreno Valley is of high quality, yields a pleasant living and working environment for existing and future residents, and attracts business as the result of consistent exemplary design.</p>	<p>Consistent. The WLCSP provides high quality architectural and landscaping themes for the proposed buildings and grounds within the project.</p>
<p>Policy 2.10.1: Encourage a design theme for each new development that is compatible with surrounding existing and planned developments.</p>	<p><u>Note: The following changes have been made due to the revisions of the Specific Plan project size.</u></p> <p>Consistent. The WLCSP encompasses 2,610 acres in the last remaining large vacant land in the City. It will create a new logistics center with unique design themes. This development will be set back and visually screened to make it compatible with other development within the project and screened from adjacent residential uses.</p>

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.1.C: WLCSP Consistency with Community Development Element

General Plan Objective or Policy	Evaluation of WLCSP Consistency
Policy 2.10.2: Screen trash storage and loading areas, ground and roof-mounted mechanical equipment, and outdoor storage areas from public view as appropriate.	Consistent. The WLCSP provides design and development guidelines that achieve these requirements.
Policy 2.10.3: Require exterior elevations of buildings to have architectural treatments that enhance their appearance. (a) A design theme, with compatible materials and styles should be evident within a development project. (b) Secondary accent materials, colors, and lighting should be used to highlight building features. (c) Variations in roofline and setbacks (projections and recesses) should be used to break up the building mass. (d) Industrial buildings shall include architectural treatments on visible façades that are aesthetically pleasing.	Consistent. The WLCSP contains detailed development and architectural design guidelines intended to provide high quality logistics warehousing development on the project site. The WLCSP design guidelines include secondary accents, roofline variations, setbacks, and façade treatments, consistent with this policy.
Policy 2.10.4: Landscaping and open spaces should be provided as an integral part of project design to enhance building design, public views, and interior spaces, provide buffers and transitions as needed, and facilitate energy and resource conservation.	Consistent. The WLCSP emphasizes landscaping and energy conservation or sustainability concepts as an integral part of project design. The entire southern boundary and the southwest corner of the project will be permanent open space.
Policy 2.10.5: Development projects adjacent to freeways shall provide landscaped buffer strips along the ultimate freeway right-of-way.	Consistent. The WLCSP provides extensive landscaping along the south side of SR-60.
Policy 2.10.6: Buildings should be designed with a plan for adequate signage. Signs should be highly compatible with the building and site design relative to size, color, material, and placement.	Consistent. The WLCSP includes a section on signage to provide a comprehensive plan for signage throughout the project area.
Policy 2.10.7: On-site lighting should not cause nuisance levels or glare on adjacent properties.	Consistent with Mitigation. The WLCSP contains lighting guidelines for future development, but ambient light level impacts will need to be calculated and, if necessary, mitigated through the City's site plan review process for each specific building proposed.
Policy 2.10.8: Lighting should improve the visual identification of structures.	Consistent. The WLCSP includes a section on signage with lighting for a comprehensive plan throughout the project area.
Policy 2.10.9: Fences and walls should incorporate landscape elements and changes in materials or textures to deter graffiti and add visual interest.	Consistent. The WLCSP design guidelines require that fences and walls incorporate landscaping and materials designed to reduce graffiti.
Policy 2.10.10: Minimize the use and visibility of reverse frontage walls along streets and freeways by treatments such as landscaping, berming, and "side-on" cul-de-sacs.	Consistent. The WLCSP design guidelines do not allow reverse frontage walls. The SR-60 freeway frontage along the north side of the project will be fully landscaped.
Policy 2.10.11: Screen and buffer non-residential projects from adjacent residential property and other sensitive land uses when necessary to minimize noise, glare, and other adverse effects on adjacent uses.	Consistent. The WLCSP provides a physical and visual setback to screen new warehouse buildings from existing residential buildings.
Policy 2.10.12: Screen parking areas from streets to the extent consistent with surveillance needs (e.g., mounding, landscaping, low profile walls, and/or grade separations).	Consistent. The WLCSP requires parking areas to be screened consistent with surveillance needs.
Policy 2.10.13: Provide landscaping in automobile parking areas to reduce solar heat and glare.	Consistent. The WLCSP landscaping plan provides for planting vegetation in parking areas that will help provide shade and reduce glare.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Due to the size and nature of the project, development of the WLCSP will eventually degrade the existing visual character of the area to a significant degree.

Project or Specific Plan Design Features. As outlined in previous sections, the WLCSP contains architectural and design guidelines that will encourage the construction of attractive warehouse buildings and surrounding grounds. The WLCSP provides examples of building designs, materials, colors, and landscaping that would be allowed (or not allowed) within the Specific Plan.

NOTE: The following mitigation measure regarding views has been changed in Response to Comment F-8-3 in Letter F-8 from Shute Mihaly & Weinberger LLP, Comment G-33-6 in Letter G-33 from Tom Behrens, Responses to Comments G-95-21, G-96-4, and related comments from others.

Mitigation Measures. Incorporation of the proposed design guidelines, landscaping guidelines, and **Mitigation Measure 4.1.6.1A and 4.1.6.1B** will help soften the visual appearance of the buildings from SR-60, Gilman Springs Road, and nearby residences. However, the fundamental change in visual character of the area will still be significant. Even with compliance with the City's General Plan and Municipal Code development guidelines for industrial development, including the 250-foot setback between industrial and residential land uses, the anticipated fundamental change in views expected in this area will be significant. Due to the heights and mass of buildings needed to accommodate the proposed land uses, no feasible mitigation is available that would reduce these potential impacts to less than significant levels. However, the following measure will help reduce the project's visual impacts on adjacent residential development:

4.1.6.3A ~~Prior to the issuance of any discretionary permit for development under the WLCSP, the developer shall provide a site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that demonstrate changes in views of Mount Russell, the Badlands, and/or Mystic Lake for travelers along SR-60 or Gilman Springs Road, as appropriate. The renderings shall be sufficient to demonstrate typical views based on proposed site and landscaping plans, but the location and number of view presentations shall be at the discretion of the City Planning Division. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource.~~

4.1.6.3A Each Plot Plan application for development shall include plans and visual rendering(s) illustrating any changes in views of Mount Russell and/or the Badlands, for travelers along SR-60, as determined necessary by the Planning Official. The plans and renderings shall illustrate typical views based on proposed project plans, with the location and number of view presentations to be determined by the Planning Official. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource. The renderings must demonstrate that the development will preserve at least the upper two thirds (67%) of the vertical view of Mt. Russell from SR-60.

Level of Significance after Mitigation. Even with implementation of **Mitigation Measures 4.1.6.1A** through **4.1.6.1B1D** and **4.1.6.3A**, the substantial change in visual character of the project site and surrounding area from development of the proposed project will cause aesthetic impacts to remain significant and unavoidable.

4.1.6.4 Light and Glare

Impact 4.1.6.4: *The proposed project will introduce a significant new source of light and glare into the project area.*

Threshold	Would the proposed project create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?
-----------	--

Currently, there are few sources of light or glare on the project site and there is little or no impact on adjacent properties. Existing sources of light and glare in the surrounding area include the new Skechers building to the northwest of the project site, SR-60 traffic, streetlights, exterior lighting from the nearby residences, and vehicle headlights from motorists on Gilman Springs Road, Redlands Boulevard, Theodore Street, and Alessandro Boulevard.

Development of the project site would introduce numerous new sources of light and glare into the area in the form of street lighting, parking lots, and security lighting for the buildings and nighttime traffic.

The WLCSP requires that all site lighting be oriented downward so as to not project direct light rays upward into the sky or onto adjacent properties. The development of the project will cause a significant increase in light and glare in the area. This new lighting will incrementally affect nighttime conditions in the area.

The WLC Specific Plan requires energy-efficient lighting in most cases, but does allow mercury or incandescent lighting under some conditions (i.e., limited walkway or entryway applications). In addition, the lighting guidelines of the Specific Plan require high-pressure sodium or light-emitting diodes (LEDs) that produce a very “white” color of light, which allows for accurate color rendition (e.g., compared to low-pressure sodium, which produces an orange-tinged light that skews color rendition).

Exterior surfaces of the concrete tilt-up structure would be finished with a combination of architectural coatings, trim, and/or other building materials such as concrete and brushed metal. The proposed project will incrementally increase the amount of daytime glare in the project area by introducing windows and metal fixtures into the area. All development in the City, which includes light generated from warehouse buildings and parking lots, is required to adhere to lighting requirements contained in the City’s Municipal Code (Section 9.08.100 *Lighting*), which states that any outdoor lighting associated with nonresidential uses shall be shielded and directed away from the surrounding residential uses. Such lighting shall not exceed one-quarter (0.25) foot-candle at property lines and shall not blink, flash, oscillate, or be of unusually high intensity or brightness. Lighting in parking areas and drive aisles must be at least 1.0 foot candle and cannot exceed a maximum of 8.0 foot candles.

Adherence to the City’s Zoning Code would help reduce potential building or parking lighting impacts, but the location of industrial uses adjacent to residential uses would not reduce potential lighting impacts on adjacent residential uses to less than significant levels.

The WLC Specific Plan also allows for the installation of roof-mounted solar panels on future warehouse buildings (~~i.e., the WLCSP will provide “solar ready” buildings~~) and these panels may produce unintended glare to the southeast, south, and southwest of the site, depending on the angle of the sun, the number and location of panels, and the degree to which the building parapet blocks views of the panels from surrounding land uses. Without additional information, this impact is determined to be potentially significant and requires mitigation.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Consistency with General Plan Policies. The only General Plan policy that specifically addresses lighting is Policy 2.10.7, which states, “On-site lighting should not cause nuisance levels or glare on adjacent properties.” Due to the amount of new development proposed, the project’s impact relative to nuisance lighting and glare is potentially significant, even with implementation of the development and lighting design guidelines in the WLCSP. Therefore, mitigation is required.

Consistency with Municipal Code Requirements. The recent changes to the Municipal Code from Ordinance 851 will help control lighting impacts of the proposed project relative to adjacent residential properties. All development within the Specific Plan adjacent to residences along Redlands Boulevard, Bay Avenue, and Merwin Street will be required to demonstrate compliance with the off-site light spillage requirements of Section 9.08.100 of the Municipal Code.

Project or Specific Plan Design Features. The WLCSP contains lighting standards and design guidelines that will require the minimal use of lighting for building visibility and safety at night. The WLCSP provides examples of lighting that would be allowed (or not allowed) within the Specific Plan. However, Section 5.5.1 of the Specific Plan states that, “... lighting in the vicinity of the San Jacinto Wildlife Area shall be designed to confine all direct light rays to the project site and preclude the visibility of direct light rays from the wildlife area” (WLCSP page ~~1265-47~~).

In addition, Section 5.5 of the Specific Plan includes the following guidelines regarding lighting (WLCSP page 127):

- 5.5.2.2 All exterior on-site lighting must be shielded and confined within site boundaries. No direct rays or glare are permitted to shine onto public streets or adjacent lots.
- 5.5.2.3 Lighting fixtures are to be of clean, contemporary design.
- 5.5.2.4 Lighting must meet all requirements of the City of Moreno Valley.
- 5.5.2.5 Tilted wall fixtures (i.e., light fixtures which are not 90 degrees from vertical) are not permitted. Lights mounted to the roof parapet are not permitted. Wall-mounted light fixtures used to illuminate vehicular parking lots are not permitted.
- 5.5.2.6 Wall-mounted utility lights that cause off-site glare are not permitted. "Shoebox" lights are preferred.

NOTE: The following changes to mitigation for lighting impacts from solar panels have been made in Response to Comment G-95-42 in Letter G-95 from Thomas Thornsley.

Mitigation Measures. Even with compliance with the City’s General Plan, Municipal Code, and the Specific Plan’s development guidelines for lighting and building materials, the anticipated lighting and glare changes in this area will be potentially significant, especially adjacent to the San Jacinto Wildlife Area. Implementation of **Mitigation Measures 4.1.6.1A** through **4.1.6.1B** will help reduce related visual impacts, while **Mitigation Measures 4.1.6.4A** through and 4.1.6.4CB, below, will help reduce light and glare associated with the new buildings near the SJWA. The project will also have to comply with the lighting requirements of ~~Mount Palomar Zone B~~ City Municipal Code.

In addition, the following measures are recommended to help ensure that potential lighting impacts of the project will remain at less than significant levels:

- ~~4.1.6.4A~~ Each project proposed to be developed under the WLCSP adjacent to residential development shall provide a photometric plot of its proposed exterior lighting prior to the issuance of building permits. This plot shall demonstrate that it is consistent with the requirements of Section 9.08.100 of the City Municipal Code, to the satisfaction of the City's Planning Division. The lighting study shall indicate the expected increase in ambient night light levels at the property lines of adjacent residential uses (i.e., in the southwestern and western portions of the project site). The study shall demonstrate that the proposed lighting fixtures and/or visual screening do not exceed City standards regarding ambient light level impacts.
- 4.1.6.4A Each Plot Plan application for development adjacent to residential development shall include a photometric plot of all proposed exterior lighting demonstrating that the project is consistent with the requirements of Section 9.08.100 of the City Municipal Code. The lighting study shall indicate the expected increase in light levels at the property lines of adjacent residential uses. The study shall demonstrate that the proposed lighting fixtures and/or visual screening meet or exceed City standards regarding light impacts.
- ~~4.1.6.4B~~ Prior to the issuance of any building permits for development under the WLCSP, the developer shall provide an analysis of any solar panels to be installed on the roof of the new building. The analysis shall demonstrate that, under "worst case" annual conditions, glare from the proposed panels will not leave the confines of the roof, based on building roof parapet design, and affect adjacent residential uses or public travelers along perimeter roadways. Design or construction modifications necessary to meet these requirements shall be implemented to the satisfaction of the City Planning Division.
- 4.1.6.4B Each Plot Plan application for development shall include an analysis of all proposed solar panels demonstrating that glare from panels will not negatively affect adjacent residential uses or negatively affect motorists along perimeter roadways. Design details to meet these requirements shall be implemented to the satisfaction of the Planning Official.
- ~~4.1.6.4C~~ Prior to the issuance of any building permit for development under the WLCSP, low-pressure sodium (LPS) lighting shall be installed on the south sides of any building adjacent to the San Jacinto Wildlife Area (SJWA) to minimize "white" light spillage into the SJWA. This measure shall be implemented to the satisfaction of the City Planning Division based on consultation with the SJWA manager.

Level of Significance after Mitigation. Light and glare impacts of the proposed project can be reduced to less than significant levels by compliance with the lighting requirements of the City Municipal Code and implementation of **Mitigation Measures 4.1.6.4A through and 4.1.6.4B.**

4.1.7 Cumulative Impacts

Significant Cumulative Impact: The proposed project, in combination with other projects in the eastern portion of the City and along SR-60 and Gilman Springs Road, would have a cumulatively significant and unavoidable impact related to views, scenic resources, night lighting, and glare in this portion of the City.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The development of the proposed project would partially obstruct views of surrounding mountain vistas from various vantage points in and around the project area. Partial view opportunities would continue to be available over future buildings, along roadways, between development areas, etc. Development of lands within the City, particularly along SR-60, would result in the cumulative conversion from open space to urbanized land uses. The proposed project would continue the development of logistics uses along the south side of SR-60 east of the City's Auto Center. The proposed project, in conjunction with other cumulative projects, would be developed in a manner consistent with existing development trends in the City. Since other projects in the area will include similar distribution uses, it can be anticipated that such uses would have a similar design and massing as the proposed project. Since the proposed project would affect views of the surrounding mountains, it is reasonable to conclude that similar warehouse distribution uses would also obstruct views of the surrounding mountains. However, the analysis in Section 4.1.6.1 determined visual impacts, though substantial, were consistent with applicable General Plan policies (Policy 7.7.4 in the Conservation Element). Based on this analysis, the proposed project, in combination with other cumulative projects in the surrounding area, will have a cumulatively significant and unavoidable impact related to aesthetics (i.e., views, scenic resources, and lighting) in this portion of the City.

The proposed, existing, and future development within the planning area will increase the amount of light and glare in the area. The cumulative lighting-related impacts of this new development would be reduced through the adherence to applicable City Municipal Code lighting standards. However, this project, in combination with the Auto Center and other approved high cube logistics developments in this portion of the City, will result in cumulatively considerable light and glare impacts, and the proposed project will make a significant contribution to that cumulative impact.

NOTE TO READERS. *This section has been revised based on responses to comments on the Programmatic DEIR regarding calculation of and mitigation for loss of agricultural land, changes to the WLC Specific Plan, and changes to related technical studies.*

4.2 AGRICULTURAL AND FORESTRY RESOURCES

This section discusses possible agricultural and forestry resource impacts attributable to the proposed project. It describes existing agricultural resources and State farmland classifications for the project site. This section focuses on applicable State, regional, and local policies regarding agricultural resources and the conversion of farmland to non-agricultural uses.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,948~~ 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately 70 percent of the area (~~2,740~~ 2,610 acres) for logistics warehousing (new LD and LL, ~~LS~~ zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the ~~2,740~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. ~~The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.~~

The analysis contained in this section is based on the following reference documents:

The California Land Evaluation and Site Assessment (LESA) Model worksheets prepared for the project are included in Appendix C to this EIR (*Agricultural Resources Assessment for the World Logistics Center Specific Plan Draft Environmental Impact Report*, Parsons Brinckerhoff, original dated February 2012, revised September 2014).

4.2.1 Existing Setting

Most of the land within the project area has been utilized for agricultural purposes since the late 1880s. The area has a history of citrus production and dryland farming incorporating various agricultural activities such as frequent disking, infrequent pesticide application, and very limited irrigation. Due to a variety of local and regional economic factors, agricultural production is no longer a principal characteristic of the Moreno Valley economy.¹

NOTE: The following changes have been made due to revision to the Specific Plan project size.

Based on the project biology study (MBA ~~2012~~2014) and the review of recent aerial photographs, currently approximately 2,452 acres or ~~9094~~ percent of the ~~2,740610~~-acre Specific Plan area is currently dry farmed, mainly with winter wheat. The remaining acreage of the Specific Plan area contains rural residences and related building/uses, and disturbed native vegetation in the northeast and southwest portions of the site.

¹ Conservation Element, City of Moreno Valley General Plan.

Approximately 897 acres or 81 percent of the 1,104-acre open space properties that are owned by the State and public utility companies and located south of the Specific Plan site are in active agriculture; they are also being dry farmed primarily with winter wheat. The remaining land in this area includes disturbed native vegetation associated with Mystic Lake and public facilities, such as the two natural gas facilities.

Adjacent to the project area, suburban residential uses are located to the west, open space and scattered rural residential uses are located to the east, and State-owned open space properties, such as the Lake Perris Recreation Area and the San Jacinto Wildlife Area, are located to the southwest and south, respectively.

4.2.1.1 State Designated Farmland

The California Government Code (Section 65570) requires the collection and reporting of agricultural land use acreage and conversion by June 30 of each even-numbered year. Utilizing data from the U.S. Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS) soil survey and current land use information, the California Department of Conservation (DOC), the Farmland Mapping and Monitoring Program (FMMP)¹ compiles important farmland maps for each county within the State. Maps and statistics are produced biannually using a process that integrates aerial photo interpretation, field mapping, a computerized mapping system, and public review. These maps delineate land use in eight mapping categories (and one overlay category) and represent an inventory of agricultural soil resources within Riverside County (see Figure 4.2.1). The categories of land shown on these maps are listed below.

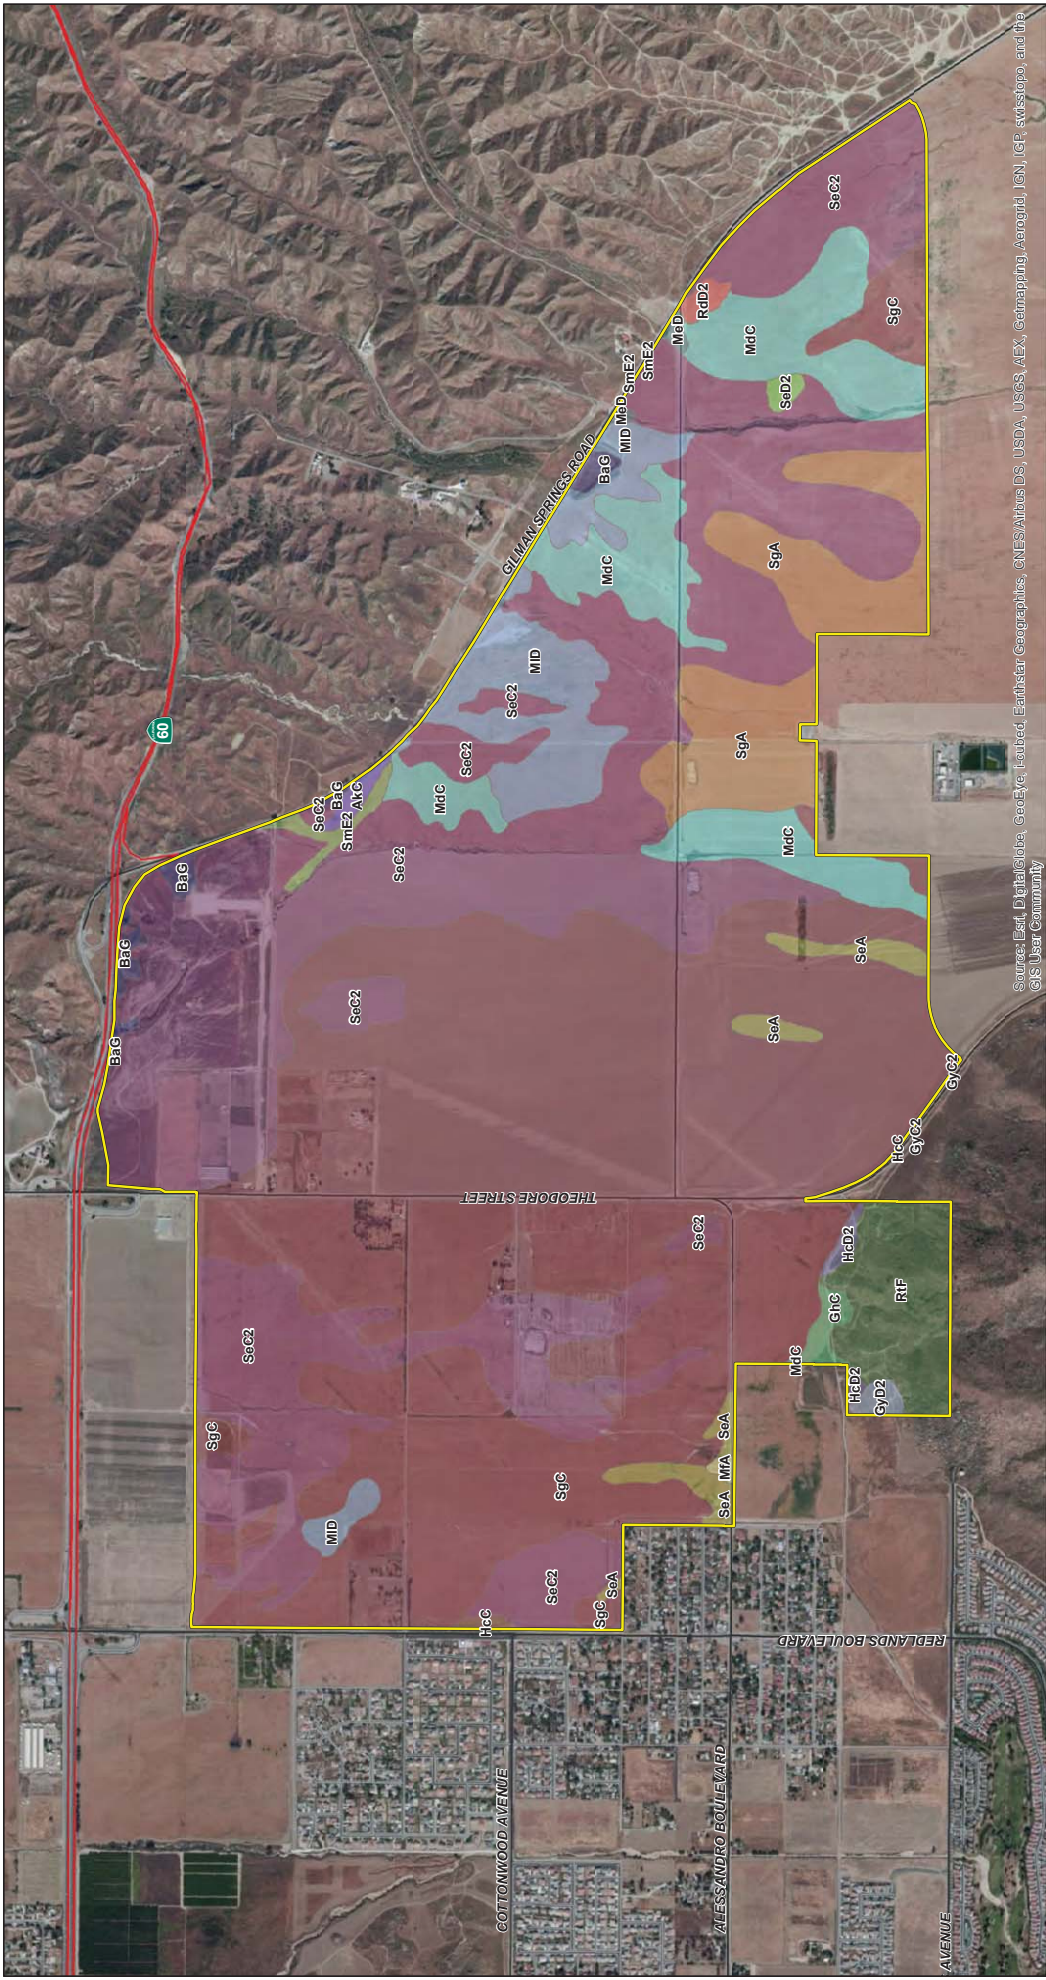

- **Prime Farmland:** Land that has the best combination of physical and chemical characteristics for the production of crops. It has the soil quality, growing season, and moisture to produce sustained high yields of crops when treated and managed, including water management, according to current farming methods.
- **Farmland of Statewide Importance:** Land that is similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store moisture.
- **Unique Farmland:** Land of lesser-quality soils used to produce specific high economic value crops. It has the special combination of soil quality, location, growing season, and moisture supply needed to produce sustained high quality or high yields of a specific crop when treated and managed according to current farming methods. It is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Examples of Unique Farmland crops include oranges, olives, avocados, rice, grapes, and cut flowers.
- **Farmland of Local Importance:** Land of importance to the local agricultural economy, as determined by each county's board of supervisors and local advisory committees, i.e., dairies, dry land farming, aquaculture, and uncultivated areas with soils qualifying for Prime Farmland and Farmland of Statewide Importance.

Farmland of Local Importance in Riverside County, including the City of Moreno Valley, is defined as:

- Lands with soils that would be classified as Prime and Statewide Farmland but lack available irrigation water.
- Lands planted with dry land crops of barley, oats, and wheat.

¹ A Guide to the Farmland Mapping and Monitoring Program, California Department of Conservation, Division of Land Resources Protection, 2004 Edition.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Lands producing major crops for Riverside County but that are not listed as Unique crops. These crops are identified as returning one million or more dollars on the 1980 Riverside County Agriculture Crop Report. Crops identified are permanent pasture (irrigated), summer squash, okra, eggplant, radishes, and watermelons.
- Dairylands, including corrals, pasture, milking facilities, hay and manure storage areas if accompanied with permanent pasture, or hayland of 10 acres or more.
- Lands identified by city or county ordinance as Agricultural Zones or Contracts, which includes Riverside City “Proposition R” lands.
- Lands planted with jojoba, which are under cultivation and are of producing age.
- **Grazing Land:** Land on which the existing vegetation, whether grown naturally or through management, is suitable for grazing or browsing of livestock.
- **Urban and Built-up Land:** Land used for residential, industrial, commercial, construction, institutional, and public administrative purposes such as railroad yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water control structures, and other development purposes. Highways, railroads, and other transportation facilities also are included in this category.
- **Other Land:** Land not included in any of the other mapping categories. Common examples include low-density rural developments, brush, timber, wetland, and riparian areas not suitable for livestock grazing, confined livestock, poultry or aquaculture facilities, strip mines, borrow pits, and water bodies smaller than 40 acres.
- **Water:** Water areas with an extent of at least 40 acres.
- **Land Committed to Nonagricultural Use:** This optional designation is an overlay to the standard farmland categories and represents existing farmland and grazing land and vacant areas that have a permanent commitment for development. Examples of Land Committed to Nonagricultural Use would include an area undergoing permanent infrastructure installation or for which bonds or assessments have been issued for public utilities. Such lands represent planning areas where there are commitments for future nonagricultural developments that are not reversible by a simple majority vote by a city council or board of supervisors.

Figure 4.2.2 details farmland designations on the project area. Approximately ~~3,389,201~~ 3,389,201 acres, or ~~89.59~~ percent of the ~~3,814,714~~-acre project area, are designated as Farmland of Local Importance. Approximately 25 acres at the ~~northeast~~ northeast corner of Theodore and Eucalyptus Streets are designated Unique Farmland. Imagery dated 2007 shows fallow fields with ruderal vegetation in this area, although some plowing appears to have occurred and several greenhouses stood on the site at that time.¹ Approximately 400 acres located in several areas of the project area are designated X (Other Land) with the largest acreages in the northeast corner, southwest, and south central portions of the project area. Although there are seven scattered rural residences on the project site, a “worst-case” assumption is that ~~2,685,200~~ 2,685,200 acres of the WLC project site are considered Farmland of Local Importance with 25 acres classified as Unique Farmland by the State.

4.2.1.2 California Land Conservation Act (Williamson Act)

The California Land Conservation Act of 1965, also referred to as the Williamson Act, is a non-mandated State program administered by counties and cities for the preservation of agricultural land. This program enables local governments to enter into contracts with private landowners to restrict specific parcels of land to agricultural or related open space use. In return, landowners receive much lower property tax assessments than normal because the assessments are based upon farming and open space uses rather than full market value.

Participation in the program is voluntary on the part of both landowners and local governments, and it is implemented through the establishment of Agricultural Preserves and the execution of Williamson Act contracts. Individual property owners enter into a contract that restricts or prohibits development of their property to non-agricultural uses during the term of the contract in return for lower property taxes. Initially signed for a minimum ten-year period, the contracts are automatically renewed each year for a successive minimum ten-year period unless a notice of non-renewal is filed, or a contract cancellation is approved by the local government.

The nearest parcel that is under Williamson Act contract is approximately 1.5 miles to the southeast of the project site just west of Gilman Springs Road (see Figure 4.2.3). This property is outside of Moreno Valley city limits but within the city's sphere of influence. There are no Williamson Act Conservation contracts¹ within the project area.

4.2.1.3 General Plan, Specific Plan, and Zoning Designations

General Plan. The City's 2006 General Plan Land Use Element has no "agricultural" land use designation.² The EIR accompanying the City's 2006 General Plan determined that the conversion of agricultural land to nonagricultural uses throughout the City represented a significant cumulative impact. As the transition from agricultural to urban and suburban uses continues, the extent to which agriculture and supporting economic activities contribute to the economic base of the City is reduced. In its adoption of the 2006 General Plan, the City recognized that these losses were offset by the economic activities and social benefits that typically accompany urban development. In connection with the City's conclusion that a significant cumulative impact would result from implementation of the General Plan, the City adopted findings and facts and a Statement of Overriding Considerations indicating that social and economic factors outweighed the significant cumulative impacts associated with conversion of agricultural land to non-agricultural use.

Most of the project area is within the current Moreno Highlands Specific Plan and is designated for a mix of Business Park, Open Space, Residential, Commercial, Mixed Use, and Public Facilities land uses (see Section 4.10, *Land Use and Planning*). The land uses proposed in the WLCSP are Logistics Development (LD), Light Logistics (LL), ~~Logistics Support (LS)~~, and Open Space (OS).

4.2.1.4 NOP/Scoping Comments

During the NOP/scoping process, some local residents expressed concern over the loss of agricultural land on the project site.

THIS PAGE INTENTIONALLY LEFT BLANK

4.2.2 Existing Policies and Regulations

4.2.2.1 City of Moreno Valley General Plan Policies

The City of Moreno Valley's General Plan does not designate any land for agricultural production or preservation, but growing crops is permitted in all of the City's zoning categories. Where practical, the City encourages incorporation of crops, such as existing tree groves, into the design of proposed development projects allowing continuation of the agricultural character of the area as well as providing a buffer between different types of land uses.

The following City General Plan goals and policies pertain to and are applicable to the proposed project.

9.1 Ultimate Goals

VIII. Recognize the need to conserve natural resources while accommodating growth and development.

9.4.2 Parks, Recreation, and Open Space Element Objectives and Policies

Objective 4.1 Retain agricultural open space as long as agricultural activities can be economically conducted, and are desired by agricultural interests, and provide for an orderly transition of agricultural lands to other urban and rural uses.

4.2.3 Thresholds of Significance

Appendix G of the *CEQA Guidelines* recognizes the following significance thresholds related to agricultural resources. Based on these significance thresholds, potential impacts to agricultural resources could be considered significant if the proposed project would:

- Conflict with existing zoning for agricultural use, or a Williamson Act contract;
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220[g]), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104[g]);
- Result in the loss of forest land or conversion of forest land to non-forest use;
- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use; and/or
- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP) of the California Resources Agency, to non-agricultural use.

4.2.4 Methodology

The methodological analysis underlying this section of the EIR consists of the following:

- First, analyze the FMMP data to determine if portions of the ~~3,814~~ 3,714-acre project area are designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance.
- Second, evaluate the current General Plan land use designations, Specific Plan proposal, and zoning applicable to the site to determine the existence of any conflicts between the project and any potential existing agricultural General Plan and zoning designations applicable to the site.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Finally, use the California Land Evaluation and Site Assessment (LESA) model, developed by the State Department of Conservation, as a guide to quantify any potential impacts the proposed project may have on agricultural resources. Utilization of the LESA model is currently considered to be the most reliable method by which to determine a project's potential impacts on agricultural resources.

In the late 1980s and the early 1990s, the DOC and the State Legislature began exploring ways by which local agencies could analyze the specific impacts of local projects related to the conversion of farmland in a manner that was consistent throughout the State. At that time, reference to the FMMP maps was the only widely utilized methodological approach to analyzing conversion impacts. Oftentimes, the FMMP maps were outdated and/or did not contain specific data on local conditions that could better assess whether local land contains viable farmland. Federal and State agencies were and are cognizant of the fact that determining the true significance of agricultural conversions is a function of understanding the specific characteristics affecting a particular site proposed for conversion. In order to create a more site-specific methodological approach to assessing agricultural impacts, following the preparation of several State and Federal studies, the DOC developed the LESA model as an optional method by which local agencies could assess the impacts of land conversion on agricultural resources. (See, e.g., Stats. 1993, Ch. 812; Pub. Res. Code § 21095; California Agricultural Land Evaluation and Site Assessment Model, Instruction Manual, 1987.) Because of its use of localized input factors, the LESA model is generally recognized as the preferred methodological tool to assess the significance of a proposed project's impacts on agricultural resources.

4.2.5 Less than Significant Impacts

The following potential impacts were determined to be less than significant. In each of the following issues, either no impact would occur or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level. In either instance, no mitigation would be required.

4.2.5.1 Forest Land Zoning

Threshold	Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?
-----------	---

According to the California Department of Forestry and Fire Protection, there are no areas designated as forest land or timberland on the project site. Therefore, no significant impacts would occur from the implementation of the project.

4.2.5.2 Loss or Conversion of Forest Land

Threshold	Would the project result in the loss of forest land or conversion of forest land to non-forest use?
-----------	---

There are no areas of forest lands on the project site. Therefore, no significant impacts would occur from the implementation of the project.

4.2.5.3 Existing Zoning and Williamson Act

Threshold	Would the project conflict with existing zoning for agricultural use or a Williamson Act contract?
-----------	--

NOTE: The following changes have been made due to revision to the Specific Plan project size.

While some portions of the ~~3,918~~ 3,714-acre project site are currently used for agriculture, there are no Williamson Act contracts (see previously referenced Figure 4.2.3) on either the project site or any adjacent properties. Because the project would not conflict with any Williamson Act contracts, the impacts related to this issue would be less than significant and no mitigation is required.

The following changes have been made due to revision to the Specific Plan project size. There are no agricultural zones identified on the ~~3,918~~ 3,714-acre project site or on any of the surrounding properties.¹ However, agriculture is allowed in most areas of the City as an interim land use until it is replaced by development. The project site is not zoned for agricultural uses, so implementation of the proposed project would not conflict with existing zoning for agricultural uses. Agriculture is a permitted use in all areas of the proposed Specific Plan. In the absence of a significant impact, no mitigation is required.

It should be noted that the CDFW Conservation Buffer Area within the SJWA, which is immediately south of the Specific Plan site, is currently being used for agriculture. For additional analysis of the CDFW Conservation Buffer Area, see Section 4.4, *Biological Resources*, and 4.9, *Water Resources*.

General Plan Consistency. The following evaluates the proposed project in relation to the City's General Plan goals and objectives relative to agriculture:

9.1 Ultimate Goals

Goal VIII. Recognize the need to conserve natural resources while accommodating growth and development.

Consistency: With mitigation outlined in Section 4.1, *Aesthetics*, the Specific Plan will allow for preservation of the most prominent existing visual resources in this portion of the City, but will result in the removal of agricultural fields to support the proposed development of logistics warehousing. Therefore, the project is consistent with this goal and no mitigation is needed.

9.4.2 Parks, Recreation, and Open Space Element Objectives and Policies

Objective 4.1 Retain agricultural open space as long as agricultural activities can be economically conducted, and are desired by agricultural interests, and provide for an orderly transition of agricultural lands to other urban and rural uses.

Consistency: The project will eventually result in the loss of agricultural land within the Specific Plan area but will allow for the permanent designation of open space within the "other project areas" south of the Specific Plan area, which are currently dry farmed. Therefore, the proposed project is consistent with this objective and no mitigation is needed.

¹ *Land Use Map, Land Use Designations, City of Moreno Valley General Plan, July 2006.*

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

4.2.6 Significant Impacts

Impacts of the project on agricultural resources have been determined to be significant based on two significance thresholds.

4.2.6.1 Farmland Conversion

Impact 4.2.6.1: *Construction of the proposed project would convert 25 acres of Unique Farmland as identified by the State of California to non-agricultural uses.*

Threshold	Would the project result in the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural land use?
-----------	---

NOTE: The following changes have been made due to revision to the Specific Plan project size.

Approximately 25 acres of the project site are designated Unique Farmland. Under the proposed Specific Plan, this land will eventually be converted to non-agricultural use, which would result in a significant and unavoidable impact relative to “designated” farmland conversion. In addition, the project would result in the conversion of ~~2,640~~ 2,585 acres of land designated as Farmland of Local Significance within the Specific Plan area (total ~~2,740~~ 2,610 acres total minus 25 acres of Unique Farmland and ~~75,384.0~~ acres designated as ~~Open Space~~Other). The 1,104 acres of open space and utility lands south of the Specific Plan site are not proposed for development and it is expected they will remain in their existing condition (i.e., dry farming).

Project or Specific Plan Design Features. Section ~~4~~12.5 of the Specific Plan contains a “right to farm” provision that will allow farming to continue on vacant land within the WLCSP until such time as it converts to developed uses. This provision will help protect onsite farming from “nuisance” claims by new landowners or tenants (e.g., dust, noise, etc.).

Mitigation Measures. Consideration was given to the contribution to an agricultural mitigation bank as potential project-related mitigation. The County of Riverside considered the establishment of an Agricultural Mitigation Bank to mitigate the loss of farmland during the adoption process of the Riverside County General Plan in 2003; however, purchase of credits in such a bank to mitigate the loss of agricultural lands as part of the Draft EIR for the County General Plan (refer to Mitigation Measures 4.2.2A, B, and C in the Draft EIR of the Riverside County Integrated Project) were specifically removed from the General Plan during the public hearings on the General Plan.¹ Since potential mitigation for regional loss of agriculture has already been considered and rejected by the County, such mitigation would be even more infeasible on a citywide basis.

The DEIR originally contained the following text. In 2009, a regional agricultural conversion report was prepared by CBRE Consultants² for an unrelated development project in the City of Perris and a similar study was prepared in 2011 for this project by Andrew Chang and Company (ACC 2012). The ACC³ and CBRE reports both concluded that the agriculture industry will continue to decline in the Inland Empire and identified three main reasons for the decline: 1) the more affordable housing market in the region compared to Los Angeles and Orange Counties, 2) the competition for cheaper farm labor from areas like the South Central Valley, and 3) lower water allocations to agriculture

¹ Riverside County Integrated Project website, <http://www.rcip.org/>, accessed April 5, 2012.

² Economic Viability of Agriculture in the East Inland Empire. CBRE Consulting. 2009.

³ Agriculture Industry Analysis of the Inland Empire, Andrew Chang and Company, 2012.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

because of the growing urban population that receives priority for the water. The reports also noted that the agriculture industry within the Inland Empire is very small, making up only 4.1 percent of California's total agricultural industry and only 1 percent of the regional economy in 2010. There is a clear pattern of agricultural decline from 2006 to 2010. Over these four years, 24,000 acres of farmland were removed in the Inland Empire to make way for urban land uses. Agricultural production levels were 28 percent lower in 2010 than they were in 2004. The combination of the small size of the Inland Empire's agricultural industry and the three key economic constraints caused these studies to conclude that the agriculture industry in the Inland Empire is in decline. The ACC report concluded that the agriculture industry within the Inland Empire will become less competitive and continue to decline regardless of whether or not this project is developed. Under these circumstances, no mitigation that would artificially preserve or prolong agricultural activities (i.e., other than current market forces) in the project area and/or on the project site would be feasible or necessary.

The DEIR originally concluded there were no feasible mitigation measures to preserve agriculture over the long term on the project site in a regional context; however, the following Mitigation Measure 4.2.6.1A was recommended to preserve a part of the local heritage of farming for the Moreno Valley community for future generations:

Subsequent to circulation of the DEIR, it was determined that the new mitigation measure outlined below would sufficiently mitigate the loss of Unique Farmland, and so Mitigation Measure 4.2.6.1A for a "heritage farm" was no longer required.

The following mitigation measure has been added to the EIR in Response to Comment F-3-27 in Letter F-3 from California Clean Energy Committee, Comments F-7A-9, F-7A-39, and F-7A-63, in Letter F-7A from Lozeau Drury LLP, Response to Comment F-9A-43 in Letter F-9A from the Sierra Club, Response to Comment F-11-34 in Letter F-11 from the Sierra Club, Response to Comment F-13-06 in Letter F-13 from the Sierra Club et al, and related comments from others. The Response to Comment F-7A-39 outlines the changes made to the agricultural resources assessment for the project (FEIR Volume 2 Appendix C-2). In addition, a new MM 4.2.6.1A has been added to the FEIR Volume 2 requiring the acquisition of a conservation easement be recorded over land of comparable productive value to preserve offsite farmland or equal or more agricultural productivity compared to the unique farmland (refer to Response to Comment F-7A-39). It should be noted that the revised agricultural assessments determined the loss of farmland of local importance was in fact not significant under CEQA based on the results of the revised LESA model (see FEIR Volume 2 Appendices C-1 and C-4 for more information).

4.2.6.1A ~~Prior to issuance of any discretionary permits for development within the WLCS property, Highland Fairview shall offer to dedicate five (5) acres of land to the City for "heritage farming" (e.g., community gardens, farm museum, or pumpkin patch). This offer shall be in force for a period of 3 years. If the City has not accepted the offer after that time, the land shall revert to Highland Fairview for development consistent with the General Plan and zoning at that time. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the Riverside County Farm Bureau and the City's Environmental and Historic Preservation Board as appropriate. The site must have water service readily available.~~

4.2.6.1A Prior to the issuance of any grading permit affecting land designated as "Unique Farmland" (Figure 4.2.2 in the World Logistics Center Environmental Impact Report), an Agricultural Conservation Easement shall be recorded over land of equivalent or better agricultural economic productivity of the offsite easement property compared to the World Logistics Center property. The analysis will include a comparison of the project's "Unique Farmland" considering its relative economic potential as the best measure of productivity (i.e., net profitability per acre or potential net rental income

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

per acre). It will include a consideration of various important physical factors including location and accessibility, soils and topography, micro and macro climatic conditions, water availability and quality, as well as local practices, good farm management and cultural (growing) costs. The form and content of this easement, as well as the estimates of agricultural productivity, shall be reviewed and approved in advance by the Planning Official.

Level of Significance after Mitigation. The eventual conversion of 25 acres of Unique Farmland is a significant impact of the project resulting from the basic project objectives. ~~There is no reasonable or feasible mitigation to reduce the significant impacts resulting from the eventual permanent loss of agricultural land to a less than significant level. Even if agriculture continues on the site for a period of time, ultimately that land use will be eliminated from the project area by ongoing market forces. Therefore, there are no feasible measures that would mitigate the permanent loss or conversion of Unique Farmland to non-agricultural uses, and this remains a significant and unavoidable impact. However, implementation of the additional Mitigation Measure 4.2.6.1A will reduce this impact to a less than significant level.~~

4.2.6.2 Conversion of Farmland to Non-Agricultural Uses

Impact 4.2.6.2: *The project would convert approximately ~~2,635~~ 2,226 acres of land currently being farmed, which includes ~~2,640~~ 2,201 acres of land designated as Farmland of Local Importance, to non-agricultural uses.*

Threshold	Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland to non-agricultural use, or conversion of forest land to non-forest use?
-----------	---

In addition to the FMMP designations, Riverside County has established a program through which it classifies various land within the County as Locally Important Farmland. While the County has established criteria by which Locally Important Farmland is categorized, a small portion of that land has been so designated due simply to the historical use of the land.

The factors used by Riverside County to define Locally Important Farmland are as follows:

- Lands with soils that would be classified as Prime and Statewide Farmland but lack available irrigation water.
- Lands planted with dry land crops of barley, oats, and wheat.
- Lands producing major crops for Riverside County but that are not listed as Unique crops. These crops are identified as returning one million or more dollars on the 1980 Riverside County Agriculture Crop Report. Crops identified are permanent pasture (irrigated), summer squash, okra, eggplant, radishes, and watermelons.
- Dairylands, including corrals, pasture, milking facilities, and hay and manure storage areas if accompanied with permanent pasture or hayland of 10 acres or more.
- Lands identified by city or county ordinance as Agricultural Zones or Contracts, which includes Riverside City “Proposition R” lands.
- Lands planted with jojoba which are under cultivation and are of producing age.

The majority of the proposed project site is currently designated Farmland of Local Importance by the County. None of the above factors supports maintaining the property as farmland, and it is likely that the property was designated as Locally Important Farmland based simply on the agricultural uses that

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

at one time existed on the property. The County's maps do not reflect the City's General Plan Land Use Map, which shows no agricultural designations in the City.

NOTE: The following changes have been made in response to Comment G-95-54 in Letter G-95 from Thomas Thornsley.

Implementation of the project would result in the permanent conversion of approximately ~~2,635~~ 2,226 acres currently used for dry farming to non-agricultural uses. While this could have an effect on accelerating the loss of other existing agricultural land, the state conservation lands to the south could be continued for agricultural production. Likewise, there is no other agricultural use in the Zone of Influence (term used in the State LESA Model) and a majority of the land in that zone is vacant (i.e., in the Badlands to the east and portions of the San Jacinto Wildlife Area and the Lake Perris State Recreation Area to the south). The conversion of agricultural lands to urban uses is supported by the City's General Plan policies, as discussed above. The entire project site and adjacent lands have been designated for urban uses for nearly 20 years by the City. Nevertheless, much of the Specific Plan area is designated Farmland of Local Importance and will be permanently converted to non-agricultural urban uses. Therefore, the project will cause significant, unavoidable impacts related to conversion of locally important farmland (see previously referenced Figure 4.2.2).

The farming that is currently conducted on the CDFW property south of the Specific Plan area is expected to continue for the foreseeable future. The existing vacant land adjacent to the SDG&E compressor plant property is not currently being farmed, but is expected to remain vacant for the foreseeable future.

The following information was added to the LESA Model analysis in Response to Comment F-7A-39 and related comments by others, and also due to changes in the two technical studies on agricultural resources (FEIR Volume 2 Appendices C-1 and C-4).

The LESA Model. The conversion of agricultural land to non-agricultural uses is a result of various economic and demographic factors. Increased costs for water and a continuing demand for housing and commercial development in the City and region have provided the primary impetus for this agricultural land conversion. Although the project results in a significant impact related to the conversion of farmland to non-agricultural use, this EIR also refers to the State LESA model as an analytical tool by which the project's impacts on agricultural conversion can be assessed, and to further gauge the level of significance of that farmland conversion. Appendix G of the *CEQA Guidelines* states as follows: "In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation (DOC) as an optional model to use in assessing impacts on agriculture and farmland."¹ Further, the LESA model was specifically created by the DOC in order to provide "specific guidance concerning how agencies should address farmland conversion impacts." Because of its use of localized inputs as part of the model, the LESA model is generally considered the preferred methodological tool by which to assess the significance of a proposed project's impacts related to agricultural resources.

The LESA model is intended to provide lead agencies with a methodology to identify potentially significant impacts that may result from agricultural land conversions. The model is a method of rating the relative quality of land resources and potential impacts to agricultural resources.

¹ *California Land Evaluation and Site Assessment Model*, Instruction Manual, State of California Department of Conservation, Office of Land Conservation, 1997.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The LESA Model uses six different factors (two based on soil resource quality and four based on on-site and adjacent land characteristics) to develop a weighted score that identifies the significance of potential impacts to agricultural resources. The Land Evaluation (LE) scoring utilizes two soil factors. The Land Capability Classification (LCC) indicates the suitability of soils for most kinds of crops and the risk of damage when they are used in agriculture, while the Storie Index provides a numeric rating (0–100) of the relative degree of suitability or value of a given soil for intensive agriculture. The Site Assessment (SA) scoring considers the size of the site to be converted, water supply restrictions in drought and non-drought years, and the presence (or absence) of adjacent agricultural, habitat, or parkland uses.

By assessing and weighing a variety of soil, water, and land use characteristics, it is possible that the conversion of a large parcel containing poor soils and with limited access to water would not result in a significant impact, while the conversion of a much smaller well-watered parcel with quality soils could be considered significant. To ensure potential impacts to adjacent agricultural activities are appropriately considered, the LESA model requires an examination of land use on all parcels within a Zone of Influence (ZOI) that extends a minimum 0.25 mile from the boundary of the site. For any site evaluated using the LESA model, the factors are rated, weighed, and combined, resulting in a single numeric score that becomes the basis for determining a project’s potential significance.¹

WLC Project Assessment

DEIR Assessment. To assess potential agricultural resource impacts that may result from development of the proposed site, the LESA model was run as part of the original DEIR for the entire 3,818-acre project area.² The total LESA score for the project is 63.51, which is considered significant unless the LE and SA sub-scores fall below 20 (see Table 4.2.A). The LE sub-score is 43 and the SA sub-score is 20.5, indicating a significant impact. The worksheets detailing the variables considered during the evaluation of each site are included in the *Agricultural Resources Assessment for the World Logistics Center Specific Plan* (DEIR Appendix C). This was the conclusion of the DEIR that was circulated for public review.

Table 4.2.A: LESA Model Significance Determination

Total LESA Score	Scoring Decision
0–39 Points	Not considered significant
40–59 Points	Considered significant <i>only</i> if LE and SA sub-scores are each <i>greater</i> than or equal to 20 points
60–79 Points	Considered significant <i>unless</i> either LE or SA sub-score is <i>less</i> than 20 points
80–100 Points	Considered significant

Revised WLCSP Assessment. In response to comments regarding agricultural impacts, the LESA Model assessment prepared by Parsons Brinckerhoff (PB)(DEIR Appendix C-1) was revised to account for the smaller WLCSP project site (2,610 acres instead of 2,710 acres) and delete the CDFW Conservation Buffer Area, and to address Response to Comment F-7A-39 and related comments by others. In addition, an independent analysis was conducted on the subject by the

¹ California Land Evaluation and Site Assessment Model, Instruction Manual, State of California Department of Conservation, Office of Land Conservation, 1997.

² *Agricultural Resources Assessment for the World Logistics Center Specific Plan Draft Environmental Impact Report*, Parsons Brinckerhoff, February 2012.

Agribusiness, Natural Resources & Energy Practice Group of Cushman & Wakefield Western, Inc. (C&WW). Part of their analysis included the preparation of a LESA Model report to validate assumptions made in the DEIR. The revised PB analysis (FEIR Volume 2 Appendix C-1) and the new C&WW analysis (FEIR Volume 2 Appendix C-4) both determined the WLC project impact on agricultural resources is not considered significant because both the LE and SA sub-scores were less than 20 points (the revised PB report indicated an SA score of 19.5 while the new C&WW report indicated an SA score of 18.5), so mitigation is not required for this impact (i.e., “Conversion of Farmland to Non-Agricultural Uses”). In addition, Mitigation Measure 4.2.6.1A has been added to address the WLC project’s contribution to loss of agricultural resources in western Riverside County.

Project or Specific Plan Design Features. There are no features included in the Specific Plan that address the loss of agriculture on the project site.

Mitigation Measures. As stated above, consideration was given to the contribution to an agricultural mitigation bank as potential project-related mitigation. However, the County, through the adoption of its General Plan, determined that contribution to an agricultural mitigation bank is not feasible and the City of Moreno Valley followed suit in the adoption of its General Plan. **Mitigation Measure 4.2.6.1A** and ~~4.2.6.1B~~ will help reduce impacts to agricultural resources, but development of the Specific Plan site will eventually remove ~~2,685,226~~ acres of locally important farmland from production, and this is considered a significant long-term impact.

Level of Significance after Mitigation. The DEIR concluded that there was no feasible mitigation to reduce the significant impacts resulting from the loss of agricultural land to a less than significant level. However, implementation of, **Mitigation Measure 4.2.6.1A**, to help establish a community garden—an off-site agricultural conservation easement, would partially mitigate the conversion of agricultural land, the permanent loss or conversion of 2,610 acres of Locally to non-agricultural uses. With implementation of these measures, project impacts to agricultural resources are reduced to less than significant levels.

4.2.7 Cumulative Impacts

Significant Cumulative Impact: *Riverside County has experienced a net loss of Unique Farmland over the most recent 2-year reporting period. The project contributes to the cumulative impacts of this net loss by removing an additional 25 acres of Unique Farmland from potential agricultural production in this portion of the County. In addition, it will eventually remove ~~3,389,201~~ acres of land that is designated as Farmland of Local Importance (including ~~3,349~~ acres all of the land currently being dry farmed, in the project area, from potential agricultural production in this portion of the County.*¹

The DOC Office of Land Conservation publishes a Farmland Conversion Report every two years as part of its FMMP. These reports document land use conversion by acreage for each California county. The most recent data are for the 2008–2010 period,² during which Riverside County experienced a net loss of 3,300 acres of Prime Farmland, 567 acres of Farmland of Statewide

¹ Revision made in response to Comment G-95-57 in Letter G-95 from Thomas Thornsley.

Importance, and 1,742 acres of Unique Farmland. The amount of Important Farmland inventoried in Riverside County during the last countywide survey of farmland totaled 428,989 acres.

The cumulative area for agricultural resource impacts is Riverside County. As detailed in Table 4.2.B, the agricultural acreage inventoried in Riverside County by the FMMP has declined in each of the five past reporting cycles. The total planted acreage in Riverside County has fluctuated during the past five years (Table 4.2.C).

Table 4.2.B: Agricultural Acreage Inventoried

	Reporting Period				
	2010	2008	2006	2002	2000
Riverside County	428,989	433,877	444,455	479,278	609,535

Source: Riverside County 2010 Agricultural Production Report, 2010.

While agricultural land is a finite resource, the City, through its designation of the site for non-agricultural urban uses in its General Plan, has previously considered that continuing development pressures in the City and region would result in the conversion of agricultural land to non-agricultural uses. The utilization of the property sites for agricultural activity would impede the City from achieving the goals and objectives set forth in its General Plan.

As explained previously, the CBRE and the ACC reports concluded that the agriculture industry within the Inland Empire will become less competitive and continue to decline whether or not the proposed project is developed. Under these circumstances, no mitigation that would artificially preserve or prolong agricultural activities (i.e., other than current market forces) in the project area would be feasible or effective over the long term.

The continuation of agricultural operations on site over the long term is likely not economically viable. The County continues to experience a net loss of Unique Farmland and Farmland of Local Importance, and the development of the project would contribute to the countywide net loss of designated farmland. ~~Therefore, cumulative agricultural impacts associated~~ However, with implementation of Mitigation Measure 4.2.6.1A, the WLC project ~~would be~~ will not make a significant and unavoidable ~~since there is no feasible mitigation for this impact.~~

THIS PAGE INTENTIONALLY LEFT BLANK

NOTE TO READERS. This section has been revised to reflect changes from the original DEIR as a result of the following:

- Reduction of the project size by 100 acres and 1 million square feet of building space from the Specific Plan (in the southwest corner);
- Commensurate changes to the Traffic Impact Assessment (TIA, see Section 4.15);
- Updated trip lengths based on the revised TIA;
- Updated CalEEMod computer program with updated emission factors;
- Revised mitigation in response to comments;
- Change in project construction phasing (from 10 to 15 years);
- Updated EMFAC2014 emission factor model;
- Updated OEHHA health risk methodology; and
- Use of the latest Health Effects Institute (HEI) research that demonstrates that new technology diesel exhaust does not cause cancer.

In January 2015, the results of a 5½-year study, led by the Health Effects Institute, were published regarding the health effects of new technology diesel exhaust and particularly the risk of cancer from exposure to diesel exhaust. The study found that new technology diesel exhaust does not cause cancer.

The HEI study distinguishes between older Traditional Diesel Engines (TDE) (exhaust from engines that are older than model year 2007) and new technology diesel exhaust (NTDE) (exhaust from engines model year 2007 or newer), which is 90-99% cleaner than TDE. The revised mitigation measures contained in this section require that all diesel trucks accessing the project during operation be model year 2010 or newer and that all off-road equipment meet Tier 4 engine standards. The results of the HEI Study indicate that the project mitigation requiring the application of Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.

The DEIR contained an air quality analysis prepared before the release of the HEI study. As a result, the DEIR analysis assumed that any diesel exhaust, including NTDE, could cause cancer. For comparison to the DEIR, the following discussion analyzes the health risks which would occur if NTDE could cause cancer, which, as noted above, it does not. This is only for informational purposes and does not reflect the health risks associated with the World Logistics Center project.

HEI is an independent, non-profit research institute funded by the U.S. Environmental Protection Agency (EPA) and industry, and supported by the California Air Resources Board (CARB), the U.S. Federal Highway Administration, the US Department of Energy, Engine Manufacturers Association, American Petroleum Institute and the Coordinating Research Council to provide credible, high quality science on air pollution and health for air quality decisions.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

These changes also resulted in updates to the traffic and air quality technical studies and proposed mitigation measures. In addition, this section has been revised in response to public comments received on the Programmatic DEIR.

4.3 AIR QUALITY

This section analyzes the proposed project's potential air quality impacts and provides a discussion of the proposed project, the physical setting of the project area, and the air quality regulatory framework. The air quality analyses evaluate potential air quality impacts by examining the short-term construction as well as long-term operational impacts associated with the project and by evaluating the effectiveness of the identified mitigation measures. Modeled air quality levels are based upon vehicle data and project trip generation included in the project's *Traffic Impact Analysis* and peak turn volumes generated for the proposed project combined with emission factors from the ~~California Air Resources Board (CARB)~~. The evaluation was prepared in accordance with appropriate standards, utilizing procedures and methodologies as recommended by ~~in~~ the South Coast Air Quality Management District (SCAQMD) ~~CEQA Air Quality Handbook (SCAQMD 1993)~~, the California Office of Environmental Health Hazards Assessment (OEHHA), and CARB. Air quality data posted by the SCAQMD, CARB, and the ~~U.S. Environmental Protection Agency (EPA)~~ web sites are included to document the local air quality environment and are incorporated herein by reference.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,918~~ 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately 70 percent of the area (~~2,740~~ 2,610 acres) for logistics warehousing (new LD and LL, ~~LS~~ zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the ~~2,740~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. ~~The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.~~

The analysis contained in this section is based on the following technical studies prepared for the proposed project:

- *Air Quality, Greenhouse Gas, and Health Risk Assessment Report* (Michael Brandman Associates – FirstCarbon Solutions [MBA-FCS], original dated January 29, 2013 and revised April 2015) contained in Appendix D of this EIR; and
- *Traffic Impact Analysis Report, The World Logistics Center*, (Parsons Brinkerhoff, Inc., original dated January 28, 2013 and revised September 2014) contained in Appendix L of this EIR.

In addition to these project-specific technical studies, the analysis contained in this section is also based on the following reference documents:

- *CEQA Air Quality Handbook*, South Coast Air Quality Management District, 1993;
- *Final EIR City of Moreno Valley General Plan*, July 2006;
- *Conservation Element*, City of Moreno Valley General Plan, adopted July 11, 2005;
- *Final 2012 Air Quality Management Plan*, South Coast Air Quality Management District ~~November 2007~~;
- Health Effects Institute, 2015: HEI Research Report 184, Advanced Collaborative Emissions Study (ACES): Lifetime Cancer and Non-Cancer Assessment in Rats Exposed to New-Technology Diesel Exhaust, January, 2015; and
- Other reference material, as cited herein and in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*.

4.3.1 Existing Setting

The project site is located in the South Coast Air Basin (Basin), a geographic area that encompasses the coastal plain and connecting broad inland valleys and low hills. The Pacific Ocean forms the southwestern border of the Basin, with mountain ranges forming the remainder of the border. The Basin includes Orange County and the non-desert portions of Los Angeles County, Riverside County, and San Bernardino County. The Basin is under the jurisdiction of the ~~South Coast Air Quality Management District (SCAQMD)~~.

Note: The following text has been added to help the reader better understand the complex topic of air quality.

The air quality in the air basin has been steadily improving over the last couple of decades as measured in air pollutant concentrations by the SCAQMD. A concentration of a pollutant is a measure of the amount of a pollutant in the air. Some pollutants are measured in parts per million (ppm) and some are measured in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).

When sensitive people, such as children, pregnant women, and the elderly, breathe in air pollutants, they can experience health effects. These health effects differ based on the type of pollutant, the length of time someone is exposed, pre-existing health conditions, and the concentration of the pollutant. In general, health effects can include coughing, sore throat, chest pain, difficulty breathing, eye irritation, reduced lung function, asthma aggravation, chronic lung diseases, cancer, and lung damage.

Federal, state, and local agencies enact rules and regulations to reduce air pollutant emissions to protect the health of sensitive individuals. The EPA sets federal ambient air quality standards and the

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

CARB sets state ambient air quality standards. When concentrations of pollutants exceed the standards, sensitive individuals may experience health effects.

Ozone is a pollutant formed in the air when emissions of volatile organic compounds (VOC) and nitrogen oxides (NOx) combine in the presence of sunlight. Ozone is a pollutant of concern in the air basin because ozone levels exceed the ozone standards.

As shown in Figure 4.3.1, ozone concentrations in the basin have generally decreased over the past twenty years for 1-hour and 8-hour averaging time periods as defined by the State and/or federal ambient air quality standards. The 1-hour and 8-hour concentration refers to the average of the concentration over a 1-hour and 8-hour time period, respectively.

Figure 4.3.1: Ozone Concentration Trends in the South Coast Air Basin

As shown in Figure 4.3.2, the main source of NOx and VOC emissions in the basin are from on-road motor vehicles, not from the operation of buildings. Although vehicle miles traveled in the basin continue to increase, ozone concentrations are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with cleaner and lower-emitting vehicles. VOC and NOx are ozone precursors; therefore, if those emissions decrease, it follows that ozone concentrations would also decrease.

Emissions of NOx in the air basin are expected to decrease in the future despite future growth in population, and vehicle miles traveled, as shown in Figure 4.3.3.

Figure 4.3.2: Ozone Precursor Emissions (VOC and NOx) in the South Coast Air Basin

Figure 4.3.3: NOx Emissions Forecast in the South Coast Air Basin

Another pollutant of concern is particulate matter (PM). PM is a mixture of small particles and liquid droplets suspended in the air. It is made up of components such as chemicals, metals, soil, or dust particles. The size of these particulates is linked to their potential for causing health problems. Ultrafine particles are less than 0.1 in micron in diameter, fine particles are less than 2.5 microns in diameter (PM_{2.5}), and coarse particles are larger than 2.5 microns and smaller than 10 microns in diameter (PM₁₀). The CARB and EPA have established standards for PM_{2.5} and PM₁₀ but not for ultrafine particles. PM_{2.5} and PM₁₀ are a concern in the air basin because sometimes the concentrations exceed the standards. PM_{2.5} is often used as a marker for toxic air pollutants such as diesel PM.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

As shown in Figure 4.3.4, PM_{2.5} emissions are expected to decrease in the Basin and then level out after the year 2014.

Figure 4.3.4: PM_{2.5} Emissions Forecast in the South Coast Air Basin

As shown in Figure 4.3.5, PM₁₀ and PM_{2.5} annual concentrations have continued to decrease since 1990 within the air basin as a whole.

Figure 4.3.5: Particulate Matter Concentration Trends in the South Coast Air Basin

Figure 4.3.6 provides an additional view of PM_{2.5} trends specifically in the Inland Empire. As shown, there is a marked decreasing trend in PM_{2.5} concentrations in Riverside-Rubidoux, Fontana, and San Bernardino from 2001 to 2012 and at Mira Loma from 2006 to 2012. The relevance of these trends is

that PM_{2.5} levels have displayed a decreasing trend in the Inland Empire despite increases in urban development including the development of large warehouse complexes since 2001.

Figure 4.3.6: PM_{2.5} Concentration Trends in the Inland Empire

Part of the success in the decreasing NO_x and PM emissions are standards placed on motor vehicles. Figure 4.3.7 demonstrates the changes in U.S. heavy duty diesel emission standards for NO_x and PM. The project would incorporate mitigation that would require that all heavy duty diesel trucks accessing the project incorporate 2010 emissions standards. As shown below, the 2010 standards are only a fraction of the older standards, at 0.2 grams per horsepower hour (g/HP-hr) of NO_x and 0.01 g/HP-hr of PM. The text in blue represents the off-road construction standards; 2011 is Tier 4 Interim and 2014 is Tier 4 Final.

Figure 4.3.7: Changes in U.S. Heavy-Duty Diesel NO_x and PM Emission Standards

4.3.1.1 Climate and Meteorology

Air quality in the project area is not only affected by various emission sources (mobile, industry, etc.), but also by atmospheric conditions such as wind speed, wind direction, temperature, rainfall, and amount of sunshine. The combination of topography, low atmospheric mixing height, abundant sunshine, and emissions from the second largest urban area in the United States combine to give the Basin one of the worst air pollution problems in the nation.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Winds in the Basin are predominantly of relatively low velocities, averaging about 4.0 miles per hour (mph). These low average wind speeds, together with a persistent temperature inversion, limit the vertical dispersion of air pollutants throughout the Basin. Strong, dry, north or northeasterly winds, known as Santa Ana winds, occur during the fall and winter months, dispersing air contaminants. These conditions tend to last for several days at a time.

During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas of Los Angeles County are transported predominantly inland into Riverside and San Bernardino Counties. In the winter, the greatest pollution problems are carbon monoxide (CO) and oxides of nitrogen (NO_x), because of extremely low inversions and air stagnation during the night and early morning hours that trap emissions principally from mobile sources. In the summer, the longer daylight hours and the brighter sunshine combine to cause a reaction between hydrocarbons and NO_x to form photochemical smog.

4.3.1.2 Regional Air Quality

Both the State of California and the Federal government have established health-based ambient air quality standards (AAQS) for six air pollutants. These pollutants are known as “criteria pollutants.”

- Carbon monoxide (CO)
- Lead (Pb)
- Nitrogen dioxide (NO₂)
- Ozone (O₃)
- Particulate matter with a diameter of 10 microns or less (PM₁₀)
- Sulfur dioxide (SO₂)

Federal standards for 8-hour ozone and for fine particulate matter less than 2.5 microns in diameter (PM_{2.5}) have also been adopted. In addition, the State has set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety and are listed in Table 4.3.A. Table 4.3.B lists the health effects of these criteria pollutants and their potential sources.

Note: Episode criteria and smog alerts are no longer used by the CARB or the SCAQMD; the EPA's Air Quality Index is now used. Therefore, the following text has been deleted and information regarding the Air Quality Index has been added.

~~In addition to setting out AAQS, the State has established a set of episode criteria for O₃, CO, NO₂, SO₂, and PM₁₀. These episode criteria refer to periods of short term exposure to air pollutants that threaten public health. Health effects are progressively more severe as pollutant levels increase from Stage One to Stage Three. These health effects will not occur unless the standards are exceeded by a large margin or for a prolonged period of time. Among the pollutants, O₃ and particulate matter (PM_{2.5} and PM₁₀) are considered regional pollutants, while the others have more localized effects. Table 4.3.B lists the health effects of these criteria pollutants and their potential sources.~~

~~An alert level is that concentration of pollutants at which initial stage control actions are to begin. An alert will be declared when any one of the pollutant alert levels is reached at any monitoring site and meteorological conditions are such that the pollutant concentrations can be expected to remain at these levels for 12 or more hours or to increase; or, in the case of oxidants, the situation is likely to recur within the next 24 hours unless control actions are taken. At times, meteorological conditions are so adverse to pollutant dispersion that concentrations of ozone exceed the State air quality standard by as much as a factor of three. The CARB has defined Episode Levels of ozone air pollution as follows:~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- **Health Advisory Levels** occur when hourly ozone concentrations equal or exceed 0.15 parts per million (ppm). At this level, residents are advised to avoid prolonged, vigorous outdoor exercise, and persons with respiratory or coronary disease should avoid exercise.
- **Stage 1 Episodes** occur when hourly ozone concentrations equal or exceed 0.20 ppm. At these times, persons with respiratory or coronary artery disease should be notified to take precautions against exposure and should stay indoors as much as possible. Schools are also notified to advise against strenuous physical activity for their students. To this end, schools are in regular communication with the SCAQMD.
- **Stage 2 Episodes** occur when hourly ozone concentrations equal or exceed 0.35 ppm. The SCAQMD requires industry to take prompt actions to reduce emissions at those times. The last Stage 2 episodes occurred in 1989 and 1992.
- **Stage 3 Episodes** occur when hourly ozone concentrations equal or exceed 0.50 ppm. The last Stage 3 episode occurred in the Basin in 1974.

Pollutant alert levels:

- O_3 : 392 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) (0.20 ppm), 1-hour average.
- CO: 17 milligrams per cubic meter (mg/m^3) (15 ppm), 8-hour average.
- NO_2 : 1,130 $\mu\text{g}/\text{m}^3$ (0.6 ppm) 1-hour average; 282 $\mu\text{g}/\text{m}^3$ (0.15 ppm) 24-hour average.
- SO_2 : 800 $\mu\text{g}/\text{m}^3$ (0.3 ppm), 24-hour average.
- Particulates, measured as PM_{10} : 350 $\mu\text{g}/\text{m}^3$, 24-hour average.

Table 4.3.B lists the health effects of these criteria pollutants and their potential sources.

The Air Quality Index is an index developed and reported by the United States EPA for reporting daily air quality. It indicates how clean or polluted the air is and what associated health effects might be a concern. The Air Quality Index focuses on health effects that may be experienced within a few hours or days after breathing polluted air. Descriptions for the various levels in the Air Quality Index are shown in Table 4.3.C.

The federal 8-hour ambient air quality standard for ozone is 75 ppb and the California standard is 70 ppb. The California 1-hour standard for ozone is 90 ppb (there is no federal 1-hour standard). As shown in the table, to achieve the federal ambient air quality standard for ozone, the Air Quality Index would need to be below 101. To achieve the state 8-hour ambient air quality standard for ozone, the Air Quality Index would need to be below 84.

In the Moreno Valley area in 2010 and 2011, the air quality index was greater than 150 for one day for each year. That means the air was unhealthy for one day in 2010 and one day in 2011. If the future years follow that trend, then one day during each of the construction years would cease construction activities.

Indirect sources of pollution are generated when minor sources collectively emit a substantial amount of pollution. Examples of this would be the motor vehicles at intersections, malls, and on highways. The California Clean Air Act (CCAA) provides the SCAQMD with the authority to manage transportation activities at indirect sources. The SCAQMD also regulates stationary sources of pollution throughout its jurisdictional area. Direct emissions from motor vehicles are regulated by the CARB.

The narrative below describes the pollutant characteristics, mechanisms of pollutant origination, and health effects for the criteria pollutants (i.e., pollutants specifically regulated under the Federal Clean

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Air Act [CAA] and/or the California Clean Air Act [CCAA]) and other pollutants of concern. Because the concentration levels of the AAQS were set with an adequate margin to protect public health and safety, these health effects will not occur unless the standards are exceeded by a large margin or for a prolonged period of time. State AAQS are more stringent than Federal AAQS. An additional discussion of health effects is contained in the *Air Quality, Greenhouse Gas, and Health Risk Assessment (2015)*.

- *Carbon Monoxide*
 - Description and Properties: CO is colorless, odorless toxic gas produce by incomplete combustion of carbon-containing fuels (e.g., gasoline, diesel fuel, and biomass). CO is a primary pollutant, meaning it is emitted directly into the air (unlike secondary pollutants such as ozone that are formed by the reactions of other pollutants). CO levels tend to be highest during the winter months when the meteorological conditions support the accumulation of the pollutants. This occurs when relatively low inversion levels trap pollutants near the ground and concentrated the CO (EPA 2006c). Because CO is somewhat soluble in water, normal winter conditions of rainfall and fog can suppress CO conditions.
 - Health Effects: CO is essentially inert to plants and materials but can have significant effects on human health. CO gas enters the body through the lungs, dissolves in the blood, and replaces oxygen as an attached hemoglobin. This binding reduces available oxygen in the blood and; therefore, reduces oxygen delivery to the body's organs and tissues. Effects on humans range from slight headaches to nausea to death. Elevated levels of CO can also cause visual impairments, reduced manual dexterity, poor learning ability, reduced work capacity, and trouble performing complex tasks.
 - Sources: The major sources of CO are on-road vehicles, aircraft, and off-road equipment, or any source that burns fuel including residential heaters and stoves. Since most of the CO sources are the indirect result of urban development, most emissions and unhealthy CO levels occur in major urban areas.
- *Ozone*
 - Description and Physical Properties: O₃ is known as a photochemical pollutant. Ozone is not emitted directly into the atmosphere, but is formed by a complex series of chemical reactions between reactive organic gases (ROG) or volatile organic compounds (VOC), NO_x, and sunlight. ROG and NO_x are emitted from automobiles, solvents and fuel combustion, the sources of which are widespread throughout the SCAQMD. Significant ozone formation generally requires an adequate amount of precursors in the atmosphere and several hours in a stable atmosphere with strong sunlight. The conditions conducive to the formation of ozone include extended periods of daylight (solar radiation) and hot temperatures. These conditions are prevalent during the summer when thermal inversions are most likely to occur. As a result, summertime conditions of long periods of daylight and hot temperatures form ozone in the greatest qualities. During the summer, thermal inversions trap ozone from dispersing vertically, high concentrations of this pollutant are prevalent.

Note: Table 4.3.C in the original DEIR was entitled "Attainment Status of Criteria Pollutants in the South Coast Air Basin" and has been moved to later in this section and renumbered Table 4.3.D.

World Logistics Center Project**

Table 4.3.A: Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards ¹		Federal Standards ²		Method ⁷	Footnotes
		Concentration ³	Method ⁴	Primary ⁵	Secondary ⁶		
Ozone (O ₃)	1-Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry	1 California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, suspended particulate matter (PM ₁₀ and PM _{2.5}) and visibility-reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
	8-Hour	0.070 ppm (137 µg/m ³)	Ultraviolet Photometry	0.075 ppm (147 µg/m ³)	Same as Primary Standard	Ultraviolet Photometry	
Respirable Particulate Matter (PM ₁₀)	24-Hour	50 µg/m ³	Gravimetric or Beta Attenuation	150 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis	2 National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth-highest eight-hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM ₁₀ , the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m ³ is equal to or less than one. For PM _{2.5} , the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current federal policies.
	Annual Arithmetic Mean	20 µg/m ³	Gravimetric or Beta Attenuation	—	—	—	
Fine Particulate Matter (PM _{2.5})	24-Hour	No Separate State Standard	Gravimetric or Beta Attenuation	35 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis	3 Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
	Annual Arithmetic Mean	12 µg/m ³	Gravimetric or Beta Attenuation	12.0 µg/m ³	Same as Primary Standard	Gravimetric Analysis	
Carbon Monoxide (CO)	8-Hour	9.0 ppm (10 mg/m ³)	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m ³)	None	Non-Dispersive Infrared Photometry (NDIR)	4 Any equivalent procedure which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.
	1-Hour	20 ppm (25 mg/m ³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m ³)	None	Non-Dispersive Infrared Photometry (NDIR)	
Nitrogen Dioxide (NO ₂)	8-Hour (Lake Tahoe)	6 ppm (7 mg/m ³)	Gas Phase Chemiluminescence	—	—	—	5 National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
	Annual Arithmetic Mean	0.030 ppm (57 µg/m ³)	Gas Phase Chemiluminescence	53 ppb (100 µg/m ³) (see footnote 8)	Same as Primary Standard	Gas Phase Chemiluminescence	
Sulfur Dioxide (SO ₂)	1-Hour	0.18 ppm (339 µg/m ³)	Ultraviolet Fluorescence	100 ppb (188 µg/m ³) (see footnote 8)	None	Ultraviolet Fluorescence; Spectrophotometry (Pararosaniline Method)	6 National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
	Annual Arithmetic Mean	—	Ultraviolet Fluorescence	0.030 ppm (for certain areas) (see footnote 9)	—	—	
Lead ¹⁰	24-Hour	0.04 ppm (105 µg/m ³)	Atomic Absorption	0.14 ppm (for certain areas) (see footnote 9)	—	—	7 Reference method as described by the EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the EPA.
	3-Hour	—	Atomic Absorption	75 ppb (196 µg/m ³) (see footnote 9)	0.5 ppm (1300 µg/m ³)	High-Volume Sampler and Atomic Absorption	
Visibility-Reducing Particles	1-Hour	0.25 ppm (655 µg/m ³)	Atomic Absorption	1.5 µg/m ³	Same as Primary Standard	—	8 To attain this standard, the 3-year average of the 98 th percentile of the daily maximum 1-hour average at each monitor within an area must not exceed 0.100 ppm (effective January 22, 2010). Note that the EPA standards are in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national standards to the California standards the units can be converted from ppb to ppm. In this case, the national standards of 63 ppb and 100 ppb are identical to 0.063 ppm and 0.100 ppm, respectively.
	8-Hour	Exinction coefficient of 0.23 per kilometer - visibility of ten miles or more (0.07, 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta Attenuation and Transmittance through Filler Tape.	Beta Attenuation and Transmittance through Filler Tape	—	—	—	
Sulfates Hydrogen Sulfide	24-Hour	25 µg/m ³	Ion Chromatography	—	—	—	9 On June 2, 2010, the U.S. EPA established a new 1-hour SO ₂ standard, effective August 23, 2010, which is based on the 3-year average of the annual 99 th percentile of 1-hour daily maximum concentrations. EPA also proposed a new automated Federal Reference Method (FRM) using the ultraviolet technology, but will retain the older pararosaniline methods until the new FRM have adequately permeated State monitoring networks. The EPA also revoked both the existing 24-hour SO ₂ standard of 0.14 ppm and the annual primary SO ₂ standard of 0.030 ppm, effective August 23, 2010. The secondary SO ₂ standard was not revised at that time; however, the secondary standard is undergoing a separate review by EPA. Note that the new standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the new primary national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
	1-Hour	0.03 ppm (42 µg/m ³)	Ultraviolet Fluorescence	1.5 µg/m ³	—	—	
Vinyl Chloride ¹¹	24-Hour	0.01 ppm (26 µg/m ³)	Gas Chromatography	—	—	—	10 The CARB has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Table 4.3.C: Air Quality Index Descriptions. (new table)

Air Quality Index Health Concern	Air Quality Index Numerical Range	Ozone Concentration for Air Quality Index (ppb)		Meaning
		8-Hour	1-Hour	
Good	Low: 0 High: 50	—	—	Air quality is considered satisfactory, and air pollution poses little or no risk.
Moderate	Low: 51 Std: 84* High: 100	Low: 59 Std: 70*	Low: 85	Air quality is acceptable; however, for some pollutants there may be a moderate health concern for a very small number of people who are unusually sensitive to air pollution.
Unhealthy for Sensitive Groups	Low: 101 High: 150	Low: 75 (also the federal standard)	Low: 125	Members of sensitive groups may experience health effects. The general public is not likely to be affected. People with heart or lung disease, children, and older adults are considered sensitive and are at greater risk. For ozone, people who are active outdoors are also considered sensitive.
Unhealthy	Low: 151 High: 200	Low: 95	Low: 165	Everyone may begin to experience health effects; members of sensitive groups may experience more serious health effects.
Very Unhealthy	Low: 201 High: 300	Low: 115	Low: 205	Health alert: everyone may experience more serious health effects
Hazardous	Low: 301 High: 500	Low: 374	Low: 405	Health warnings of emergency conditions. The entire population is more likely to be affected.

ppb = parts per billion (a measure of concentration) * Std = 8-hour California ozone ambient air quality standard

Source: MBE/EGS-2014_2015

- Health Effects: Health effects of ozone can include respiratory system irritation, reduction of lung capacity, asthma aggravation, inflammation and damage to lung cells, aggravated cardiovascular disease, and permanent lung damage. The greatest health risk is to those who are more active outdoors during smoggy periods, such as children, athletes, and outdoor workers. Ozone also damages natural ecosystems such as forests, foothill communities, and damages agricultural crops and some man-made materials such as rubber, paint, and plastics.
- Sources: Ozone is a secondary pollutant, thus is not emitted directly in the lower level of the atmosphere. The sources of ozone precursors (ROG and NO_x) are discussed above in the description of ozone.
- *Oxides of Nitrogen*
 - Description and Physical Properties: During combustion of fossil fuels, oxygen reacts with nitrogen to produce NO_x (NO, NO₂, NO₃, N₂O, N₂O₃, N₂O₄, and N₂O₅). Atmospheric deposition of NO_x occurs when atmospheric or airborne nitrogen is transferred to water, vegetation, soil, or other materials. Acid deposition involves the deposition of nitrogen and/or sulfur acidic compounds that can harm natural resources and materials. NO_x is also an ozone precursor. When NO_x and ROG are released in the atmosphere, they can also be a precursor to PM₁₀ and PM_{2.5}.
 - Health Effects: The EPA has concluded that the only form of NO_x that exists at a level high enough to cause public health concerns is nitrogen dioxide (NO₂) (EPA 1997). Nitrogen dioxide is a brown gas with a strong odor. NO_x can react with moisture, ammonia, and other compounds to form nitric acid and related particles. The main human health concerns of nitrogen dioxide include lung damage, increased incidence of chronic bronchitis, eye and mucus membrane damage, negative effects on the respiratory system, pulmonary dysfunction, and premature death. Small particles can penetrate deeply into the sensitive tissue of the lungs and can cause or worsen respiratory disease such as emphysema, asthma, and bronchitis, and can also aggravate existing heart disease (EPA 2005b). Because NO_x is an ozone precursor, the health effects associated with ozone are also indirect health effects associated with unhealthy levels of NO_x emissions.
 - Sources: A major source of NO_x includes stationary source fuel combustion (i.e. manufacturing and industrial, food and agricultural processing, and service commercial uses). Additionally, NO_x emission sources include motor vehicles internal combustion engines and electric utility and industrial boilers powered by fossil fuel combustion. Natural sources of NO_x include lightning, soils, wildfires, stratospheric intrusion, and the oceans. Natural sources accounted for approximately seven percent of 1990 emissions of NO_x for the United States. On-road vehicles also contribute to NO_x emissions.
- *Sulfur Dioxide*
 - Description and Physical Properties: Sulfur dioxide (SO₂) is a colorless, pungent gas. At levels greater than 0.5 ppm, the gas has a strong odor, similar to rotten eggs. Sulfuric acid is formed from sulfur dioxide, which is an aerosol particle component that affects acid deposition. Sulfur oxides (SO_x) include sulfur dioxide and sulfur trioxide (SO₃). The gas can also be produced in the air by dimethylsulfide and hydrogen sulfide. Sulfur dioxide is removed from the air by dissolution in water, chemical reactions, and transfer to soils and ice caps. Historically, sulfur dioxide was a pollutant of concern. However, with the successful application of regulations at the State and local level, the levels of sulfur dioxide have been reduced dramatically in the past several decades. The CARB, the State regulatory agency charged with regulating air pollution in the State, demonstrates that sulfur dioxide levels in the State are well below the maximum standards (CARB 2006b, Page 107, 408, and 409). Although sulfur dioxide concentrations have been reduced to levels well below State and

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Federal standards, further reductions are desirable because sulfur dioxide is a precursor to sulfate and PM₁₀. Sulfates are a particulate formed through the photochemical oxidation of sulfur dioxide.

- Health Effects: Sulfur dioxide is a soluble gas; therefore, it can be absorbed in the mucous membranes of the respiratory tract and nose. Long-term exposure of high levels of sulfur dioxide can cause irritation of existing cardiovascular disease, respiratory illness, and changes in the defenses in the lungs. When people with asthma are exposed to high levels of sulfur dioxide for short periods of time during moderate activity, effects may include wheezing, chest tightness, or shortness of breath (EPA 2000).
- Sources: Anthropogenic, or human caused, sources include fossil-fuel combustion, mineral ore processing, and chemical manufacturing. Volcanic emissions are a natural source of sulfur dioxide.
- *Lead*
 - Description and Physical Properties: Lead (Pb) is a solid heavy metal that can exist in air pollution as an aerosol particle component. An aerosol is a collection of solid, liquid, or mixed-phase particles suspended in the air. Lead was first regulated as an air pollutant in 1976. Leaded gasoline was first marketed in 1923 and was used in motor vehicles until around 1970. The exclusion of lead from gasoline helped to decrease emissions of lead in the United States from 219,000 to 4,000 short tons per year between 1970 and 1997. Even though leaded gasoline has been phased out in most countries, some still use leaded gasoline. The mechanisms by which lead can be removed from the atmosphere (sinks) include deposition to soils, ice caps, and oceans, and inhalation.
 - Health Effects: Lead accumulates in bones, soft tissue, and blood and can affect the kidneys, liver, and nervous system. The more serious effects of lead poisoning include behavior disorders, mental retardation, and neurological impairment. Low levels of lead in fetuses and young children can result in nervous system damage, which can cause learning deficiencies and low IQs. Lead may also contribute to high blood pressure and heart disease.
 - Sources: Lead-ore crushing, lead-ore smelting, and battery manufacturing are currently the largest sources of lead in the atmosphere in the United States. Other sources include dust from soils contaminated with lead-based paint, soil waste disposal, and crustal physical weathering.
- *Particulate Matter (PM₁₀ and PM_{2.5})*
 - Description and Physical Properties: Particulate matter is a generic term that defines a broad group of chemically and physically different particles (either liquid droplets or solids) that can exist over a wide range of sizes. Examples of atmosphere particles include those produced from combustion (diesel soot or fly ash), light produced (urban haze), sea spray produced (salt particles), and soil-like particles from re-suspended dust. In discussions of air pollution, particulate matter is typically divided up into two size categories: PM₁₀ and PM_{2.5} because of the adverse health effects associated the smaller-sized particles. PM₁₀ refers to particulate matter that is 10 microns or less in diameter (1 micron is one-millionth of a meter, also known as a micrometer [μm]). PM_{2.5} refers to particulate matter that is 2.5 microns or less in a diameter. Soil dust consists of the minerals and organic material found in soil being lifted up into the air by winds (e.g., fugitive dust).
 - Health Effects: Particulate matter can be inhaled directly into the lungs where it can be absorbed into the bloodstream. It is a respiratory irritant and can cause direct pulmonary effects such as coughing, bronchitis, lung disease, respiratory illnesses, increased airway reactivity, and exacerbation of asthma. Relatively recent mortality studies have shown a statistically significant direct association between mortality and daily concentrations of

particulate matter in the air. Non-health effect includes reduced visibility and soiling of property.

- Sources: Particulate matter originates from a variety of stationary and mobile sources. Stationary sources include fuel combustion for electrical utilities, residential space heating, and industrial processes; construction and demolition; metals, minerals, and petrochemicals; wood products processing; mills and elevators used in agriculture; erosion from tilled lands; waste disposal and recycling. Mobile or transportation-related sources include particulate matter from highway vehicles and non-road vehicles and fugitive dust from paved and unpaved roads. Secondary particulate matter is formed in the atmosphere through chemical reactions that can involve ROG, SO_x, NO_x, and ammonia.
- *Diesel Particulate Matter*
 - Description and Physical Properties: Diesel particulate matter (DPM) is a source of PM_{2.5} because the size of diesel particles are typically 2.5 microns and smaller. In 1998, DPM made up about 6 percent of the total PM_{2.5} inventory nationwide (EPA 2002). Diesel exhaust is a complex mixture of thousands of particles and gases that is produced when an engine burns diesel fuel. DPM includes the particles-phase constituents in diesel exhaust. Organic compounds account for 80 percent of the total particulate matter mass, which is composed of compounds such as hydrocarbons and their derivatives, and polycyclic aromatic hydrocarbons (PAHs) and their derivatives. Fifteen PAHs are confirmed for carcinogenicity, a number of which are found in diesel exhaust (NTP 2005b). The chemical composition and particle sizes of diesel PM vary between different engine types (heavy-duty, light-duty), engine operating conditions (idle, accelerate, decelerate), expected load, engine emission controls, fuel formulations (high/low sulfur fuel), and the year of the engine (EPA 2002).
 - ~~Non-Cancer Health Effects: Some short term (acute) effects of diesel exhaust include eye, nose, throat, and lung irritation, and can cause coughs, headaches, light-headedness, and nausea. Diesel exhaust is a major source of ambient particulate matter pollution as well, and numerous studies have linked elevated particle levels in the air to increase hospital admission, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems (OEHHA 2002).~~
 - Cancer Health Effects: Human studies on the carcinogenicity of diesel particulate matter demonstrate an increased risk of lung cancer, although the increased risk cannot be clearly attributed to diesel exhaust exposure (NTP 2005b). Several occupational and ambient studies have documented the health effects due to exposure to diesel PM. The California Office of Environmental Health Hazards Assessment (OEHHA), in its role in assessing risk from environmental factors reviews such studies and makes recommendations on the way environmental risk should be evaluated through programs like the AB2588 Hot Spot Program. In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, 1950's era railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provided strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. However, all of these studies were based on exposure to exhaust from traditional diesel engines and prior to the advent of highly efficient emissions controls like the diesel particulate filter. Based on these studies, CARB identified diesel exhaust a toxic air contaminant in 1998.
 - More recently, in January 2015, a major new study evaluated the health impacts of “new technology diesel exhaust” (NTDE). Beginning in 2001, USEPA and CARB begin issuing a series of regulations that require new diesel-powered vehicles and equipment to use the latest emissions control technology. This technology relies on two components. The first is a diesel particulate filter, which is capable of reducing particulate matter emissions by over 90%

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

(required for new engines beginning in 2007). The second technology is selective catalytic reduction, which reduces emissions of nitrogen oxides by over 90% (required for new engines beginning in 2010). Diesel emissions from engines equipped with this technology are referred to as NTDE. As a result of the advances in emission control technology, USEPA, CARB, and other government and industry stakeholders commissioned a series of studies called the Advanced Collaborative Emissions Study (ACES). ACES has been guided by an ACES Steering Committee consisting of representatives of HEI and the Coordinating Research Council (CRC: a nonprofit organization that directs engineering and environmental studies on the interaction between automotive or other mobility equipment and petroleum products), along with the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others. The Health Effects Institute (HEI), funded in part by USEPA, was selected to oversee Phase 3 of ACES.

- Phase 3 of ACES evaluated whether emissions from new technology diesel engines cause cancer or other health effects. Specifically, it evaluated the health impacts of an 2007-compliant engine equipped with a diesel particulate filter. HEI found:
 - "Lifetime inhalation exposure of rats exposed to one of three levels of NTDE from a 2007-compliant engine, for 16 hours per day, 5 days a week, with use of a strenuous operating cycle that more accurately reflected the real-world operation of a modern engine than cycles used in previous studies, did not induce tumors or pre-cancerous changes in the lung and did not increase tumors that were considered to be related to NTDE in any other tissue. A few mild changes were seen in the lungs, consistent with long-term exposure to NO₂, a major component of NTDE, which is being further substantially reduced in 2010-compliant engines". (Page 1)
 - "Using appropriate statistical approaches to analyze the data from more than 100 endpoints in the broad areas of histology, serum chemistry, systemic and lung inflammation, and respiratory function, the investigators confirmed the a priori hypothesis, namely, that NTDE would not cause an increase in tumor formation or substantial toxic health effects in rats, although some biologic effects might occur". (Page 3)
 - "The overall conclusion was that chronic exposure of rats to NTDE did not produce tumors in the lung, in marked contrast to the effects of chronic exposure to TDE observed in multiple previous rat studies, in which lung tumors, as well as inflammation and the deposition of soot in the lung, were observed. Rather, the effects of NTDE in the lung more closely resembled changes noted after long-term exposures to gaseous oxidant pollutants, in particular NO₂, and to TDE from which particles have been filtered out. It is possible that components of NTDE other than NO₂ may have contributed to the effects reported, but the low levels of other components suggest that they would not be primarily responsible" (Page 3)
 - "Some mild histologic changes were found in the lung; however, these were not pre-cancerous lesions, previously described in long-term exposure studies of rats to TDE. Rather, the histologic changes — periacinar epithelial hyperplasia, bronchiolization, accumulation of macrophages, and periacinar interstitial fibrosis — were confined to a small region, the centriacinus, which is involved in gas exchange." (Page 3)
 - "The histologic changes in the lungs were consistent with previous findings in rats after long-term exposure to NO₂ — a major component of the exposure

atmosphere, which is being substantially further reduced in 2010-compliant engines.” (Page 4)

- “The present findings strongly support the premise that advances in engine, fuel, and combustion technologies have substantially reduced the potential health impacts of DE and that estimates of hazard and risk based on laboratory or epidemiologic studies of the health impacts of TDE exposures most likely do not reflect either the hazards or the risks from NTDE”. (Page 40)
- “As shown, the ACES Phase I study (Khalek et al. 2009) found that emissions from 2007-compliant engines were reduced more than 90% compared with those from a 2004 engine; emissions of hydrocarbons and other air toxics by 2007-compliant engines were also lower by more than 80% than those of older engines” (Page 154)
- The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.
- Non-Cancer Health Effects: Some short-term (acute) effects of diesel exhaust include eye, nose, throat, and lung irritation, and can cause coughs, headaches, light-headedness, and nausea. Diesel exhaust is a major source of ambient particulate matter pollution as well, and numerous studies have linked elevated particle levels in the air to increase hospital admission, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems (OEHHA 2002). The HEI study discussed above also evaluated non-cancer health effects. The study found NTDE would not cause an increase in substantial toxic health effects in rats, although some biologic effects might occur.
- Sources: Diesel exhaust.
- *Visibility-Reducing Particles*
 - Description and Physical Properties: Visibility-reducing particles (VRP) are suspended particulate matter that reduces visibility. Visibility is the distance through the air that can be seen without the use of instrumental assistance. The distance that can be seen is limited by the amount of gases and aerosol particles in the way. The EPA implemented a Regional Haze Rule in 1999 to attempt to protect visibility in 156 national parks and wilderness areas in the United States. The regulation requires states to establish goals for improving their areas and to work together with other states as the pollution is often transported over long distances (EPA 1999).
 - Health Effects: The human health effects of VRP are those of pollution (particulate matter, oxides of nitrogen, and sulfur dioxide) discussed above.
 - Sources: The sources are other pollutants (particulate matter, oxides of nitrogen, and sulfur dioxide) as discussed above.
- *Vinyl Chloride*
 - Description and Physical Properties: Vinyl chloride, or chloroethene, is a chlorinated hydrocarbon and colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products, including pipes, wire and cable coatings, and packaging materials. Vinyl chloride is formed when other substances such as trichloroethylene and tetrachloroethylene are broken down. This can occur when plastics containing these substances are left to decompose in solid waste landfills. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites due to microbial breakdown of chlorinated solvents. In 1978, the CARB established a State ambient air quality standard for vinyl chloride. The standard was set at 0.01 ppm for a 24-hour duration because

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

that was the lowest level that could be detected at that time. In 1990, the CARB identified vinyl chloride as a toxic air contaminant and estimated a cancer unit risk factor.

- Health Effects: Short-term exposure to high levels of vinyl chloride in air causes central nervous system effects, such as dizziness, drowsiness, and headaches (CARB 2005). Epidemiological studies of occupationally exposed workers have linked vinyl chloride exposure to development of a rare cancer, liver angiosarcoma, and have suggested a relationship between exposure and lung and brain cancers.
- Sources: Manufacturing of PVC plastic and vinyl products.
- *Hydrogen Sulfide*
 - Description and Physical Properties: Hydrogen sulfide (H₂S) is a flammable, colorless, poisonous gas that smells like rotten eggs.
 - Health Effects: High levels of hydrogen sulfide can cause immediate respiratory arrest. It can irritate the eyes and respiratory tract and cause symptoms like headache, nausea, vomiting, and cough. Long exposure to hydrogen sulfide can cause pulmonary edema.
 - Sources: Hydrogen sulfide and other reduced sulfur compounds form by the anaerobic decomposition of manure some types of bacteria found in animal and human by-products produce hydrogen sulfide during reduction of sulfur-containing compounds, such as proteins. Manure, storage tanks, ponds, anaerobic lagoons, and land application sites are the primary sources of hydrogen sulfide emissions. Anthropogenic sources include the combustion of sulfur containing fuels (oil and coal) and organic matter that undergoes putrefaction. It is used in the production of heavy water for nuclear reactors, the manufacture of chemicals, in metallurgy, and as an analytical reagent.
- *Reactive Organic Gases and Volatile Organic Compounds*
 - Description and Physical Properties: Reactive organic gases (ROG), or volatile organic compounds (VOC), are defined as any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions. ROG consist of nonmethane hydrocarbons and oxygenated hydrocarbons. Hydrocarbons are organic compounds that contain only hydrogen and carbon atoms. Nonmethane hydrocarbons are hydrocarbons that do not contain the unreactive hydrocarbon, methane. Oxygenated hydrocarbons are hydrocarbons with oxygenated functional groups attached.
 - It should be noted that there are no State or Federal ambient air quality standard for ROG because they are not classified as criteria pollutants. They are regulated, however, because a reduction in ROG emissions reduces certain chemicals reactions that contribute to the formulation of ozone. ROG are also transformed into organic aerosols in the atmosphere, which contribute to higher PM₁₀ and lower visibility.
 - Health Effects: Although health-based standards have not been established for ROG, health effects can occur from exposures to high concentrations because of interference with oxygen uptake. In general, concentrations of ROG are suspected to cause eye, nose, and throat irritation; headaches, loss of coordination, nausea, damage to liver, kidney, and the central nervous system (EPA 2005). There are many ROG that have been classified as toxic air contaminates. A particular ROG of concern is benzene, which is described in more detail below. The EPA maintains a list of all air substances that have been classified as hazardous to humans and/or animals, and includes ROG, pesticides, herbicides, and radionuclides (EPA 2006d).
 - Sources: The major sources of ROG are on-road motor vehicles and solvent evaporation.

- *Benzene*

- Description and Physical Properties: Benzene is an ROG. It is a clear or colorless light-yellow, volatile, highly flammable liquid with a gasoline-like odor. The EPA has classified benzene as a “Group A” (human) carcinogen.
- Health Effects: Short-term (acute) exposure of high doses from inhalation of benzene may cause dizziness, drowsiness, headaches, eye irritation, skin irritation, and respiratory tract irritation, and at higher levels, unconsciousness can occur. Long-term (chronic) occupational exposure of high dose by inhalation has caused blood disorders, including aplastic anemia and lower levels of red blood cells (EPA 1992). Occupational exposure to benzene has been shown to cause leukemia (mainly acute myelogenous leukemia) (NTP 2005). Studies have also found that benzene exposure increased the risks of lymphatic and hematopoietic cancer (cancers of lymphatic system and of organs and tissues involved in the production of blood), total leukemia, and specific histologic types of leukemia (NTP 2005).
- Sources: Benzene is emitted into the air from gasoline services station (fuel evaporation), motor vehicle exhaust, tobacco smoke, and from burning oil and coal. Benzene is also used as a solvent for paints, inks, oils, waxes, plastic, and rubber. It is used in the extraction of oils from seeds and nuts. It is also manufactured for detergents, explosives, dyestuffs, and pharmaceuticals.

Ultrafine Particles. Ultrafine particles are particulate matter (PM) that exists in the ambient air and are less than 0.1 micrometer (μm or microns) in diameter. Ultrafine particles (UFP or $\text{PM}_{0.1}$) are included in the group called $\text{PM}_{2.5}$, particulate matter less than 2.5 micrometers in diameter.

The picture to the right displays the relative size of the particles compared with a human hair, with PM_{10} (particulate matter less than 10 micrometers in diameter) indicated as yellow circles, $\text{PM}_{2.5}$ shown as blue circles, and ultrafine particles shown as red circles.

The CARB or the EPA have not set an ambient air quality standard for ultrafine particles because health effect evidence and measurements are currently limited. In its recent revisions to the national ambient air quality standards for particulate matter, the EPA states, “In considering both the currently available health effects evidence and the air quality data, the Policy Assessment concluded that this information was still too limited to provide support for consideration of a distinct PM standard for ultrafine particles” (EPA 2013, ¹ page 3122).

The EPA indicates that evidence and research regarding health effects from short-term and long-term exposure to ultrafine particles are still too limited to establish a standard for ultrafine particles. In addition, the EPA reports that the studies that do exist have reported inconsistent and mixed results. The following is an excerpt from the Federal Register illustrating this point:

¹ U.S. Environmental Protection Agency. 2013. Federal Register. National Ambient Air Quality Standards for Particulate Matter. Website: <http://www.gpo.gov/fdsys/pkg/FR-2013-01-15/pdf/2012-30946.pdf>. Accessed December 17, 2013.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

“New evidence, primarily from controlled human exposure and toxicological studies, expands our understanding of cardiovascular and respiratory effects related to short-term ultrafine particle exposures. However, the Policy Assessment concluded that this evidence was still very limited and largely focused on exposure to diesel exhaust, for which the Integrated Science Assessment concluded it was unclear whether the effects observed are due to ultrafine particles, larger particles within the PM_{2.5} mixture, or the gaseous components of diesel exhaust. In addition, the Integrated Science Assessment noted uncertainties associated with the controlled human exposure studies using concentrated ambient particle systems, which have been shown to modify the composition of ultrafine particles.

The Policy Assessment recognized that there are relatively few epidemiological studies that have examined potential cardiovascular and respiratory effects associated with short-term exposures to ultrafine particles. These studies have reported inconsistent and mixed results.

Collectively, in considering the body of scientific evidence available in this review, the Integrated Science Assessment concluded that the currently available evidence was suggestive of a causal relationship between short-term exposures to ultrafine particles and cardiovascular and respiratory effects. Furthermore, the Integrated Science Assessment concluded that evidence was inadequate to infer a causal relationship between short-term exposure to ultrafine particles and mortality as well as long-term exposure to ultrafine particles and all outcomes evaluated” (EPA 2013, page 3121).

The Integrated Science Assessment for Particulate Matter concluded that evidence is inadequate to determine a causal relationship between short-term exposures of ultrafine particles to mortality or central nervous system effects, but that the evidence is suggestive of short-term (24-hour) exposures causing cardiovascular and respiratory effects. The assessment also concluded that there is inadequate evidence linking long-term exposure (typically measured in terms of an annual concentration) of ultrafine particles to health effects, including respiratory, developmental, cancer, and mortality. Overall, epidemiological studies of atmospheric PM suggest that cardiovascular effects are associated with smaller particles, but there are few reports that make a clear link between ultrafine particle exposures and increased mortality. In January 2015, a new study¹ on the relationship of mortality to long-term exposure to fine and ultra-fine particles was released. The study found there was a relationship between mortality and both fine and ultra-fine particles exposure.

In its Quantitative Health Risk Assessment for Particulate Matter, the EPA did not assess ultrafine particles, stating “ that there was insufficient data to support a quantitative risk assessment for other size fractions (e.g., ultrafine particles).”²

The availability of measurements of ultrafine particles to support health studies is also limited:

With respect to our understanding of ambient ultrafine particle concentrations, at present, there is no national network of ultrafine particle samplers; thus, only episodic and/or site-specific data sets exist. Therefore, the Policy Assessment recognized a national characterization of concentrations, temporal and spatial patterns, and trends was not possible at this time, and the availability of ambient ultrafine measurements to support health studies was extremely limited. In general, measurements of ultrafine particles are highly dependent on monitor location and, therefore, more subject to exposure error than accumulation mode particles. Furthermore, the number of

¹ Environmental Health Perspectives. January 2015. Associations of Mortality with Long-Term Exposures to Fine and Ultrafine Particles. Species and Sources: Results from the California Teachers Study Cohort.

² U.S. Environmental Protection Agency. 2010. Quantitative Health Risk Assessment for Particulate Matter. EPA-452/R-10-005. Website: <http://www.epa.gov/nscep/index.html>. (Search for the document.) Accessed December 20, 2013.

ultrafine particles generally decreases sharply downwind from sources, as ultrafine particles may grow into the accumulation mode by coagulation or condensation. Limited studies of ambient ultrafine particle measurements have suggested that these particles exhibit a high degree of spatial and temporal heterogeneity driven primarily by differences in nearby source characteristics. Internal combustion engines and, therefore, roadways are a notable source of ultrafine particles, so concentrations of these particles near roadways are generally expected to be elevated. Concentrations of ultrafine particles have been reported to drop off much more quickly with distance from roadways than fine particles (EPA 2013, page 3121).

In addition, it was hypothesized that chemical composition of PM may be a better predictor of health effects than particle size:

In addressing the issue of particle composition, the Integrated Science Assessment concluded that, '[f]rom a mechanistic perspective, it is highly plausible that the chemical composition of PM would be a better predictor of health effects than particle size.' Heterogeneity of ambient concentrations of PM_{2.5} constituents (e.g., elemental carbon, organic carbon, sulfates, nitrates) observed in different geographical regions as well as regional heterogeneity in PM_{2.5}-related health effects reported in a number of epidemiological studies are consistent with this hypothesis (EPA 2013, page 3122).

The SCAQMD's Multiple Air Toxics Exposure Study (MATES-IV) states, "the health impact caused by exposure to UFPs [ultrafine particles] is still not well-understood." MATES-IV presents measurements of black carbon and ultrafine particles at 10 fixed sites within the Basin. The results indicate that the highest black carbon levels were at more urban sites located near major roadways. Black carbon was not measured in the previous MATES-III; however, elemental carbon levels decreased about 35 percent during from 2005 to 2012. Black carbon is a term used for elemental and graphitic components of soot.

The SCAQMD's 2012 Air Quality Management Plan (AQMP) contains a detailed chapter on near roadway exposure and ultrafine particles. The AQMP summarizes current health effect research on ultrafine particles. The potential health effects from ultrafine particle exposure are similar to those of PM_{2.5} and PM₁₀: such as adverse cardio-respiratory responses including elevated blood pressure, and mild inflammatory and prothrombotic (obstruction of circulation) responses. The AQMP indicated that future research and assessment is needed in the following areas:

- *Chemical Composition.* Chemical composition of ultrafine particles depends on many factors, including vehicle technology, fuel, and atmospheric chemical reactions after being emitted. Particle composition may be a factor determining particle toxicity; therefore, knowledge regarding the chemistry is important.
- *Formation.* More research is needed regarding the processes leading to ultrafine particle formation.
- *Standardized Measurement Methods and Procedures.* Currently, there is no standard method for conducting size-classified or particle-number measurements. Characteristics measured in ambient and emission-testing studies are highly dependent on the measurement instrument/protocol used and its setting.
- *Measurements at Hot Spot Locations.* More measurements should be taken at "hot spots" where large numbers of vehicles are operated.
- *Emissions Inventories.* Vehicle emission factors for different particle size ranges and for particle numbers are highly uncertain, and there are no emission inventories for ultrafine particles from motor vehicles. New estimations of ultrafine particle levels should not be derived solely from

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

vehicle emission factors (i.e., EMFAC), but have to include predictions for formation near the tailpipe and in the atmosphere.

- *Air Quality Modeling.* Modeling tools will need to be developed to simulate the formation and transport over a wide range of atmospheric conditions and emissions scenarios. The dispersion near the first few hundred meters of the roadway needs to be better understood.
- *Health Effects.* New toxicological and epidemiological studies targeting exposure to controlled and uncontrolled emissions from gasoline and diesel vehicles are needed to better characterize the exposure-response relationships to ultrafine particles and to help develop health guidelines and potential regulations. The health effects of inorganic ultrafine particle emissions from vehicles are only now starting to receive significant attention.
- *Other Sources.* More work is needed to better understand size, composition, and health impact of particles near stationary sources and other processes (rather than just motor vehicles).

Children and Air Pollution. Numerous studies have shown strong links between air pollution exposures and a range of health outcomes. One particular study was carried out over a 10-year experimental time period by the University of Southern California, the Children's Health Study (Gauderman, 2000)¹. The Children's Health Study, which began in 1992, is a large, long-term, study of the effects of chronic air pollution exposures on the health of children living in Southern California. Children may be more strongly affected by air pollution because their lungs and their bodies are still developing. Children are also exposed to more air pollution than adults since they breathe faster and spend more time outdoors in strenuous activities. About 5,500 children in twelve communities were enrolled in the study; two-thirds of them were enrolled as fourth-graders. Data on the children's health, their exposures to air pollution, and many factors that affected their responses to air pollution were gathered annually until they graduated from high school. The major conclusions reached in the University of Southern California's Children's Health Study are shown below. Note however, that the conclusions provided below were developed based on measurements made in the 1990's when levels of air pollution in the Basin were substantially higher than current levels as shown earlier in Figures 4.3.1 to 4.3.6 and as noted further in Section 4.3.1.4 below and new technology diesel vehicles had not yet been introduced.

- Children exposed to higher levels of particulate matter, nitrogen dioxide, acid vapor and elemental carbon, had significantly lower lung function at age 18, an age when the lungs are nearly mature and lung function deficits are unlikely to be reversed.
- Children who were exposed to current levels of air pollution had significantly reduced lung growth and development when exposed to higher levels of acid vapor, ozone, nitrogen dioxide, and particulate matter, which is made up of very small particles that can be breathed deeply into the lungs.
- Children living in communities with higher concentrations of nitrogen dioxide, particulate matter, and acid vapor had lungs that both developed and grew more slowly and were less able to move air through them. This decreased lung development may have permanent adverse effects in adulthood.
- Children who moved away from study communities had increased lung development if the new communities had lower particulate matter levels, and had decreased lung development if the new communities had higher particulate matter levels.

¹ Gauderman, W, et. al. Peters: Association between Air Pollution and Lung Function Growth in Southern California Children. American Journal of Respiratory and Critical Medicine. Vol 162. Page 1383. 2000. Accessed October 22, 2013.

- Days with higher ozone levels resulted in significantly higher school absences due to respiratory illness. Children with asthma who were exposed to higher concentrations of particulate matter were much more likely to develop bronchitis.
- In the most recent update to the Children’s Health Study , researchers discovered that improvements in regional air quality contributed to improved children’s lung function. Specifically, combined exposure to two harmful pollutants, nitrogen dioxide (NO2) and fine particulate matter, fell approximately 40 percent for children in the third study group (2007-2011) compared to the first study group (1994-98). The study followed children from Long Beach, Mira Loma, Riverside, San Dimas and Upland.
- Children’s lungs grew faster as air quality improved. Lung growth from age 11 to 15 was more than 10 percent greater for children breathing the lower levels of NO2 from 2007 to 2011 compared to those breathing higher levels from 1994 to 1998.
- The percentage of children in the study with abnormally low lung function at age 15 dropped from nearly 8 percent for the 1994-98 group, to 6.3 percent in 1997-2001, to just 3.6 percent for children followed between 2007 and 2011.

4.3.1.3 Air Pollution Constituents and Attainment Status

The CARB has many responsibilities with respect to air quality, including the following:

- Coordination and oversight of State and Federal air pollution control programs in California;
- Oversight activities of local air quality management agencies (e.g., the SCAQMD);
- Responsibility for incorporating air quality management plans for local air basins into a State Implementation Plan (SIP) for EPA approval; and
- Maintaining air quality monitoring stations throughout the State in conjunction with local air districts.

The CARB has divided the State into 15 air basins based on meteorological and topographical factors that affect air pollution. An air basin generally has similar meteorological and geographic conditions throughout. The CARB and EPA use the data collected at monitoring stations to classify air basins as attainment, nonattainment, nonattainment transitional, or unclassified, based on air quality data for the most recent three calendar years compared with the AAQS. Nonattainment areas are imposed with additional restrictions, as required by the EPA to attain and maintain air quality standards. The air quality data are also used to monitor progress in attaining and maintaining air quality standards.

Significant authority for air quality control within the various air basins has been given to local air districts that regulate stationary source emissions and develop local nonattainment plans. Table 4.3.D identifies the attainment status¹ for the criteria pollutants in the Basin. The State AAQS are more stringent than the Federal AAQS.

Table 4.3.D: Attainment Status of Criteria Pollutants in the South Coast Air Basin

Pollutant	State	Federal
O ₃ 1-hour	Nonattainment	N/A
O ₃ 8-hour	Nonattainment	Extreme Nonattainment

¹ Unclassified designation: a pollutant that is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment; Attainment designation: a pollutant is designated attainment if the State standard for that pollutant was not violated at any site in the area during a 3-year period. Nonattainment: a pollutant is designated nonattainment if there was at least one violation at any site in the area during a 3-year period.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.3.D: Attainment Status of Criteria Pollutants in the South Coast Air Basin

Pollutant	State	Federal
PM ₁₀	Nonattainment	Maintenance – serious (San Bernardino County is in nonattainment)
PM _{2.5}	Nonattainment	Nonattainment
CO	Attainment	Attainment/Maintenance
NO ₂	Nonattainment Attainment	Attainment/Maintenance
SO ₂	Attainment	Attainment
Pb	Attainment	Attainment
All others	Attainment/Unclassified	Attainment/Unclassified

Unclassified designation: a pollutant that is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.

Attainment designation: a pollutant is designated attainment if the State standard for that pollutant was not violated at any site in the area during a 3-year period.

Nonattainment: a pollutant is designated nonattainment if there was at least one violation at any site in the area during a 3-year period.

4.3.1.4 Regional Air Quality Improvements

The SCAQMD website (aqmd.gov) includes historical air quality data dating back to 1994; the year after air pollution emissions thresholds were established. As described on the SCAQMD website,¹ in 1994 pollutant concentrations in the Basin exceeded three of the six Federal ambient air quality standards. The state sulfate standard was exceeded in some Basin areas. The state lead standard was exceeded in one localized area immediately adjacent to a source of lead emissions. No areas of the Basin exceeded standards for nitrogen dioxide or sulfur dioxide. The Los Angeles and Riverside County areas of the Southeast Desert Air Basin (SEDAB) served by the District exceeded standards for ozone and PM₁₀. No other standards were exceeded in the District SEDAB areas. The Federal standards were exceeded at one or more locations in the Basin during 142 days in 1994.

Although both Federal and State standards were exceeded for three criteria pollutants during 1994, current air quality represents substantial improvement over historical air quality. Between 1982–1984 and 1992–1994, the number of days on which the Federal ozone standard was exceeded dropped by one third, from 33 percent to 22 percent of days, in the East San Gabriel Valley area, which is exceeded most frequently. Exceedances of the Federal carbon monoxide standard decreased from 11 percent of days in 1982–1984 to 7 percent of days in 1992–1994. A comparison for the same periods cannot be made for PM₁₀ since the first full year of monitoring was 1985. However, between 1985–1987 and 1992–1994, the percent of days exceeding the Federal 24-hour standard decreased from 13 percent to 3 percent.²

Exceedances of the State nitrogen dioxide standard decreased from 1 percent of days in 1982–1984 to 0.1 percent of days in 1992–1994. The Federal nitrogen dioxide standard has not been exceeded in any area since 1991. There have been no exceedances of lead standards at regular air monitoring stations in the Basin since 1982. The State and Federal sulfur dioxide standards were not exceeded in any of the Basin monitoring areas during either period. Exceedances of the State sulfate standard decreased from 2 percent to 0 percent at the long-term site used in this analysis, though a few sites were exceeded in 1994. The areas of the Basin recording the highest pollutant concentrations have shown a significant decrease in exceedances of the Federal standards over the past decade.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

As described in the SCAQMD *December 2000 Air Quality Standards Report*, in a continuing trend of significant long-term improvement in air quality, the Basin did not experience a Stage 1 Episode for the second year in a row in the year 2000. Also, the year 2000 was the second year in the history of ambient air monitoring that the Basin was not the location recording the highest ozone concentration in the nation. Nonetheless, maximum pollutant concentrations in the region still exceeded the Federal standards for ozone, carbon monoxide and particulate matter (PM₁₀ and PM_{2.5}) by a wide margin.

Maximum 1-hour average and 8-hour average ozone concentrations in 2000 (0.184 ppm and 0.159 ppm) were 147 percent and 187 percent of the Federal 1-hour and 8-hour standards, respectively. The highest 8-hour average carbon monoxide concentration of 2000 (10.0 ppm) was 105 percent of the Federal standard. Maximum 24-hour average and annual average PM₁₀ concentrations (139 µg/m³ and 60.1 µg/m³) were 92 percent and 119 percent of the Federal 24-hour and annual standards, respectively. Maximum 24-hour average and annual average PM_{2.5} concentrations (119.6 µg/m³ and 28.2 µg/m³) were, respectively, 183 percent and 182 percent of the Federal 24-hour and annual standards.

In 2000, the Federal nitrogen dioxide standard was not exceeded, with a maximum concentration (0.0435 ppm), which was 81 percent of the Federal standard. The maximum 1-hour average nitrogen dioxide concentration (0.21 ppm) was 81 percent of the State standard. State standard for sulfate was exceeded on one day at one location. The maximum 24-hour concentration (26.7 µg/m³) was 107 percent of the State standard. (There is no Federal sulfate standard.) Sulfur dioxide and lead concentrations continued to remain well below the Federal and State standards in 2000.¹

As identified in the SCAQMD *December 2000 Air Quality Standards Report*, the number of exceedances recorded in 2000 shows that air quality trends through 2000 are consistent with a continuation of the downtrends reported in previous years. Figure 4.3.8 shows the trend in the percentage exceeding the Federal standards in the Basin. In 2000, there were 43 days on which one or more Federal standards were exceeded somewhere in the Basin, most of which (40 days) were for ozone alone. Between 1976–1978 and 1998–2000, the three-year average number of days exceeding any of the Federal standards for 1-hour ozone, 8-hour carbon monoxide or 24-hour PM₁₀ in the Basin was reduced by 80 percent. (“All Standards” does not include PM₁₀ until 1985.) The three-year average number of days exceeding the carbon monoxide Federal standard was reduced by 94 percent for the same period. The number of sampling days exceeding the Federal 24-hour PM₁₀ standard decreased 93 percent between 1985–1987 and 1998–2000. (Three-year averages were used to minimize the effect of year-to-year variations due to changes in meteorological conditions.)

¹ *December 2000 Air Quality Standards Compliance Report*, SCAQMD, <http://aqmd.gov/smog/AQSCR2000/aq00web.pdf>, website accessed December 17, 2012.

Figure 4.3.8: Percent of Days Basin Exceeds Federal AAQS

Between the periods 1976–1978 and 1998–2000, Stage 1 Episodes decreased 96 percent and health advisories decreased 86 percent. Exceedances of 1-hour and 8-hour Federal standards decreased 76 percent and 47 percent, and State standard exceedances decreased 49 percent as shown in Figure 4.3.9.

Figure 4.3.9: Exceedances of 1-Hour and 8-Hour Federal Standards

Figure 4.3.10 shows the number of days per month exceeding the Federal ozone standard for the period of 1976–2000. Up until the early 1990s, it was common to have days exceeding the Federal ozone standard as early as February and as late as November and December. Since the mid-1990s there have been no Federal standard exceedances recorded in the months of January–March and November–December. Also, the frequency of exceedances in fall (September and October) has been reduced significantly in recent years.

**Final Programmatic Environmental Impact Report

* Number of Days: 0 1-10 11-20 21-31 (Total Basin-Days)

Figure 4.3.10: Number of Days per Month Federal Ozone Standard Exceeded, 1976–2000

The monthly distribution of the Federal ozone standard exceedances shows the trend toward shorter duration of the period of the year that high ozone concentrations occur (smog season). Although weather conditions contributed to the lower ozone concentrations, weather-adjusted trend studies have indicated that the significant downtrend in ozone concentration and shorter smog season in the Basin are mainly attributed to emission reduction and reduced reactivity of emitted organic compounds in the region.

As described in the SCAQMD *November/December 2006 Air Quality Standards Report*, the maximum 8-hour and 1-hour average ozone concentrations in the Basin (0.142 ppm and 0.175 ppm, recorded in the Central San Bernardino Mountains and East San Gabriel Valley areas) were 167 percent and 140 percent of the 8-hour and former 1-hour Federal standards, respectively. Maximum 24-hour average and annual average PM₁₀ concentrations in the Basin (142 µg/m³ and 64.0 µg/m³, recorded in the Central San Bernardino Valley and Metropolitan Riverside County areas) were 94 percent of the Federal 24-hour standard and 125 percent of the former annual PM₁₀ standards.

Maximum 24-hour average PM_{2.5} concentration (72.2 µg/m³ recorded in the South San Gabriel Valley area) was 203 percent of the new Federal 24-hour standard (35 µg/m³) and 110 percent of the former standard (65 µg/m³). Maximum annual average PM_{2.5} concentration (20.6 µg/m³ recorded in the Metropolitan Riverside County area) was 136 percent of the Federal annual PM_{2.5} standard.

Nitrogen dioxide maximum annual average concentration (0.031 ppm recorded in the Northwest San Bernardino Valley area) was 58 percent of the Federal standard. (The annual average concentration was 103% of the proposed new annual State standard for NO₂.) Carbon monoxide concentrations have not exceeded the standards in the Basin since 2002. The highest 8-hour average carbon monoxide concentration in 2006 (6.4 ppm, recorded in the South Central Los Angeles County area) was 70 percent of the Federal standard. Sulfur dioxide, sulfate and lead concentrations remained well below the State and Federal standards in 2006.¹

The American Lung Association website (lung.org) includes data collected from State air quality monitors that are used to compile an annual *State of the Air* report. These reports have been published over the last 13 years. The latest *State of the Air Report* compiled for the Basin was in 2010.² As noted in this report, air quality in the Basin has significantly improved in terms of both pollution levels and high pollution days over the past three decades. The area's average number of high ozone days dropped from 189.5 day per year in the initial 2000 State of the Air report (1996–1998) to 141.8 in the 2006–2008 report. The region has seen dramatic reduction in particle pollution since the initial State of the Air report (2000). While the 2010 *State of the Air Report* shows a slight uptick in the number of days of unhealthy air for ozone and annual particle pollution since the 2009 report, it is important to note that pollution levels measured in this latter report were affected by fluctuations in weather conditions in 2010 and the addition of several new particulate monitoring stations in areas in San Bernardino known to be particularly problematic for particulate matter given local conditions.

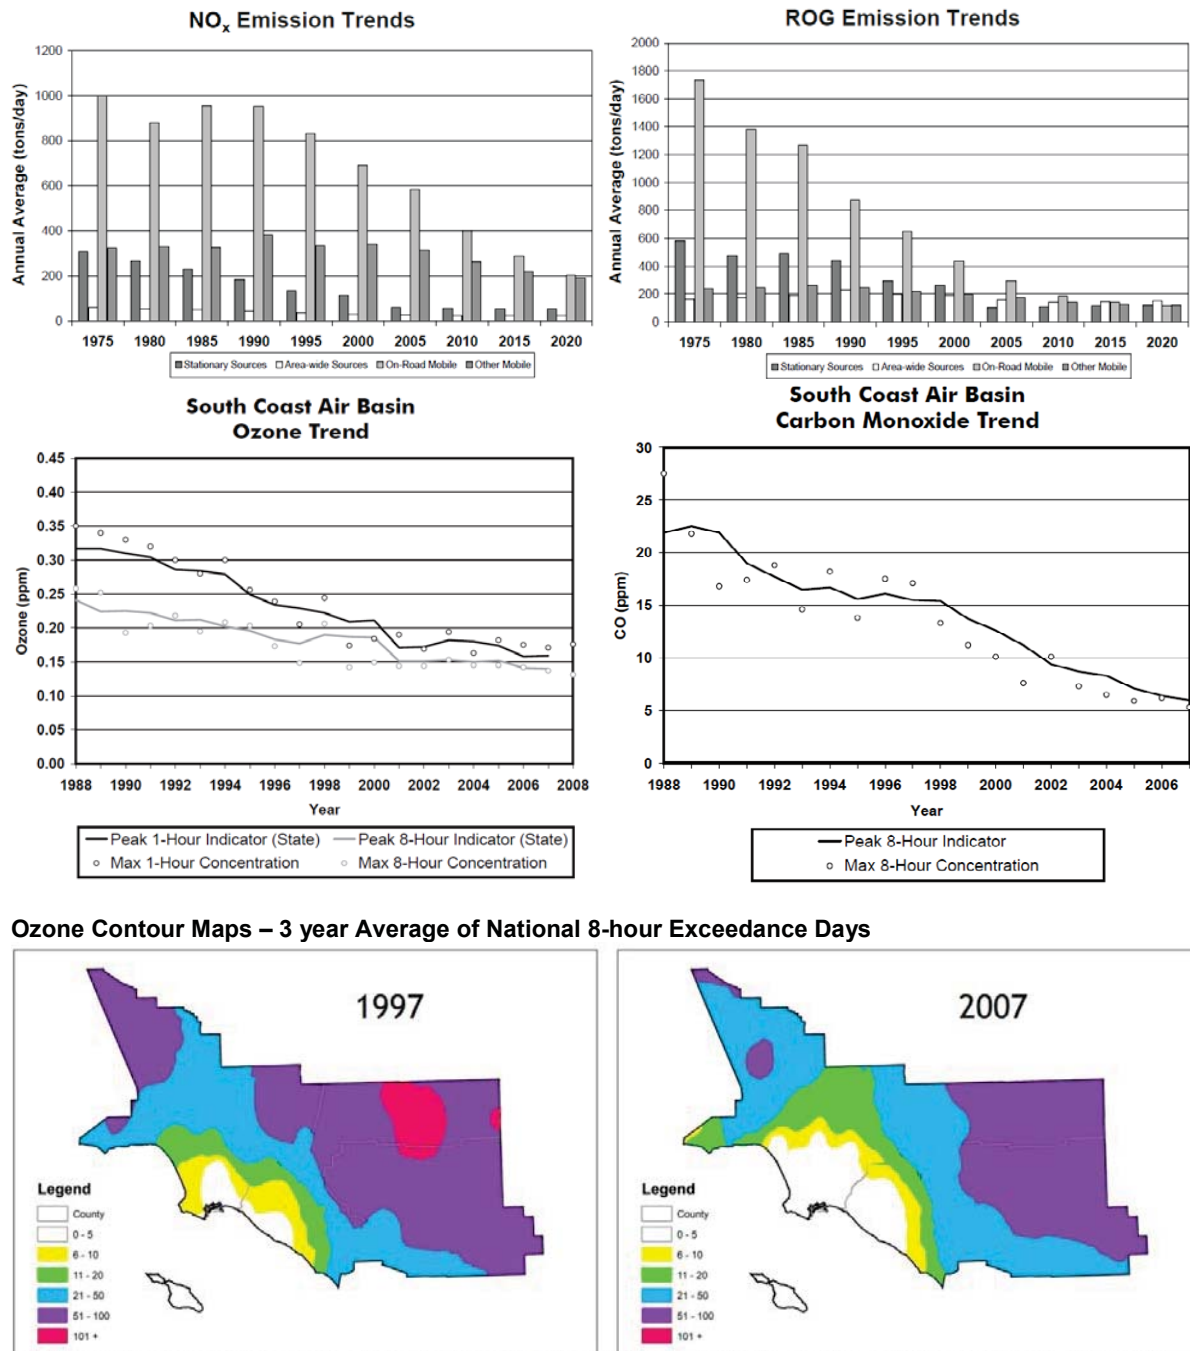

The 2012 Air Quality Management Plan states, “The remarkable historical improvement in air quality since the 1970s is the direct result of Southern California’s comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs” (South Coast Air Quality Management District 2012). As shown in Figure 4.3.11, ozone, NO_x, VOC, and CO have been decreasing in the Basin since 1975 and are projected to continue to decrease through 2020 (CARB 2009). These decreases result primarily from motor vehicle controls and reductions in evaporative emissions. Although vehicle miles traveled in the Basin continue to increase, NO_x and VOC levels are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with lower-emitting vehicles. NO_x emissions from electric utilities have also decreased due to use of cleaner fuels and renewable energy.

Figure 4.3.11 also displays ozone contour maps, which show that the number of days exceeding the national 8-hour standard has decreased between 1997 and 2007. In the 2007 period, there was an overall decrease in exceedance days compared with the 1997 period.

Figure 4.3.11: NO_x, VOC, CO, and Ozone Trends in the South Coast Air Basin

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

As shown in the top portion of Figure 4.3.12, the overall trends of PM₁₀ and PM_{2.5} in the air (not emissions) show an overall improvement since 1975. As shown in the bottom portion of Figure 4.3.12, direct emissions of PM₁₀ have remained somewhat constant in the Basin and direct emissions of PM_{2.5} have decreased slightly since 1975. Area-wide sources (fugitive dust from roads, dust from construction and demolition, and other sources) contribute the greatest amount of direct particulate matter emissions.

Source: CARB, California Almanac of Emissions and Air Quality, 2009 Edition.
Figure 4.3.12: Particulate Matter Trends in the South Coast Air Basin

The reduction in air pollution levels experienced in the Basin is attributable to multiple factors. First, Federal and State regulatory strategies requiring the use of cleaner fuels and use of emissions control technology in the transportation and energy production industries have proven to greatly reduce the amount of tailpipe emission (vehicles) and point source (power plants) pollutants (e.g., NO_x and ROG). Second, the SCAQMD’s rules and regulatory programs have proven to be instrumental in improving the air quality in the Basin. As an example, the SCAQMD has adopted multiple rules regarding fugitive dust (PM₁₀ and PM_{2.5}) and construction emissions that have resulted in reduced emission levels. Third, the SCAQMD’s creation of the 1993 CEQA review handbook has resulted in lead agencies throughout the air basin employing uniform CEQA analyses and methodologies. The use of uniform CEQA review has allowed the SCAQMD and lead agencies that rely on the 1993 SCAQMD Air Quality Handbook to perform CEQA analysis to better track progress and to employ uniform mitigation and design feature strategies. Fourth, the use of the SCAQMD thresholds of significance to determine a project’s direct and cumulative impact has allowed the

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

SCAQMD to make tremendous progress toward achieving air quality attainment. The discussion above (pertaining to the air quality improvements achieved over the past 20 years) demonstrates that the SCAQMD's rules and procedures, including the uniform utilization of the thresholds of significance recommended in the SCAQMD *CEQA Air Quality Handbook* are contributing toward the achievement of improved air quality in the Basin.

It is for this reason that this EIR and the City have chosen to rely on the thresholds of significance established by the SCAQMD in its 1993 CEQA Handbook and subsequent additions to the Handbook. These thresholds of significance (which serve as both direct and cumulative thresholds) have been uniformly utilized by lead agencies throughout the Basin for the past 20 years and the improvement of air quality within the Basin throughout this time period has demonstrated the efficacy of these thresholds, along with the other regional and statewide regional programs discussed above, in improving air quality throughout the Basin.

4.3.1.5 Local Air Quality

The SCAQMD, together with the CARB, maintains ambient air quality monitoring stations in the Basin. The air quality monitoring station ~~closest most representative of~~ to the project site is are the Riverside-Magnolia and Riverside-Rubidoux stations. ~~This~~ These stations monitors CO, SO₂, NO₂, O₃, PM₁₀, and PM_{2.5}. ~~The air quality monitoring station closest to the site monitoring the rest of the criteria pollutants is the Metropolitan Riverside station.~~ Some monitoring data for SO₂ has been omitted as attainment is regularly met for this pollutant within the Basin. These stations characterize the air quality representative of the ambient air quality in the project area.⁴ The ambient air quality data in Table 4.3.E identify that CO and NO₂ levels are consistently below the relevant State and Federal standards in the project vicinity. O₃, PM₁₀, and PM_{2.5} levels all exceed State and/or Federal standards regularly. Figure 4.3.13 identifies the locations of the monitoring stations relative to the proposed project site.

4.3.1.6 Sensitive Land Uses in the Project Vicinity

Sensitive receptors include residences, schools, medical offices, convalescent facilities, and similar uses ~~that are sensitive to air pollutants~~ where people sensitive to air pollutants may be located (i.e., the ill, elderly, pregnant women, and children). There are currently seven occupied single-family homes and associated ranch/farm buildings in various locations on the proposed project site. These residences are existing on-site sensitive receptors. The nearest off-site existing sensitive receptors in the vicinity of the proposed project site are the residences located along Bay Avenue, Merwin Street, ~~and west of Redlands Boulevard,~~ and scattered residences along Gilman Springs Road north of Alessandro Boulevard. Nearby sensitive land uses are depicted in Figure 4.3.14.

4.3.1.7 Existing Project Area Emissions

The project area is largely vacant undeveloped marginal agricultural land, with seven occupied single-family homes and associated ranch/farm buildings in various locations on the property. Much of the site is currently used for dry farming. San Diego Gas & Electric (SDG&E) operates a natural gas compressor plant, known as the Moreno Compressor Station, on 19 acres in the south-central portion of the site. The Southern California Gas Company (SCGC) also operates a metering and pipe cleaning station on two separate parcels (totaling 1.5 acres) in the south-central portion of the site south of Alessandro Boulevard along existing Virginia Street. Existing air quality conditions at the proposed project site reflect ambient² monitored conditions as presented in Table 4.3.E.

⁴ Air quality data, 2009-2011; EPA, CARB, and SCAQMD websites.

² Ambient: of or related to the immediate surroundings of something; in this context it means "in the air"

4.3.2 Policies and Regulations

4.3.2.1 Federal Regulations

Clean Air Act. Pursuant to the Federal Clean Air Act (CAA) of 1970, the EPA established national ambient air quality standards (NAAQS). The NAAQS were established for six major pollutants, termed “criteria” pollutants. Criteria pollutants are defined as those pollutants for which the Federal and State governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health.

The EPA established national air quality standards for ground-level O₃ and PM_{2.5} in 1997. On May 14, 1999, the Court of Appeals for the District of Columbia Circuit issued a decision ruling that the CAA, as applied in setting the new public health standards for O₃ and particulate matter, was unconstitutional as an improper delegation of legislative authority to the EPA. On February 27, 2001, the U.S. Supreme Court upheld the way that the government sets air quality standards under the CAA. The Court unanimously rejected industry arguments that the EPA must consider financial cost as well as health benefits in writing standards. The Justices also rejected arguments that the EPA took too much lawmaking power from Congress when it set tougher standards for O₃ and soot in 1997. Nevertheless, the Court threw out the EPA’s policy for implementing new O₃ rules, stating that the EPA ignored a section of the law that restricts its authority to enforce such rules.

In April 2003, the EPA was cleared by the White House Office of Management and Budget (OMB) to implement the eight-hour ground-level O₃ standard. The EPA issued the proposed rule implementing the eight-hour O₃ standard in April 2003. The EPA completed final eight-hour nonattainment status on April 15, 2004. The EPA issued the final PM_{2.5} implementation rule in fall 2004. The EPA issued final designations on December 14, 2004.

Effective January 22, 2010, the EPA strengthened the standard for NO₂ by setting a new 1-hour standard at the level of 100 parts per billion (ppb). This standard defines the maximum allowable concentration anywhere in an area and will protect against adverse health effects associated with short-term exposure to NO₂. To attain this standard, the 3-year average of the 98th percentile of the daily maximum 1-hour average at each monitor within an area must not exceed 100 ppb. On January 25, 2010, the EPA issued the final rule setting the one-hour maximum standard for NO₂ at 100 parts per billion (ppb). The agency retained the annual standard of 53 ppb.

Additionally, effective June 2, 2010, the EPA revised the primary standard for SO₂ by establishing a new 1-hour standard at a level of 75 ppb. The EPA revoked the two existing primary standards of 140 ppb evaluated over 24 hours and 30 ppb evaluated over an entire year as they would not provide additional public health protection given a 1-hour standard at 75 ppb. To attain this standard, the 3-year average of the 99th percentile of the daily maximum 1-hour average at each monitor within an area must not exceed 75 ppb.

4.3.2.2 State Regulations

Mulford-Carrell Act. The State began to set California Ambient Air Quality Standards (CAAQS) in 1969 under the mandate of the Mulford-Carrell Act. The CAAQS are generally more stringent than the NAAQS. In addition to the six criteria pollutants covered by the NAAQS, there are CAAQS for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles.

Originally, there were no attainment deadlines for CAAQS; however, the CCAA of 1988 provided a time frame and a planning structure to promote their attainment. The CCAA required nonattainment areas in the State to prepare attainment plans and proposed to classify each such area on the basis of the submitted plan, as follows: moderate, if CAAQS attainment could not occur before December

31, 1994; serious, if CAAQS attainment could not occur before December 31, 1997; and severe, if CAAQS attainment could not be conclusively demonstrated at all. The attainment plans are required to achieve a minimum 5 percent annual reduction in the emissions of nonattainment pollutants unless all feasible measures have been implemented. The EPA has designated the Southern California Association of Governments (SCAG) as the Metropolitan Planning Organization (MPO) responsible for ensuring compliance with the requirements of the CAA for the Basin.

California Clean Air Act (CCAA). The CCAA was passed into law in 1988. The CCAA provides the basis for air quality planning and regulation independent of federal regulations. A major element of the CCAA is the requirement that local air districts in violation of the CAAQS must prepare attainment plans that identify air quality problems, causes, trends and actions to be taken to attain and maintain California's air quality standards by the earliest practicable date. The CCAA provides air districts with the authority to manage transportation activities at indirect sources that individually are minor but collectively emit a substantial amount of pollution such as motor vehicles at intersections, malls, and on highways. The SCAQMD also regulates stationary sources of pollution throughout its jurisdictional area. Direct emissions from motor vehicles are regulated by the CARB.

CARB Airborne Toxic Control Measure/Asbestos. Asbestos is listed as a toxic air contaminant by CARB and as a Hazardous Air Pollutant by the EPA. Asbestos occurs naturally in surface deposits of several types of rock formations. Asbestos most commonly occurs in ultramafic rock that has undergone partial or complete alteration to serpentine rock (serpentinite) and often contains chrysotile asbestos. In addition, another form of asbestos, tremolite, can be found associated with ultramafic rock, particularly near faults. Crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma. In July 2001, the CARB approved an Air Toxic Control Measure for construction, grading, quarrying and surface mining operations to minimize emissions of naturally occurring asbestos. The regulation requires application of best management practices (BMPs) to control fugitive dust in areas known to have naturally occurring asbestos and requires notification to the local air district prior to commencement of ground-disturbing activities. The measure establishes specific testing, notification and engineering controls prior to grading, quarrying or surface mining in construction zones where naturally occurring asbestos is located on projects of any size. There are additional notification and engineering controls at work sites larger than one acre in size. These projects require the submittal of a "Dust Mitigation Plan" and approval by the air district prior to the start of a project. There is no asbestos in the project area (U.S. Geological Survey 2011).

4.3.2.3 Regional Regulations

Lewis Air Quality Management Act. The 1976 Lewis Air Quality Management Act established the SCAQMD and other air districts throughout the State. The Federal CAA Amendments of 1977 required that each state adopt an implementation plan outlining pollution control measures to attain the Federal standards in nonattainment areas of the State.

The CARB is responsible for incorporating air quality management plans for local air basins into an SIP for EPA approval. Significant authority for air quality control within them has been given to local air districts that regulate stationary source emissions and develop local nonattainment plans.

Carl Moyer Memorial Air Quality Standards Attainment Program. Since 1998, the Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program) has provided funding to encourage the voluntary purchase of cleaner engines, equipment, and emission reduction

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

technologies. The Carl Moyer Program plays a complementary role to California's regulatory program by funding emission reductions that are surplus, i.e., early and/or in excess of what is required by regulation. The Carl Moyer Program accelerates the turnover of old highly-polluting engines, speeds the commercialization of advanced emission controls, and reduces air pollution impacts on environmental justice communities. Emission reductions achieved through the Carl Moyer Program are an important component of the California State Implementation Plan.

Regional Air Quality Management Plan (AQMP). The SCAQMD and the SCAG are responsible for formulating and implementing the AQMP, which has a 20-year horizon for the Basin. An AQMP is a plan prepared and implemented by an air pollution district for a county or region designated as nonattainment of the Federal and/or California ambient air quality standards. The SCAQMD and SCAG must update the AQMP every three years. The current regional air quality plan is the Final 2012 Air Quality Management Plan (AQMP) adopted by the SCAQMD on December 7, 2012.

2003 AQMP. One of the purposes of the 2003 AQMP is to lead the Basin and portions of the Salton Sea Air Basin under SCAQMD jurisdiction into compliance with the 1-hour ozone and PM₁₀ Federal standards (SCAQMD 2003).

The 2003 AQMP also replaced the 1997 attainment demonstration for the Federal CO standard, provided a basis for a maintenance plan for CO for the future, and updated the maintenance plan for the Federal nitrogen dioxide standard that the Basin has met since 1992 (2003 AQMP, page 1-1).

The 2003 AQMP also incorporated new scientific data in the form of updated emissions inventories, ambient measurements, new meteorological episodes, and new air quality modeling tools. The 2003 AQMP utilized complex modeling to show that with the control measures, the Basin would be in compliance with the Federal and State standards for all pollutants by 2010, except for the State ozone and PM₁₀ standards and the State ozone and PM₁₀ standards after 2010 or by the earliest practicable date, as mandated by the California Health and Safety Code Section 40462. The CARB approved the 2003 AQMP on August 1, 2003. The EPA's adequacy finding on the emissions budgets for conformity determination in the Basin was published in the Federal Register (69 FR 15325-15326).

2007 AQMP. One of the purposes of the 2007 AQMP is to lead the Basin into compliance with the Federal 8-hour ozone and PM_{2.5} standards. The 2007 AQMP was adopted by the SCAQMD on June 1, 2007 (SCAQMD 2007b). On July 13, 2007, the SCAQMD Board adopted the 2007 Final AQMP Transportation Conformity Budgets and directed the Executive Officer to forward them to the CARB for approval and subsequent submittal to the EPA. On September 27, 2007, the CARB adopted the State Strategy for the 2007 State Implementation Plan and the 2007 AQMP as part of the State Implementation Plan. On January 15, 2009, the EPA's regional administrator signed a final rule to approve in part and disapprove in part the SCAQMD 2003 1-hour ozone plan and the nitrogen dioxide maintenance plan. The parts of the plan that were approved strengthen the State Implementation Plan. The Clean Air Act does not require the disapproved portions of the plan, and the disapprovals do not start sanctions clocks.

The 2007 AQMP outlines a detailed strategy for meeting the Federal health-based standards for PM_{2.5} by 2015 and 8-hour ozone by 2024 while accounting for and accommodating future expected growth. The 2007 AQMP incorporates significant new emissions inventories, ambient measurements, scientific data, control strategies, and air quality modeling. Most of the reductions will be from mobile sources, which are currently responsible for about 75 percent of all smog and particulate-forming emissions. The 2007 AQMP includes 37 control measures proposed for adoption by the SCAQMD, including measures to reduce emissions from new commercial and residential developments, more reductions from industrial facilities, and reductions from wood-burning fireplaces and restaurant char broilers.

2012 AQMP. The 2012 AQMP was adopted December 7, 2012 (SCAQMD 2012b). The purpose of the 2012 AQMP for the Basin is to set forth a program that will lead the Basin into compliance with the Federal 24-hour PM_{2.5} air quality standard, and to provide an update of the Basin's projections in meeting the Federal 8-hour ozone standards. The AQMP was adopted by the SCAQMD Board; therefore, it was submitted to the EPA as the State Implementation Plan (SIP) once it is approved by the SCAQMD Governing Board and the CARB. Specifically, the AQMP will serve as the official SIP submittal for the Federal 2006 24-hour PM_{2.5} standard ~~for which the EPA has established a due date of December 14, 2012.~~ In addition, the AQMP will update specific elements of the previously approved 8-hour ozone SIP: 1) an updated emissions inventory, and 2) new control measures and commitments for emissions reductions to help fulfill the Section 182(e)(5) portion of the 8-hour ozone SIP.

The 2012 AQMP states, "The remarkable historical improvement in air quality since the 1970's is the direct result of Southern California's comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs."

The 2012 AQMP proposes Basin-wide PM_{2.5} measures that will be implemented by the 2014 attainment date, episodic control measures to achieve air quality improvements (would only apply during high PM_{2.5} days), Section 182(e)(5) implementation measures (to maintain progress toward meeting the 2023 8-hour ozone national standard), and transportation control measures. Most of the control measures focus on incentives, outreach, and education.

Proposed PM_{2.5} reduction measures in the 2012 AQMP include the following:

- Further NO_x reductions from the SCAQMD's Regional Clean Air Incentives Market (RECLAIM) program. The RECLAIM program was adopted by the SCAQMD in October 1993 and set an emissions cap and declining balance for many of the largest facilities emitting NO_x and SO_x in the South Coast Air Basin. RECLAIM includes over 350 participants in its NO_x market and about 40 participants in its SO_x market. RECLAIM has the longest history and practical experience of any locally designed and implemented air emissions cap and trade program. RECLAIM allows participating facilities to trade air pollution while meeting clean air goals.
- Further reductions from residential wood-burning devices.
- Further reductions from open burning.
- Emission reductions from under-fired char broilers.
- Further ammonia reductions from livestock waste.
- Backstop measures for indirect sources of emissions from ports and port-related sources.
- Further criteria pollutant reductions from education, outreach, and incentives.

There are multiple VOC and NO_x reductions in the 2012 AQMP to attempt to reduce ozone formation, including further VOC reductions from architectural coatings, miscellaneous coatings, adhesives, solvents, lubricants, and mold release products.

The 2012 AQMP also contains proposed mobile source implementation measures for the deployment of zero and near-zero emission on-road heavy-duty vehicles, locomotives, and cargo handling equipment. There are measures for the deployment of cleaner commercial harbor craft, cleaner ocean-going marine vessels, cleaner off-road equipment, and cleaner aircraft engines.

The 2012 AQMP proposes the following mobile source implementation measures:

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- On-road mobile sources:
 - Accelerated penetration of partial zero-emission and zero-emission vehicles. This measure proposes to continue incentives for the purchase of zero-emission vehicles and hybrid vehicles with a portion of their operation in an all-electric range mode. The state Clean Vehicle Rebate Pilot program is proposed to continue from 2015 to 2023 with a proposed funding for up to \$5,000 per vehicle. The measure seeks to provide funding assistance for up to 1,000 zero-emission or partial-zero emission vehicles per year.
 - Accelerated penetration of partial zero-emission and zero-emission light-heavy and medium-heavy duty vehicles through funding assistance for purchasing the vehicles. The objective of the proposed action is to accelerate the introduction of advanced hybrid and zero-emission technologies for Class 4 through 6 heavy-duty vehicles. The state is currently implementing a Hybrid Vehicle Incentives Project program to promote zero-emission and hybrid heavy-duty vehicles. The proposed measure seeks to continue the program from 2015 to 2023 to deploy up to 1,000 zero- and partial-zero emission vehicles per year with up to \$25,000 funding assistance per vehicle. Zero-emission vehicles and hybrid vehicles with a portion of their operation in an all-electric range mode would be given the highest priority.
 - Accelerated retirement of older light-, medium-, and heavy-duty vehicles through funding incentives.
 - Further emission reductions from heavy-duty vehicles serving near-dock rail yards This proposed control measure calls for a requirement that any cargo container moved between the ports of Los Angeles and Long Beach to the nearby rail yards be with zero-emission technologies. The measure would be fully implemented by 2020 through the deployment of zero-emission trucks or any alternative zero-emission container movement system such as a fixed guideway system. The measure calls for the CARB to either adopt a new regulation or amend an existing regulation to require such deployment by 2020.
- Off-road mobile sources:
 - Extension of the Surplus Off-Road Opt-In for NOx (SOON) provision for construction/industrial equipment, which provides funding to repower or replace older Tier 0 and Tier 1 equipment.
 - Further emission reductions from freight and passenger locomotives calls for an accelerated use of Tier 4 locomotives in the Basin.
 - Further emission reductions from ocean-going marine vessels while at berth.
 - Emission reductions from ocean-going marine vessels.

The 2012 AQMP also relies upon the SCAG regional transportation strategy, which is in its adopted 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program, which contains the following sections:

1. Linking regional transportation planning to air quality planning and making sure that the regional transportation plan supports the goals and objectives of the AQMP/SIP.
2. Regional transportation strategy and transportation control measures: The RTP/SCS contains improvements to the regional multimodal transportation system including the following: active transportation (non-motorized transportation, e.g., biking and walking); transportation demand management; transportation system management; transit; passenger and high-speed rail; goods movement; aviation and airport ground access; highways; arterials; and operations and maintenance.
3. Reasonably available control measure analysis.

World Logistics Center Project**

Diesel Regulations. The Ports of Long Beach and Los Angeles and the CARB have adopted regulations aimed at reducing the amount of diesel particulate. These programs are the Ports of Los Angeles and Long Beach “Clean Truck Program,”¹ the CARB Drayage Truck Regulation,² and the CARB statewide On-road Truck and Bus Regulation.³ Each of these regulatory programs will require an accelerated introduction of “clean trucks” into the statewide truck fleet that will result in substantially lower diesel emissions during the 2008 to 2020 timeframe.

- *Airborne Toxic Control Measure for Diesel Particulate Matter from Portable Engines Rated at 50 horsepower and Greater.* Effective February 19, 2011, each fleet shall comply with weighted reduced particulate matter emission fleet averages by compliance dates listed in the regulation.
- *CARB Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling* adopts new Section 2485 within Chapter 10, Article 1, Division 3, Title 13 in the California Code of Regulations. The measure limits the idling of diesel vehicles (i.e., commercial trucks over 10,000 pounds) to reduce emissions of toxics and criteria pollutants. The driver of any vehicle subject to this section: (1) shall not idle the vehicle’s primary diesel engine for greater than five minutes at any location; and (2) shall not idle a diesel-fueled auxiliary power system for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools).
- *CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks,* requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to ‘neutral’ or ‘park,’ and the parking brake is engaged. If the parking brake is not engaged, then the engine shutdown system shall shut down the engine after 900 seconds of continuous idling operation once the vehicle is stopped and the transmission is set to neutral or park.” There are a few conditions where the engine shutdown system can be overridden to prevent engine damage. Any project trucks manufactured after 2008 would be consistent with this rule, which would ultimately reduce air emissions.
- *CARB Regulation for In-Use Off-Road Diesel Vehicles.* On July 26, 2007, the CARB adopted a regulation to reduce diesel particulate matter and NO_x emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. All self-propelled off-road diesel vehicles over 25 horsepower (hp) used in California and most two-engine vehicles (except on-road two-engine sweepers) are subject to this regulation. This includes vehicles that are rented or leased (rental or leased fleets). Such vehicles are used in construction, mining, and industrial operations. The regulation:
 - imposes limits on idling to no more than five consecutive minutes.
 - restricts adding of older equipment (such as Tier 0 and Tier 1) into fleets.
 - requires reporting and labeling, and
 - requires disclosure of the regulation upon vehicle sale.

The CARB is enforcing that with fines up to \$10,000 per day for each vehicle in violation. Performance requirements of the rule are based on a fleet’s average NO_x emissions, which can be met by replacing older vehicles with newer, cleaner vehicles or by applying exhaust retrofits. The regulation was amended in 2010 to delay the original timeline of the performance requirements making the first compliance deadline January 1, 2014 for large fleets (over 5,000

horsepower), 2017 for medium fleets (2,501-5,000 horsepower), and 2019 for small fleets (2,500 horsepower or less).

Toxic Air Contaminants. A toxic air contaminant (TAC) is defined as an air pollutant that may cause or contribute to an increase in mortality (death) or serious illness, or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations. Hazardous Air Pollutants (HAPs) and TACs are used interchangeably in this discussion. HAPs are regulated by the EPA under the Federal Clean Air Act. TAC is the term used under the California Clean Air Act to regulate the same hazardous pollutants. These contaminants tend to be localized and are found in relatively low concentrations in ambient air. However, they can result in adverse chronic health effects if exposure to low concentrations occurs for periods of several years. Many of these contaminants originate from human activities, such as fuel combustion and solvent use.

In general, for those TACs that may cause cancer, there is no concentration that does not present some risk. In other words, there is no threshold level below which adverse health impacts are not expected to occur. This contrasts with the criteria pollutants carbon dioxide, nitrogen dioxide, particulate matter, and ozone for which acceptable levels of exposure can be determined and for which the State and federal governments have set ambient air quality standards. For this reason, thresholds for TAC impacts for regulatory purposes and for CEQA thresholds have been set based on the increase in risk of cancer of a specific amount at sensitive receptors located near the source of TAC emissions.

The California Almanac of Emissions and Air Quality presents the relevant concentration and cancer risk data for the ten TACs that pose the most substantial health risk in California based on available data. These TACs are as follows: acetaldehyde, benzene, 1,3-butadiene, carbon tetrachloride, hexavalent chromium, paradichlorobenzene, formaldehyde, methylene chloride, perchloroethylene, and diesel particulate matter (diesel PM).

TAC measurements, available at the SCAQMD Riverside Rubidoux monitoring station (14 miles ~~northwest~~ eastwest of the project site) can be used to characterize the “background” health risks from regional TAC emission sources. Table 4.3.F provides this summary of TAC levels in the project area and health risk information. This table lists the air concentration levels and associated health cancer risks for eight of the nine TACs reported by the CARB in its Almanac as measured at the Riverside-Rubidoux air monitoring station. Note that since diesel PM cannot be measured directly, the table does not provide estimates of either measured diesel PM or the cancer risk associated with diesel PM.

Some Past studies have indicated that diesel PM poses the greatest health risk among the TACs listed in Table 4.3.F. The principal concern regarding exposures to diesel PM lies in its small size and thus its ability to penetrate deep into lung tissues when inhaled. Diesel exhaust has been found to cause health effects from short-term or acute exposures and from long-term chronic exposures, such as repeated occupational exposures. The type and severity of health effects depends upon several factors including the amount of chemical you are exposed to and the length of time you are exposed. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel PM but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.

Long-term (chronic) exposure to diesel exhaust is likely to occur when a person works in a field where diesel is used regularly or experiences repeated exposure to diesel fumes over a long period of time. Human health studies demonstrate a correlation between exposure to diesel exhaust and increased lung cancer rates in occupational settings. Experimental animal inhalation studies of chronic exposure to diesel exhaust have shown that a range of doses causes varying levels of inflammation and

cellular changes in the lungs. Human and laboratory studies have also provided considerable evidence that diesel exhaust is a likely carcinogen.

Several occupational and ambient studies have documented the health effects due to exposure to diesel PM. The California Office of Environmental Health Hazards Assessment (OEHHA), in its role in assessing risk from environmental factors reviews such studies and makes recommendations on the way environmental risk should be evaluated through programs like the AB2588 Hot Spot Program. In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, 1950's era railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. However, all of these studies were based on exposure to exhaust from traditional diesel engines and prior to the advent of highly efficient emissions controls like the diesel particulate filter. Based on these studies, CARB identified diesel exhaust a toxic air contaminant in 1998.

In 2008, the SCAQMD released the third iteration of the Multiple Air Toxics Exposure Study (MATES-III). The MATES-III report includes monitoring of various air toxic compounds in the Basin, establishes and updates existing baseline toxic air contaminants, and simulates cancer risk in the Basin. The study focuses on the carcinogenic risk from exposure to air toxics. It does not estimate mortality or other health effects from particulate exposures. The SCAQMD MATES-III report indicates that overall in the Basin, diesel PM contributes 83.6 percent of the risk.

In 2014, the SCAQMD released the fourth iteration of the Multiple Air Toxics Exposure Study (MATES-IV). The MATES-IV is a follow up to the previous MATES studies and included an updated toxics air emission inventory, new air toxics air dispersion modeling, and enhanced air toxics monitoring. A key conclusion reached in the MATES-IV study was that the population weighted cancer risk in the Basin decreased by 57 percent from the MATES-III period in 2005 to the MATES-IV period in 2012 indicating that overall, cancer risks are declining in the Basin as a result of the implementation of emission controls principally on large diesel trucks. The MATES-IV study also concluded that diesel PM contributed 68 percent to the total cancer risk in the Basin with benzene and 1.3 Butadiene also making important contributions to cancer risk. Figure 4.2.15 summarizes the basin-wide cancer risks as derived from the MATES-IV study.

Table 4.3.F: Toxic Air Contaminant Concentration Levels and Associated Health Effects (Riverside, California) (new table)

TAC	Concentration ^A / Health Risk ^B	2007		2008		2009		Health Effects
		Mean	Health Risk	Mean	Health Risk	Mean	Health Risk	
Acetaldehyde	Mean	1.08		0.99		1.22		Acetaldehyde is a carcinogen that also causes chronic non-cancer toxicity in the respiratory system. Symptoms of chronic intoxication of acetaldehyde in humans resemble those of alcoholism. The primary acute effect of inhalation exposure to acetaldehyde is irritation of the eyes, skin, and respiratory tract in humans. At higher exposure levels, erythema, coughing, pulmonary edema, and necrosis may also occur. Acute inhalation of acetaldehyde resulted in a depressed respiratory rate and elevated blood pressure in experimental animals. Benzene is highly carcinogenic and occurs throughout California. Benzene also has non-cancer health effects. Brief inhalation exposure to high concentrations can cause central nervous system depression. Acute effects include central nervous system symptoms of nausea, tremors, drowsiness, dizziness, headache, intoxication, and unconsciousness. Neurological symptoms of inhalation exposure to benzene include drowsiness, dizziness, headaches, and unconsciousness in humans. Ingestion of large amounts of benzene may result in vomiting, dizziness, and convulsions in humans. Exposure to liquid and vapor may irritate the skin, eyes, and upper respiratory tract in humans. Redness and blisters may result from dermal exposure to benzene.
	Health Risk	5		5		5		
Benzene	Mean	0.40		0.33		ID		Chronic inhalation of certain levels of benzene causes disorders in the blood in humans. Benzene specifically affects bone marrow (the tissues that produce blood cells). Aplastic anemia, excessive bleeding, and damage to the immune system (by changes in blood levels of antibodies and loss of white blood cells) may develop. Increased incidence of leukemia (cancer of the tissues that form white blood cells) has been observed in humans occupationally exposed to benzene. In California, hexavalent chromium has been identified as a carcinogen. There is epidemiological evidence that exposure to inhaled hexavalent chromium may result in lung cancer. The principal acute effects are renal toxicity, gastrointestinal hemorrhage, and intravascular hemolysis. The respiratory tract is the major target organ for chromium (VI) following inhalation exposure in humans. Other effects noted from acute inhalation exposure to very high concentrations of chromium (VI) include gastrointestinal and neurological effects, while dermal exposure causes skin burns in humans. Chronic inhalation exposure to chromium (VI) in humans results in effects on the respiratory tract, with perforations and ulcerations of the septum, bronchitis, decreased pulmonary function, pneumonia, asthma, and nasal itching and soreness reported. Chronic human exposure to high levels of chromium (VI) by inhalation or oral exposure may produce effects on the liver, kidneys, gastrointestinal and
	Health Risk	37		30		ID		
Chromium Hex	Mean	0.35		ID		ID		In California, hexavalent chromium has been identified as a carcinogen. There is epidemiological evidence that exposure to inhaled hexavalent chromium may result in lung cancer. Table 4.3.F: Toxic Air Contaminant Concentration Levels and Associated Health Effects (Riverside, California) (new table)

TAC	Concentration ^A / Health Risks ^B	2007	2008	2009	Health Effects
Para-Dichlorobenzene	Mean	ID	ID	ID	immune systems, and possibly the blood. In California, para-dichlorobenzene has been identified as a carcinogen. Acute exposure to 1,4-dichlorobenzene via inhalation results in irritation to the eyes, skin, and throat in humans. In addition, long-term inhalation exposure may affect the liver, skin, and central nervous system in humans (e.g., cerebellar ataxia, dysarthria, weakness in limbs, and hyporeflexia).
	Health Risk	ID	ID	ID	
Formaldehyde	Mean	2.88	2.88	3.12	The major toxic effects caused by acute formaldehyde exposure via inhalation are eye, nose, and throat irritation and effects on the nasal cavity. Other effects seen from exposure to high levels of formaldehyde in humans are coughing, wheezing, chest pains, and bronchitis. Chronic exposure to formaldehyde by inhalation in humans has been associated with respiratory symptoms and eye, nose, and throat irritation. Animal studies have reported effects on the nasal respiratory epithelium and lesions in the respiratory system from chronic inhalation exposure to formaldehyde. Occupational studies have noted statistically significant associations between exposure to formaldehyde and increased incidence of lung and nasopharyngeal cancer. This evidence is considered "limited" rather than "sufficient" due to possible exposure to other agents that may have contributed to the excess cancers. EPA considers formaldehyde to be a probable human carcinogen (cancer-causing agent) and has ranked it in EPA's Group B1. In California, formaldehyde has been identified as a carcinogen.
	Health Risk	21	21	23	
Methylene Chloride	Mean	0.19	0.2	ID	Case studies of methylene chloride poisoning during paint-stripping operations have demonstrated that inhalation exposure to extremely high levels can be fatal to humans. Acute inhalation exposure to high levels of methylene chloride in humans has resulted in effects on the central nervous system, including decreased visual, auditory, and psychomotor functions, but these effects are reversible once exposure ceases. Methylene chloride also irritates the nose and throat at high concentrations. The major effects from chronic inhalation exposure to methylene chloride in humans are effects on the central nervous system, such as headaches, dizziness, nausea, and memory loss. In addition, chronic exposure can lead to bone marrow, hepatic, and renal toxicity. EPA considers methylene chloride to be a probable human carcinogen and has ranked it in EPA's Group B2. California considers methylene chloride to be carcinogenic.
	Health Risk	0.7	0.7	ID	
Perchloroethylene	Mean	0.035	0.024	ID	In California, perchloroethylene has been identified as a carcinogen. Perchloroethylene vapors are irritating to the eyes and respiratory tract. Following chronic exposure, workers have shown signs of liver toxicity, as well as kidney dysfunction and neurological disorders.
	Health Risk	1	1	ID	
Diesel PM	Mean	No Monitoring Data Available			In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad

					<p>workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provided strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. This research was based on studies <u>prior to the advent of modern diesel engines with high efficiency emissions controls.</u></p> <p><u>Note: There have been some studies that suggest the risk from diesel PM is exaggerated, as discussed elsewhere in this EIR. Since then the Health Effects Institute study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.</u></p>

ID = Insufficient data

A = Concentrations for Hexavalent Chromium are expressed as $\mu\text{g}/\text{m}^3$, and concentrations for Diesel PM are expressed as $\mu\text{g}/\text{m}^3$. Concentrations for all other TACs are expressed as ppb.

B = Health Risk represents the number of excess cancer cases per million people based on a lifetime (70-year) exposure to the annual average concentration. Total Health Risk represents only those compounds listed in this table and only those with data for the year. There may be other significant compounds for which monitoring and/or health risk information are not available

Source: CARB 2011 for the SCAQMD Riverside-Rubidoux air monitoring station.

THIS PAGE INTENTIONALLY LEFT BLANK

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The risk basin-wide population weighted cancer risk is 4,194 367 per million based on average at fixed monitoring sites estimated during the MATES-IV study. This level of risk means that on average an estimated 367 individuals in the basin could contract cancer out of a population of one million individuals exposed to all sources of toxic air contaminants over a lifetime of 70 years. A comprehensive air dispersion model and a detailed air toxics emission inventory were then used to estimate cancer risks at other locations where no monitoring sites were deployed. A 10-year research program (CARB 1998) demonstrated that diesel PM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to diesel PM poses a chronic health risk.

In addition to increasing the risk of lung cancer, exposure to diesel exhaust can have other health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. Diesel exhaust ~~is a~~ has been major source of fine particulate pollution as well, and studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems.

Diesel PM differs from other TACs in that it is not a single substance but a complex mixture of hundreds of substances. Although diesel PM is emitted by diesel-fueled, internal combustion engines, the composition of the emissions varies, depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present. Unlike the other TACs, however, no ambient monitoring data are available for diesel PM because no routine measurement method currently exists. The CARB has made preliminary concentration estimates based on a diesel PM exposure method. This method uses the CARB emissions inventory's PM₁₀ database, ambient PM₁₀ monitoring data, and the results from several studies to estimate concentrations of diesel PM. Within the Basin, in addition to diesel PM, there are emissions of benzene, formaldehyde, acetaldehyde, naphthalene, ethylbenzene, acrolein, toluene, hexane, propylene, and xylene from a variety of sources located within the Basin that contribute to health risks.

The average cancer risk in the project area is estimated to be 213 in a million based on the MATES-IV and ranges from 198 in a million at the southeast corner of the project to 239 in a million in the northern portion of the project as shown in Figure 4.3.16.

As shown in Figure 4.3.17, nearly all areas of the Basin experienced decreases in cancer risk during the time period from MATES-III time period of 2005 to the MATES-IV time period of 2012. The project area also experienced a decrease in cancer risk of between 100 and 400 in one million from the years 2005 to 2012.

~~As shown in Figure 4.3.16, the project area experienced an increase of between 51 and 250 in one million from 1998-99 to 2005.~~

Figure 4.3.16 ~~17~~ depicts the cancer risk estimates as a "snapshot in time." That is, the cancer risks are derived from air dispersion models and are based on the emissions of various TACs during the years ~~1998 and 2005 and 2012~~. The basic tenet used to estimate cancer risk assumes that the public will be exposed to these TAC emissions during an entire 70-year lifetime of continuous exposure. However, the SCAQMD, CARB, and the EPA have adopted numerous regulations that have resulted in significant reductions in pollutant emissions with the attendant reductions in prevailing air quality levels since ~~1998 and 2005~~ 2012 as noted above earlier. The benefits of substantial additional emission reductions derived from the adoption and application of SCAQMD, CARB, and EPA regulations are not reflected in the estimate of 70-year lifetime cancer risks referred to in Figure 4.3.16 ~~17~~.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Additionally, in January 2015, a major new study¹ evaluated the health impacts of “new technology diesel exhaust” (NTDE). Beginning in 2001, USEPA and CARB begin issuing a series of regulations that require new diesel-powered vehicles and equipment to use the latest emissions control technology. This technology relies on two components. The first is a diesel particulate filter, which is capable of reducing particulate matter emissions by over 90% (required for new engines beginning in 2007). The second technology is selective catalytic reduction, which reduces emissions of nitrogen oxides by over 90% (required for new engines beginning in 2010). Diesel emissions from engines equipped with this technology is referred to as NTDE. As a result of the advances in emission control technology, USEPA, CARB, and other government and industry stakeholders commissioned a series of studies called the Advanced Collaborative Emissions Study (ACES). ACES has been guided by an ACES Steering Committee consisting of representatives of HEI and the Coordinating Research Council (CRC: a nonprofit organization that directs engineering and environmental studies on the interaction between automotive or other mobility equipment and petroleum products), along with the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others. The Health Effects Institute (HEI), funded in part by USEPA, was selected to oversee Phase 3 of ACES.

Phase 3 of ACES evaluated whether emissions from new technology diesel engines cause cancer or other health effects. Specifically, it evaluated the health impacts of a 2007-compliant engine equipped with a diesel particulate filter. HEI found chronic exposure to NTDE did not induce tumors or pre-cancerous changes in the lung and did not increase tumors that were considered to be related to NTDE in any other tissue in laboratory rats. The study also confirmed that the concentrations of particulate matter and toxic air pollutants emitted from NTDE are more than 90% lower than emissions from traditional older diesel engine. Rats are the most sensitive laboratory animal species for evaluation of older technology diesel engines (pre-model year 2007), because of their sensitivity to high concentrations of particles (present in older technology diesel engines), compared with other species (including humans).

The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.

Conservative Nature of Health Risk Assessments. Moreover, the current methodological protocols required by the SCAQMD and CARB when studying the health risk posed by diesel PM assume the following (from the California Air Pollution Control Officers Association 2009): (1) 24-hour constant exposure; (2) 350 days a year; (3) for a continuous period lasting 70 years. These are overly conservative assumptions that are not replicated in reality. Most people are indoors for 18–20 hours a day (at their place of employment or home) and most people do not live in the same location for a 70-year period. In fact, less than 10 percent of the population has a continuous residency at the same location of greater than 30 years (American Community Survey 2011). Thus, the health risk assessments prepared pursuant to the current protocols overestimate the risk of cancer associated with diesel PM exposure.

Alternate Views on Diesel PM Risk. Some researchers, such as Dr. James E. Enstrom (2008), believe that the risk from diesel PM is exaggerated. Enstrom calls into question some of the basic research on the declaration of diesel exhaust as a toxic air contaminant. In particular, the article states the following:

¹ Health Effects Institute, 2015: HEI Research Report 184, Advanced Collaborative Emissions Study (ACES): Lifetime Cancer and Non-Cancer Assessment in Rats Exposed to New-Technology Diesel Exhaust, published in January. Website: <http://pubs.healtheffects.org/getfile.php?u=1067>

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

There is substantial new epidemiologic evidence relevant to the health effects of diesel exhaust that was not considered when the 1998 toxic air contaminant declaration was made. For instance, the 2007 paper by Francine Laden et al. measured death rates during 1985–2000 among 54,000 members of the unionized U.S. trucking industry. ... This cohort, which included 36,000 diesel truck drivers, had death rates from all causes and all cancer that were substantially below the rates among US males. Furthermore, unlike earlier evidence that was used in the TAC declaration, this cohort did not have a substantially elevated lung cancer death rate.

Dr. Enstrom also indicates that the premature mortality calculation in the report, “Quantification of the Health Impacts and Economic Valuation of Air Pollution from Ports and Goods Movement in California,” is exaggerated. Dr. Enstrom’s analysis “found no relationship between PM_{2.5} and mortality in elderly Californians during 1983–2002.”

~~Moreover, the current methodological protocols required by the SCAQMD and CARB when studying the health risk posed by diesel PM assume the following: (1) 24-hour constant exposure; (2) 350 days a year (the OEHHA assumption that allows for a 2-week period away from home each year); (3) for a continuous period lasting 70 years. These are extremely conservative assumptions that are not replicated in reality. Most people are indoors for 18–20 hours a day (at their place of employment or home) and most people do not live in the same location for a 70-year period. In fact, the OEHHA observed that perhaps only 5 to 10 percent of the population has a continuous residency of greater than 30 years (OEHHA 2012). Thus, the health risk assessments prepared pursuant to these protocols overestimate the risk of cancer associated with diesel PM exposure.~~

4.3.2.4 Local Policies

City of Moreno Valley General Plan Policies. Chapter 9 of the City’s General Plan defines goals and policies related to air quality within the City of Moreno Valley. The specific policies of the General Plan that are relevant to the proposed project are as follows:

- Objective 6.7** Reduce mobile and stationary source air pollutant emissions.
- Policy 6.7.1** Cooperate with regional efforts to establish and implement regional air quality strategies and tactics.
- Policy 6.7.2** Encourage the financing and construction of park and ride facilities.
- Policy 6.7.4** Locate heavy industrial and extraction facilities away from residential areas and sensitive receptors.
- Policy 6.7.5** Require grading activities to comply with South Coast Air Quality Management District’s Rule 403 regarding the control of fugitive dust.
- Policy 6.7.6** Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code.

4.3.3 Methodology

The *Air Quality, Greenhouse Gas, and Health Risk Assessment Report* contained in Appendix D for the DEIR (Michael Brandman Associates, January 2013)¹ evaluated the air quality impacts associated with the development of the proposed project including the following:

¹ *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, Michael Brandman Associates, January 2013.

- Determine the short-term construction air quality impacts on both on-site and off-site sensitive receptors based on SCAQMD assessment methodologies and significance thresholds;
- Determine the long-term air quality impacts, including vehicular traffic, on both on-site and off-site sensitive uses based on SCAQMD assessment methodologies and significance thresholds; and
- Determine the required mitigation measures to reduce short-term and long-term on-site air quality impacts from all sources.

A revised Air Quality, Greenhouse Gas, and Health Risk Assessment Report (revised analysis) was prepared by Michael Brandman Associates – FirstCarbon Solutions (MBA-FCS) in 2015, which estimated the impacts from the reduced size of the project and also refined and updated the methodology used in the analysis, as discussed below.

Air quality in the project area would be affected by air pollutant emissions from stationary sources and mobile sources related to the proposed project. On February 3, 2011, the SCAQMD released the California Emissions Estimator Model (CalEEMod). The purpose of this new model is to calculate air quality and greenhouse gas (GHG) emissions more accurately from direct and indirect sources associated with the project and quantify applicable air quality and GHG reduction achieved from mitigation measures. The latest version of CalEEMod (version 2011.1.1) was utilized to predict these project-related air quality impacts.

4.3.3.1 Construction

Construction-related emissions are expected from various activities associated with the construction of the project such as rough grading, infrastructure construction, asphalt paving, building construction, architectural coatings, and construction workers commuting. Construction emissions for construction worker vehicles traveling to and from the project site, in addition to vendor trips (construction materials delivered to the project site) and haul trips (dump trucks and concrete trucks) were also accounted for in the analysis. Localized air quality in the project area would be affected by both heavy-duty construction equipment usage on site as well as local traffic due to the equipment delivery and construction worker commuting. The anticipated construction equipment and construction schedule are identified in Section 3.0, *Project Description*, in Table 3.C. The SCAQMD CEQA methodology¹ was used to analyze the criteria pollutant emissions from these activities.

Note: In response to comments received on the DEIR, the following revisions have been made to the construction emissions analysis:

- *New Version of CalEEMod.* The construction emissions in the DEIR were estimated with the approved model at the time, CalEEMod version 2011.1.1, which uses emission factors from the outdated OFFROAD2007 and EMFAC2007 emission models. Since publication of the DEIR, a new version of CalEEMod has been released, version 2013.2, uses construction emission factors from OFFROAD2011 and mobile source emissions from EMFAC2011. The new version of CalEEMod has lower construction equipment load factors, which are also used in this revised analysis.
- *Extended Construction Period.* In the DEIR, construction was assumed to occur over 10 years; in response to comments to reduce emissions, the revised analysis construction schedule is assumed to occur over 15 years.

¹ CEQA Air Quality Handbook, April 1993 and subsequent additions to the Handbook.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Refined Building Phasing. The DEIR had all building construction activities lumped together. For better understanding and clarification, building construction activity was subdivided in this revised analysis into the following sub-phases: building-concrete; building-wet utilities; building-electrical; and building-landscaping to more accurately describe construction activities.
- Mass Grading Duration. In the DEIR, grading covered 12 months (for the unmitigated version) and 24 months (for the mitigated version). For the revised analysis, each planning area is graded separately over a total of approximately 58 months to reflect a more realistic grading plan.
- On-Site On-road Vehicle Emissions. On-site travel and idling emissions from concrete trucks, haul trucks, service/support trucks, and delivery trucks were not included in the DEIR but are included for the revised analysis.
- Equipment for Grading. The construction equipment and haul truck deliveries for the mass excavation and fine grading phases now vary per planning area (since there are varying sizes of each planning area), whereas in the DEIR, one equipment fleet was assumed for the mass grading and finish grading phases. In addition, because the grading duration has been extended and due to variations in the grading fleet based on the size of the planning area, less equipment is required. The overall construction equipment horsepower-hours per day has decreased in the revised analysis.
- Onsite Equipment Fleet for Non-Grading Phases. The duration for construction has been extended; therefore, the peak number of equipment has decreased. In addition, the types and daily horsepower hours for the equipment has changed.
- Onsite Equipment Hours per Day. The revised analysis assumes that the onsite equipment are in the on position for 10 hours per day as a project design feature. The analysis in the DEIR assumed 15 hours per day for the unmitigated version and 10 hours per day for the mitigated version. Because construction has been spread out over more time, there is no need for the equipment to operate 15 hours per day; therefore, the equipment hours per day has been added as a project design feature that sets the maximum hours per day is 10 hours per day for the onsite equipment. This means that each piece of construction equipment is assumed to be on for 10 hours per day. This would also apply to the onsite equipment used during concrete pouring, which would most likely occur during the night. This is a conservative scenario as the CalEEMod default assumes construction equipment would be on for 6 to 8 hours per day. This is used to calculate maximum daily emissions which are required for the regional analysis, because project emissions can occur on any day of the week. However, in order to calculate annual average emissions, it is necessary to base emissions upon a realistic work schedule. The revised analysis assumes a more realistic annual average use of construction equipment by assuming that the maximum equipment would occur for five days per week (instead of six days per week as in the DEIR). In this way, an annual average and daily emission inventories were estimated.
- Tier 4 Equipment. The analysis in the DEIR assumed the CalEEMod default construction equipment tier levels for the unmitigated version and for the mitigated version, assumed Tier 3 engines for years prior to 2017 and Tier 3 with diesel particulate matter filters for years after 2017. The revised analysis assumes that for the mitigated emissions, all equipment over 50 horsepower Tier 4 as required by a revised mitigation measure.
- VOC Emissions from Striping Pavement. The DEIR did not include these emissions because these emissions have been recently integrated within CalEEMod.

4.3.3.2 Operation

Air quality in the project area would be affected by long-term air emissions from stationary sources and mobile sources related to the proposed project once it commences operations. The stationary source emissions would come from consumption of natural gas and emergency generators while

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

mobile source emissions would come from vehicular emissions from automobiles and trucks traveling to, from, and within the project site and from on-site forklifts and yard trucks.

A key piece of information required to estimate the project's operational emissions deals with an estimate of the number of trips and types of vehicles (i.e., cars and trucks) generated by the project during a peak hour and on a daily basis. To determine mobile source emissions associated with the project, the trip generation rates were derived from the *Traffic Impact Analysis Report for the project* prepared by Parsons Brinckerhoff (December 2013).

~~It is important to note that~~ Appendix E of the CalEEMod Manual states the following regarding trip rates for large warehouses and distribution centers, and demonstrates that the trip rate applied for this project is appropriate, since the project is a Specific Plan containing more than 10 warehouse buildings:

In the case that air quality is evaluated for multiple warehouses (>10), such as in an analysis for a general plan, the average rate of 1.44 trips per TSF [thousand square feet] from the ITE [Institute of Transportation Engineers] 8th Edition Trip Generation manual is acceptable. This lower value may be more appropriate as on average, a small portion of warehouses can be expected to operate at varying levels of service, including some warehouses experiencing temporary partial or complete vacancy. (SCAQMD 2013, CalEEMod manual,¹ pages 14-15)

Additionally, the SCAQMD is currently working with the Institute of Transportation Engineers to provide enhanced information and guidance regarding vehicle trips associated with warehouse operations. SCAQMD staff is recommending truck trip rates from the Institute of Transportation Engineers for high cube warehouse projects located in SCAQMD. Consistent with CEQA Guidelines, the SCAQMD states that an EIR may use a non-default trip rate if there is substantial evidence indicating another rate is more appropriate for the air quality analysis. The trip generation rate applied in this assessment for high cube warehouses (1.68 trips per thousand square feet) is greater than the average rate of 1.44 trips per thousand square feet recommended by the SCAQMD in CalEEMod thereby providing a more conservative estimate of vehicle trips (i.e., larger number of trips) and hence higher estimate of air quality impacts than the SCAQMD-recommended trip rate. ~~The CalEEMod model was used to predict these project-related long-term impacts. Localized air quality impacts in the project area would be affected by increased traffic flow due to the proposed project.~~

The EPA AERMOD air dispersion model, the Caltrans CALINE4 model, the CalEEMod, and the CARB EMFAC 2014~~2014~~ mobile source emission factor model were used to assess the project's impact on ~~the local air quality pollutant emissions and~~ concentrations.

~~For the criteria air pollutant analysis, emission factors for the year 2012 as embedded in CalEEMod (EMFAC2007) are used for the "worst case" scenario. CalEEMod file runs for 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, and 2022 were conducted for both local and long-haul trips.~~

~~The emission factors for the truck CalEEMod files were modified to reflect the project design feature that requires the use of model year 2010 or newer trucks for all medium-heavy and heavy-heavy duty diesel trucks associated with the project. These factors were derived from EMFAC2011 for running exhaust emissions and replaced the respective emission factor entries in CalEEMod, which are based on the outdated CARB EMFAC2007 mobile source emission model. The CARB EMFAC2007 emission factors reflect a vehicle population that spans almost 25 years.~~

¹ South Coast Air Quality Management District. 2013. CalEEMod, Appendix E, Technical Source Documentation. Website: <http://www.aqmd.gov/docs/default-source/caleemod/caleemod-appendixe.pdf?sfvrsn=2><http://www.aqmd.gov/caleemod/doc/AppendixE.pdf>. Accessed May 16, 2012.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Emission factors for the year 2012 are used for the “worst-case” scenario. Phase 1 of the project used emission factors from the year 2022, and Phase 2 of the project used emission factors for the year 2035. For the mitigated version, the emission factors were modified to reflect the mitigation measure that requires the use of model year 2010 or newer trucks for all diesel trucks associated with the project.

Note: In response to comments received on the DEIR, the following revisions have been made to the regional operational emissions analysis:

- Trip Lengths for Motor Vehicle Emissions. Forecasted traffic volumes contained in the revised Traffic Impact Analysis were used to estimate the project’s motor vehicle emissions instead of an arbitrary 50 miles per truck trip length and the CalEEMod default trip lengths for local trips used in the DEIR. The traffic model provided estimates of project traffic volumes for nearly 500 individual freeway and surface street roadway segments segregated by vehicle class as passenger cars, light heavy duty trucks, medium heavy duty trucks, and heavy-heavy duty trucks. This revised methodology provides a much more accurate estimate of the project’s operational mobile source vehicle miles traveled and resulting emissions.
- Updated Emission Factors for Motor Vehicles. In the DEIR, regional motor vehicle emissions were estimated by CalEEMod using the EMFAC2007 mobile source emission model and EMFAC2011 emission model for the localized and health risk analysis. On December 30, 2014, the CARB released an updated version of its emission factor model, EMFAC2014. The CARB indicates that the EMFAC2014 mobile source emission model will be used henceforth to estimate on-road mobile source emissions in California. The EMFAC2014 model is an updated version of the EMFAC2011 model that was used in the DEIR. The EMFAC2011 mobile source emission model was applied to all vehicle classes in the revised analysis.
- Decrease in Operational Square Footage. The number of vehicle trips was revised to reflect a reduction of the project size from 41.6 million square feet to 40.6 million square feet and the redistribution of land use building square footage between the high cube logistics warehouse and light logistics land uses. In addition, a fire station land use was also added.
- Additional On-site Emissions Sources. Additional sources of operational emissions were also accounted for in this revised analysis including standby diesel generators, fork lifts, and yard trucks.
- On-site Existing Emissions Estimated. The existing agricultural emissions were estimated in the revised analysis; they were not estimated in the DEIR.

4.3.3.3 Localized Construction/Operation

SCAQMD has developed the Localized Significance Threshold (LST) methodology that can be used to determine whether or not a project may generate significant adverse localized air quality impacts that substantially affect sensitive receptors. LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable Federal or State AAQS and are developed based on the ambient concentrations of that pollutant for each source receptor area identified by the SCAQMD. SCAQMD’s current guidelines, *Final Localized Significance Threshold Methodology* (June 2003) and subsequent additions, were adhered to in the assessment of local air quality impacts from the proposed project. The local emissions of concern from construction and operational activities as defined by the SCAQMD are NO_x, CO, PM₁₀, and PM_{2.5} combustion emissions from construction equipment and fugitive PM₁₀ dust from construction site preparation activities.

~~The localized significance threshold analysis evaluated two scenarios:~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- *Scenario 1: Existing + Project:* this scenario assumes that the project is fully built out in 2012, the year that the Notice of Preparation for the project was published.
- *Scenario 2: Proposed Development Schedule:* this scenario examines the proposed development of the two-phased project with development buildout years of 2017 for Phase 1 and 2022 for Phase 2 as compared to the existing 2012 year.

Scenario 1 represents a worst-case scenario since the project could not be physically built out in its entirety in a single year and does not reflect the fact that the project would be expected to be developed over a time period of at least 10 years depending on market demands for warehouse space. This assumption also does not account for the fact that emissions from mobile sources particularly from heavy-duty diesel trucks are expected to decline significantly over the next 10 to 15 years as a result of emission controls already mandated by the CARB specifically for these vehicles.

In Scenario 1, emissions from the project were estimated for the year 2012 as the existing condition (date of publication of the Notice of Preparation) assuming the full buildout of the project in 2012. Scenario 1 also provides consistency with the project traffic and noise impact analyses reports which examine the Existing (2012) plus project condition and corresponds to the year when the Notice of Preparation was published for the project. Emission factors for the project were derived from the EMFAC2011 mobile source emission model for the year 2012. Information from the project traffic report was used to derive estimates of vehicle trips from within the project and from the local roadways that are within and along the boundaries of the Specific Plan as if the project were fully built out in 2012. This is a worst-case scenario because it assumes that all the trucks and vehicles accessing the project would consist of the fleet of today instead of the fleet of the future. The fleet of today has more emissions because there are older vehicles and trucks on the road that would be replaced in the future.

Scenario 2 represents the proposed project development including the localized impacts during construction and operation over the time period of 2013 to 2022. These results are compared to the existing air quality levels in 2012.¹ Scenario 2 examined three time periods:

- The year 2013, which is the year with the highest construction emissions.
- The year 2017, which is the year with the highest total emissions from both construction and operation and the first year during which project construction and the Phase 1 buildout operations would overlap.
- The year 2022, which is the first year with the complete build-out of the project.

Note: In response to comments received on the DEIR, the following revisions have been made to the localized significance threshold analysis:

- *Revisions to the Traffic Volumes.* The operational assessment of localized impacts reflects the changes in traffic volumes associated with the reduction in the project size and realignment of roadway segments that are within and border the project's boundaries.
- *Changes in Construction Schedule.* The analysis in the DEIR assumed a construction schedule of 10 years, whereas the revised assessment is based on a 15-year construction schedule. The

¹ The existing air quality levels in 2012 are actually represented by the highest monitored levels at the SCAQMD Riverside air monitoring station during the past three years (2009, 2010, and 2011). No air quality data summaries have been published by the CARB or SCAQMD for the complete year for 2012.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

changes in construction schedule both by year and location within the project were accounted for under the revised, extended project development schedule for estimating the emissions subject to the LST assessment.

- Emission Source Configuration. The analysis in the DEIR of the off-road construction equipment exhaust was represented in the air dispersion model as a large area source that covered the construction area. The revised analysis represents the off-road construction exhaust emission source as a series of contiguous volume sources, which is consistent with the SCAQMD methodology for LST assessments.
- Operational Truck Idling. The analysis in the DEIR assumed that each heavy-duty truck that accessed the site during operation idled for a total of 15 minutes per day. In the revised analysis, each truck was assumed to idle for 5 minutes per day consistent with the California Air Resources Board's Air Toxic Control Measure that limits such idling to 5 minutes and requirements specified in the World Logistics Center Specific Plan. For the mitigated assessment, each truck was assumed to idle for 3 minutes per day.

The localized significance threshold analysis evaluated three conditions:

- Project Phase 1 (2012): this condition assumes that Phase 1 of the project is fully built out in 2012, the year that the Notice of Preparation for the project was published.
- Project Phase 1 and Phase 2 Full Build Out (2012): this condition assumes that Phase 1 and Phase 2 of the project are fully built out in 2012, the year that the Notice of Preparation for the project was published.
- Proposed Development Schedule: this condition examines the proposed development schedule of the two-phased project three analysis years were examined under this condition for potential localized air quality impacts:
 - 2021, the year when the projected construction schedule would result in construction activities in the western portion of the project adjacent to and across from the existing residential areas along Redlands Boulevard and when a substantial portion of Phase I operations would occur (approximately 56 percent of entire project floor space);
 - 2027, the year when the project emissions from both project construction and operation are at their highest combined levels for several pollutants; and when construction activities would occur adjacent to the existing residences along Gilman Springs Road and
 - 2035¹ when the Phase 1 and Phase 2 of the project are fully operational.

Project Phase 1 (2012) represents an interim step during which Phase 1 of the project (approximately 56 percent of the total size of the project) is completely built out in 2012. This analysis simply looks at the situation of what would happen if Phase 1 of the project were built in its entirety with no reductions in motor vehicle emissions that would occur in the future as a result of emission control programs that have already been adopted. This assessment also provides consistency with the project traffic impact analysis and noise reports which examine the Project Phase 1 (2012) condition. The project impact results are compared to the existing air quality levels in 2012 and only consider the project's operational emissions and not construction emissions.

¹ In some circumstances, references are made to the year 2035. The year 2031 is the proposed first year the project is fully built out. However, detailed traffic volumes were provided by the project traffic consultant for the long-term planning year 2035. For purposes of this assessment, project traffic volumes in 2031 were assumed to be the same as the forecast volumes in 2035.

Project Phase 1 and 2 Full Build Out 2012 represents a worst-case scenario since the project could not be physically built out in its entirety in a single year and does not reflect the fact that the project would be developed over a time period of 15 years depending on market demands for warehouse space. This assumption also does not account for the fact that emissions from mobile sources, prior to mitigation, particularly from heavy duty diesel trucks are expected to decline significantly over the next 10 to 15 years as a result of emission controls already mandated by the CARB specifically for these vehicles. This assessment also provides consistency with the project traffic impact analysis and noise reports which examine the full Project Phase 1 and Phase 2 (2012) Build Out (2012) condition. The project impact results are compared to the existing air quality levels in 2012 and only consider the project's operational emissions and not construction emissions.

The Proposed Project Development condition represents the proposed project development including the localized impacts during construction and operation over the time period of 2015 to 2035. These results are compared to the existing air quality levels in 2012.

4.3.3.4 Health Risk Assessment

A Health Risk Assessment (HRA) is a guide that helps to determine whether current or future exposures to a chemical or substance in the environment could affect the health of a population. In general, risk depends on the following factors:

- How much of a chemical is present in an environmental medium (e.g., air);
- How much contact (exposure) a person has with the contaminated environmental medium; and
- The inherent toxicity of the chemical.

The assessment of health impacts is a continuing evolution of science and regulation. Since December 2014, three major scientific and regulatory activities have come forward that will affect how such assessments are performed and what such impacts mean to society as described below.

- On December 30, 2014, the ARB released its update to the Emissions Factor Model, EMFAC2014, which is used to estimate emissions from motor vehicles in California. The EMFAC2014 model represents the ARB's current understanding of motor vehicle technologies and regulatory implementation of rules aimed at reducing air emissions from motor vehicles. Of significance in this regard are the new projections of air emissions from heavy duty diesel engines. Based on the results of the EMFAC2014 model, emissions of diesel particulate matter range from 50 to 80 percent lower than previously estimated using the previous version of the EMFAC model, EMFAC2011. Since heavy duty trucks constitute nearly all of the project's diesel PM emissions, the incorporation of the emission information from the EMFAC2014 model is important in estimating the amount of diesel PM and in assessing the project's health risk impacts resulting from these emissions
- On January 27, 2015, the Health Effects Institute (HEI), a joint private-government partnership, released a major peer-reviewed scientific report entitled *Effects of Lifetime Exposure to Inhaled New-Technology Diesel Exhaust in Rats*. This is the first study to conduct a comprehensive evaluation of lifetime inhalation exposure to emissions from heavy-duty 2007-compliant engines (referred to as "new technology diesel exhaust," or NTDE). The study evaluated the long-term effects of multiple concentrations of inhaled NTDE, which has greatly reduced particle emissions compared with "traditional-technology diesel exhaust" (TDE) in male and female rats on more than 100 different biologic endpoints, including tumor development, and compared the results with biologic effects seen in earlier studies in rats

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

after exposure to TDE. Lifetime inhalation exposure of rats exposed to one of three levels of NTDE from a 2007-compliant engine, for 16 hours per day, 5 days a week, with use of a strenuous operating cycle that more accurately reflected the real-world operation of a modern engine than cycles used in previous studies, did not induce tumors or pre-cancerous changes in the lung and did not increase tumors that were considered to be related to NTDE. The importance of this study is that diesel PM emissions from new technology diesel engines does not cause any increase in the risk of lung cancer or other significant adverse health effects in study animals that, in fact are more sensitive to toxics exposures than humans. While this study focused on heavy duty truck emissions, the new clean diesel technology has the potential for impacting all sectors, including passenger cars, agriculture, construction, maritime and transportation. Previous studies directed at studying the effects of diesel PM on health were based on exposure studies that date 15 to 20 years ago when diesel emissions were significantly higher than the NTDE. It is also important to highlight that the U.S. Environmental Protection Agency (EPA), the California Air Resources Board, the U.S. Department of Energy (DOE) and the U.S. Federal Highway Administration are sponsors and/or reviewers of this study in conjunction with the manufacturers of emissions control equipment.

- On March 6, 2015, the California Office of Environmental Health Hazards Assessment (OEHHA) adopted a new guidance for estimating health risks from toxic air contaminants that incorporated the importance of early-in-life sensitivities of young children to exposures to toxics air contaminants and recommends a lifetime exposure duration of 30-years. Within the context of this assessment, this new assessment guidance is referred to as the “Current OEHHA Guidance”. The new guidance updates earlier guidance recommended by OEHHA and SCAQMD referred to in this assessment as the “Former OEHHA Guidance”, which was used in the DEIR. The “Former OEHHA Guidance” is based on a lifetime exposure of 70 years and does not incorporate early-in-life age sensitivity factors. The importance of the “Current OEHHA Guidance” is that the guidance produces much more conservative estimates of cancer risks from toxic air contaminant exposures than the “Former OEHHA Guidance”.
- The HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study.

~~The Health Risk Assessment (HRA) builds upon the methodology described above in the localized air quality assessment by examining the regional nature of the project’s potential health risk impacts. The HRA methodology applies a risk characterization model to the results from the air dispersion model to estimate potential health risks at each sensitive receptor location. However, unlike the localized assessment, which looks at impacts within a specific year, the HRA examines the impacts over extended exposure time, which, in the case of cancer risk, is typically a 70-year lifetime exposure. Because of the pervasive nature of diesel particulate matter (diesel PM) in contributing to estimated health risks in California, the focus of this assessment is on estimating the health risks from diesel PM. While the project activities may result in the emission of other TACs (e.g., TACs from gasoline powered vehicles), diesel PM from the project was found to contribute approximately 98 percent of the total cancer risk from project operations (see *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, Appendix D of this EIR).~~

~~The methodology applied in calculating cancer risk from TACs has been published by the SCAQMD and the California Office of Environmental Health Hazard Assessment (OEHHA). In this regard, cancer risk is expressed as the probability of an individual developing cancer due to exposure to TAC emissions out of a population of 1 million individuals. Thus, a receptor calculated to have a cancer~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

risk of 1 in one million means that this receptor has a probability of 1 in 1 million of developing cancer from the continuous exposure to TACs.

The methodology assumes that a person is exposed continuously to a project's TAC emissions for a period of 350 days per year, 24 hours per day over a 70-year lifetime period. The SCAQMD has established a significance threshold of 10 in 1 million for cancer risk attributable to exposure to a project's emissions. Project-related cancer risks at sensitive receptors exceeding this significance threshold are considered by the SCAQMD to result in significant health risk impacts for purposes of CEQA compliance.

Risk characterization for non-cancer health risks from TACs is expressed as a hazard index (HI). The HI is a ratio of the predicted concentration of a project's emissions to a concentration considered acceptable to public health professionals, termed the Reference Exposure Level (REL). A significant risk is defined by the SCAQMD as an HI of 1 or greater. The California OEHHA has assigned a chronic non-cancer REL of 5 µg/m³ for diesel PM (OEHHA 2011). Diesel PM has effects on the respiratory system, which accounts for essentially all of its potential chronic non-cancer hazards. Therefore, the only HI calculated was for the respiratory system.

Two health risk analysis scenarios were examined to assess potential cancer risks to nearby sensitive receptors as follows:

- Scenario 1: the "No Project" scenario in which cancer risks are estimated given vehicle traffic and diesel PM emissions spanning the 70-year cancer risk exposure time period from the existing condition 2012 to 2081 under the assumption that existing land uses plus other past, present, and reasonably foreseeable projects (both land development and roadway improvements) are implemented in 2017, 2022, and 2035. Within the City of Moreno Valley full buildout of the General Plan was assumed in 2035, except for the project site, which was assumed to be unchanged from existing conditions.
- Scenario 2: the "With Project" scenario shows the effect of project-related construction and operational traffic diesel PM emissions if the project were built out in accordance with its proposed phased buildout schedule and then added to the No Project scenario during the 70-year cancer exposure time period from 2012 to 2081. This scenario forms the basis of comparison with the "No Project" scenario to quantify the incremental impacts from the project.

The DPM emissions and annual average DPM impacts for the Scenario 1, "No Project" scenario, were based on traffic information provided in the *Traffic Impact Analysis Report* for the existing condition (2012), buildout of Phase 1 (2017), final buildout of Phases 1 and 2 (2022), and the long-term planning year (2035). The existing condition scenario was based on the land uses as they exist today (2012).

For the year 2017 scenarios other past, present, and reasonably foreseeable projects in the study area were added to existing land uses. The 2017 scenarios also included the assumption of 2 percent annual growth in background traffic. Because including the other past, present, and reasonably foreseeable projects and a growth factor for background traffic represents a double-counting of growth, this ensures a conservative approach to estimating near-term future traffic. The scenarios analyzing longer-term conditions required the use of longer-term forecasts for land use in the Inland Empire based on the SCAG 2012 Regional Transportation Plan (RTP). A listing of other existing past, present, and reasonably foreseeable projects in the study area can be found in Appendix E of the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report* (Appendix D of this EIR).

The diesel PM emission factors for the vehicle traffic were derived from the CARB EMFAC2011 mobile source emission model for each assessment year. The emission factors and traffic information

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

were interpolated for the time period 2012 to 2035 for the years for which traffic information was not provided. Finally, since the EMFAC2011 mobile source emission model does not provide emission factors beyond the year 2035, vehicle traffic volumes, diesel PM emission factors, and annual average diesel PM impacts for the years beyond 2035 were set to the year 2035 levels to complete the 70-year cancer risk exposure time period (2012 to 2081). The exposure levels averaged over each individual year (of the 70 total years) were then also averaged to get a total 70-year average. For example, the exposure levels for each day in 2012 were averaged (365 values) to get an average exposure for just 2012. Then, all the annual averages for 2012 through 2081 (i.e., over 70 years) were averaged to generate the 70-year average. The average diesel PM annual average was then used to estimate cancer risks.

For Scenario 2, annual average diesel PM emissions and impacts were calculated for each year starting from 2012 to 2081 to correspond to an exposure time period of 70 years required for estimating cancer risk for sensitive receptors. Specifically, annual average diesel PM concentrations were estimated from the diesel PM construction emissions for each year of construction from 2013 to 2021 according to the construction schedule and equipment usage projected for each year of construction. Zero project emissions were assumed in 2012 as the project does not exist in 2012. Annual average diesel PM emissions and impacts during operation were estimated for the years 2017, 2022, and 2035, years for which detailed traffic information was available from the traffic impact report. The annual average operational diesel PM impacts were then interpolated among these three calculation years based on the amount of square footage of buildings brought online during each year. Finally, since the EMFAC2011 mobile source emission model does not provide emission factors beyond the year 2035, annual average diesel PM concentrations for the years beyond 2035 were set to the year 2035 levels.

During years when both construction and operations occur simultaneously (2017 to 2021), the annual diesel PM concentrations at the sensitive receptors from construction were added to the annual diesel PM concentrations from operations to provide a total impact assessment of all diesel PM emissions from the project. The resulting total annual average diesel PM concentrations calculated each year for the 70-year exposure time period (70 individual annual averages) were then averaged to obtain an average diesel PM air concentration for the 70-year time period for use in estimating health risks.

The following information is from the Health Risk Assessment contained in the revised *Air Quality, Greenhouse Gas, and Health Risk Assessment* (2015) contained in Appendix D. The text in this section is supported by references and discussion that can be found in the report in Appendix D.

Note: In response to comments received on the DEIR, the following revisions have been made to the health risk assessment:

- Revisions to the Construction Emissions. This revised analysis reflected the numerous changes in construction equipment, load factors, schedule, and sequencing of construction by location within the project as discussed above.
- Revisions to Traffic Volumes. The revised analysis made use of the revised traffic volume forecasts along nearly 500 individual roadway segments.
- Expanded Model Extent. The geographic extent of the air dispersion model domain was expanded to include freeway segments to the ports of Los Angeles and Long Beach.
- Organic Gas Emissions Included. The assessment of acute non-cancer hazards was expanded to examine the impacts of the toxic components of the project's total organic gas emissions from gasoline and diesel vehicles. The analysis in the DEIR focused on diesel PM to derive health impacts from the project.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Calculated Cancer Population Burden. The health risk assessment was extended to include the computation of cancer population burden attributed to the project's diesel PM emissions.
- Maximum Exposure Duration for Sensitive/Residential Receptors. The analysis contained in the DEIR assumed a cancer risk exposure time period of 70 years for sensitive/residential receptors as representative of the "Former OEHHA Guidance" in estimating cancer risks. In this revised assessment, the cancer risk are presented using the "Current OEHHA Guidance." The "Current OEHHA Guidance" incorporates early-in-life exposure sensitivities and recommends an exposure duration of 30-year; the "Current OEHHA Guidance" reflects early age sensitivities¹ (i.e., weighting the effects of exposure more heavily for infants and teenagers than for adults) to toxic compounds and the US Census data showing that 90 percent of individuals live in their residence for 30 years or less; overall the "Current OEHHA Guidance" results in a more conservative analysis of cancer risks than "Former OEHHA Guidance" on performing health risk assessments.
- Maximum Exposure Duration for Worker Receptors. The analysis contained in the DEIR assumed a cancer risk exposure time period of 40 years for workers as recommended in the "Former OEHHA Guidance." In this revised assessment, the cancer risk impacts are presented for the "Current OEHHA Guidance" which assumes an exposure duration of 25 years for worker receptors, which is based on labor statistics showing 95 percent of workers stay in the same job for 25 years or less.
- Include School Receptors. The assessment of cancer risks at local school receptors was included in the revised analysis based on the "Current OEHHA Guidance", including the new proposed high school site #5 located north of SR-60. The analysis for the high school #5 is included in the Revised Air Quality Report (Appendix D).
- Buffer Analysis. The mitigated analysis includes assessment of cancer risks with a buffer of 250 feet (the project design) and 1,000 feet between the project's operational emissions and the centerlines of Redlands Boulevard, Gilman Springs Road, Bay Avenue, and Merwin Street. This assessment is included as a response to comments on the DEIR. The analysis found that a 1,000 foot buffer would result in no substantial reduction in the cancer risk impacts.

The HRA examines the regional nature of the project's potential health risk impacts over a multi-year time period. The HRA methodology applies a risk characterization model to the results from an air dispersion model to estimate potential health risks at each sensitive receptor location. Because of the pervasive nature of diesel particulate matter (diesel PM) in contributing to estimated health risks in California, the focus of this assessment is on estimating the health risks from diesel PM. While the project activities may result in the emission of other TACs (e.g., Total Organic Gases (TOG) from diesel and gasoline-powered vehicles), diesel PM from the project was found to contribute approximately 98 percent of the total cancer risk from project operations (see the revised *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, Appendix D of this EIR). TOG emissions from diesel and gasoline vehicles were, however, included in the assessment of acute non-cancer hazards.

The HRA process involves four main steps: hazard identification, dose-response assessment, exposure assessment, and risk characterization.

- **Hazard Identification:** Hazard identification is the process by which contaminants of concern are selected for investigation in the risk assessment, and includes a review of the chemicals

¹ Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015, Section 8.2, http://www.oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

that are potentially released to the atmosphere from the equipment of concern. This assessment is responsive to the emissions of various toxic air contaminants from the construction and operation of the project. The main toxic air contaminants associated with the project include diesel PM from diesel-fueled equipment and total organic gases (TOG) from both gasoline and diesel vehicles.

- **Dose-Response Assessment:** The dose-response assessment develops relationships between exposures to a given chemical and the corresponding potential health effects associated with exposure to that chemical. In general, data are limited regarding adverse effects associated with direct exposure to humans to a particular chemical. Therefore, animal experiments have often been performed to assess a chemical's toxicity. These experiments are conducted to determine the organs that are adversely affected by a toxic chemical and the amount of the chemical needed to produce an adverse effect on the organ. Two types of adverse health effects are generally considered in health risk assessments: carcinogenic and non-carcinogenic. Carcinogenic compounds are not considered to have threshold levels (i.e., dose levels below which there are no risks). Any exposure, therefore, will have some associated risk. Chemicals that potentially produce carcinogenic effects have been shown or are suspected to produce tumors in animals or humans. Non-carcinogenic effects, such as liver or kidney damage, may be either reversible or permanent. In these situations, it is assumed that there is a level of exposure at which these chemicals produce no adverse effects in the human body. In other words, exposure to these chemicals in amounts less than a threshold level will result in no adverse health effects. The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure
- **Exposure Assessment** identifies potential exposure pathways, estimates chemical concentrations at potential exposure points, and calculates expected doses of emitted substances. An exposure pathway is defined as the means by which an individual or a population is exposed to contaminants that originate from a source. Each pathway represents a different mechanism for exposure. An exposure pathway is defined as the means by which an individual or a population is exposed to contaminants that originate from a source. For this purpose, an air dispersion model (the USEPA AERMOD regulatory model), is used to estimate the toxic air concentrations at locations within and surrounding the project.
- **Risk Characterization** is the process of combining dose-response information with the estimates of human exposure in order to derive a quantitative estimate of the likelihood that humans will experience any adverse health effects for the given exposure assumptions. Two general types of health effects are generally considered: potential carcinogenic risks after chronic (long-term) exposure and potential non-carcinogenic health impacts following chronic (long-term) and acute (short-term) exposure. Each of these health effects was evaluated in this report.

Estimation of Cancer Risks. Excess cancer risks¹ are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a unit-less probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). A risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time.

¹ Excess cancer risk is the risk from exposure to a source of air toxics that is over and above any cancer risk borne by a person not exposed to these air toxics.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The health risk assessment methodology that was included in the DEIR for estimating cancer risks is described below. This methodology, taken from the AB2588 Hot Spot program, estimates cancer risks over a 70-year lifetime of exposure and includes assumptions concerning individual rates of the inhalation of air. This methodology is referred to as the “Former OEHHA Guidance” since it has been updated by OEHHA since the circulation of the DEIR. The “Former OEHHA Guidance” also provides for an estimate of off-site worker exposures over a 40-year duration.

On March 6, 2015, the OEHHA released its final version of the document, *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments*. This Guidance Manual has been developed by OEHHA, in conjunction with CARB, for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). OEHHA is required to develop guidelines for conducting health risk assessments under the Air Toxics Hot Spots Program (Health and Safety Code Section 44360 (b) (2)). OEHHA earlier developed three Technical Support Documents (TSDs) in response to this statutory requirement, which provided the scientific basis for values used in assessing risk from exposure to facility emissions. The three TSDs describe non-cancer risk assessment (derivation of acute, 8-hour and chronic reference exposure levels), derivation of cancer potency factors, and exposure assessment methodology including stochastic risk assessment. The Guidance incorporates the awareness of the sensitivity of early-in-life exposures to toxic air contaminants for sensitive receptors. The methodology is referred to in this document as the “Current OEHHA Guidance”.

The “Current OEHHA Guidance” provides for a 30-year lifetime exposure for sensitive receptors along with assumptions on age-specific sensitivity factors, daily breathing inhalation rates, and time at home estimates. The “Current OEHHA Guidance” also provides for a 25-year exposure duration for off-site worker receptors. To date, the technical support documents relative to the “Current OEHHA Guidance” have been finalized by the OEHHA relative to the AB2588 Hot Spots program; the CARB, and SCAQMD have initiated the process to adopt the guidance for AB2588 assessments and application to CEQA air quality impact assessments. This revised assessment estimates the project’s health risk impacts under the “Current OEHHA Guidance”. The changes in the “Current OEHHA Guidance” result in a more conservative estimate of cancer risks resulting from the incorporation of early-in-life exposures compared to the “Former OEHHA Guidance”. This HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study. The estimation of cancer risk involves the specification of several parameters including the concentration level of the toxic air contaminant (for purposes of this assessment diesel PM10 exhaust), the rate of inhalation of the toxic, the exposure frequency (number of days per year), the exposure duration in years, the time period over which the exposure takes place, what is termed a slope factor that represents an upper bound on the increased cancer risk from a lifetime exposure to a toxic by ingestion or inhalation and early-in-life age sensitivity factors. The values of these parameters depends on the type of receptor, i.e., sensitive/residential, worker, and student as discussed below.

Cancer Risk Exposure Assumptions. The principal focus of this HRA is on the potential health impacts to sensitive/residential receptors located within and surrounding the project site, based on the assumption that diesel exhaust can cause cancer. Sensitive receptors include hospitals, schools, daycare facilities, elderly housing and convalescent facilities. Residences are also considered sensitive receptors. An important parameter necessary to estimate cancer risk requires the specification of the duration of exposure of an individual to toxic air contaminants. An assessment of population mobility can assist in determining the length of time a residential receptor is exposed in a

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

particular location. For example, the duration of exposure to a source of toxic air contaminants will be directly related to the period of time residents live near the source of the emissions.

Table 4.3.G summarizes the primary exposure assumptions used to calculate individual cancer risk by receptor type for the “Current OEHHA Guidance”.

Table 4.3.G: Exposure Assumptions for Cancer Risk for “Current OEHHA Guidance” (new table)

Type of Guidance	Receptor Type	Exposure Frequency		Exposure Duration (years)	Age Sensitivity Factors	Time at Home Factor (%)	Daily Breathing Rate (L/kg-day)
		Hours/day	Days/year				
Current OEHHA Guidance	Sensitive/Residential:						
	3 rd Trimester	24	350	0.25	10	85	361
	0-2 years	24	350	2	10	85	1090
	3-16 years	24	350	14	3	72	745
	Older than 16 years	24	350	14	1	73	290
	Student	8	180	9	3	NA	745
	Worker	8	250	25	1	NA	230

(L/kg-day) = liters per kilogram body weight per day; NA = not applicable
The daily breathing rates shown are the 95th percentile rate as recommended by the OEHHA.
Source: OEHHA 2014

The underlying factors used in the analysis exemplify the conservative nature of utilizing the exposure scenarios and the underlying assumptions:

- The residential cancer risk calculation assumes that each resident will be exposed to diesel particulate matter (diesel PM) and organic gases for 24 hours a day for 350 days a year at the location of his or her home throughout the entire 30 year residential exposure period.
- The worker cancer risk calculation assumes that workers are exposed to diesel PM for 8 hours a day for 250 days a year, next to, but outside of the buildings in which they work.
- The atmospheric dispersion model and traffic model that are used to estimate risks generally provide impact estimates that are over-estimates based on the use of conservative model assumptions.

Other Factors that Influence Health Risk Estimates: Conservative Trip Estimates. It should also be noted that the traffic analysis used a conservative estimate of the number of truck trips after the project begins operation. This is important because diesel PM emissions are directly related to both the number of trucks and the vehicle miles traveled.

The traffic analysis in the EIR used the traffic generation rate for high-cube warehouses suggested by the Institute of Traffic Engineers (“ITE”) which is based on traffic counts from a number of large warehouses located in California and elsewhere in the United States. This rate was also compared to the trip generation rate actually resulting from the Skechers warehouse immediately adjacent to the project. The Skechers warehouse is representative of the warehouses planned for the project. The ITE trip generation rate is three times greater than the Skechers warehouse traffic counts (see Table 4.15.K in the revised EIR). Because the project analysis used a higher trip generation rate, the vehicle miles traveled are also higher. The combination of the conservative forecasts of traffic and of the miles traveled means that the calculation of the cancer risk in the EIR overstates the extent of that risk regardless of the exposure period used.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Cancer Burden. Whereas cancer risk represents the probability of an individual to develop cancer, cancer burden multiplies the cancer risk by the exposed population to estimate the number of individuals that would be expected to contract cancer from the project. The exposed population is defined as the number of persons within a facility's zone of impact, which is typically the area exposed to an incremental cancer risk of one in a million from the project. Consistent with this definition, cancer burden was calculated by first identifying all population census tracts¹ located within the project's zone of impact, multiplying the estimated incremental project cancer risk impact in the census tract by the population of the census tract and then summing all of products of population times estimated cancer risk in the zone of impact. Note that each census tract contributes to the cancer burden in proportion to its population and risk. For example, if a census tract has a relatively high estimated cancer risk, but no people living there, it will not contribute to the estimation of the cancer burden. As provided in the "Current OEHHA Guidance", the cancer burden is calculated assuming a 70-year exposure duration along with the appropriate exposure frequency, daily breathing rates, age sensitivity factors, and time at home factors appropriate to each age group².

Non-cancer Hazards. Separate from cancer risk impacts, exposures to TACs such as diesel PM can also cause chronic (long-term) and acute (short-term) related non-cancer illnesses such as reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system, birth defects, or other adverse environmental effects. Risk characterization for non-cancer health risks from TACs is expressed as a hazard index (HI). The HI is a ratio of the predicted concentration of a project's emissions to a concentration considered acceptable to public health professionals, termed the Reference Exposure Level (REL). This is a separate and distinct analysis from the analysis conducted for cancer risk. A significant risk is defined by the SCAQMD as an HI of 1 or greater. The California OEHHA has assigned a chronic non-cancer REL of 5 $\mu\text{g}/\text{m}^3$ for diesel PM (OEHHA 2011). Diesel PM has effects on the respiratory system, which accounts for essentially all of its potential chronic non-cancer hazards. Therefore, the only HI calculated was for the respiratory system.

Exposures to toxics air contaminants can also have short-term or acute non-cancer effects, typically dealing with exposures over an hour or so. The California OEHHA has not defined a reference exposure level for diesel PM appropriate for estimating acute non-cancer hazards from diesel PM. Therefore, to estimate the potential acute non-cancer impacts from the project, it was necessary to examine the various individual chemical components (or chemical species) that comprise the emissions from both diesel vehicles and gasoline vehicles. For this purpose, use was made of emission source profiles that provide estimates of the various chemical components that comprise the exhaust from diesel and gasoline vehicles. From this information, an estimate can be made of the maximum one-hour average concentration levels of the project's various chemical species from which an acute non-cancer hazard index can be determined.

Morbidity and Mortality. Respirable particulate matter is a public health concern as it is known to impact both the respiratory and cardiovascular systems. Respirable particulate matter deposition in the lungs and penetration into the bloodstream (for the smallest particles) triggers a range of inflammation responses and exacerbates health problems such as asthma and chronic bronchitis. Individuals susceptible to higher health risks from exposure to airborne particulate matter (PM_{10} and

¹ A census tract is a geographic region defined for the purpose of taking a census. Usually these regions coincide with the limits of cities, towns, or other administrative areas. Each tract has a unique numeric code and averages about 4,000 inhabitants. The census tract centroid is the geographic center of the tract based on a weighted distribution of the population within the tract using the census blocks that comprise the tract. A census block is the smallest geographic unit used to tabulate population and each tract can be comprised of several blocks.

² Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015, Section 8.1, http://www.oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

PM_{2.5}) include children, the elderly, smokers, and people of all ages with low pulmonary/cardiovascular function. The CARB reviewed and summarized the toxic health effects (i.e., mortality and morbidity) of PM exposure and presented a health effect model attempting to quantify these impacts based on concentration-response functions (C-R functions). This CARB model has been used, for example, to estimate the number of cases of disease and premature deaths linked to PM and ozone exposure from ports and goods movement in California.

The CARB model has also been used to quantitatively assess project-specific incremental levels of public mortality and morbidity, however, such calculations are subject to significant uncertainty. Sources of uncertainty include emission estimates, population exposure estimates, concentration-response functions, baseline rates of mortality and morbidity that are entered into C-R functions, and occurrence of additional not-quantified adverse health effects. It should be noted that the nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as sulfur dioxide, NO₂, CO, and O₃ that tend to co-occur with PM in ambient air, greatly increase the complexity of deriving accurate PM concentration-response functions. Health risk estimates derived in the presence of significant uncertainty tend to rely on very conservative assumptions that may greatly overestimate the potential adverse health effects. Risk assessment has various uncertainties in the methodology and is therefore deliberately designed so that risks are not under predicted.

Despite a number of uncertainties in the analysis methodology, the expected increase in mortality and morbidity was calculated for the project's toxic air emissions.

Geographic Scope of the Health Risk Assessment. The HRA is characterized by two important differences from the localized significance threshold assessment for criteria pollutants. According to the SCAQMD localized significance threshold assessment methodology, the assessment of localized impacts addresses only those emissions that are generated "onsite", that is for the purposes of this project, emissions generated from within or along the boundaries of the Specific Plan. However, for the HRA, both the universe of the project's emission sources and air dispersion model receptors were greatly expanded to assess the regional impact of the project's emissions of toxics. For this purpose, the project's toxics emission sources included over 500 individual arterial road and freeway mainline segments in the region that extended from North Palm Springs to Long Beach in the east-west direction and from Rancho Cucamonga to Hemet/San Jacinto in the north-south direction, roughly an area of 3,500 square miles. The study area for the arterial roads covered all intersections in the City of Moreno Valley of a collector or higher classification street with another collector street or higher classification street at which the project would add 50 or more peak hour trips. The study area included the main arterial routes between the project and neighboring communities of Riverside, Perris, Beaumont, San Jacinto, Hemet, and Redlands.

The study area for freeways was selected to cover the freeway routes radiating from the project site to the north, south, east, and west. The analysis covered major portions of the following freeways from North Palm Springs to the ports of Los Angeles and Long Beach: Interstate 10, State Route 60, State Route 91, Interstate 215, and Interstate 710.

The generation of emissions from traffic traveling along the various arterial and freeway mainline roadway segments requires information on traffic volumes, length of segment, and emission factors. The emission factors, in turn, depend on vehicle type, speed, calendar year, and fuel type. Estimates of daily and peak hour vehicle volumes and types (passenger cars, light heavy duty trucks, medium heavy duty trucks, and heavy-heavy duty trucks) were provided by the traffic consultant for each roadway segment analyzed. The physical length and width of each roadway segment were estimated using the segment location as provided by the traffic consultant and aerial photographs available from Google Earth. Vehicle speeds for each roadway segment and vehicle type were estimated based on posted speed limits and peak morning and afternoon average speeds taken from the 2012 Regional

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Transportation Plan for the years 2008 and 2035 (Southern California Association of Governments 2012). Segment speeds were adjusted to account for stop signs and traffic lights and other stoppages by reducing the prevailing vehicle speeds by 5 to 10 mph. The various roadway parameters are provided in Appendix D.

The expanded geographic scope of the assessment also necessitated an expansion in the locations of the receptors where the project's impacts were calculated. This expanded network included locations of individual schools within the Moreno Valley School District and over 2,300 census tract centroid locations.

Finally, it is recognized that because of the large geographical extent of the region covered in this HRA, meteorological conditions differ for different portions of the study region. The most frequent wind direction patterns in the Riverside and Moreno Valley areas are from the northwest direction as represented by the SCAQMD Riverside air monitoring station. In contrast, the most frequent wind directions along the SR-60 and SR-91 west of SR-71 in the La Habra and Anaheim areas are generally from the southwest. Because of these wind differences, it was necessary to separate the air dispersion modeling into two separate pieces as follows. Those emission sources located east of SR-71 were assumed to be influenced by the meteorological conditions represented by the Riverside meteorological data. Those emission sources located west of SR-71 were assumed to be influenced by the meteorological conditions represented by the Anaheim meteorological data. The air dispersion modeling was done separately for the region east of SR-71 and for the region west of SR-71. The air pollutant concentrations at each receptor location were then comprised as the sum of the emission impacts from those sources located east of SR-71 and west of SR-71 as influenced by their respective meteorological conditions.

The health risk analysis examined the following condition:

- Proposed Project Development condition which examines the effect of project-related construction and operational traffic diesel PM emissions as if the project were built out in accordance with its proposed phased construction and operational buildout schedule commencing with the construction of Phase 1 in 2015, build out of Phase 1 in 2022, and the final full build out in 2035. This condition forms the basis for quantifying the incremental impacts from the project.

Annual average diesel PM emissions and impacts were calculated for each year starting from 2015 based on the assumption that diesel exhaust can cause cancer. Specifically, annual average diesel PM concentrations were estimated from the diesel PM construction emissions for each year of construction from 2015 to 2030 according to the construction schedule and equipment usage projected for each year of construction. Proposed Project Development examines project impacts resulting from the proposed construction and operation of the project from the commencement of construction in 2015 for a 30-year duration for sensitive/residential receptors, 25-year for worker receptors, and 9-year exposure time periods for school-site student receptors. Annual average diesel PM emissions and impacts during operation were estimated for the years 2022 and 2035, years for which detailed traffic information was available from the traffic impact report. The annual average operational diesel PM impacts were then interpolated among three calculation years: 2015 (operational emissions were assumed to be zero in this year), 2022 and 2035 based on the amount of square-footage of buildings brought online during each year. Annual average diesel PM concentrations for the years beyond 2035 were set to the year 2035 levels.

During years when both construction and operations occur simultaneously (2016 to 2030), the annual diesel PM concentrations at the sensitive receptors from construction were added to the annual diesel PM concentrations from operations to provide a total impact assessment of all diesel PM emissions from the project during each year. The resulting total annual average diesel PM concentrations

calculated each year for the exposure time period (individual annual averages) multiplied by the requisite daily breathing rates, age sensitivity factors, and time-at-home factors for each year of exposure assuming the a child of age zero (within the mother's womb) commences its lifetime exposure in year 2015. The HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study. The revised mitigation conditions require that all diesel trucks accessing the project during operation be model year 2010 or newer and that all on-site equipment be Tier 4. The results of the HEI Study indicate that the project mitigation requiring the application of Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.

4.3.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, air quality impacts would occur if the proposed project would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; and/or
- Create objectionable odors affecting a substantial number of people.

In addition to the Federal and State AAQS, there are daily emissions thresholds for construction and operation of a proposed project in the Basin. The Basin is administered by the SCAQMD, and guidelines and emissions thresholds established by the SCAQMD in its *CEQA Air Quality Handbook*¹ and subsequent additions to the Handbook were used in this analysis. It should be noted that the emissions thresholds were established based on the attainment status of the air basin with regard to air quality standards for specific criteria pollutants. Because the concentration standards were set at a level that protects public health with an adequate margin of safety, these emissions thresholds are regarded as conservative and would overstate an individual project's contribution related to air quality and health risks.

4.3.4.1 Thresholds for Construction Emissions

The following CEQA significance thresholds for construction emissions have been established by the SCAQMD for the Basin:

- 75 pounds per day of VOC, also known as reactive organic compounds (ROC).
- 100 pounds per day of NO_x.
- 550 pounds per day of CO.
- 150 pounds per day of PM₁₀.

¹ *CEQA Air Quality Handbook*, April 1993.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- 150 pounds per day of SO_x.
- 55 pounds per day of PM_{2.5}.

Projects in the Basin with construction-related emissions that exceed any of the emission thresholds are considered to be significant under CEQA.

4.3.4.2 Thresholds for Operational Emissions

Projects with operation-related emissions that exceed any of the emission thresholds listed below are considered significant under the SCAQMD guidelines.

- 55 pounds per day of VOC, also known as ROC.
- 55 pounds per day of NO_x.
- 550 pounds per day of CO.
- 150 pounds per day of PM₁₀.
- 150 pounds per day of SO_x.
- 55 pounds per day of PM_{2.5}.

4.3.4.3 Federal 1-Hour NO₂ Standard

~~On January 22, 2010, the EPA revised the primary nitrogen dioxide (NO₂) NAAQS in order to provide requisite protection of public health. Specifically, the EPA established a new 1-hour standard at a level of 100 ppb (188.68 µg/m³), based on the 3-year average of the annual 98th percentile of the daily maximum 1-hour concentrations (form of the standard), in addition to the existing annual secondary standard (100 µg/m³). EPA has also established requirements for an NO₂ monitoring network that will include monitors at locations where maximum NO₂ concentrations are expected to occur, including within 50 meters of major roadways, as well as monitors sited to measure the area-wide NO₂ concentrations that occur more broadly across communities.~~

~~The effective date of the new 1-hour standard was 60 days after the final rule was published in the Federal Register. The final rule was published in the Federal Register on February 9, 2010, with an effective date of April 12, 2010.~~

4.3.4.4 Air Pollutant Standards for CO with Localized Effects

The significance of localized project impacts under CEQA depends on whether ambient CO levels in the vicinity of the project are above or below State and Federal CO standards (previously referenced Table 4.2.A). If ambient levels are below the standards, a project is considered to have a significant impact if project emissions result in an exceedance of one or more of these standards. If ambient levels already exceed a State or Federal standard, project emissions are considered significant if they increase one-hour CO concentrations by 1.0 ppm or more or eight-hour CO concentrations by 0.45 ppm or more. The Basin meets State and Federal attainment standards for CO; therefore, the proposed project would have a significant CO impact if project emissions result in an exceedance of State or Federal one-hour or eight-hour standard. The following emission concentration standards for CO, based on the SCAQMD *CEQA Air Quality Handbook* (1993), apply to the proposed project:

- California State one-hour CO standard of 20.0 ppm.

- California State eight-hour CO standard of 9.0 ppm.

4.3.4.5 Localized Significance Thresholds

The SCAQMD published its *Final Localized Significance Threshold Methodology* in June 2003, revised July 2008) and *Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM_{2.5} Significance Thresholds* (October 2006), recommending that all air quality analyses include a localized assessment of both construction and operational impacts on the air quality of nearby sensitive receptors. LSTs represent the maximum emissions from a project site that are not expected to result in an exceedance of Federal or State AAQS. LSTs are based on the ambient concentrations of that pollutant within the Source Receptor Area (SRA) where a project is located and the distance to the nearest sensitive receptor. The project site is located in the northern portions of SRAs 24 (Moreno Valley) and 28 (San Jacinto).

In the case of CO and NO₂, if ambient levels are below the air standards for these pollutants, a project is considered to have a significant impact if project emissions result in an exceedance of one or more of these standards. If ambient levels already exceed a State or Federal standard, then project emissions are considered significant if they increase ambient concentrations by a measurable amount. This would apply to PM₁₀ and PM_{2.5}, both of which are nonattainment pollutants in the Basin. For these latter two pollutants, the significance criteria are the pollutant concentration thresholds presented in SCAQMD Rules 403 and 1301. The Rule 403 threshold of 10.4 µg/m³ applies to construction emissions (and may apply to operational emissions at aggregate handling facilities). The Rule 1301 threshold of 2.5 µg/m³ applies to non-aggregate handling operational activities.

Sensitive receptors include residences, schools, hospitals, and similar uses that are sensitive to adverse air quality. There are currently seven occupied single-family homes and associated ranch/farm buildings in various locations on the proposed project site. These residences are existing on-site sensitive receptors. The nearest off-site existing sensitive receptors in the vicinity of the proposed project site are the residences located along Bay Avenue, Merwin Street, and west of Redlands Boulevard, and scattered residences along Gilman Springs Road.

Following the SCAQMD LST methodology, for sites larger than 5 acres, air dispersion modeling needs to be conducted. Because the project site greatly exceeds 5 acres, the localized significance for project air pollutant emissions was determined by performing dispersion modeling to determine if the pollutant concentrations would exceed relevant significance thresholds established by the SCAQMD.

The following LSTs were applied to the construction and operation of the project:

- 0.18 ppm (State 1-hour); 0.100 ppm (Federal 1-hour); and 0.03 ppm (Annual) of NO_{2x} for construction or operations.
- 20 ppm (1-hour) and 9.0 ppm (8-hour) of CO for construction or operation.
- 10.4 µg/m³ (24-hour) and 1 µg/m³ of PM₁₀ (Annual) for construction.
- 2.5 µg/m³ (24-hour) and 1.0 ppm (Annual) of PM₁₀ for operations.
- 10.4 µg/m³ (24-hour) of PM_{2.5} for construction.
- 2.5 µg/m³ (24-hour) of PM_{2.5} for operation.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Note that when construction and operational activities occur at the same time, the SCAQMD recommends application of the significance thresholds for operation apply in determining emission significance

4.3.4.6 Diesel Exhaust Health Risk Significance Thresholds

For pollutants without defined significance standards or air contaminants not covered by the standard criteria cited above, the definition of substantial pollutant concentrations varies. For toxic air contaminants (TAC), “substantial” is taken to mean that the individual cancer risk exceeds a threshold considered to be a prudent risk management level. ~~If best available control technology for toxics (T-BACT) has been applied, the individual cancer risk to the maximum exposed individual (MEI) must not exceed 10 in 1 million if an impact is to be considered less than significant.~~

The following limits for maximum individual cancer risk (MICR), cancer burden and non-cancer acute and chronic hazard indices (HI) from project emissions of TACs have been established for the Basin:

- ~~**MICR.** MICR is the estimated probability of a potential maximally exposed individual contracting cancer as a result of exposure to TACs over a period of 70 years for residential and 40 years for worker receptor locations. The MICR calculations include multipathway consideration, when applicable.~~

~~The total increase in MICR that is the sum of the calculated MICR values for all TACs emitted from the project will not result in an increased MICR greater than 10 in 1 million (1.0×10^{-5}) at any receptor location (assumes the project will be constructed with T-BACT).~~

~~(A)~~

- ~~**Chronic HI.** This is the ratio of the estimated long-term level of exposure to a TAC for a potential maximally exposed individual to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.~~

~~The cumulative increase in total chronic HI for any target organ system due to total emissions from the project will not exceed 1.0 at any receptor location.~~

- ~~**Acute HI.** This is the ratio of the estimated maximum one-hour concentration of a TAC for a potential maximally exposed individual to its acute reference exposure level.~~

~~The cumulative increase in total acute HI for any target organ system due to total emissions from the project will not exceed 1.0 at any receptor location.~~

The SCAQMD has defined several health risk significance thresholds that it recommends to Lead Agencies in assessing a project’s health risk impacts. The City of Moreno Valley has not adopted its own set of thresholds. Therefore, the following SCAQMD thresholds were adopted for the project.

- **Maximum Individual Cancer Risk and Cancer Burden (MICR).** MICR is the estimated probability of a potential maximally exposed individual contracting cancer as a result of exposure to TACs over the applicable exposure period.

A significant impact would occur for:

(A) An increased MICR greater than 10 in 1 million at any receptor location; or

(B) A cancer burden greater than 0.5

- **Chronic Hazard Index.** This is the ratio of the estimated long-term level of exposure to a TAC for a potential maximally exposed individual to its chronic reference exposure level. A reference exposure level is the exposure level below which an adverse health effect will not occur as

determined by health professionals. The Chronic Hazard Index calculations include multi-pathway consideration, when applicable.

A significant impact would occur if the increase in total chronic hazard index for any target organ system due to exposures to total TAC emissions from the project exceeds 1.0 at any receptor location.

- **Acute Hazard Index.** This is the ratio of the estimated maximum one-hour concentration of a TAC for a potential maximally exposed individual to its acute reference exposure level, the exposure level below which an adverse health effect will not occur as determined by health professionals.

A significant impact would occur if the increase in total acute Hazard Index for any target organ system due to exposure to total TAC emissions from the project exceeds 1.0 at any receptor location.

4.3.5 Less than Significant Impacts

The following impacts were determined to be less than significant. For each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.

4.3.5.1 Odors

Threshold	Would the proposed project create objectionable odors affecting a substantial number of people?
-----------	---

The SCAQMD recommends that odor impacts be addressed in a qualitative manner. Such an analysis shall determine whether the project would result in excessive nuisance odors, as defined under the California Code of Regulations and Section 41700 of the California Health and Safety Code, and thus would constitute a public nuisance related to air quality.

Land uses typically considered associated with odors include wastewater treatment facilities, waste-disposal facilities, or agricultural operations. The project does not contain land uses typically associated with emitting objectionable odors.

SCAQMD Rule 402 dictates that air pollutants discharged from any source shall not cause injury, nuisance, or annoyance to the health, safety, or comfort of the public. With the exception of short-term construction-related odors (e.g., equipment exhaust, paint, and asphalt odors), the proposed uses that would be developed on the proposed site do not include uses that are generally considered to generate offensive odors (e.g., agricultural uses, wastewater treatment plants, or landfills). While the application of architectural coatings and installation of asphalt may generate odors, these odors are temporary and not likely to be noticeable beyond the project boundaries. SCAQMD Rules 1108 and 1113 identify standards regarding the application of asphalt and architectural coatings, respectively.

SCAQMD Rule 1108 sets limitations on ROG (reactive organic gases), which are similar to and for the purposes of this EIR equivalent to and therefore interchangeable with volatile organic compounds (VOC) content in asphalt. This rule is applicable to any person who supplies, sells, offers for sale, or manufactures any asphalt materials for use in the Basin. Rule 1113 of the SCAQMD deals with the selling and application of architectural coatings. Rule 1113 is applicable to any person who supplies, sells, offers for sale, or manufactures any architectural coating for use in the Basin that is intended to be applied to buildings, pavements, or curbs. This rule is also applicable to any person who applies or

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

solicits the application of any architectural coating within the Basin. Rule 1113 sets limits on the amount of VOC emissions allowed for all types of architectural coatings, along with a time table for tightening the emissions standards in the future. Compliance with Rule 1113 means that architectural coatings used during construction would have VOC emissions that comply with these limits. In addition, pursuant to Mitigation Measure 4.3.6.2C, the project would be required to use low VOC paints.

The SCAQMD indicates that the number of overall complaints has been declining. Between 2003 and 2007, odor complaints made up 50 to 55 percent of the total nuisance complaints. Over the past decade, odor complaints from paint and coating operations have decreased from 27 to 7 percent and odor complaints from refuse collection stations have increased from 9 to 34 percent.

Diesel exhaust and VOCs would be emitted during construction of the project, which are objectionable to some; however, emissions would disperse rapidly from the project site and therefore should not reach an objectionable level at the nearest sensitive receptors. Diesel exhaust would also be emitted during operation of the project from the long-haul trucks that would visit the project site. However, the concentrations would not be at a level to result in a negative odor response at nearby sensitive or worker receptors. In addition, modern emission control systems on diesel vehicles since 2007 virtually eliminate diesel's characteristic odor.

During blow-down maintenance activities, natural gas odors will be present around the SDG&E Compressor Plant located on the project site. When this portion of the WLC Specific Plan is developed, these odors will occasionally be detectable from the industrial warehouse properties adjacent to the SDG&E facility. These odors will be infrequent and odorized natural gas will not be present in high concentrations. Therefore, potential odor impacts from on-site natural gas operations are considered to be less than significant and do not require mitigation.

Adherence to applicable provisions of these rules is standard for all development within the Basin. In addition, conditions for the design of waste storage areas on the proposed site would be established through the permit process to ensure enclosures are appropriately designed and maintained to prevent the proliferation of odors. Solid waste generated by the proposed on-site uses will be collected by a contracted waste hauler, ensuring that any odors resulting from on-site uses would be adequately managed. Therefore, impacts associated with this issue would be less than significant and no mitigation is required.

4.3.5.2 Long-Term Microscale (CO Hot Spot) Emissions

Threshold	Would the proposed project violate any air quality standard or contribute substantially to an existing or projected air quality violation? For CO, the applicable thresholds are: - California State one-hour CO standard of 20.0 ppm; and - California State eight-hour CO standard of 9.0 ppm.
-----------	---

Vehicular trips associated with the development of the proposed project could contribute to congestion at intersections and along roadway segments in the project vicinity resulting in potential local CO "hot spot" impacts. The primary mobile source pollutant of local concern is CO, which is a direct function of vehicle travel speeds and idling time and, thus, traffic flow conditions. CO transport is extremely limited; it disperses rapidly with distance from the source under normal meteorological conditions. However, under certain extreme meteorological conditions, CO concentrations proximate to a congested roadway or intersection may reach unhealthful levels affecting local sensitive

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

receptors (residents, schoolchildren, etc.). High CO concentrations are typically associated with roadways or intersections operating at unacceptable levels of service or with very high traffic volumes. In areas with high ambient background CO concentrations, modeling is recommended to determine a project's effect on local CO levels.

Carbon monoxide (CO) "hot spot" thresholds ensure that emissions of CO associated with traffic impacts from a project in combination with CO emissions from existing and forecast regional traffic do not exceed State or Federal standards for CO at any traffic intersection affected by the project. Project concentrations may be considered significant if a CO hot spot intersection analysis determines that project-generated CO concentrations cause a localized violation of the State CO 1-hour standard of 20 ppm, State CO 8-hour standard of 9 ppm, Federal CO 1-hour standard of 35 ppm, or Federal CO 8-hour standard of 9 ppm.

A CO hot spot is a localized concentration of CO that is above the State or Federal 1-hour or 8-hour CO ambient air standards. Localized high levels of CO are associated with traffic congestion and idling or slow-moving vehicles. To provide a worst-case scenario, CO concentrations are estimated at project-impacted intersections where the concentrations would be the greatest.

This analysis follows guidelines recommended by the CO Protocol (University of California, Davis 1997) and the SCAQMD. According to the CO Protocol, intersections with Level of Service (LOS) E or F require detailed analysis. In addition, intersections that operate under LOS D conditions in areas that experience meteorological conditions favorable to CO accumulation require a detailed analysis. The LOS for intersections is determined in the project Traffic Impact Analysis (refer to Section 4.15 of this EIR, Traffic and Circulation). The SCAQMD recommends that a local CO hot spot analysis be conducted if the intersection meets one of the following criteria: (1) the intersection is at LOS D or worse and where the project increases the volume to capacity ratio by 2 percent, or (2) the project decreases LOS at an intersection from C to D. A decrease in LOS, i.e., from C to D, means that there is more traffic and more delay at the intersection.

For this project analysis, the ~~top five~~ intersections with the highest traffic volumes and the LOS E or F before mitigation were identified for 2022 using information from the table in the traffic study "Intersection LOS under 2022 Plus Phase 1 Conditions." ~~In addition, intersection 103 was added because after mitigation, the LOS at the a.m. peak hour is E; the rest of the intersections are at D or better.~~ The ~~five~~ intersections with the greatest LOS before mitigation were also identified for 2035 using information from the table in the traffic study "Intersection LOS under 2035 Plus Build-out Conditions."

The CO concentrations were estimated using the CALINE4 model using 2012 emission factors. The emission factors are for "all" vehicle classes and are not adjusted for a project-specific fleet to provide a worst-case scenario. In addition, the emission factors do not take into account the project ~~design feature mitigation~~ reductions from requiring that ~~all medium-heavy duty trucks and heavy-heavy duty diesel trucks~~ are model year 2010 or newer.

Table ~~4.3-I~~ 4.3.H shows estimated CO concentrations at year 2022 plus project traffic conditions. The estimated CO concentrations at year 2035 are shown in Table ~~4.3-J~~ 4.3.I. As shown in the tables, the estimated 1-hour and 8-hour average CO concentrations from project-generated and cumulative traffic plus the background concentrations are below the State and Federal standards. No CO hot spots are anticipated because of traffic-generated emissions by the project in combination with other anticipated development in the area. Therefore, the mobile emissions of CO from the project are not anticipated to contribute substantially to an existing or projected air quality violation of CO. Therefore, according to this criterion, air pollutant emissions during operation would result in a less than significant impact. No mitigation is required.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Note: The following tables were edited because the revised Traffic Impact Analysis revised traffic volumes and LOS. CO hotspot analyses are dependent of traffic volumes through specific intersections; changes in a traffic analysis may result in changes to the intersections that require analysis in order to determine the location of greatest impact. That occurred in this analysis with changing transportation analysis requiring a modified CO hotspot analysis.

Table 4.3H: Carbon Monoxide Concentrations at Intersections, 2022

Intersection	Peak Hour	CO Concentration (ppm)		Significant Impact?
		1 Hour	8 Hour	
Cactus Avenue at Graham Street	PM	5.2	3.4	No
Cactus Avenue at Elsworth Street	PM	4.9	3.2	No
Alessandro Blvd at Sycamore Canyon Road	PM	4.8	3.1	No
Alessandro Blvd at Chicago Avenue	AM	5.2	3.4	No
Alessandro Blvd at Chicago Avenue	PM	5.4	3.5	No

- ppm = parts per million
- A significant impact would occur if the estimated CO concentration is over the 1-hour State standard of 20 ppm or the 8-hour State/Federal standard of 9 ppm.

4.3.6 Significant Impacts

The following impacts were determined to be potentially significant. In each of the following issues, mitigation measures have been recommended to reduce the significance of the identified impacts.

4.3.6.1 Air Quality Plan Management Plan Consistency

Impact 4.3.6.1: *Implementation of the proposed project has the potential to conflict with implementation of the SCAQMD 2012 AQMP.*

Threshold	Would the proposed project conflict with or obstruct implementation of the applicable air quality plan?
-----------	---

According to the 1993 SCAQMD Handbook, there are two key indicators of consistency with the Air Quality Management Plan (AQMP):

1. Indicator: Whether the project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
2. Indicator: A project would conflict with the AQMP if it would exceed the assumptions in the AQMP in 2010 or increments based on the year of project buildout and phase. The Handbook indicates that key assumptions to use in this analysis are population number and location and a regional housing needs assessment. The parcel-based land use and growth assumptions and inputs used in the Regional Transportation Model run by the Southern California Association of Governments that generated the mobile inventory used by the SCAQMD for AQMP are not available and assumed not to include the proposed project; therefore, the SCAQMD's significance thresholds are used to determine if the project exceeds the assumptions in the AQMP.

Considering the recommended criteria in the SCAQMD's 1993 Handbook, this analysis utilizes the following criteria to address this potential impact:

- Project's contribution to air quality violations (SCAQMD's first indicator, 1 as listed above);
- Assumptions in AQMP (SCAQMD's second indicator, 2, as listed above); and
- Compliance with applicable emission control measures in the AQMPs.

Project's Contribution to Air Quality Violations and Assumptions in AQMP. According to the SCAQMD, the project is consistent with the AQMP if the project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP (SCAQMD 1993, page 12-3). As shown in analyses in Impact 4.3.6.3, the project could violate an air quality standard and therefore could contribute substantially to an existing or projected air quality violation.

If a project's emissions exceed the SCAQMD regional thresholds for NO_x, VOC, PM₁₀, or PM_{2.5}, it follows that the emissions could cumulatively contribute to an exceedance of a pollutant for which the Basin is in nonattainment (ozone, ~~nitrogen dioxide~~, PM₁₀, and PM_{2.5}) at a monitoring station in the Basin.

The thresholds are criteria for determining environmental significance and are discussed in the SCAQMD's 1993 Handbook for Air Quality Analysis and are updated in the SCAQMD's most recent

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

thresholds published online in 2012.¹ An exceedance of a nonattainment pollutant at a monitoring station would not be consistent with the goals of the AQMP to achieve attainment of pollutants.

As discussed in the analyses below (Impact 4.3.6.2, Construction Emissions, and Impact 4.3.6.4, Long-Term Operational Emissions), the project would exceed the regional emission significance thresholds for VOC, NO_x, CO, PM₁₀, and/or PM_{2.5} prior to the application of mitigation. (Refer specifically to Table 4.3.J for construction emissions and Table 4.3.Y for operational emissions.) This means that project emissions of VOC and NO_x could combine with other sources and could result in an ozone, nitrogen dioxide, PM₁₀, or PM_{2.5} exceedance at a nearby monitoring station. The Basin in which the project is located is in nonattainment for these pollutants; therefore, the project would not be consistent with the AQMP. According to this criterion, the project would not be consistent with the AQMP. The regional emissions assume a zero baseline for existing emissions on the project site and therefore assumes that the AQMP had no emissions for the project site. The regional significance thresholds can be interpreted to mean that if project emissions exceed the thresholds, then the project would also not be consistent with the assumptions in the AQMP. The project does not meet this criterion.

Note: The project comparison with the Moreno Highlands Specific Plan was removed because it is assumed that there would be a zero baseline for the existing emissions, instead of assuming that the existing conditions are emissions from the Moreno Highlands Specific Plan. Please see the paragraphs above for a discussion. Note that a comparison to the Moreno Highlands Specific Plan is still part of the No Project analysis of the EIR and can be found in the Alternatives Section 6.0.

Assumptions in AQMP. The analyses in the AQMP use demographic growth forecasts for various socioeconomic categories (e.g., population, housing, and employment by industry) developed by the SCAG for its RTP. Although it is uncertain what precise assumptions were used to generate the modeling in the AQMPs, for purposes of this analysis, it is assumed that the AQMPs use the assumptions from the current Moreno Highlands Specific Plan (MHSP).

The MHSP, adopted in 1992, had the land use acreages as displayed in Section 3.0, *Project Description* (Table 3.A). The emissions from the Specific Plan were estimated using CalEEMod (for assumptions, refer to the Air Quality, Greenhouse Gas, and Health Risk Assessment Report). Table 4.3.H shows the operational emissions for the MHSP.

Table 4.3.H: Operational Regional Air Pollutant Emissions for Moreno Highlands Specific Plan

Source	Summer Emissions (pounds per day)				
	VOC	NO _x	CO	PM ₁₀	PM _{2.5}
Motor Vehicles	435	1,000	4,210	1,213	68
Natural Gas	8	65	33	5	5
Painting	123	—	—	—	—
Consumer Products	516	—	—	—	—
Natural Gas Hearths	14	0	4	10	10
Landscaping	18	7	609	3	3
Total	1,114	1,072	4,853	1,231	86
Significance Threshold	55	55	550	150	55
Significant Impact?	Yes	Yes	Yes	Yes	Yes

¹ The most recent SCAQMD significance thresholds are located at the following website: www.aqmd.gov/ceqa/handbook/signthres.pdf <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.3.H: Operational Regional Air Pollutant Emissions for Moreno Highlands Specific Plan

Source	Summer Emissions (pounds per day)				
	VOC	NO _x	CO	PM ₁₀	PM _{2.5}

— PM₁₀ and PM_{2.5} emissions include exhaust and road dust.
 — Sulfur oxides emissions are under the 150 pounds per day significance threshold and at buildout total approximately 12 pounds per day.
 — Winter emissions are similar to summer emissions and are contained in Appendix A of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report.
 VOC = volatile organic compounds NO_x = nitrogen oxides CO = carbon monoxide PM₁₀ and PM_{2.5} = particulate matter
 Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, January 2013.

Table 4.3.I shows a comparison of the project operational emissions with the MHSP operational emissions is shown in Table 4.3.I. As shown in the table, the project would result in a net decrease in VOC and CO emissions but an increase in NO_x, PM₁₀, and PM_{2.5}. This is primarily due to the number of heavy duty trucks that would serve the project site. Although there may be fewer trips, the heavy-duty trucks are assumed to travel a farther distance. In addition, heavy-duty trucks have greater NO_x, PM₁₀, and PM_{2.5} emissions compared with automobiles.

Compliance with Emission Control Measures. The second indicator of whether the project could conflict with or obstruct implementation of the AQMP is by assessing the project’s compliance with the control measures in the AQMPs and the State Implementation Plan (SIP).

2003 AQMP. The 2003 AQMP contains a number of land use and transportation control measures including the following: the SCAQMD’s Stationary and Mobile Source Control Measures; State Control Measures proposed by the CARB; and SCAG Transportation Control Measures (TCMs). The CARB’s strategy for reducing mobile source emissions includes the following approaches: new engine standards; reduction of emissions from in-use fleet; requiring clean fuels; supporting alternative fuels and reduction of petroleum dependency; working with the EPA to reduce emissions from Federal and State sources; and pursuit of long-term advanced technology measures (AQMP 2003, page 4-25). SCAG TCMs include those contained in the Regional Transportation Plans (RTPs), the most current version of which is the 2008 RTP, which has control measures to reduce emissions from on-road sources by incorporating strategies such as high occupancy vehicle interventions, transit, and information-based technology interventions (AQMP 2003, page 4-19). The project would comply with the control measures and regulation set by the CARB and SCAG.

2007 AQMP. The focus of the 2007 AQMP is to demonstrate attainment of the Federal PM_{2.5} ambient air quality standard by 2015 and the Federal 8-hour ozone standard by 2024, while making expeditious progress toward attainment of State standards. This is to be accomplished by building upon improvements from the previous plans and incorporating all feasible control measures while balancing costs and socioeconomic impacts. The 2007 AQMP indicates that PM_{2.5} is formed mainly by secondary reactions of precursor gases. Therefore, instead of reducing fugitive dust (a primary source), the strategy for reducing PM_{2.5} focuses on reducing precursor emissions of SO_x, directly emitted PM_{2.5}, NO_x, and VOC.

The 2007 AQMP control measures consist of four components: The first component is SCAQMD’s Stationary and Mobile Source Control Measures. The Final 2007 AQMP includes 30 short-term and mid-term stationary and seven mobile source control measures for SCAQMD implementation. A complete listing of the measures is in the 2007 AQMP and includes measures such as VOC reductions from gasoline transfer and dispensing facilities, further NO_x reductions from space heaters, localized control program for PM emission hot spots, urban heat island, energy efficiency and conservation, etc. Some of the measures will become new rules and some will be amendments to existing rules. When the rules pass, the owner-operator will follow the applicable rules.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

The second component is the CARB's Proposed State Strategy, which includes short- and mid-term control measures aimed at reducing emissions from sources that are primarily under State jurisdiction, including on-road and off-road mobile sources, and consumer products. These measures are required in order to achieve the remaining emission reductions necessary for PM_{2.5} attainment. The CARB's strategy includes measures such as improvements to California's Smog Check Program, expanded passenger vehicle retirement, cleaner in-use heavy-duty trucks, reductions from port-related sources, cleaner off-road equipment, evaporative and exhaust strategies, pesticide strategies, etc. When these measures are implemented by the CARB, the project would be required to follow them.

The third component is the SCAQMD Staff's Proposed Policy Options to Supplement CARB's Control Strategy. SCAQMD staff believes that a combination of regulatory actions and public funding is the most effective means of achieving emission reductions. As such, the 2007 Final AQMP proposes three policy options for the ~~decision-makers~~ lead agency to consider in achieving additional reductions. The first option is to incorporate the SCAQMD-proposed additional control measures as a menu of selections further reducing emissions from sources primarily under State and Federal jurisdiction. The second option is to have the State fulfill its NO_x emission reduction obligations under the 2003 AQMP by 2010 for its short-term defined control measures plus additional reductions needed to meet the NO_x emission target between 2010 and 2014. The third option is based on the same rate of progress under Policy Option 1 (the first option discussed above), but it relies heavily on public funding assistance to achieve the needed NO_x reductions via accelerated fleet turnover to post-2010 on-road emission standards or the cleanest off-road engine standards in effect today (or after 2010). This third component, the CARB's Control Strategy does not directly apply to the project. However, Mitigation Measure 4.3.6.3B requires that all diesel trucks accessing the project during operation be model year 2010 or newer, which is consistent with the third option under CARB's Strategy.

The fourth component consists of Regional Transportation Strategy and Control Measures provided by SCAG. Transportation plans within the Basin are statutorily required to conform to air quality plans in the region, as established by the 1990 Federal Clean Air Act and reinforced by other Acts. The region must demonstrate that its transportation plans and programs conform to the mandate to meet the Federal ambient air quality standards in a timely manner. The SCAG RTP is developed every 4 years with a 20-year planning horizon to meet the long-term transportation planning requirements for emission reductions from on-road mobile sources within the Basin. The Regional Transportation Improvement Program (RTIP) requires that SCAG meet the short-term implementation requirements of the Transportation Conformity Rule. The first 2 years of the program are fiscally constrained and demonstrate timely implementation of a special category of transportation projects called Transportation Control Measures (TCMs). In general, TCMs are those projects that provide emission reductions from on-road mobile sources, based on changes in the patterns and modes by which the regional transportation system is used. Strategies are grouped into three categories: high occupancy vehicle strategy, transit and systems management, and information-based technology (traveling during a less congested time of day). SCAG approved the transportation measures in the RTP, which have been included in the region's air quality plans. The TCMs will be implemented by the appropriate agencies and will subsequently reduce emissions in the Basin.

2012 AQMP. The 2012 AQMP was adopted in December 2012. The purpose of the 2012 AQMP for the Basin is to set forth a comprehensive and integrated program that will lead the Basin into compliance with the federal 24-hour PM_{2.5} air quality standard, and to provide an update of the Basin's projections in meeting the Federal 8-hour ozone standards. The 2012 AQMP states, "The remarkable historical improvement in air quality since the 1970's is the direct result of Southern California's comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs."

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Similar to the prior AQMPs, the project would comply with all applicable rules and regulations enacted as part of the AQMP. In addition, the AQMP relies upon the SCAG regional transportation strategy, which is in its adopted 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program. Included in the RTP/SCS are transportation control measures including active transportation (non-motorized transportation, e.g., biking and walking); transportation demand management; transportation system management; transit; passenger and high-speed rail; goods movement; aviation and airport ground access; highways; arterials; and operations and maintenance.

The project would be involved in goods movement. The heavy-duty trucks would access local highways and arterials.

State Implementation Plans. Geographical areas in the State that exceed the Federal air quality standards are called nonattainment areas. The project area is in nonattainment for ozone, PM₁₀, and PM_{2.5}, and nitrogen dioxide. SIPs show how each area will attain the Federal standards. To do this, the SIPs identify the amount of pollutant emissions that must be reduced in each area to meet the standard and the emission controls needed to reduce the necessary emissions. On September 27, 2007, the CARB adopted its State Strategy for the 2007 SIP. In 2009, the SIP was revised to account for emissions reductions from regulations adopted in 2007 and 2008 and clarifies CARB's legal commitment. Additional recent revisions to the SIP are as follows:

- In 2008, the EPA revised the lead¹ national ambient air quality standard by reducing it to 0.15 µg/m³. On December 31, 2010, the Los Angeles County portion of the Basin was designated as nonattainment for the 2008 lead national standard as a result of exceedances measured near a large lead-acid battery recycling facility. The 2012 Lead SIP for Los Angeles County was prepared by the SCAQMD and addresses the recent revision to the lead national standard, and outlines the strategy and pollution control activities that demonstrate attainment of the lead national standard before December 31, 2015. The 2012 Lead SIP was approved May 4, 2012.
- A SIP revision for the federal nitrogen dioxide standard was prepared in 2012, to address the new 1-hour federal ambient air quality standard for nitrogen dioxide.
- The proposed California Infrastructure SIP revision was considered by the CARB on January 23, 2014. The proposed Infrastructure SIP revision is administrative in nature and covers the National Ambient Air Quality Standards (federal standards) for ozone (1997 and 2008), fine particulate matter (PM_{2.5}; 1997, 2006, and 2012), lead (2008), nitrogen dioxide (2010), and sulfur dioxide (2010). The proposed revision describes the infrastructure (authorities, resources, and programs) California has in place to implement, maintain, and enforce these federal standards. It does not contain any proposals for emission control measures.

The SIP takes into account CARB rules and regulations. The project will comply with applicable rules and regulations as identified in the AQMPs and SIPs. Because the project would comply with all applicable rules and regulations, the project complies with this criterion.

Summary. Although the project would be consistent with the policies, rules, and regulations in the AQMPs and SIPs, the project must meet all the criteria listed above to be consistent with the AQMPs. The project could impede AQMP attainment because its construction and operation emissions exceed the SCAQMD regional significance thresholds, so the project is considered to be inconsistent with the AQMP.

¹ Lead referred to here is a chemical element; a heavy metal.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Mitigation Measures. To facilitate monitoring and compliance, applicable SCAQMD regulatory requirements are restated in the mitigation identified below in Section 4.3.6.2 and 4.3.6.3. These measures shall be incorporated in all project plans, specifications, and contract documents. Typical mitigation measures identified to reduce the level of emissions of criteria pollutants include those identified below in Section 4.3.6.2 and 4.3.6.3. Mitigation Measures 4.3.6.2A, 4.3.6.2B, 4.3.6.2C, 4.3.6.2D, 4.3.6.3A, 4.3.6.3B, 4.3.6.3C, 4.3.6.3D, and 4.3.6.4A are required.

Level of Significance After Mitigation. As noted above, implementation of the proposed project would exceed applicable thresholds for all criteria pollutants, with the exception of SO_x. Despite the implementation of mitigation measures, emissions associated with the proposed project cannot be reduced below the applicable thresholds. In the absence of feasible mitigation to reduce the proposed project's emission of criteria pollutants to below SCAQMD thresholds, potential air quality impacts resulting from exhaust from construction equipment will remain significant and unavoidable.

4.3.6.2 Construction Emissions

Impact 4.3.6.2: *Construction of the proposed project has the potential to exceed applicable daily thresholds that may affect sensitive receptors.*

Threshold	Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants? For construction operations, the applicable daily thresholds are: - 75 pounds per day of ROC/VOC; - 100 pounds per day of NO _x ; - 550 pounds per day of CO; - 150 pounds per day of PM ₁₀ ; - 150 pounds per day of SO _x ; and - 55 pounds per day of PM _{2.5} .
------------------	--

Grading and other construction activities produce combustion emissions from various sources such as site grading, utility engines, on-site heavy-duty construction vehicles, equipment hauling materials to and from the site, asphalt paving, and motor vehicles transporting the construction crew. Exhaust emissions during these construction activities will vary daily as construction activity levels change. The use of construction equipment on site would result in localized exhaust emissions. Activity during peak grading days typically generates a greater amount of air pollutants than other project construction activities.

While the actual details of the future construction schedule are not known, it is expected that project construction would occur in two phases with seven discrete activities in Phase 1 and eight discrete activities in Phase 2. For Phase 1, the following activities are assumed to occur over the course of ~~four~~ seven years in the analysis: 1) rough grading, which includes mass site grading; 2) finish grading; 3) building construction; 4) infrastructure construction which includes utility installation; 5) curb, gutter, sidewalk, subgrade preparation, drop rock, and paving activities; 6) asphalt paving; and 7) landscaping. For Phase 2, the same activities are assumed to occur over the course of nine years in the analysis, Phase 1 includes interchange construction as the eighth activity. Within the "building construction" phase, it is assumed that there would also be subphases of concrete pouring, installation of wet utilities, electrical installation, and landscaping. Appendix D of this EIR includes details of the emission factors and other assumptions.

Table 4.3.KJ identifies projected emissions resulting from grading and construction activities for the proposed project and shows the estimated maximum daily construction emissions over the course of project construction prior to the application of mitigation.

The construction emissions estimates summarized in Table 4.3.KJ are based on the assumed construction scenario described in Section 3.0, *Project Description*, of this EIR. Using emission factors from the CalEEMod model, Table 4.3.KJ indicates that construction emissions of criteria pollutants would exceed the SCAQMD daily emission thresholds for all criteria pollutants (VOC, NOx, CO, PM₁₀, and PM_{2.5}), with the exception of SO_x.¹ This is a significant impact requiring mitigation.

Fugitive dust emissions are generally associated with land clearing and exposure of soils to the air and wind, and cut-and-fill grading operations. Dust generated during construction varies substantially by project, depending on the level of activity, the specific operations and equipment, local soils, and weather conditions at the time of construction. The proposed project will be required to comply with SCAQMD Rules 402 and 403 to control fugitive dust. There are a number of feasible control measures that can be reasonably implemented to significantly reduce PM₁₀ emissions from construction.

As identified in Table 4.3.KJ, fugitive dust and exhaust emissions (i.e., PM₄₀) during the anticipated peak construction day for the proposed project would exceed SCAQMD daily construction thresholds. The percentage of dust and exhaust varies by year but for PM₁₀ is an average of 70 percent dust and 30 percent exhaust. PM_{2.5} has an average of 29 percent dust and 71 percent exhaust.

¹ The project would emit SO_x from construction equipment exhaust; however, the maximum emissions (6.8 pounds per day) are less than significant as they are far below the threshold of 150 pounds per day.

SCAQMD Threshold	75	100	550	NA	NA	150	NA	NA	55
Exceeds Threshold?	Yes	Yes	Yes	NA	NA	Yes	NA	NA	Yes

–PM₁₀ and PM_{2.5} emissions include exhaust and fugitive dust emissions.

- Sulfur oxide (SOx) emissions are contained in the CalEEMod output; the maximum emissions would be 2.5 pounds per day, substantially under the threshold of 150 pounds per day.

- The emissions assume all construction activities (mass grading, fine grading, building, utilities, curbing, landscaping, painting, paving, and/or interchange) occur on the same day, depending on the year in which the activity occurs.

- Emissions assume compliance with SCAQMD Rule 403.

VOC = volatile organic compounds NO_x = nitrogen oxides CO = carbon monoxide PM₁₀ and PM_{2.5} = particulate matter
NA = not applicable as there is no separate threshold for dust/exhaust

Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report, 2014-2015.*

The proposed project is required to comply with regional rules that assist in reducing short-term air pollutant emissions. SCAQMD Rule 402 requires implementation of dust-suppression techniques to prevent fugitive dust from creating a nuisance off site. SCAQMD Rule 403 requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off site. Applicable dust suppression techniques from Rule 403 are summarized below. Implementation of these dust suppression techniques can reduce the fugitive dust generation (and thus the PM₁₀ component). Compliance with these rules would reduce impacts on nearby sensitive receptors. The applicable Rule 403 measures are as follows:

- All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- Cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meter (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicular Code Section 23114.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are 15 miles per hour or less to reduce fugitive dust haul road emissions.

As previously discussed, SCAQMD Rule 1113 regulates the sale and application of architectural coatings. Rule 1113 is applicable to any person who applies or solicits the application of any architectural coating within the Basin. Rule 1113 sets limits on the amount of ROG or VOC emissions allowed for all types of architectural coatings. Compliance with Rule 1113 means that architectural coatings used during construction would have ROG or VOC emissions that comply with these limits.

Mitigation Measures. The following measures are recommended to reduce the level of emissions of criteria pollutants:

~~4.3.6.2A~~ — During construction of any development within the WLCSP, the following measures shall be implemented by each developer to the satisfaction of the City Planning Department. Construction equipment maintenance records and data sheets of equipment design specifications (including the emission control tier of the equipment) shall be kept on site during construction subject to inspection by the City and provided to the City on a monthly basis by the applicant or construction manager depicting that the mitigation measures are being met.

~~a) Prior to the year 2017, off-road diesel-powered construction equipment greater than 50 horsepower shall meet or exceed United States Environmental Protection Agency (EPA) Tier 3 off-road emissions standards.~~

~~b) In the year 2017 and thereafter, off-road diesel-powered construction equipment greater than 50 horsepower shall implement one of the following: meet EPA Tier 4 emissions standards, meet EPA Tier 4 Interim emissions standards, or meet EPA Tier 3 standards with California Air Resources Board verified Level 3 filters to reduce 85 percent diesel particulate matter. If a good faith effort to rent Tier 4 equipment within 200 miles of project has been conducted but has been unsuccessful, then Tier 3 equipment (without filters) can be used. Written~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~verification of the Tier 4 equipment search of three or more rental companies shall be provided by the project applicant to the City verifying the results of the search prior to the use of Tier 3 construction equipment.~~

- ~~c) Off road diesel-powered equipment during all construction shall be limited to 10 hours per day in the on position and in compliance with the project Noise Reduction Compliance Plan with regards to the timing and location of grading operations. There are no restrictions for equipment powered by natural gas or electricity.~~
- ~~d) Construction equipment shall be properly maintained according to manufacturer specifications.~~
- ~~e) Contractors shall turn off all construction equipment and delivery vehicles when not in use or limit on-site idling to 5 minutes or less in any one hour.~~
- ~~f) On-site electrical hook ups to power grid shall be provided for electric construction tools including saws, drills and compressors, where feasible, to reduce the need for diesel-powered electric generators.~~
- ~~g) The project shall demonstrate compliance with South Coast Air Quality Management District Rule 403 concerning fugitive dust and provide appropriate documentation to the City of Moreno Valley.~~
- ~~h) Off-site construction shall be limited to the hours between 6a.m. to 8 p.m. on weekdays only. Construction during City holidays shall not be permitted.~~

4.3.6.2A Construction equipment maintenance records (including the emission control tier of the equipment) shall be kept on site during construction and shall be available for inspection by the City of Moreno Valley.

- a) Off-road diesel-powered construction equipment greater than 50 horsepower shall meet United States Environmental Protection Agency Tier 4 off-road emissions standards. A copy of each unit's certified tier specification shall be available for inspection by the City at the time of mobilization of each applicable unit of equipment.
- b) During all construction activities, off-road diesel-powered equipment may be in the "on" position not more than 10 hours per day. c) Construction equipment shall be properly maintained according to manufacturer specifications.
- d) All diesel powered construction equipment, delivery vehicles, and delivery trucks shall be turned off when not in use. On-site idling shall be limited to three minutes in any one hour.
- e) Electrical hook ups to the power grid shall be provided for electric construction tools including saws, drills and compressors, where feasible, to reduce the need for diesel-powered electric generators. Where feasible and available, electric tools shall be used
- f) The project shall demonstrate compliance with South Coast Air Quality Management District Rule 403 concerning fugitive dust and provide appropriate documentation to the City of Moreno Valley.
- g) All construction contractors shall be provided information on the South Coast Air Quality Management District Surplus Off-road Opt-In "SOON" funds which provides funds to accelerate cleanup of off-road diesel vehicles.
- h) Construction on-road haul trucks shall be model year 2007 or newer.

- i) Information on ridesharing programs shall be made available to construction employees.
- j) During construction, lunch options shall be provided onsite.
- k) A publicly visible sign shall be posted with the telephone number and person to contact regarding dust complaints per AQMD Standards. l) Only non-diesel material handling equipment may be used in any logistics building in the WLC.
- m) Off-site construction shall be limited to the hours between 6 a.m. to 8 p.m. on weekdays only. Construction during City holidays shall not be permitted.

~~**4.3.6.2B** Prior to issuance of any grading permits for development within the WLCSP, the developer shall provide a traffic control plan to the City that describes in detail the location of equipment staging areas, stockpiling/storage areas, construction parking areas, safe detours around the project construction site, as well as provide temporary traffic control (e.g., flag person) during construction-related truck hauling activities. The traffic control plan is intended to minimize traffic congestion and delays that increase idling and acceleration emissions. The developer shall maintain one copy on site in the construction trailer to the satisfaction of the City.~~

4.3.6.2B Prior to issuance of any grading permits, a traffic control plan shall be submitted to and approved by the City of Moreno Valley that describes in detail the location of equipment staging areas, stockpiling/storage areas, construction parking areas, safe detours around the project construction site, as well as provide temporary traffic control (e.g., flag person) during construction-related truck hauling activities. Construction trucks shall be rerouted away from sensitive receptor areas. Trucks shall use State Route 60 using Theodore Street, Redlands Boulevard (north of Eucalyptus Avenue), and Gilman Springs Road. In addition to its traffic safety purpose, the traffic control plan can minimize traffic congestion and delays that increase idling emissions. A copy of the approved Traffic Control Plan shall be retained on site in the construction trailer.

~~**4.3.6.2C** During construction of any development within the WLCSP, the following measures shall be applied to construction activities as indicated:~~

- ~~a) Use paints with a volatile organic compound (VOC) content 100 grams per Liter or lower for both interior and exterior surfaces, if painted.~~
- ~~b) Recycle leftover paint. Take any leftover paint to a household hazardous waste center; do not mix leftover water-based and oil-based paints.~~
- ~~c) Keep lids closed on all paint containers when not in use to prevent VOC emissions and excessive odors.~~
- ~~d) For water-based paints, clean up with water only. Whenever possible, do not rinse the clean-up water down the drain or pour it directly into the ground or the storm drain. Set aside the can of clean-up water and take it to the hazardous waste center (www.cleanup.org).~~
- ~~e) Use compliant low VOC cleaning solvents to clean paint application equipment.~~
- ~~f) Keep all paint and solvent-laden rags in sealed containers to prevent VOC emissions.~~

4.3.6.2C The following measures shall be applied during construction of the project to reduce volatile organic compounds (VOC):

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- a) Non-VOC containing paints, sealants, adhesives, solvents, asphalt primer, and architectural coatings (where used), or pre-fabricated architectural panels shall be used in the construction of the project to the maximum extent practicable. If such products are not commercially available, products with a VOC content of 100 grams per Liter or lower for both interior and exterior surfaces shall be used.
- b) Leftover paint shall be taken to a designated hazardous waste center.
- c) Paint containers shall be closed when not in use
- d) Low VOC cleaning solvents shall be used to clean paint application equipment.
- e) Paint and solvent-laden rags shall be kept in sealed containers.

~~4.3.6.2D~~ During construction of any development within the WLCSP, grading shall not occur on days with an Air Quality Index forecast greater than 150 for particulates or ozone (unhealthy for sensitive groups, unhealthy, very unhealthy, or hazardous conditions). Air Quality Index forecasts can be obtained at www.airnow.gov and/or www.enviroflash.info.

4.3.6.2D No grading shall occur on days with an Air Quality Index forecast greater than 150 for particulates or ozone as forecasted for the project area (Source Receptor Area 24).

~~Level of Significance After Mitigation.~~ There are several methods to reduce daily construction emissions, one of which is to increase the tier of the off road construction equipment. The unmitigated construction emissions assumed CalEEMod default equipment tiers. Beginning in the year 2011, new off road mobile engines sold that are greater than 175 horsepower (hp) and non-emergency stationary engines less than 10 liters per cylinder and greater than 175 hp are required to meet Tier 4 Interim standards. Tier 4 Final for engines greater than 130 hp will not be required for new construction equipment until the year 2014. The availability of Tier 3 and Tier 4 equipment varies; therefore, it is not always feasible to use Tier 3 and Tier 4 equipment. Therefore, **Mitigation Measure 4.3.6.2A** allows for flexibility in requiring higher-tiered equipment.

~~Level of Significance After Mitigation.~~ Significant and unavoidable. There are several methods to reduce daily construction emissions, one of which is to increase the tier of the off road construction equipment. The mitigation measure with the greatest reduction is **Mitigation Measure 4.3.6.2.A**, which requires Tier 3 equipment before year 2027 and Tier 4 Interim (or higher) equipment for all equipment except scrapers in the year 2027 and after. Therefore, this measure was estimated in CalEEMod by assuming that construction equipment before 2027 is Tier 3 and construction equipment in 2027 and later is Tier 4 (with the exception of scrapers, which are Tier 3). This exception for scrapers is necessary because Tier 4 scrapers are difficult to find.

As shown in Table 4.3.LK, construction emissions are still significant after mitigation, with the exception of PM_{2.5}. The reduction in PM_{2.5} emissions is by a reduction in exhaust from the application of Tier 4 off-road equipment. PM₁₀ emissions are still significant because emissions in 2019 exceed the threshold; however, emissions of PM₁₀ during all other years of construction are less than significant. Although mitigation reduces emissions of all pollutants during construction, potential air quality impacts resulting from exhaust from construction equipment and fugitive dust will remain significant and unavoidable.

Average Emissions from Draft EIR (for informational purposes)	233	1,100	1217	87	49
SCAQMD Threshold	75	100	550	150	55
Exceeds Threshold?	Yes	Yes	Yes	Yes	Yes No

* There is an error in the way CalEEMod estimates the effect of a higher tier (such as Tier 3 or 4) on mitigated CO; therefore, the unmitigated values are reported for CO. This was confirmed by the SCAQMD by a personal communication. The SCAQMD is currently preparing a work around for this; however, it was not available as of the date of this analysis.

- Sulfur oxide (SO_x) emissions are contained in the CalEEMod output in Appendix A of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report; the maximum emissions would be approximately 23 pounds per day after mitigation, substantially under the threshold of 150 pounds/day.
- Mitigation Measure 4.3.6.2A(a) was estimated by CalEEMod using its mitigation module by assuming Tier 4 off-road equipment.
- Mitigation Measure 4.3.6.2A(b) restricts equipment from operating more than 10 hours per day in the on position, which is estimated in CalEEMod in both the unmitigated and mitigated estimates.
- Mitigation Measures 4.3.6.2A(c) through (e), 4.3.6.2A(g) through (m), 4.3.6.2B, and 4.3.6.2D are not quantified.
- Mitigation Measure 4.3.6.2A(f) is assumed in the unmitigated and mitigated estimates (Rule 403).
- Mitigation Measure 4.3.6.2A(i) requires that construction haul trucks be 2007 model year or greater. CalEEMod does not have a mitigation measure embedded in the model to quantify the reduction from this measure. Therefore, this reduction quantification was not provided.
- Mitigation Measure 4.3.6.2C reduces VOC emissions during painting and is calculated as demonstrated in the spreadsheets in Appendix A of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report.

VOC = volatile organic compounds NO_x = nitrogen oxides CO = carbon monoxide PM₁₀ and PM_{2.5} = particulate matter
Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report, MBA-2014, 2015.*

Comparing the emissions to those as estimated in the DEIR, average daily emissions of VOC, NO_x, CO and PM_{2.5} have decreased by approximately 100, 600, 500 and 25 pounds per day, respectively. This is primarily because 1) the construction period for the project increased from 10 years to 15 years, resulting in decreased construction activity levels (if market conditions further slow project development, impacts would be no greater than those described in this analysis); 2) Tier 4 equipment is applied as mitigation; and 3) a newer version of CalEEMod was used to estimate construction emissions. The average PM₁₀ emissions increased slightly by approximately 35 pounds per day, primarily because of the inclusion of unpaved road dust.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The results of this regional construction analysis indicate that during construction, the South Coast Air Basin may experience the following cumulative health effects from ozone exposure:¹

Ozone can cause the following health effects: Irritate respiratory system; reduce lung function; breathing pattern changes; reduction of breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; and/or increased mortality risk.

4.3.6.3 Localized Construction and Operational Air Quality Impacts

Impact 4.3.6.3: *Construction and operation of the proposed project has the potential to exceed localized daily thresholds that may affect sensitive receptors.*

Threshold	Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants? The applicable localized thresholds are: - 20 ppm (1 hour) and 9 ppm (8 hours) of CO during construction or operation; - 0.18 ppm (State 1 hour), 0.100 ppm (National 1 hour), and 0.030 ppm (Annual) of NO _x during construction or operation; - 10.4 µg/m ³ (24 hours) 1.0 µg/m ³ (Annual) of PM ₁₀ during construction - 2.5 µg/m ³ (24 hours) and 1.0 µg/m ³ (Annual) of PM ₁₀ ; during operation and - 2.5 µg/m ³ (24 hours) of PM _{2.5} during operation - During time periods when construction and operational activities occur at the same time, the SCAQMD recommends application of the significance thresholds for operations to assess the significance of the activities
------------------	--

Note: Section 4.3.6.3 in the original DEIR was replaced in its entirety in this revised DEIR section. The reader is referred to the original DEIR section 4.3.6.3 for the text of that section.

The localized analysis focused on three analysis conditions:

1. Project Phase 1 (2012), which evaluates what air quality impacts the project-related emissions would have if Phase 1 of the project (approximately 56 percent of the square footage) was built out in full in 2012² and no other changes occurred to land uses or the roadway system;
2. Project Phase 1 and Phase 2 Full Build Out (2012), which evaluates what air quality impacts the project-related emissions would have if the entire project, both Phase 1 and Phase 2, were build out in full in 2012 and no other changes occurred to land uses or the roadway system; and
3. Proposed Project Development Schedule, which evaluates the air quality impacts from the construction and operation of the project as a 2-phase development with the construction commencing in 2015, build out of Phase 1 in 2022 and the final Phase 1 and Phase 2 build out in 2035.

¹ Although carbon monoxide emissions are over the threshold, it is primarily a localized pollutant. The localized analyses demonstrated that concentrations would not exceed the ambient air quality standards for carbon monoxide; therefore, less than significant health effects are anticipated.

² 2012 is the CEQA Baseline year for this project.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The Project Phase 1 (2012) and Project Phase 1 and Phase 2 Full Build Out (2012) conditions represents worst-case conditions in that the project physically could not be built-out in 2012 or, in fact, in any single year due to the size of the project. These conditions have been included in this assessment to correspond to the analysis scenarios examined in the project traffic impact report. These conditions also do not account for the fact that vehicle emissions are expected to decline significantly over the next ten years in response to mandated motor vehicle emission controls adopted by the CARB and EPA as the project develops in the future. Thus, consideration of these conditions will significantly overestimate the project's potential air quality impacts. The Proposed Project Development condition represents the logical and realistic development of the project over a period of 15 years as represented by the project applicant. The LST analysis is presented for each condition below.

Pursuant to the SCAQMD's LST methodology, only emissions generated from emission sources located within and along the project boundaries are included in the LST assessment. These emission sources include vehicle travel on the roadway network within and along the borders of the project and emissions from support equipment including forklifts, yard/hostler trucks, and emergency standby electric generators.

The project's emissions then served as input into the AERMOD air dispersion model to derive estimate of the project's localized air quality impacts for each condition.

Project Phase 1 (2012) LST Assessment

The project's on-site emissions were estimated from the traffic-generated by the various project vehicles as provided by the traffic impact report. Vehicle emissions were assumed to be representative of the calendar year 2012 vehicle fleet. Also included were emissions from various support equipment including forklifts, yard trucks, and standby emergency generators. The localized assessment results for the Project Phase 1 (2012) condition are provided in Table 4.3.L for receptors located within the project boundaries and in Table 4.3.M for receptors located outside the project's boundaries along with a comparison to the SCAQMD's localized significance thresholds. The significance thresholds for CO and nitrogen dioxide are derived from the measured ambient air quality data from the SCAQMD Riverside air monitoring station and serve as the measure of existing air quality.¹

Table 4.3.ML: Localized Assessment of Project Phase 1 (2012) Emissions Maximum Impacts Within the Project Boundaries (without mitigation) (revised)

Pollutant	Averaging Time, Units	Existing Background ¹	Air Concentration ²		Standard/Threshold	Total Impact Exceeds Threshold
			Project Local Impact	Total (Background + Project)		
Carbon Monoxide	1 hour, ppm	2.64	<u>0.140</u> .12	<u>2.782</u> .75	20	No
	8 hour, ppm	1.84	<u>0.040</u> .03	<u>1.881</u> .87	9.0	No
Nitrogen Dioxide	State 1 hour, ppm	0.078	<u>0.068</u> 0.065	<u>0.146</u> 0.143	0.18	No
	National 1 hour, ppm	0.060	<u>0.012</u> 0.060	<u>0.113</u> 0.120	0.100	Yes
	Annual, ppm	0.017	<u>0.012</u> 0.018	<u>0.029</u> 0.035	0.030	<u>No</u> <u>Yes</u>

¹ In keeping with the SCAQMD recommendations, the highest air quality measurement for the years 2009, 2010, 2011, and 2012 served as a measure of the existing background air quality data for NO₂ and CO.

As noted from Table 4.3.L, the project would exceed the SCAQMD's localized significance thresholds for nitrogen dioxide and PM₁₀ at receptors located within the project boundaries, realizing again however, that this scenario reflects an impossible situation that assumes that Phase 1 of the project is built out in its entirety in 2012 and that the existing receptors located within the project boundaries remain in place. As shown in Table 4.3.M, the significance thresholds would not be exceeded at any sensitive receptor located outside of the project boundaries except for the annual PM₁₀ project impact.

As noted from the above tables, the project would exceed the SCAQMD's significance thresholds for NO₂, PM₁₀, and PM_{2.5} for receptors located within the project's boundaries and NO₂ and PM₁₀ at receptors located outside of the project's boundaries.

It is important to note the Project Phase 1 (2012) and Project Phase 1 and Phase 2 Full Build Out (2012) conditions assume that the project's emissions are at the levels that would occur in 2012. The majority of the project's operational emissions are from on-road mobile sources, more particularly, heavy-duty trucks that contribute a disproportionate amount of emissions compared to passenger vehicles. Emissions from on-road mobile sources are regulated at the State and Federal levels and, therefore, are outside of the control of local agencies such as the City and the SCAQMD. For example, the CARB is working closely with the EPA, engine and vehicle manufacturers, and other interested parties to identify programs that will reduce emissions from heavy-duty diesel vehicles in California. In its "Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles," the CARB presented a blueprint for achieving a 75 percent reduction in diesel particulates by 2010 and an 85 percent reduction by 2020 from the 2000 baseline. The emission reductions would arise from a combination of measures including the use of ultra-low sulfur diesel fuel, new emission standards for large diesel engines, restrictions on diesel engine idling, addition of post-combustion filter and catalyst equipment, and retrofits for business and government diesel truck fleets. The implementation of these emission reductions will also result in reductions of other pollutants such as NO_x, VOC, and CO. As these emission reduction programs are implemented and there is a turnover in the use of older vehicles with newer and cleaner vehicles, the project's operational emissions are expected to decline significantly in the future.

Emission controls on mobile source vehicles already adopted by the CARB particularly dealing with NO_x and PM₁₀ controls on heavy duty trucks will reduce truck emissions significantly over the next 10 years. As an example, in the South Coast Air Basin, the per-mile running exhaust rate of NO_x emissions from the largest category of heavy duty diesel trucks is estimated to decline from an average of 11.4 grams/mile in 2012 to 3.9 grams/mile by 2022, a decline of 66 percent from 2012 levels and to 1.8 grams/mile in 2035, a decrease of 84 percent from 2012 levels. Similarly, the per-mile running exhaust rate of PM₁₀ emissions from the largest category of heavy duty diesel trucks is estimated to decline from an average of 0.34 gram/mile in 2012 to 0.02 gram/mile in 2022, a decline of 94 percent from 2012 levels and decline to 0.006 grams/mile in 2035, a decline of 98 percent from 2012 levels. Thus, two Project (2012) conditions represent highly conservative estimates, in terms of overestimating of the project's operational impacts.

Proposed Project Development Schedule LST Assessment

The final localized threshold assessment condition examined potential local project impacts considering the proposed construction and build out schedule of the project over a time period of 15 years from the commencement of construction in 2015 to the final build out in 2035. This condition examined three specific time periods:

- The year 2021: the year 2021 was selected to determine the potential localized impacts from the project's construction and operational emissions to the existing residences located to the west of the project across Redlands Boulevard. These residences are the closest sensitive receptors outside of the project's boundaries. According to the conceptual construction schedule provided by the applicant, extensive building construction is expected to take place within the project site along and to the east of Redlands Boulevard in 2021. The year 2021 also corresponds to the completion of approximated 88 percent of the Phase 1 operation (50 percent of the entire project) and the attendant operational emissions. The project's onsite maximum daily and annual construction emissions were estimated using the CalEEMod land use emission model and the construction equipment inventory and activities provided by the applicant (see discussion in Appendix D). The project's onsite operational emissions, principally from the project's mobile sources, were derived from detailed traffic volume data provided by the project's traffic impact analysis. The traffic impact analysis applied a comprehensive regional transportation model to develop daily and peak hour traffic volumes for 2022 and 2035 from the project's mobile sources. Peak hour and daily project traffic volumes were developed for each year from 2015 to 2035 for roadway segments within and along the boundaries of the project using the following assumptions:
 - Project operational traffic volumes were assumed to be zero in 2015, the year that project construction would commence.
 - Traffic volumes for the years 2016 to 2022 (the completion year for Phase 1 operations) were interpolated from 2015 to 2022 by applying the annual project occupancy schedule to the 2022 traffic volumes.
 - Traffic volumes for the years 2023 to 2035 were interpolated from the provided traffic volumes in 2022 and 2035 by applying the annual project occupancy schedule.
- The year 2027, when the project's total daily on-site construction and operational emissions would be the highest for several air pollutants and construction and operations would occur along the eastern portion of the project potentially impacting the existing residences across from the project along Gilman Springs Road; and
- The year 2035, which is the long term planning year analyzed in the project traffic impact report and representative of the complete build out of both Phases 1 and 2.

Localized Impact Analysis, 2021. The localized impacts for the short-term construction and operational activities were analyzed using an air dispersion model (EPA AERMOD Model) to simulate the transport and dispersion of project-related emissions through the air. These impacts were then compared to the applicable SCAQMD localized concentration thresholds.

The estimated maximum localized air quality impacts from the construction and operation of the project in 2021 are summarized in Table 4.3.P for locations within the project's boundaries. These maximum impacts were found at the locations of the existing residences within the project boundaries. Table 4.3.Q summarizes the highest air quality impacts for sensitive receptors located outside of the project boundaries. As noted from these two tables, project impacts would exceed the significance thresholds for nitrogen dioxide, PM₁₀ and PM_{2.5} for locations within the project boundaries and nitrogen dioxide and PM₁₀ at receptors located outside the project boundaries, and thus represents a significant impact without mitigation.

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Localized Air Quality Impact Analysis, 2027. The year 2027 was selected for the LST Analysis for two principal reasons: 1) the year 2027 corresponds to the year with the highest combined total onsite construction and operational emissions of NO_x and CO and the third or fourth highest onsite emissions of PM₁₀ and PM_{2.5} during the time period of 2015 to 2035; and 2) the location of the building construction in 2027 places the construction emissions adjacent to the existing residences located on the eastern side of the project across Gilman Springs Road.

The project's maximum combined impacts from construction and operations during 2027 are shown in Table 4.3.R for the existing sensitive receptors located within the project boundaries along with the SCAQMD-recommended significance thresholds. Table 4.3.S shows the maximum combined impacts for sensitive receptors located outside of the project boundaries. These latter impacts were found within the residential areas located to the east of the project across Gilman Springs Road. As shown in these tables, the project would exceed the SCAQMD's significance thresholds for PM₁₀ at locations within the project boundary and no thresholds outside of the project boundary.

Table 4.3.SR: Localized Assessment – Construction and Operation, Year 2027 Maximum Impacts Within the Project Boundaries (without Mitigation) (revised)

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.3.TS: Localized Assessment – Construction and Operation, Year 2027 Maximum Impacts Outside the Project Boundaries (without Mitigation) (revised)

Pollutant	Averaging Time, Units	Existing Background ¹	Air Concentration ²		Standard/Threshold	Total Impact Exceeds Threshold?
			Project Local Impact	Total (Background + Project)		
Carbon Monoxide	1 hour, ppm	2.64	0.18 <u>0.10</u>	2.82 <u>2.74</u>	20	No
	8 hour, ppm	1.84	0.02 <u>0.05</u>	1.86 <u>1.89</u>	9.0	No
Nitrogen Dioxide	State 1 hour, ppm	0.078	0.074 <u>0.071</u>	0.152 <u>0.149</u>	0.18	No
	Annual, ppm	0.017	0.001 <u>0.003</u>	0.018 <u>0.020</u>	0.030	No
PM ₁₀	24 hour, µg/m ³	NA	3.1 <u>2.2</u>	3.1 <u>2.2</u>	2.5 ³	No <u>Yes</u>
	Annual, µg/m ³	NA	0.9 <u>0.8</u>	0.9 <u>0.8</u>	1.0	No
PM _{2.5}	24 hour, µg/m ³	NA	1.8 <u>1.1</u>	1.8 <u>1.1</u>	2.5 ³	No

µg/m³ = micrograms per cubic meter (a concentration unit)

NA = Not Applicable, the SCAQMD threshold methodology does not require a background for PM₁₀ or PM_{2.5}

¹ Background data for 2012 for CO and nitrogen dioxide derived as the highest air quality measured data during the 4-year time period of 2009 to 2012

² Highest impacts at any receptor located outside of the boundaries of the project generally occur in the residential areas to the east of the project across Gilman Springs Road

³ During periods when both construction and operation overlap the SCAQMD recommends the operational significance thresholds for PM₁₀ and PM_{2.5} as opposed to the construction thresholds which are 10.4 ug/m³ for PM₁₀ and PM_{2.5}. This provides a very conservative threshold for determining the significance of project impacts.

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment Report, MBA-September-2014-2015.

Localized Air Quality Impact Analysis, 2035. The year 2035 represents a long-term planning year when both phases of the project would be fully in operation. Operational emissions during 2035 were estimated based on the project's trip generation and project-related travel along the local roadway network within and along the project boundaries. Table 4.3.T shows the maximum localized air quality impacts for 2035 relative to the background air quality levels at the existing sensitive receptors located within the project boundaries. Table 4.3.U identifies the highest localized impacts for sensitive receptors located outside of the project boundaries. These latter impacts were found within the residential areas located to the west of the project across Redlands Boulevard. As shown in Table 4.3.T, the concentrations of PM₁₀ exceed the SCAQMD's significance thresholds due principally to the inclusion of entrained road dust in the impact assessment and would, therefore, represent a significant impact without mitigation. Table 4.3.U indicates that no receptor located outside of the project boundary would exceed any significance threshold.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Summary. The localized significance analysis demonstrates that without mitigation, the project would exceed the localized significance thresholds for NO₂, PM₁₀, or PM_{2.5} for one or more of the LST assessment years (2021, 2027, or 2035) analyzed under this revised LST assessment. Therefore, according to this criterion, the air pollutant emissions would result in a significant impact and could exceed or contribute to an exceedance of the ambient air quality standards for NO₂, PM₁₀, and PM_{2.5}.

Mitigation Measures. Mitigation measures identified previously under Impact 4.3.6.2 (**Mitigation Measures 4.3.6.2A, 4.3.6.2B, and 4.3.6.2D**) to reduce construction emissions of criteria pollutants are required. The project will also be required to comply with SCAQMD Rules 402 and 403. Additionally, the following mitigation measures are required to reduce emissions of criteria pollutants during project operations.

~~4.3.6.3A~~ — ~~Prior to issuance of a Certificate of Occupancy, vehicles must be able to access the building using paved roads and parking lots.~~

~~4.3.6.3A~~ — ~~Prior to issuance of occupancy permits for each warehouse building within the WLCSP, the developer shall demonstrate to the City that vehicles can access the building using paved roads and parking lots.~~

~~4.3.6.3B~~ — ~~All applications for development shall be subject to the following conditions of approval:~~

~~————— **Prior to the issuance of a Certificate of Occupancy**~~

- ~~a) Post signs informing truck drivers about the health effects of diesel particulates, the California Air Resources Board diesel idling regulations, and the importance of being a good neighbor by not parking in residential areas.~~
- ~~b) Post signs in all dock and delivery areas containing the following: truck drivers shall turn off engines when not in use; trucks shall not idle for more than five minutes; telephone numbers of the building facilities manager and the California Air Resources Board to report violations.~~
- ~~c) Prior to issuance of occupancy permits, signs shall be installed at each exit driveway, providing directional information to the City's truck route. Text on the sign shall read "To Truck Route" with a directional arrow. Truck routes shall be clearly marked per the City's Municipal Code.~~

~~**On an Ongoing Basis**~~

- ~~d) Tenants shall maintain records on their fleet equipment and vehicle engine maintenance to ensure that equipment and vehicles serving the warehouses within the project are in good condition and in proper tune pursuant to manufacturer's specifications. The records shall be maintained on-site and be made available for inspection by the City.~~
- ~~e) Tenants will ensure that site enforcement staff in charge of keeping vehicle records will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board approved courses (such as the free, one-day Course #512). Documentation of said training shall be maintained on-site and be available for inspection by the City.~~
- ~~f) Tenants will be encouraged to become a SmartWay Partner.~~
- ~~g) Tenants will be encouraged to maximize the number of truck trips will be carried by SmartWay 1.0 or greater carriers.~~

All of the measures above shall be incorporated into conditions of approval for each future development project within the WLCSP.

4.3.6.3B The following shall be implemented as indicated:

Prior to Issuance of a Certificate of Occupancy

- a) Signs shall be prominently displayed informing truck drivers about the California Air Resources Board diesel idling regulations, and the prohibition of parking in residential areas.
- b) Signs shall be prominently displayed in all dock and delivery areas advising of the following: engines shall be turned off when not in use; trucks shall not idle for more than three consecutive minutes; telephone numbers of the building facilities manager and the California Air Resources Board to report air quality violations.
- c) Signs shall be installed at each exit driveway providing directional information to the City's truck route. Text on the sign shall read "To Truck Route" with a directional arrow. Truck routes shall be clearly marked per the City Municipal Code.

On an Ongoing Basis

- d) Tenants shall maintain records on fleet equipment and vehicle engine maintenance to ensure that equipment and vehicles are maintained pursuant to manufacturer's specifications. The records shall be maintained on site and be made available for inspection by the City.
- e) Tenant's staff in charge of keeping vehicle records shall be trained/certified in diesel technologies, by attending California Air Resources Board approved courses (such as the free, one-day Course #512). Documentation of said training shall be maintained on-site and be available for inspection by the City.
- f) Tenants shall be encouraged to become a SmartWay Partner.
- g) Tenants shall be encouraged to utilize SmartWay 1.0 or greater carriers.
- h) Tenants' fleets shall be in compliance with all current air quality regulations for on-road trucks including but not limited to California Air Resources Board's Heavy-Duty Greenhouse Gas Regulation and Truck and Bus Regulation.
- i) Information shall be posted in a prominent location available to truck drivers regarding alternative fueling technologies and the availability of such fuels in the immediate area of the World Logistics Center.
- j) Tenants shall be encouraged to apply for incentive funding (such as the Voucher Incentive Program [VIP], Carl Moyer, etc.) to upgrade their fleet.
- k) All yard trucks (yard dogs/yard goats/yard jockeys/yard hostlers) shall be powered by electricity, natural gas, propane, or an equivalent non-diesel fuel. Any off-road engines in the yard trucks shall have emissions standards equal to Tier 4 Interim or greater. Any on-road engines in the yard trucks shall have emissions standards that meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.
- l) All diesel trucks entering logistics sites shall meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025 or be powered by natural gas, electricity, or other diesel alternative. Facility operators shall maintain a log of all trucks entering the

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

facility to document that the truck usage meets these emission standards. This log shall be available for inspection by City staff at any time.

m) All standby emergency generators shall be fueled by natural gas, propane, or any non-diesel fuel.

n) Truck and vehicle idling shall be limited to three (3) minutes.

~~4.3.6.3C~~ ~~The 2012 Regional Transportation Plan includes a zero/near-zero emissions truck corridor along State Route 60. The WLC project shall provide for the establishment of onsite alternative fueling infrastructure (electric charging stations and/or natural gas fueling), which will help facilitate the use of these low-emitting trucks. An alternative fueling facility to serve the WLCSP will be in place prior to the issuance of building permits for more than 25 million total square feet of logistics warehousing within the WLC Specific Plan. This facility may be on or offsite, subject to review and approval by the City.~~

4.3.6.3C Prior to the issuance of building permits for more than 25 million square feet of logistics warehousing within the Specific Plan area, a publically-accessible fueling station shall be operational within the Specific Plan area offering alternative fuels (natural gas, electricity, etc.) for purchase by the motoring public. Any fueling station shall be placed a minimum of 1000 feet from any off-site sensitive receptors or off-site zoned sensitive uses. This facility may be established in connection with the convenience store required in Mitigation Measure 4.3.6.3D.

~~4.3.6.3D~~ ~~The WLC project shall provide a site for the sale of food, fuel, and convenience items to minimize the need for trucks to travel off-project to purchase these goods and services. This facility shall be in place within the project area prior to the issuance of building permits for more than 25 million total square feet of logistics warehousing within the WLC Specific Plan to minimize the need for trucks to traverse through residential neighborhoods.~~

4.3.6.3D Prior to the issuance of building permits for more than 25 million square feet of logistics warehousing within the Specific Plan area a site shall be operational within the Specific Plan area offering food and convenience items for purchase by the motoring public. This facility may be established in connection with the fueling station required in Mitigation Measure 4.3.6.3C.

4.3.6.3E Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such environmental analysis shall be provided with any warehouse plot plan proposing refrigerated space. Any such proposal shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).

~~**Level of Significance After Mitigation.** For Scenario 1, which reflects the worst case of full build of the project in 2012, there are no mitigation measures that can be logically applied. Therefore, the project's impact would remain significant and unavoidable.~~

For Scenario 2, even after mitigation, both the daily and annual emissions of all pollutants would exceed the SCAQMD's regional emission significance levels and would also continue to exceed the localized significance thresholds as well for nitrogen dioxide, PM₁₀, and PM_{2.5} during construction and PM₁₀ during operations. In the absence of feasible mitigation to reduce the proposed project's emission of criteria pollutants to below SCAQMD thresholds, potential localized air quality impacts will remain significant and unavoidable.

Level of Significance After Mitigation. Significant and unavoidable. Table 4.3.V compares the project impacts before and after mitigation for those assessment conditions and pollutants that indicated a significant impact before mitigation. After application of mitigation, the project would continue to exceed the localized significance thresholds at one or more of the existing residences located within the project boundaries for PM₁₀ (24-hour and annual) all assessment conditions. Mitigation does reduce impacts from NO₂ emissions. The project's localized impacts would not exceed any significance thresholds for receptors located outside of the project boundaries.

In summary, those residents inside the project boundaries could be exposed to significant short-term and long-term PM₁₀ concentrations on an ongoing basis. The health effects from particulate matter were discussed earlier and could include the following:

- Particulate matter can cause the following health effects from short-term (24-hour) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.
- Particulate matter can cause the following health effects from long-term exposure (annual): reduced lung function; chronic bronchitis; changes in lung morphology; and/or death.

4.3.6.4 Long-Term Operational Emissions

Impact 4.3.6.4: *Implementation of the proposed project may have the potential to exceed applicable daily thresholds for operational activities.*

Threshold	Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants? For long-term operations, the applicable daily thresholds are: <ul style="list-style-type: none">- 55 pounds of VOC;- 55 pounds of NO_x;- 550 pounds of CO;- 150 pounds of PM₁₀;- 55 pounds of PM_{2.5}; and- 150 pounds of SO_x.
------------------	--

Long-term air pollutant emission impacts that would result from the proposed project are those associated with stationary sources and mobile sources involving any project-related change (e.g., emissions from the use of motor vehicles by project-generated traffic). This analysis assesses the mobile source emissions generated by vehicles driving to and from the proposed land uses, as well as area source emissions generated by project maintenance operations.

Worst-Case Scenario. Projected emissions resulting from operational activities of the proposed project under the worst-case scenario are identified in Table 4.3.XW.

Emissions from the existing on-site residences and fugitive dust are not included in the worst-case analysis. In addition, there may be minor emissions of VOC from the fueling station, depending on what type of fuel is used. However, details regarding the fueling station are currently unknown so the emission source is not estimated. This is a worst-case analysis because it assumes that the entire project would be built-out in 2012. The motor vehicle and truck emission factors are from 2012, which assumes a “dirtier” fleet than would be the case in later years. ~~The emission factor models assume that later on, the average fleet would be newer as people purchase newer cars, which are more efficient and have fewer air pollutants. In addition, no reductions are taken for the model year 2010 trucks that would be accessing the project pursuant to project design features. In addition, no reductions are taken for mitigation measures.~~

As identified in Table 4.3.XW, operational emissions for the proposed project would exceed SCAQMD daily operational thresholds for all criteria pollutants with the exception of SO_x for the “worst-case” 2012 scenario.

Operational Regional Emissions. Table 4.3.YX shows the detailed operational emission sources generated both on site and off site for Phase 1 (2022) and buildout. The table shows particulate matter (PM₁₀ and PM_{2.5}) divided into dust and exhaust sources. As shown in the table, emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} are significant after completion of Phase 1 and after full buildout.

Table 4.3.ZY shows the operational emissions year by year using future year emission factors: year 2022 for Phase 1 (2016 to 2022) and year 2035 for Phase 2 (2023 to buildout). The VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions would be over the SCAQMD’s significance thresholds. The emissions demonstrate that although the number of vehicles and trucks would increase year by year, the emissions do not increase dramatically because the per-vehicle emission factors decrease over time as cleaner vehicles enter the fleet over time.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Combined Construction and Operation. There would be overlapping of construction and operational emissions with project implementation. The maximum daily operational emissions as shown in Table 4.3.ZY were added to the maximum daily construction emissions (from Table 4.3.K) and are shown in Table 4.3.AAZ, which shows all pollutants for all years exceed the SCAQMD thresholds, with the exception of SO_x emissions. SO_x are not shown in the table as they are far below the significance threshold of 150 pounds per day.

As identified in the preceding tables, project-related air quality impacts for all criteria pollutants, with the exception of SO_x, would be significant and mitigation measures are required.

Mitigation Measures. The mitigation measures previously identified under Impact 4.3.6.3 (**Mitigation Measures 4.3.6.3A through 4.3.6.3E**) would reduce operational emissions of criteria pollutants associated with the project. Additionally, the following mitigation measure is required:

~~4.3.6.4A~~ Prior to the issuance of a building permit for each development within the WLCSP, the developer shall demonstrate to the satisfaction of the City that the project incorporates the following:

- ~~a) All tenants shall participate in Riverside County's Rideshare Program. The purpose of the program would be to discourage single-occupancy vehicle trips and encourage alternate modes of transportation such as carpooling, transit, walking, and biking. The program shall provide employees with assistance in using alternate modes of travel, including carpooling encouragement, ride-matching assistance, and vanpool assistance.~~
- ~~b) Storage lockers shall be provided in each building for a minimum of three percent of the full-time equivalent employees based on a ratio of 0.60 employee per 1,000 square feet of building area.~~
- ~~c) Class II bike lanes shall be incorporated into the design for Gilman Springs Road (SR-60 to Alessandro Boulevard), Theodore Street (SR-60 to project), Eucalyptus Avenue (Redlands Boulevard to Theodore Street), and the main roads in the project (Street A, Street B, Street C, Street D, Street E, and Street F).~~
- ~~d) The project shall incorporate pedestrian pathways between on-site uses.~~
- ~~e) Site design and building placement shall provide pedestrian connections between internal and external facilities.~~
- ~~f) The project shall provide pedestrian connections to residential uses within 0.25 mile from the project site.~~
- ~~g) A minimum of two electric vehicle charging stations for automobiles or light duty trucks shall be provided at each building.~~
- ~~h) Each building shall provide secure bicycle storage space equivalent to five percent of the automobile parking spaces provided.~~
- ~~i) Each building shall provide a minimum of two shower and changing facilities within 200 yards of a building entrance.~~
- ~~j) Each building shall provide preferred parking for low emitting and fuel efficient vehicles equivalent to at least eight percent of the required number of parking spaces.~~
- ~~k) All discretionary approvals for development shall include a 250 foot setback along the western portion of the site adjacent to Redland Boulevard, Bay Avenue~~

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

and Merwin Street, from the CDFW property, and between residentially zoned property and logistics buildings in the WLC Specific Plan along Redlands Boulevard, Bay Avenue, and Merwin Street.

- t) ~~Electrical power sources shall be provided for service equipment and docking of trucks to minimize idling emissions and emissions from transportation refrigeration units if such units are to be used. The project applicant shall include in all new lease documents the requirement that tenants shall use only trucks with transportation refrigeration units capable of utilizing electrical hook-ups.~~

4.3.6.4A The following measures shall be incorporated as conditions to any Plot Plan approval within the Specific Plan:

- a) All tenants shall be required to participate in Riverside County's Rideshare Program.
- b) Storage lockers shall be provided in each building for a minimum of three percent of the full-time equivalent employees based on a ratio of 0.50 employees per 1,000 square feet of building area. Lockers shall be located in proximity to required bicycle storage facilities.
- c) Class II bike lanes shall be incorporated into the design for all project streets.
- d) The project shall incorporate pedestrian pathways between on-site uses.
- e) Site design and building placement shall provide pedestrian connections between internal and external facilities.
- f) The project shall provide pedestrian connections to residential uses within 0.25 mile from the project site.
- g) A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building. In addition, parking facilities with 100 parking spaces or more shall be designed and constructed so that at least three percent of the total parking spaces are capable of supporting future electric vehicle supply equipment (EVSE) charging locations. Only sufficient sizing of conduit and service capacity to install Level 2 Electric Vehicle Supply Equipment (EVSE) or greater are required to be installed at the time of construction.
- h) Each building shall provide indoor and/or outdoor - bicycle storage space consistent with the City Municipal Code and the California Green Building Standards Code.-Each building shall provide a minimum of two shower and changing facilities for employees.
- i) Each building shall provide preferred and designated parking for any combination of low-emitting, fuel-efficient, and carpool/vanpool vehicles equivalent to the number identified in California Green Building Standards Code Section 5.106.5.2 or the Moreno Valley Municipal Code whichever requires the higher number of carpool/vanpool stalls.
- j) The following information shall be provided to tenants: onsite electric vehicle charging locations and instructions, bicycle parking, shower facilities, transit availability and the schedules, telecommunicating benefits, alternative work schedule benefits, and energy efficiency.

It is important to note that, in addition to the operational activity mitigation measures identified previously, future development would need to incorporate physical attributes and operational programs that will act to generally reduce operational-source pollutant emissions including GHG

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

emissions. These project characteristics are identified in Section 4.7, *Climate Change and Greenhouse Gas Emissions*, of this EIR.

Level of Significance after Mitigation. ~~he project may employ workers locally from the City. This has the benefit of improving the local jobs/housing balance leading to air quality benefits in terms of shorter trip lengths, which lead to lower emissions than if the workforce was derived from distant locations. Mitigated operational emissions for full buildout are shown in Table 4.3.ABAA. Also shown in the table are existing emissions from the onsite agricultural activities. When those emissions are reduced from 3 percent pursuant to **Mitigation Measure 4.3.6.4A** (see greenhouse gas analysis for description of mitigation reductions). However, even subtracted from the project emissions, emissions are still over the significance thresholds. Note that the emissions are based on conservative assumptions such as truck trips and miles traveled. Even with mitigation, emissions are still significant. Despite implementation of mitigation measures, emissions of criteria pollutants would still exceed SCAQMD significance thresholds resulting in a significant and unavoidable operational air quality impact. Therefore, there could be cumulative health effects from ozone, PM₁₀, and PM_{2.5} as described earlier in this section and summarized as follows:~~

- Ozone can cause the following health effects: irritate respiratory system; reduce lung function; breathing pattern changes; reduce breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; and/or increase mortality risk.
- Particulate matter (PM₁₀ and PM_{2.5}) can cause the following health effects from short-term (hours/days) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.
- Particulate matter can cause the following health effects from long-term exposure: reduced lung function; chronic bronchitis; changes in lung morphology; and/or death.

Operational emissions (not including construction emissions) at buildout in this revised analysis as compared with the estimates in the DEIR are as follows:

- Emissions of VOC have decreased slightly by 140 pounds/day, in accordance with a reduction in square feet for the project and a revision of emission factors.

Significant?	Yes	Yes	Yes	No	Yes	Yes

- Emissions are from local vehicles, trucks, natural gas, emergency generators, forklifts, yard trucks, painting, and consumer products. There is no reduction from existing onsite emissions.
 - Emissions for Phase 1 are years 2016-2022. Emissions for Phase 2 are year 2023-buildout operational emissions are assumed to be zero in 2015 when project construction commences.
 - PM₁₀ and PM_{2.5} emissions include exhaust and road dust.
 - Landscaping emissions are negligible.
 - * Sulfur dioxide emissions as estimated in the Draft EIR were substantially less than the threshold of 150 pounds per day. Thus, emissions reflecting decreased vehicle miles traveled would also be less than significant.
- VOC = volatile organic compounds; NO_x = nitrogen oxides; SO₂ = sulfur dioxide; CO = carbon monoxide; PM₁₀ and PM_{2.5} = particulate matter

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- For the unmitigated emissions, NO_x, CO, and PM₁₀ in the revised analysis are about 1,800, 2,200, and 600 pounds per day lower than in the DEIR, respectively. For the mitigated emissions, NO_x, CO, and PM₁₀ in the revised analysis are about 2,000, 2,000, and 600 lower than in the DEIR, respectively. The revised emissions are lower because the emission factors for the mobile trucks and vehicles have been revised and because the vehicle miles traveled (VMT) has decreased. In the DEIR, the VMT at buildout for heavy duty trucks was 730,100 miles per day and in the revised analysis, the diesel vehicles is 420,400 miles per day; therefore, the VMT for diesel vehicles decreased by approximately 309,700 miles per day. The VMT decreased because the analysis in the DEIR assumed a conservative, but arbitrary 50 miles per trip for all heavy duty trucks and in the revised analysis the VMT is based on actual model results for all trips as estimated in the Traffic Impact Analysis for nearly 500 freeway and roadway segments. The VMT for light duty vehicles increased by approximately 64,600 miles: in the DEIR, the VMT for light duty vehicles was 549,700 miles per day and in the revised analysis, the VMT for gasoline vehicles is 614,300 miles per day.
- Emissions of PM_{2.5} in the revised analysis have increased by approximately 150 pounds per day because of the use of updated emission factors.

During overlap of construction and operation, VOC, NO_x, CO, PM₁₀, and PM_{2.5} would continue to exceed SCAQMD significance thresholds after mitigation, as shown in Table 4.3.ACAB. Therefore, impacts are significant and unavoidable. The emissions do not take into account the existing onsite agricultural emissions.

Table 4.3.ACAB: Combined Construction and Operational Regional Air Pollutant Emissions (Year by Year, pounds per day) – Mitigated (revised)

4.3.6.5 Impacts to Sensitive Receptors

Impact 4.3.6.5: *Implementation of the proposed project may have the potential to result in impacts to sensitive receptors.*

Threshold	<p>Would the proposed project expose sensitive receptors to substantial pollutant concentrations?</p> <p>For localized air quality impacts, the applicable thresholds are:</p> <ul style="list-style-type: none"> - 20 ppm (1 hour) and 9 ppm (8 hours) of CO during construction and operation; - 0.18 ppm (State 1 hour), 0.100 ppm National 1 hour), and 0.030 ppm (Annual) of NO_x during construction and operation; - 10.4 µg/m³ (24-hours) and 1 µg/m³ (Annual) of PM₁₀ during construction - 2.5 µg/m³ (24 hours) and 1.0 µg/m³ (Annual) of PM₁₀ during operations; and - 2.5 µg/m³ (24 hours) of PM_{2.5} during operations. - <u>During time periods when construction and operational activities occur at the same time, the SCAQMD recommends application of the significance threshold for operations.</u> <p>For health risk impacts, the applicable thresholds are:</p> <ul style="list-style-type: none"> - Maximum Individual Cancer Risk: An increased cancer risk greater than 10 in 1 million (1.0×10^{-5}) at any receptor location; - <u>Cancer burden: An increase in cancer burden of 0.5 or</u> - Non-cancer chronic hazard indices (HI): A cumulative increase for any target organ system exceeding 1.0 at any receptor location.
-----------	--

Localized Air Quality Impacts. The construction and operation of the project would result in the emissions of carbon monoxide, oxides of nitrogen, and particulate matter. As noted in the discussion of Impact 4.3.6.3, construction and operation of the proposed project have the potential to exceed localized air quality significance thresholds for oxides of nitrogen (NO_x) and particulate matter (PM₁₀ and PM_{2.5}) that may expose sensitive receptors to substantial pollutant concentrations. These impacts are shown in Impact 4.3.6.3.

Acute and Chronic Health Risk Impacts. Acute and chronic health risk impact analysis examines the increased risk associated with air pollution for non-cancer health outcomes. Since these are non-cancer health impacts, as described below, the impacts are analyzed separately from increased cancer risk associated with air pollution.

~~The construction and operation of the project would result in the emissions of several toxic air contaminants, the most ubiquitous being diesel particulate matter (diesel PM), which constitutes in excess of 80 percent of the estimated airborne inhalation cancer risk in the Basin. Past studies have indicated that exposures to diesel PM can have both short-term and long term non-cancer health effects. The construction and operation of the project would not emit any toxic chemicals in any significant quantity other than vehicle exhaust. While there may be other toxic substances in use on site, compliance with State and Federal handling regulations will bring these emissions to below a level of significance.~~

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Exposure to diesel exhaust can have immediate (acute) health effects, such as irritation of the eyes, nose, throat, and lungs, and can cause coughs, headaches, light headedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. However, according to the rulemaking on *Identifying Particulate Emissions from Diesel-Fueled Engines as a Toxic Air Contaminant* (CARB 1998), the available data from studies of humans exposed to diesel exhaust are not sufficient for deriving an acute non-cancer health risk guidance value. ~~While the lung is a major target organ for diesel exhaust, studies of the gross respiratory effects of diesel exhaust in exposed workers have not provided sufficient exposure information to establish a short-term non-cancer health risk guidance value for respiratory effects.~~

The revised analysis, however, does derive an estimate of acute non-cancer risks by examining the acute health effects of the various toxic components that comprise diesel and gasoline emissions. There is specific guidance for estimating the acute non-cancer hazards from these toxic components based on chemical profiles established by the CARB which was used in the revised analysis to determine the project's acute non-cancer hazards.

To determine the project's chronic non-cancer hazard impact, the highest annual diesel PM concentration was determined covering the years 2015 (the commencement of project construction) to 2035 (the full build out of the project). In this regard, the highest annual average diesel PM concentration prior to mitigation determined through air dispersion modeling was 1.02 ug/m³, at an existing residence located within the project boundaries. This diesel PM concentration was due to the impacts of diesel PM emissions from the off-road construction equipment and operation equipment. This level of diesel PM impact results in a chronic non-hazard index of 0.20. This hazard index is less than the SCAQMD's significance level of 1.0, and is, therefore, less than significant.

The estimation of the acute non-cancer hazard index requires the estimation of the maximum 1-hour impacts of total organic gases (TOG). Estimates of the project's maximum 1-hour TOG emissions were derived from the project's peak hour traffic data along the nearly 500 roadway segments contained within the assessment and then speciated or broken down into the various toxic air contaminant components by fuel type, gasoline and diesel. The acute non-cancer hazard index was determined for a worst-case condition that assumed the project would be completely built out in 2012 with the project's attendant traffic and emission estimates as they would exist in 2012. This condition is the same as the Project Phase 1 and Phase 2 Full Build Out (2012) condition assumed in the Localized Significance Threshold assessment provided earlier. Based on this information, the maximum acute non-cancer hazard index found at any receptor within the model domain was 0.07, which is less than the SCAQMD's non-cancer hazard index of 1.0, and, therefore, is less than significant.

Therefore, the potential for short-term acute and chronic exposure from diesel exhaust are considered to be less than significant and no mitigation is required.

Cancer Risks. ~~As noted in Section 4.3.3, *Methodology*, the project health risk assessment examined two scenarios:~~

- ~~Scenario 1: "No Project" scenario in which cancer risks are estimated given vehicle traffic and diesel PM emissions spanning the 70-year cancer risk exposure time period from the existing condition 2012 to 2081 under the assumption that existing land uses plus other past, present, and reasonably foreseeable projects (both land development and roadway improvements) are implemented in 2017, 2022, and 2035. Within the City of Moreno Valley, full buildout of the General Plan was assumed in 2035, except for the project site, which was assumed to be unchanged from existing conditions.~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Scenario 2: the “With Project” scenario shows the effect of project-related construction and operational traffic diesel PM emissions if the project were built out in accordance with its proposed phased buildout schedule and then added to the No Project scenario during the 70-year cancer exposure time period from 2012 to 2081. This scenario forms the basis of comparison with the “No Project” to quantify the incremental impacts from the project.

Table 4.3.Z compares the total operational diesel PM emissions estimated for Scenario 1 “No Project” and Scenario 2 “With Project” including project truck yards, local roadway network internal to the project site, local surface streets, and freeway mainline segments in this assessment for the years 2012, 2017, 2022, and 2035.

Table 4.3.Z: Operational Diesel PM Emissions (pounds per day)

Year	Daily Diesel PM Emissions (pounds per day)		
	Scenario 1 (No Project)	Scenario 2 (With Project)	Project Increment
2012	823	823	0
2017	265	289	24
2022	260	314	54
2035	362	413	51

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment Report, January 2013.

Of note from the above table is that diesel PM emissions decline significantly from the existing condition in 2012 throughout the future years due to the effects of mandated emission controls on heavy duty diesel vehicles. Further, the Scenario 2 “With Project” emissions for 2017, 2022, and 2035 are all less than the existing 2012 emissions. Note further that the future decline in emissions would even be greater than indicated except that the emission totals reflect growth in future vehicle traffic that offsets some of the emission declines resulting simply from the mandated emission controls.

Table 4.3.AA compares the maximum cancer risks for Scenario 1, “No Project,” Scenario 2, “With Project,” and the project’s incremental impact at three locations: at the maximum individual cancer risk anywhere in the area covered by the dispersion model, at the sensitive receptors located within the boundaries of the WLC Specific Plan, and at the sensitive receptors located in the residential areas to the west of the project across Redlands Boulevard. Note that each scenario quantified cancer risks over the 2012–2081 70-year risk exposure time period. Note further that the project’s incremental impacts include both construction and operational emissions.

Table 4.3.AA: Estimated Cancer Risks, Without Mitigation

Receptor Location	Cancer Risk (risk per million) ^A				Project Increment Exceeds Threshold?
	Scenario 1 No Project	Scenario 2 With Project ^B	Project Increment ^B	Significance Threshold	
Maximum Individual Cancer Risk ^C	183.9	190.4	6.5	40	No
Cancer Risk within the Specific Plan ^D	21.0	121.7	100.7	40	Yes
Cancer Risk in Residential Areas Across Redlands Boulevard ^E	25.0	47.2	22.2	40	Yes

Table 4.3.AA: Estimated Cancer Risks, Without Mitigation

Receptor Location	Cancer Risk (risk per million) ^A				Project Increment Exceeds Threshold?
	Scenario 1 No Project	Scenario 2 With Project ^B	Project Increment ^B	Significance Threshold	

- A. 70-year lifetime exposures over the 2012 to 2081 time period.
 B. Project's incremental impacts assume unmitigated construction diesel PM emissions.
 C. The maximum individual cancer risk is located near the intersection of Interstate 10 and State Route 60 near the City of Beaumont.
 D. The maximum affected sensitive receptor located within the Specific Plan is located near the Intersection of Theodore Street, Street E and Street F.
 E. The maximum impacted sensitive receptor within the residential areas to the west of the project across Redlands Boulevard is located near the intersection of Redlands Boulevard and Eucalyptus Avenue.
 Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, January 2013.

As noted in Table 4.3.AA, the project's incremental cancer risks exceed the SCAQMD's cancer risk significance threshold of 10 in a million at sensitive receptor locations both within the WLC Specific Plan boundaries (existing residences) as well as within the residential areas located to the west of the WLC Specific Plan across Redlands Boulevard.

Figure 4.3.9 shows a plot of the "No Project" cancer risks while Figure 4.3.10 shows the "With Project" cancer risks. Figure 4.3.11 shows a plot of the project's incremental cancer risks compared to the No Project scenario prior to any mitigation. Figure 4.3.12 provides the cancer risk within the immediate vicinity of the project.

As shown in Table 4.3.AA, the estimated cancer risk at the sensitive receptors located within the boundaries of the Specific Plan from the project is 100.7 in one million, above the threshold of 10 in one million. Within the existing residential areas to the west of the project across Redlands Boulevard, the cancer risk from the project is 22.2 in 1 million, also above the threshold of 10 in one million. This is a significant impact and mitigation is required.

A risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the specific concentration over 70 years (an assumed lifetime). This risk would be an excess cancer risk that is in addition to any cancer risk borne by a person not exposed to these air toxics.⁴

Cancer Risks. As noted in Section 4.3.3, *Methodology*, the project health risk assessment examined the following condition for impacts to both sensitive/residential and worker receptors:

Proposed Project Development condition which evaluates the impacts of project-related construction and operational traffic diesel PM emissions as if the project were built out in accordance with its proposed phased construction and operational buildout schedule commencing with the construction of Phase 1 in 2015, build out of Phase 1 in 2022, and the full build out in 2035.

This HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study. The revised mitigation conditions require that all diesel trucks accessing the project during operation be model year 2010 or newer and that all on-site equipment be Tier 4. The results of the HEI Study indicate that the project mitigation requiring the application of

¹ Definition of a 1 in a million cancer risk from the US EPA, Technology Transfer Network Air Toxics, Glossary of Key Terms, Website: www.epa.gov/ttn/atw/natamain/gloss1.html.

Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.

Cancer Risk for Sensitive/Residential Receptors. To provide context with the methodology shown in the DEIR, Table 4.3.AC presents the results of the health risk assessment as presented in the DEIR. The cancer risk estimated applied the “Former OEHHA Guidance” and the now out-of-date EMFAC2011 mobile source emission model at several receptor locations inside and outside of the project boundary. For reference, a risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the specific concentration of diesel PM over the duration of the exposure. This risk would be an excess cancer risk that is in addition to any cancer risk borne by a person not exposed to these air toxics¹.

Table 4.3.AD presents the estimated cancer risks applying the “Current OEHHA Guidance” and the use of the EMFAC2014 mobile source emission model. The results are provided separately for project construction diesel PM emissions, operational diesel PM emissions, and the total project diesel PM emissions prior to the application of emission mitigation. As noted therein, the estimated cancer risks are far greater than the corresponding risks estimated using the “Former OEHHA Guidance”. This is because of the use of the age-specific factors (e.g., age-sensitivity factors and daily breathing rates) used in the “Current OEHHA Guidance” during the first 16 years, and in particular the first 2 years, of the 30-year exposure duration that greatly influence the risks over the entire 30-year exposure duration. The “Former OEHHA Guidance” used a 70-year exposure but did not make use of any age-specific factors. Because of the use of the age-specific early-in-life factors under the “Current OEHHA Guidance”, the estimated cancer risks would result in an exceedance of the 10 in a million cancer risk significance threshold in the first year of the project construction in 2015 alone. As can be seen from Table 4.3.AD the construction impacts contribute the greatest proportion of the total impact particularly under the “Current OEHHA Guidance”.

On the basis of the results shown in Table 4.3.AD based on the application of the “Current OEHHA Guidance”, the project would exceed the SCAQMD’s cancer risk significance threshold of 10 in a million prior to the application of mitigation and would represent a significant impact. However, this analysis is based on the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study and discussed in more detail below.

World Logistics Center Project**

Figures 4.3.18a and 4.3.18b show the incremental cancer risks for the project location as calculated based on the EMFAC2014 emission model and the application of the “Current OEHHA Guidance” cancer risk estimation methodology and based on the assumption that diesel exhaust from old technology engine diesel emissions can cause cancer. The figures show the results prior to the application of mitigation.

Estimates of Cancer Risk for School Site Receptors. Cancer risk at school sites in the area with the application of the “Current OEHHA Guidance” is provided in Appendix D. Prior to the application of the mitigation, the maximum cancer risk is 3.2 in a million at Ridgecrest Elementary School. The cancer risk at the proposed high school at Ironwood Avenue and Quincy Street is 3.4 in a million. Impacts at schools are less than the 10 in one million significance threshold prior to mitigation and are less than significant.

Estimates of Cancer Risk for Worker Receptors. Estimates of worker exposures were prepared based on the assumption of a 25-year exposure duration for 250 days per year and 8 hours per day as described in the methodology section above and in the revised Air Quality, Greenhouse Gas, and Health Risk Assessment Report (Appendix D). Note that the OEHHA early-in-life age factors do not apply to worker receptors. The highest worker cancer risk estimates prior to the application of mitigation are greater than the SCAQMD cancer risk threshold of 10 in a million at 10.1 in a million inside the project boundaries and 4.1 in a million outside the project boundaries.

However, this analysis is based on the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study and discussed in more detail below.

Estimates of Cancer Burden. In response to comments received on the DEIR, an estimate of cancer burden was developed in this revised analysis. The cancer burden calculation provides an estimate of the increased number of cancer cases as a result of exposures to TAC emissions. The total cancer burden is the product of the number of persons in a population area (such as a census tract) and the estimated individual risk from TACs in that population area and then summed over all population areas. The SCAQMD indicates that the burden calculation include those population units having an incremental cancer risk of 1 in a million or greater.

Cancer risks were estimated at the geographical center (centroid) of 2,360 census tracts that spanned the Basin from Palm Springs to the City of Los Angeles. For the 70-year exposure duration with the inclusion of the “Current OEHHA Guidance”, the cancer burden is estimated to be 1.6 out of a population of about 880,000 individuals that were estimated to have a cancer risk of 1 in a million or more. The SCAQMD has established a threshold for cancer burden of 0.5. Therefore, the project would exceed the SCAQMD’s cancer burden significance threshold prior to the application of mitigation.

Informational Purposes: Morbidity and Mortality. There is no established threshold or approved methodology for calculating morbidity and mortality. For purposes of this assessment, morbidity is a term for describing how an external effect such as air pollution would exacerbate an existing illness and other health effect. Mortality is another term for death. The following represents the result of the calculations for long-term mortality and various morbidity health endpoints due to diesel PM for the project prior to the application of mitigation. The locations for the morbidity/mortality estimations were at the location with the highest combined annual diesel PM concentration and census tract population such that the change in diesel PM would affect the greatest number of people. A cumulative total of each mortality/morbidity health endpoint was also calculated that totals the number of added cases of an identified health endpoint at each census tract location within the entire region potentially impacted by the project emissions.

The estimates of mortality and morbidity impacts are based on the application of concentration-response functions (C-R functions) that relate the change in the number of adverse health effect

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

incidences in a population to a change in air pollutant concentration experienced by that population. However, such estimations are subject to great uncertainty. Sources of uncertainty include emission estimates, population exposure estimates, form of C-R functions, baseline rates of mortality and morbidity that are entered into the C-R functions, and occurrence of additional not-quantified adverse health effects. It should be noted that the nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as sulfur dioxide, NO₂, CO, and ozone that tend to co-occur with PM in ambient air, greatly increase the complexity of deriving accurate PM concentration-response functions.

Exposure to the Project’s diesel PM emissions prior to mitigation would result in an increase in mortality of approximately 0.002 additional cases per year at the location where the project has its maximum impact from diesel PM emissions or 0.2 additional cases over all of the census tracts contained in the modeling domain.

Table 4.3.AE summarizes the estimates of the various morbidity health endpoints due to the emissions from the project. As shown in this table, the project would not result in a single new added case of a quantified health endpoint either at either the location where the impact would be greatest or cumulatively over the entire air dispersion modeling domain examined in this assessment (approximately 3,500 square miles, potentially impacted by the project).

Table 4.3.AE: Estimates of Various Morbidity Health Endpoints from Project Emissions Without Mitigation (new table)

City of Moreno Valley General Plan. The project is consistent with the following City of Moreno Valley General Plan (2006) policies to help reduce air quality impacts to sensitive receptors:

- Policy 6.7.4 Locate heavy industrial and extraction facilities away from residential areas and sensitive receptors. Project consistency: The project would not contain heavy industrial and extraction facilities (such as a gravel mine). The project would contain warehousing, distribution, and light logistics. Therefore, the project is consistent with this policy. Nonetheless, the proposed plan places this development at the eastern end of the City, reducing the potential residential/development interface.
- Policy 6.7.5 Require grading activities to comply with South Coast Air Quality Management District’s Rule 403 regarding the control of fugitive dust. Project consistency: The project would

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

comply with all applicable rules and regulations. Mitigation Measure 4.3.6.2A requires that the project demonstrate compliance with Rule 403.

Mitigation Measures. The mitigation measures previously identified under other impact sections are required (**Mitigation Measures 4.1.6.1A, 4.3.6.2A, 4.3.6.2B, 4.3.6.2D, 4.3.6.3A, 4.3.6.3B, 4.3.6.3C, 4.3.6.3D, and 4.3.6.3E**) to reduce construction and operational emissions of criteria pollutants would reduce the estimated cancer risks associated with the project.

Level of Significance after Mitigation. ~~Table 4.3.AB summarizes the 70-year lifetime cancer risks after implementation of mitigation for the project-related health risk impacts. As shown, cancer risk exceed the threshold of 10 in one million. Despite implementation of mitigation measures, impacts remain significant and unavoidable. Figure 4.3.13 displays the project's cancer risks after mitigation.~~

Table 4.3.AB: Estimated Cancer Risks for Sensitive Receptors – With Mitigation

Receptor Location	Cancer Risk (risk per million) ^A				Project Increment Exceeds Threshold?
	Scenario 1 No Project	Scenario 2 With Project ^B	Project Increment ^B	Significance Threshold	
Maximum Individual Cancer Risk ^C	183.9	190.2	6.3	10	No
Cancer Risk within the Specific Plan ^D	21.0	97.8	76.8	10	Yes
Cancer Risk in Residential Areas Across Redlands Boulevard ^E	25.0	45.9	20.9	10	Yes

A. 70-year lifetime exposures over the 2012 to 2081 time period.

B. Project's incremental impacts assume unmitigated construction diesel PM emissions.

C. The maximum individual cancer risk is located near the intersection of Interstate 10 and State Route 60 near the City of Beaumont.

D. The maximum affected sensitive receptor located within the Specific Plan is located near the Intersection of Theodore Street, Street E and Street F.

E. The maximum impacted sensitive receptor within the residential areas to the west of the project across Redlands Boulevard is located near the intersection of Redlands Boulevard and Eucalyptus Avenue.

Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, January 2013.

Level of Significance after Mitigation for Worker and School Children Cancer Risk. Less than Significant. The cancer risk impacts are less than the threshold of 10 in a million for workers (1.3 in one million onsite; 0.5 in one million offsite) and school children (0.7 in one million). More importantly, HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study.

Level of Significance after Mitigation for Localized Particulate Matter Impacts. Significant and unavoidable. In summary, those residents inside the project boundaries could be exposed to significant short-term and long-term PM10 concentrations on an ongoing basis. The health effects from particulate matter were discussed earlier and could include the following:

- Particulate matter can cause the following health effects from short-term (24-hour) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.
- Particulate matter (PM₁₀) can cause the following health effects from long-term exposure (annual): reduced lung function; chronic bronchitis; changes in lung morphology; and/or death.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Level of Significance after Mitigation for Sensitive Receptor Cancer Risk. Less than significant.

Mitigation Measure 4.3.6.3B would require that all diesel trucks that access the project site be model year 2010 or later and limits truck and vehicle idling to 3 minutes. Mitigation Measure 4.3.6.2A would require that Tier 4 construction equipment be used on the project site. These mitigation measures would reduce the cancer risk from the project.

Mitigation Measure 4.3.6.3C may encourage alternative fueled vehicles and trucks on the project site; however, no reduction is taken. Mitigation Measure 4.3.6.3D may reduce vehicle miles traveled to food establishments; however, no direct reduction is taken. Mitigation Measure 4.3.6.3E requires that if transportation refrigeration units are to be used, electrical hookups would be required. In addition, refrigerated space is prohibited unless the impacts do not exceed any environmental impacts identified in the EIR. Therefore, it is assumed in the unmitigated and mitigated estimates that there would be no transportation refrigeration units.

Table 4.3.AF shows the cancer risks estimated with the “Current OEHHA Guidance” after application of mitigation. As noted, the cancer risks are substantially less after mitigation. However, the SCAQMD cancer risk significance threshold would continue to be exceeded at locations within the project boundaries but not at any residential areas outside of the project boundary. The large reduction in cancer risk after mitigation is attributable principally to the reduced diesel PM attributed to mitigation such as the commitment to Tier 4 construction equipment. The impact of this mitigation is largely felt during the first 3 to 5 years of construction when the “Current OEHHA Guidance” assigns large age sensitivity factors to the first few years of the 30-year exposure duration. Figure 4.3.19a and Figure 4.3.19b provided a regional and close-in view of the risks, respectively after the application of mitigation. Even so, this HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study, as discussed in more detail below. Through mitigation, new technology diesel engines are required for the WLC project. The revised mitigation conditions require that all diesel trucks accessing the project during operation be model year 2010 or newer and that all on-site equipment be Tier 4. The results of the HEI Study indicate that the project mitigation requiring the application of Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.

The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.

Mitigation measures 4.3.6.2A and 4.3.6.3B require 2010-compliant trucks for operation and Tier 4 equipment for construction, both of which rely on diesel particulate filters similar to those tested in the HEI study. These vehicles reduce emissions by 90% when compared to 2006 vehicles and by 99% when compared to uncontrolled diesel engines. Recent emissions testing by CARB revealed that these diesel engines are cleaner than originally estimated. These findings, which are reflected in the latest CARB emissions factor model EMFAC2014, are 70% cleaner than previously estimated.

Beginning in 2001, USEPA and CARB began issuing a series of regulations that require new diesel-powered vehicles and equipment to use the latest emissions control technology. This technology relies on two components. The first is a diesel particulate filter, which is capable of reducing particulate matter emissions by over 90% (required for new engines beginning in 2007). The second technology is selective catalytic reduction, which reduces emissions of nitrogen oxides by over 90% (required for new engines beginning in 2010). Diesel emissions from equipment equipped with this technology is referred to as NTDE. As a result of the advances in emission control technology, USEPA, CARB, and other government and industry stakeholders commissioned a series of studies called the Advanced Collaborative Emissions Study (ACES). ACES has been guided by an ACES

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Steering Committee consisting of representatives of HEI and the Coordinating Research Council (CRC: a nonprofit organization that directs engineering and environmental studies on the interaction between automotive or other mobility equipment and petroleum products), along with the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others. The Health Effects Institute (HEI), funded in part by USEPA, was selected to oversee Phase 3 of ACES.

Phase 3 of ACES evaluated whether emissions from new technology diesel engines cause cancer or other health effects. Specifically, it evaluated the health impacts of a 2007-compliant engine equipped with a diesel particulate filter. HEI found that lifetime exposure to new technology diesel exhaust (NTDE) did not cause carcinogenic lung tumors. The study also confirmed that the concentrations of particulate matter and toxic air pollutants emitted from NTDE are more than 90% lower than emissions from traditional older diesel engine.

As a result of the very low emissions from new technology diesel engines and the research conducted by HEI, it is projected that the project would not result in any new cancer risks from the project's diesel emissions. Therefore, the project would have a less than significant health risk impact.

As discussed above, there are no significant health risk impacts associated with the project. However, under a very conservative application of the "Current OEHHA Guidance" to the proposed project (which was provided for informational purposes), three homes within the Specific Plan area could be identified as having a health risk in excess of the SCAQMD threshold. Although air quality significance thresholds have been established for outdoor environments, a significant portion of human exposure to air pollutants occurs indoors where people spend more than 90 percent of their time (USEPA 2011). One approach to reduce exposure is the installation of high efficiency panel filters inside the HVAC system. Air filters and other air-cleaning devices are designed to remove pollutants from indoor air. Some are installed in the ductwork of a home's central heating, ventilating, and air-conditioning (HVAC) system to clean the air in the entire house. In studies of the effectiveness of air filtration systems in classrooms (SCAQMD 2009) and by the EPA in residences (USEPA 2009b), the combination of an HVAC system with a high performance panel filter reduced indoor levels of fine particulate matter, PM_{2.5} and smaller particles by 70 to 90 percent.

The use of a filtration system consisting of the application of filters with a rating of ASHRAE Standard 52.2 MERV-13 is sufficient to capture a significant portion of the diesel particulate matter. However, the filtration system would not remove the smallest of particles (less than approximately 0.01 to 0.2 micron in diameter). MERV-13 filters would, however, reduce particles in the range of 0.3 to 1 micron by up to 75 percent and particles larger than 1 micron by 90 percent (see Table 1 of the Addendum to CARB 2012). Based on measurement studies of the size distribution of the collected DPM, approximately 0.1 to 10 percent of the total DPM mass includes particles between 0.01 and 0.2 micrometer in diameter, particles between 0.3 and 1 micrometer in diameter comprise 70 percent of the total DPM mass, and particles above 1 micrometer comprise 5 to 20 percent of the total DPM mass (DieselNet.com 2002).

Since the cancer risk from DPM is calculated from the mass of DPM emitted, the quantity of DPM reduced by the action of air filters would thus equate to a reduction in cancer risk. The application of MERV-13 air filter filtration system would result in a reduction of DPM exposures by approximately 70 percent.

DPM Size: 0.01 to 0.2 micrometers 0.3 to 1 micrometers Greater than 1 micrometer

(10% total mass x 0% reduction + 70% total mass x 75% reduction + 20% total mass x 90% reduction)

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Attributing an adjustment for time that windows might be open, residents would be outside, or for different compounds that result in the cancer risk would reduce the efficacy of the filters by about 20 percent, bringing the total cancer risk reduction from the filters to 50 percent.

Absent the results of the HEI study, installation of air filters meeting the requirements discussed above on the three identified homes within the WLCSP area would reduce the OEHHA-calculated risk to below 10 in one million. The use of the filters would bring the OEHHA-calculated risk below the SCAQMD threshold eliminating any possible risk from the project on those three homes within the Specific Plan area. However, based upon the results of the HEI study, health risk impacts are less than significant and no further mitigation is required.

In summary, the implementation of all the recommended mitigation measures, including the requirement to use 2010 diesel engine emissions standards and Tier 4 construction equipment, will reduce the OEHHA-calculated cancer risk to below 10 in one million on all but three existing residences within the WLCSP boundary. However, the HEI study indicates the use of 2010 diesel engines and TIER 4 equipment will eliminate the project cancer risk, therefore, there will be no impacts to the three homes and no mitigation is required.

Finally, note further that after application of mitigation, the cancer risk burden is estimated at 0.10 based on the “Current OEHHA Guidance” which is less than the SCAQMD cancer burden significance threshold of 0.5, based on the assumption that diesel exhaust can cause cancer. Therefore, the project would not exceed the SCAQMD’s cancer burden significance threshold.

As requested in comments received during the DEIR comment period, an analysis was conducted to compare cancer risks for a design buffer area of 250 feet from the project boundaries (this is the current project design) to a buffer area of 1,000 feet from the property boundary based on the “Current OEHHA Guidance”. As shown in Table 4.3.AG, the results for the maximum incremental cancer risk are nearly identical for the 250-foot buffer and the 1,000-foot buffer. The 1,000-foot buffer would not appreciably reduce air quality impacts. More importantly, as result of revised mitigation measures such as 4.3.6.2.A that commits to cleaner construction equipment, there is no significant health impact outside the project boundaries for residents, workers, or other sensitive receptors that would be affected by an increased buffer area. That analysis assumes that traditional diesel equipment would be used as opposed to new technology diesel (which does not contribute to cancer risk), as required by project mitigation measures. As shown in Figure 4.3.20, the locations of the 10 in one million cancer risk contour line for the project design and the 1,000 foot buffer under the “Current OEHHA Guidance” exposure duration are coincident and overlap each other.

Table 4.3.AF: Estimated Cancer Risks, 30-Year Exposure Duration for Sensitive/Residential Receptors, Based on the “Current OEHHA Guidance”, With Mitigation

Receptor Location	Incremental Cancer Risk During Project Construction (risk/million)	Incremental Cancer Risk During Project Operation (risk/million)	Total Incremental Cancer Risk ⁽¹⁾ (risk/million)	SCAQMD Cancer Risk Significance Threshold (risk/million)	Exceeds Threshold?
Maximum risk anywhere in the modeling domain ⁽²⁾	11.4	5.6	17.0	10	Yes

Risk in Perspective. To better understand cancer risk, even though new technology diesel exhaust does not cause cancer according to the HEI study, it helps to understand risk in other contexts. For instance, SCAQMD estimates that the risk of developing cancer from all sources of air pollution in Southern California is approximately 367 in one million. According to the National Cancer Institute, Americans face an overall risk of developing cancer from all causes of 408,000 in one million. Figure 4.3.21 presents the project risk in perspective with other lifetime risks in the United States based on mortality statistics. As shown in the figure, the project cancer risk (the risk of developing cancer, not dying of cancer) has a slightly higher risk than dying from a lightning strike and lower risk than accidental drowning.

4.3.7 Cumulative Impacts

4.3.7.1 Short-Term Air Quality Impacts

The cumulative area for air quality impacts is the Basin. It is generally accepted that if a project exceeds the regional threshold for a nonattainment pollutant, then it would result in a cumulatively considerable net increase of that pollutant and result in a significant cumulative impact. The Basin is currently in nonattainment for ozone, ~~nitrogen dioxide, and particulate matter~~ (PM₁₀ and PM_{2.5}). The implementation of the project would contribute criteria pollutants to the area during project construction. A number of individual projects in the area may be under construction simultaneously with the proposed project. Depending on construction schedules and actual implementation of projects in the area, generation of fugitive dust and pollutant emissions during construction would result in substantial short-term increases in air pollutants. Each project would be required to comply with the SCAQMD's standard construction measures; however, despite adherence to SCAQMD's standard construction measures and **Mitigation Measures 4.3.6.2A through 4.3.6.2D** identified previously, project-related emissions would still exceed applicable SCAQMD regional thresholds for ~~all criteria pollutants~~ VOC, NOx, and CO. Therefore, cumulative impacts associated with short-term air quality impacts would be significant and unavoidable.

4.3.7.2 CO Hot Spot Impacts

As identified in Section 4.3.5.2, no significant CO hot spot impacts would occur. It is anticipated that CO emissions in the future will decrease with advances in technology. As previously identified, background concentrations in future years are anticipated to continue to decrease as the concerted effort to improve regional air quality progresses. Therefore, CO concentrations in the future years would generally be lower than existing conditions. Based on the analysis, because no CO hot spot impacts would occur, it is reasonable to assume that a less than significant cumulative CO impact would occur.

4.3.7.3 Long-Term Regional Air Quality Impacts

As previously identified in Tables 4.3.M, 4.3.ABAA, and 4.3.ACAB, the long-term operation and the combined construction and operational emissions of the project would contribute to long-term regional air pollutants despite implementation of mitigation measures. The Basin is in nonattainment for ozone, ~~nitrogen dioxide, and particulate matter~~ (PM₁₀ and PM_{2.5}) at the present time; therefore, the operation of the proposed project would exacerbate nonattainment of air quality standards within the Basin and contribute to adverse cumulative air quality impacts. Implementation of the proposed project would unavoidably contribute to significant long-term cumulative air quality impacts.

4.3.7.4 Cumulative Health Risk Impacts

As noted from the results shown in previously referenced Table 4.3.AA and Table 4.3.AB, since the project on its own exceeds the SCAQMD's cancer risk significance threshold with mitigation, the project would also result in a cumulatively considerable impact. The cumulative cancer risk noted as the "With Project Scenario (No Project + Project)" is depicted in previously referenced Figure 4.3.13, which shows the maximum cumulative cancer risk is estimated to be 190 in a million and was found to occur near the intersection of Interstate 10 and State Route 60 near Banning, California. Maximum cumulative risk occurs at a different location than the project's maximum risk. At the location of the maximum cumulative risk, the project contributes a risk of approximately 6 in a million or less than 4 percent of the total. The project's maximum cancer risk occurs at the existing sensitive receptors located within the boundaries of the WLC Specific Plan near the intersection of Theodore Street and Street E and Street F. At the location of the project's maximum incremental impact, the project contributes approximately 78 percent of the total cumulative risk.

Cancer Risks to Sensitive Receptors and Cancer Burden. SCAQMD recommends that any given project's potential contribution to cumulative cancer risk impacts should be assessed using the same significance criteria as for project-specific impacts. Therefore, a project that has the potential to exceed any significance threshold on its own would also result in a cumulatively considerable significant impact. As noted from the results shown in previously discussed in Impact 4.3.6.5 in the subsection *Cancer Risks*, since the project would implement mitigation measures resulting in the cleanest on-road and off-road diesel equipment and such equipment has been shown through extensive health effects studies to not result in cancer. Therefore, the project would not result in a cumulatively considerable impact.

SCAQMD MATES Studies. The SCAQMD conducted detailed toxic air contaminant emission inventory, air sampling, and dispersion modeling studies: Multiple Air Toxics Exposure Study (MATES II and (MATES III). The MATES studies provide health risk estimates of various toxic air contaminants as well as their spatial magnitude and distribution across the Basin. The MATES III program results indicate that the cancer risks in the area where the project site is located are estimated to be approximately 500 in one million of which diesel PM contributes approximately 84 percent of the total cancer risk. The remaining portion of the total cancer risk consists mainly of exposures to benzene, formaldehyde, acrolein, and 1,3-butadiene. The MATES-III study found that the population weighted cancer risk in the entire Basin was estimated to be 853 in one million.

The MATES risks are estimated using assumptions that are substantially different than the assumptions used in the project's impact assessment. The MATES risks represent a snapshot in time based on the inventory of toxic air emissions from the year 2005, which are assumed to remain constant over the next 70 years. In reality, the toxic emissions in the South Coast Air Basin have changed dramatically since 2005 with reductions noted in virtually all toxic levels, including diesel PM emissions. The MATES risks also do not take account of the fact that a number of emission control regulations have been adopted particularly on heavy duty diesel trucks, which will substantially reduce their per mile emissions over the next 10 years. In accordance with guidance from the SCAQMD, the diesel PM emissions from the project incorporate the mandated changes in future vehicle emissions. Using comparable emissions assumptions, the MATES risks could be substantially lower than the levels indicated below in Table 4.3.AGAF. Nonetheless, the project's incremental cancer risk when added to the MATES risk levels, would result in a cumulatively considerable impact.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.3.AGAF: Cumulative Cancer Risk Values, 70-year Exposure Duration (revised)

Receptor Location	Cancer Risk (risk per million)		
	Project Increment (with Mitigation)	MATES-III	Total Cumulative Risk
Maximum risk anywhere in the modeling domain	52.0	497	549
Maximum risk at existing residences located within of the project boundaries	52.0	497	549
Maximum risk at existing residential area outside project boundaries ⁽¹⁾	25.5	497	523
Maximum risk at any undeveloped residentially zoned property outside of the project boundaries ⁽²⁾	27.2	497	524

⁽¹⁾ Location is north of State Route 60 and east of the junction with Interstate 215.

⁽²⁾ Location is at an undeveloped property zoned for residential on Redlands Boulevard north of Eucalyptus Avenue. Source of project increment: dispersion modeling conducted by Michael Brandman Associates (see tables above), September 2014.

Source of MATES-III risk: South Coast Air Quality Management District (refer to MATES Cancer Risk Exhibit); the risk is at the project location.

Figure 4.3.20 displays the cancer risk in the project area as estimated by the SCAQMD MATES-III study and shows the estimated cancer risk on the project site ranges from 497 near the highway to 409 farthest in the southeastern corner of the project site.

Table 4.3.AC displays a summary of the cancer risk values. The project values represent the maximum cancer risk values from project-related diesel emissions. The cumulative values represent the project impact plus the impact of other diesel trucks in the area. The MATES-III values are estimated by the SCAQMD. If the cancer risk values were compared with the project-specific threshold of 10 cancers per million, the cancer risk values would exceed the threshold. In fact, virtually all areas within the SCAQMD would exceed the 10 in a million significance threshold.

The 70-year lifetime cancer risks after implementation of mitigation are summarized in previously referenced Table 4.3.AB for the project-related health risk impacts. As shown, cancer risks exceed the threshold of 10 in one million. The cumulative impacts include the impacts from both the project trucks and motor vehicles and trucks and other motor vehicles from all other existing, planned, and reasonably foreseeable projects. Applying the SCAQMD's cancer risk significance threshold of 10 in a million would result in a cumulative impact that exceeds the threshold. Impacts would remain significant and unavoidable as there are no other feasible mitigations that would reduce health risks associated with implementation of the proposed project.

Worker Exposure. There are a variety of State and Federal programs that protect onsite workers from safety hazards, including high air pollutant concentrations (California Division of Occupational Safety and Health; Centers for Disease Control and Prevention 2012;

On-site workers are not required to be addressed through this health risk assessment process. A document published by the California Air Pollution Control Officers Association (2009), "Health Risk Assessments for Proposed Land Use Projects," indicates that on-site receptors are included in risk assessments if they are persons not employed by the project. Persons not employed by the project would not remain on-site for any significant period. Therefore, a health risk assessment for on-site workers is not required or recommended. With regards to offsite worker exposures, assuming the worker exposure assumptions of 40 years, 8 hours per day, and 49 weeks per year as per the OEHHA recommendations, the highest offsite worker exposure cancer risk due to the project's DPM

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~emissions was found to be 7.0 in a million. This risk level is less than the SCAQMD cancer risk threshold of 10 in one million. Persons not employed by the project would not remain on-site for any significant period. Therefore, a health risk assessment for on-site workers is not required or recommended.~~

Non-Cancer Acute and Chronic Hazards Impacts. As previously identified, the maximum non-cancer chronic hazard index and acute non-cancer hazard index from the operation of the project are estimated to be less than 0.05 at any location outside of the boundaries of the WLC Specific Plan less than 0.13 and 0.06, respectively. These values are less than the SCAQMD's significance threshold of 1.0. Therefore, the project would also have a less than significant cumulative non-cancer hazard impact.

NOTE TO READERS. *The following revisions have been made due to changes in the proposed WLC project, responses to comments on the Programmatic DEIR and revisions and updates to the project biological resources assessment.*

4.4 BIOLOGICAL RESOURCES

Changes from December 2012 Biological Resource Analysis

- *At the request of Metropolitan Water District of Southern California (Letter C-2) information about the Inland Feeder was added to the Section 4.4.1.*
- *Additional details about existing setting Section 4.4.1 were added in response to the revised survey area and comments made on the DEIR. The format of this section was revised to follow the format and organization that was used in the revised MSHCP report. However, the information is conceptually the same.*
- *Table 4.4.A: Summary of Vegetation was updated based on the revised MSHCP report and moved to Section 4.4.1.4.*
- *Table 4.4.B was divided into two separate tables based on the updated biological resources report in addition to comments regarding the presence of sensitive plants and wildlife in the area.*
- *Additional discussion of burrowing owl was added to Sections 4.4.1.13 and 4.4.1.14 due to a burrowing owl being identified within the project site during the 2013 focus survey.*
- *Table 4.4.D Special Interest Species was incorporated into Tables 4.4.B Sensitive Plant Species in the WLC Project Area and 4.4.C Sensitive Wildlife Species in the WLC Project Area.*
- *The discussion of riparian habitat and potential wildlife species was expanded in section 4.4.1.14 due to the updated MSHCP report.*
- *Detailed information about on-site drainages has been excerpted from the Jurisdictional Delineation Report and added to Section 4.4.1.19. A discussion of on-site drainages were also added to Section 4.4.6.3.*
- *The updated MSHCP report determined that Section 4.4.5.1 Jurisdictional Waters/Wetlands required mitigation to be less than significant. This section was added to 4.4.6.3 Jurisdictional Delineation, Riparian Habitat or Other Sensitive natural Communities. The existing mitigation was revised to mitigate potential jurisdictional impacts to less than significant levels.*
- *All mitigation measures in Section 4.4.6 were updated based on the revised the MSHCP report.*
- *In response to a comment made on the DEIR a nitrogen deposition section of added to section 4.4.6.2.*
- *Mitigation Measures 4.4.6.1A through 4.4.6.1C were revised based on comments from the U.S. Fish and Wildlife Service.*
- *Additional discussion of burrowing owl impacts was added to Section 4.4.6.4 due to the burrowing owl being identified within the project site during the 2013 focus survey. Burrowing Owl mitigation was also expanded.*

This section discusses the potential impacts of development of the proposed project on biological resources. In 2012, Michael Brandman Associates (MBA) conducted a Habitat Assessment, Multiple

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Species Habitat Conservation Plan (MSHCP) Consistency Analysis, Habitat Acquisition and Negotiation Strategy (HANS) ~~Review Report~~, and California Environmental Quality Act (CEQA) Biological Resources Assessment to comply with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) requirements. The 2012 MBA report summarized the results of several focused surveys conducted since 2004 on the WLC property. In 2014, the various WLC project studies were updated to reflect the most current information about the project area. Information to evaluate and analyze the proposed project's impacts to biological resources is derived from the following references and studies included in Appendix E:

- *Habitat Assessment, MSHCP Consistency, and HANS Report*, MBA, ~~December 20, 2012, original dated December 20, 2012, revised September 2014.~~ (This includes the focused surveys included as separate documents in the previous version.)
- *Jurisdictional Delineation of the World Logistics Center*, MBA, original dated October 29, 2012, revised dated December 19, 2013.
- *Determination of Biologically Equivalent or Superior Preservation (DBESP)*, MBA, December 5, 2013, revised September 2014.

In addition, the analysis contained in this section is based on the following reference documents:

- *Conservation Element*, City of Moreno Valley General Plan, adopted in July 2006.
- Western Riverside County MSHCP, adopted October 2003.
- MSHCP Final EIR, certified October 2003.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,918~~ 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately ~~7470~~ percent of the area (~~2,710~~ 2,610 acres) for logistics warehousing (new LD and LL, LS zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (this project September 2014) will be adopted to govern development of the World Logistics Center for the ~~2,710~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. ~~The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.~~

~~For the purposes of analysis in this section of the EIR, the project area has been divided into three sections. The first includes the Specific Plan area and associated off-site facilities referred to as the Specific Plan area. The second section includes the California Department of Fish and Wildlife (CDFW) conservation area as well as the SDG&E-owned lands and will be referred to as the CDFW Buffer Area.~~

The MBA report included an assessment of the WLC Specific Plan (WLCSP) site (2,610 acres), the 910-acre CDFW Conservation Buffer Area within the San Jacinto Wildlife Area (SJWA), the SDG&E Moreno Compressor Plant (194 acres), an “indirect impact zone” surrounding portions of the WLCSP property (502 acres), potential offsite infrastructure facilities (304 acres) and modified survey areas to match the reduced project area of the specific plan. In this section, the combined areas described in this paragraph total 5,972 acres and are hereafter referred to in this section as the survey area.

~~third includes a 1,000-foot wide area along the south and east boundaries of the site to examine possible indirect impacts on the San Jacinto Wildlife Area and referred to as the “Off-site Analysis Zone.”~~

The information presented in this section is based on surveys of various portions of the project site conducted by MBA from 2005 to ~~2012~~2013 as referenced above. Development is only proposed on the Specific Plan property; the CDFW and public facilities property are not proposed for development and are expected to remain in their present condition. The habitat assessment information summarized in this section was collected during several site visits to the project area, the CDFW buffer area, the public facilities property, and the off-site improvement area, ~~and the 1,000-foot buffer area in 2010 and 2012. Other focused surveys for sensitive species were conducted at various times from 2005 to 2012~~2013.

The entire project area is regulated by the MSHCP, which is a regional conservation plan adopted by Riverside County in 2003. The MSHCP establishes core areas identifying important land that supports listed or sensitive species. The MSHCP also establishes criteria cells for land with important resources that need to be protected as part of the overall plan. The MSHCP identifies these critical lands for preservation or for relatively passive open space and utility uses. The MSHCP serves as a regional habitat conservation plan. The MSHCP was created, studied, and adopted by the County, the U.S. Fish and Wildlife Service (USFWS), CDFW, and fourteen cities in Riverside County along with the County. A more complete discussion of the MSHCP is provided in Section 4.4.1.6.

4.4.1 Existing Setting

The project area is located on the fringe of the urbanized development area of the City of Moreno Valley. The majority of the project area has been used for agricultural purposes for decades. Various portions of the area contain structures associated with previous agricultural activities, including residential structures, farm buildings, concrete pads, and fences. There are two small portions of relatively undisturbed vegetation on site, one in the northeastern portion of the site on land owned by Metropolitan Water District, and the second in the southwestern portion of the site in the rocky hills south of Alessandro Road and west of Theodore Street. Many of the off-site facilities such as water and sewer lines and access to potential water reservoirs are proposed along existing rights-of-way in the City of Moreno Valley. Debris basins are proposed along the eastern side of Gilman Springs Road

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

to prevent debris and sediment from the Badlands from disrupting traffic on Gilman Springs Road after significant storm events. The CDFW Conservation Buffer Area south of the Specific Plan area is similar in history and conditions to the project site. The 1,104-acre area has been plowed for decades and portions of it are being actively farmed. The southwestern portion of the Conservation Buffer contains areas of non-native grasslands, although aerial photographs show that the area has been intermittently tilled over last 80 years.

Note: The following information was added at the request of the Metropolitan Water District of Southern California (Letter C-2) regarding the Inland Feeder. A figure showing the location of the Inland Feeder can be found at the end of comment Letter C-2 from the Metropolitan Water District of Southern California.

“Metropolitan owns property and owns and operates facilities on and adjacent to the site of the proposed project. As shown on the attached map, Metropolitan's irregularly shaped fee-owned property (APN 422-040-009 and 422-040-015), Inland Feeder Tunnel, and appurtenant tunnel access structure are located within the proposed specific plan area. In addition, Metropolitan's 145-inch-inside-diameter Inland Feeder pipeline and appurtenant structures extend through the specific plan area in the street rights-of-way for Eucalyptus Avenue, Theodore Street, and Davis Road. Metropolitan also has a 110-foot-wide easement along Davis Road.”

4.4.1.1 Topography and Soils

The project area is located in Rancho Belago, in the eastern portion of the City of Moreno Valley, in western Riverside County. The site is generally located south of SR-60, east of Redlands Boulevard, west of Gilman Springs Road, and north of the San Jacinto Wildlife Area (SJWA). The project site gently slopes down from north to south, and contains 15 identifiable drainages, as outlined in the jurisdictional delineation.¹

The soils in the project area have been mapped by the *Soil Survey of Western Riverside Area, California* (1971)² and include San Emigdio loam (SgA and SgC) and San Emigdio fine sandy loam (SeC2), with smaller inclusions of Arbuckle loam (AkC), Badland (BaG), Gorgonio loamy sand (GhC), Greenfield sandy loam (GyA, GyC2, GyD2), Hanford coarse sandy loam (HcC and HcD2), Metz loamy sand (MdC and MeD), Metz loamy fine sand (MfA), Metz gravelly sandy loam (MID), Ramona sandy loam (RdD2), Rockland (RtF), San Emigdio fine sandy loam (SeA and SeD2), and San Timoteo loam (SmE2).

The observed surface soils in the area contain evidence of heavy repeated disturbance from agriculture-related activities. None of the soils present in the project area is considered sensitive pursuant to the MSHCP, which includes all of Moreno Valley (i.e., the City is a signatory to the MSHCP).

4.4.1.2 Land Uses

Agricultural fields including dry-land grain farming dominate the project area. Some rural residences are located in the central portion of the area along Theodore Street, and areas of open space are located throughout the southern and northeastern portions of the site. General land uses around the project area include suburban residential development to the west, vacant land and scattered rural residences to the north and east (across SR-60 and Gilman Springs Road, respectively), the SJWA and natural gas distribution facilities to the south, and the Lake Perris State Recreation Area (LPSRA) to the southwest.

² *Soil Survey of Western Riverside Area, California*, United States Department of Agriculture, November 1971.

4.4.1.3 Vegetation, General

The following data on vegetation in the study area are from the City's *General Plan Final Program EIR*¹ and the *MSHCP Consistency Analysis Report*² for the project area. The following describes the vegetation within each of the three main reporting various WLC project areas: the WLC Project, including the Specific Plan, Offsite Improvement Area (3,300.6 acres); CDFW Conservation Buffer Area (1,104.0 acres); Indirect Impact Zone, and Off-site Analysis Zone (1,636.6 acres), which includes a 1,000-foot off-site area studied by MBA (2012). Additional Survey Areas. Table 4.4.A provides a numerical summary of the various types of vegetation within the WLC planning area.

Note: Table 4.4.A: Summary of Vegetation with the WLC Study Area has been removed in its entirety. To see original table please refer to FEIR Volume IV Section 4.4.1.3, Table 4.4.A.

Note: The following changes are the result of modifications to the WLCSP project area and updates to the various biological technical studies, and in response to a number of comments recommending the biological site surveys be updated. In addition, some paragraphs in this section were moved and only new information is shown in double underline.

4.4.1.4 Vegetation (MBA Project Survey Area)

There are ~~ten~~ eleven (11) plant communities/vegetation types that occur within the MBA project survey area: extensive agriculture (e.g., dry-land farming), non-native grassland, urban/developed, disturbed, Riversidean sage scrub, mule fat scrub, non-vegetated channel, open water, ornamental, and southern willow scrub, and northern mixed chaparral (see Figure 4.4.1). Figure 4.4.2 depicts the location of drainage features and Riparian/Riverine areas. The following acreages are for approximately ~~3,300.5~~ 3,305.972 acres including the WLCSP (~~2,710~~ 2,710.610 acres) plus off-site improvements and the existing Highland Fairview Corporate Park (Skechers) property, which was included in some of the historical vegetation surveys for this area. The vegetation of the CDFW/public facilities lands and the Off-site Analysis Zone are addressed following the information on the Project Area (i.e., areas of proposed or existing development).

Almost all (~~3,238~~ 3,238.815 acres or ~~97%~~ 97.4 percent) of the ~~WLC Project Area~~ MBA survey area (5.972 acres) is disturbed by human activity³, mainly ~~dry-land~~ dryland farming, with only ~~63~~ 157 acres or ~~32.6~~ percent consisting of native plant communities. The nature and extent of the existing plant communities are discussed below in the order of their presence on the property.

THIS PAGE INTENTIONALLY LEFT BLANK

a. Extensive Agriculture

This disturbed plant association covers ~~2,452.23~~23,434.0 acres or ~~7457.5~~ percent of the ~~WLC planning~~MBA survey area, and includes areas where vegetative cover comprises less than 10 percent of the surface area and where there is evidence of intense soil surface disturbance associated with agricultural uses. ~~Vegetation~~This community is generally dominated by winter wheat (*Triticum aestivum*), but also has small inclusions of non-native vegetation along the margins of the fields. Non-native vegetation within disturbed land will have a high predominance of ~~non-native~~invasive or weedy species that are indicators of heavy, soil disturbance, such as horse nettle (*Solanum elaeagnifolium*), bindweed (*Convolvulus arvensis*), and short-pod mustard (*Hirschfeldia incana*).

The extensive agriculture community in the project area also contains various interstitial ditches that are excluded from regular heavy-agricultural equipment disturbances, such as disking. These areas are less frequently disturbed and contain larger, more established, ruderal vegetation, such as tree tobacco (*Nicotiana glauca*) and tree of heaven (*Ailanthus altissima*), in addition to the fast-growing Russian thistle (*Salsola tragus*), telegraph weed (*Heterotheca grandiflora*), lamb's quarters (*Chenopodium album*), sow thistle (*Sonchus oleraceus*), and short-pod mustard. The interstitial ditch areas do not occupy enough area nor are continuous enough to constitute a separate plant community and are therefore considered part of the extensive agricultural plant community. The majority of the project area is occupied by extensive agriculture and recently disked or heavily grazed, such as in the pasturelands in the northwestern portion of the project area. Most of these areas are disked at least once each year and planted with winter wheat.

b. Non-Native Grassland

Non-native grassland is characterized by a dense to sparse cover of non-native annual grasses often associated with numerous weedy species and native annual forbs (wildflowers), especially in years with plentiful rain. Seed germination occurs with the onset of winter rains. Some plant growth occurs in winter, but most growth and flowering occurs in the spring. Plants then die in the summer, and persist as seeds in the uppermost layers of soil until the next rainy season. Dominant plants include brome (*Bromus* spp.), wild oat (*Avena* spp.), Jimson weed (*Datura stramonium*), and common sunflower. Non-native grassland occupies 1,729.0 acres or 29.0 percent of the MBA survey area, mainly in the Badlands area east of Gilman Springs Road and the southern portion as part of the CDFW Conservation Buffer land.

cb. Urban/Developed

The urban/developed area includes any form of human disturbance associated with the development of rural residences that has resulted in permanent impacts to natural communities. This land use type comprises approximately ~~366.94~~92.0 acres or ~~418.2~~ percent of the ~~WLC project~~MBA survey area. By definition, urban/developed areas include roads, buildings and structures, pavement, concrete, landscape vegetation, and windrow vegetation. The isolated occurrences of the urban/developed community occur throughout the study area. The urban/developed area is not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds and common terrestrial wildlife that have adapted to urban, agricultural, or other disturbed areas associated with human activity. The largest area of Urban/Developed land occurs in the northwestern corner of the survey area and is associated with the existing Skechers building.

d. Disturbed Areas

These areas support sparse ruderal vegetation and an occasional scattering of native plant species. This type of "habitat" is not a plant community and is considered to be of little or no value to wildlife; it

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

does not have a Holland classification code. Disturbed areas include an area in the northern portion of the project site associated with the adjacent rural residences. These areas have been cleared of vegetation. The remaining disturbed areas are associated with dirt access roads and the area surrounding the existing natural gas compressor station. This category occupies ~~72.5~~150 acres or ~~2.25~~ percent of the WLC site.

e. Riversidean Sage Scrub

~~The dominant species observed within the~~Stands of Riversidean sage scrub (RSS) ~~plant community includes native shrubs such as~~range from fairly open to dense with dominant species including brittlebush (*Encelia farinosa*), California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), California sagebrush (*Artemisia californica*), and coastal goldenbush (*Isocoma menziesii*). Other species observed include four-winged saltbush (*Atriplex canescens*), scalebroom (*Lepidospartum squamatum*), and California aster (*Lessingia filaginifolia*), in addition to non-native grasses such as ripgut brome (*Bromus diandrus*), slender oat (*Avena barbata*), red brome (*Bromus madritensis*), and non-native weedy species such as short-pod mustard. There are ~~48.6~~97.0 acres (~~1.6~~1.6%) of RSS located within the main drainage feature on the eastern side of the WLC project site (Drainage Feature 9, see Figure 4.4.2). The quality of the habitat on site can generally be considered moderate based on vegetation characteristics such as plant density, diversity of species, and level of disturbance. The stand within Drainage Feature 9 is of low quality due to high levels of disturbance, low density of native species, and sparse coverage. There are small patches of RSS in the northeastern and southwestern corners of the ~~WLCSP project site.~~ Stands of RSS range from fairly open to dense, and are typically dominated by California sagebrush (*Artemisia californica*) and California buckwheat, and are often found integrated with chaparral, scrub, grassland and ruderal type plant communitiesMBA survey area.

f. Mule Fat Scrub

Mule fat scrub is a widespread natural community throughout California and usually occurs below 2,000 feet. Mule fat scrub occupies approximately ~~8.8~~841.0 acres or ~~0.37~~ percent of the ~~WLC project~~MBA survey area within a portion of Drainage Feature 9 in the southeastern portion of the ~~project area (i.e., the WLC Specific Plan area and the CDFW Conservation Buffer lands).~~ The mule fat scrub in the project area is generally characterized by dense stands of mule fat (*Baccharis salicifolia*) with various shrubs, weeds, and non-native grasses sparsely intermixed.

All areas of mule fat scrub within the drainage feature on the site are relatively undisturbed and contain little trash dumping, agricultural activities, or the presence of domesticated animals. The mule fat scrub plant community provides moderate quality habitat for a number of species. The dominant species observed within the mule fat scrub community were mule fat and tree tobacco. Other species observed include cheeseweed (*Malva parviflora*), wild radish (*Raphanus raphanistrum*), Russian thistle, common sunflower (*Helianthus annuus*), and short-pod mustard, in addition to non-native grasses such as ripgut brome, slender oat, and red brome. Drainage Feature 9 also contains scattered occurrences of scalebroom and four-winged saltbush.

gi. Southern Willow Scrub

The southern willow scrub community is characterized by dense, broad-leafed, winter deciduous riparian thickets of vegetation, and is dominated by several species of willow tree. Scattered emergent Fremont cottonwood (*Populus fremontii*) and California sycamore (*Platanus racemosa*) are most closely associated with this community. Most stands are too dense for understory development. This plant community is typically found on loose, sandy, or fine gravelly alluvium soils near stream channels during flood flows. It requires repeated flooding to prevent it from converting to a more mature Southern Cottonwood-Sycamore Riparian Forest community. The CDFW lists it as a

sensitive plant community. Plant species identified within the community include sandbar willow (*Salix exigua*), black willow (*Salix goodingii*), mule fat, Fremont's cottonwood, Mexican fan palm (*Washingtonia robusta*), olive (*Olea europea*), phacelia (*Phacelia sp.*), and common sunflower.

~~There is a single patch of southern willow scrub within the project area that comprises approximately 0.9 acre within an abandoned man-made catch basin the central portion of the WLCSP. This community is composed of a single isolated stand within a human-made, catch basin that occurs south of Alessandro Boulevard and west of Virginia Street (see Figure 4.4.2). This stand is the was a direct result of nuisance flow and agricultural runoff from concrete cattle containment areas south of the Skechers facility. The concrete cattle containment areas have been removed and the adjacent to the catch basin facilities are. This area no longer functional. Due to the small size of the stand and the geographic isolation receives runoff from any other riparian the previous cattle facility and habitat in the project area, the plant community on site provides limited staging quality is progressively getting worse due to a lack of available moisture. Therefore, this patch of habitat for migrating avian species, and only poor quality is considered of low-habitat value. The remainder of the southern willow scrub habitat is either within additional survey area or within the CDFW Conservation Buffer.~~

h. Non-Vegetated Channel

The non-vegetated channel community occurs within the northeastern portion of the site (east of Gilman Springs Road) and the southwestern corner of the survey area, west of Theodore Street and south of Alessandro Road and accounts for 7 acres (0.1%) of habitat within the survey area. This habitat contains mainly cobbles and boulders along the channel bottom and banks. The substrate contains sparse sandy deposits with limited vegetative cover and therefore provides low quality habitat for sensitive plant and wildlife species.

i. Ornamental

~~The area with this vegetation previously contained southern willow scrub, but has recently converted to a dense stand of salt cedar. Wildlife that uses this area has adapted to urban, agricultural, or other disturbed areas associated with human activity and development, and is found within one of two catch basins on the project site. The other is discussed relative to the southern willow scrub community below. This plant group occupies 2.3 acres or less than 0.1 percent of the WLC project site. The vegetation in these areas is artificially irrigated and likely planted several decades ago as part of housing or farm landscaping or gardens.~~

This plant community occupies 6.0 acres or 0.1 percent of the MBA survey area. There are two distinct areas within the survey area that contain ornamental vegetation. The first area is located within rural residential development just west of Theodore Street and south of Eucalyptus Avenue. This portion of the survey area contains a stand of olive trees. The second area occurs within a human-made catch basin in the center of the WLCSP and is likely naturally occurring and likely began growing several decades ago. The area with this vegetation previously contained southern willow scrub, but has naturally converted to a dense stand of salt cedar. Wildlife that uses this area has adapted to urban, agricultural, or other disturbed areas associated with human activity. The other catch basin is discussed relative to the southern willow scrub community above. The ornamental area is not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds.

An ornamental plant community is typically described as a large stand of non-native ornamental trees or shrubs. These areas are often artificially created, but can be naturally occurring. Plant species vary from project site to project site, but are generally non-native and are often associated with landscape plants.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

There are two distinct areas within the survey area that contain ornamental vegetation. The first area is located within rural residential development just west of Theodore Street and south of Eucalyptus Avenue. This portion of the survey area contains a stand of olive trees. The second area occurs within a human-made catch basin in the center of the WLCSP and is likely naturally occurring and likely began growing several decades ago.

The ornamental areas are not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds and common terrestrial wildlife that have adapted to urban, agricultural, or other disturbed areas associated with development. This land use type comprises approximately six acres of the survey area.

j. Open Water

Open water is characterized by ponded or flowing water with little to no vegetative cover. These areas are specifically associated with freshwater drainage features and typically provide habitat for aquatic plant and wildlife species. There is a 1.0-acre area or less than 0.1 percent of open water located in the northern portion of the SJWA. The open water areas within the survey area are artificially created ponded areas.

k. Northern Mixed Chaparral

The northern mixed chaparral community is characterized by broad-leaved shrubs forming dense, often nearly impenetrable vegetation dominated by scrub oak (*Quercus dumosa*), chamise (*Adenostoma fasciculatum*), and any one of several species of manzanitas (*Arctostaphylos*) and lilacs (*Ceanothus*). Plants are typically deep-rooted and little or no understory vegetation is present. This vegetation community is adapted to repeated fires, to which many species respond by stump sprouting. A dense cover of annual herbs may appear during the first growing season after a fire, followed in subsequent years by perennial herbs, short-lived shrubs, and reestablishment of dominance by the original shrub species. There is 1.0-4 acre or less than 0.1 percent of northern mixed chaparral located on a north-facing slope of the hills at the southwestern corner of the project area.

4.4.1.5 Vegetation in the CDFW Conservation Buffer Area

~~Seven~~Six plant communities/land use types occur within the 1,104-acre CDFW Conservation Buffer Area: ~~disturbed, extensive agriculture (e.g., dry-land/dryland farming), mule-fat scrub, non-native grassland, Riversidean sage scrub,~~ disturbed, southern willow scrub, and urban/developed. The CDFW Conservation Buffer consists of the 910 acres of land that was placed into conservation in 2001 and the 194-acre SDG&E facility. The CDFW Conservation Buffer Area has been used for agricultural pursuits over many years, but there are a few isolated areas that have been left fallow and these have begun to return to non-native grassland and Riversidean sage scrub. See Table 4.4.A for a listing of plant associations in the CDFW Conservation Buffer Area.

a. Extensive Agriculture

~~The “extensive agriculture” plant community includes areas where native vegetative cover comprises less than ten percent of the surface area and where there is evidence of intense soil surface disturbance associated with agricultural uses. Vegetation within disturbed land will have a predominance of non-native or weedy species that are indicators of heavy soil disturbance, such as horse nettle, bindweed, and short-pod mustard. The extensive agriculture community in the project area also contains various interstitial ditches that are excluded from regular heavy agricultural equipment disturbances, such as disking. These areas are less frequently disturbed and contain~~

larger, more established, ruderal vegetation, such as tree tobacco and tree of heaven, in addition to the fast-growing Russian thistle, telegraph weed, lamb's quarters, sow thistle, and short-pod mustard. The existing interstitial ditch areas do not occupy enough acreage nor are they continuous enough to constitute a separate plant community; therefore, they are considered part of the extensive agricultural plant community.

The majority of the CDFW Conservation Buffer Area, approximately 897 acres, is occupied by extensive agriculture. These areas include regularly disked areas used for dry-land farming. These areas of extensive agriculture appear to be disked at least once each year and planted with winter wheat, and may support wintering raptors and game birds.

b. Non-native Grassland

The non-native grassland community is characterized by a dense-to-sparse cover of non-native annual grasses often associated with numerous weedy species and native annual forbs (wildflowers), especially in years with plentiful rain. Seed germination occurs with the onset of winter rains. Some plant growth occurs in winter, but most growth and flowering occurs in the spring. Plants then die in the summer and persist as seeds in the uppermost layers of soil until the next rainy season. Dominant plant genera typically found within non-native grasslands include brome, wild oat, fescue (*Vulpia* sp.), and barley (*Hordeum* sp.).

Non-native grassland occupies approximately 151.7 acres of the southwestern-most portion of the CDFW Conservation Buffer Area northwest of the SJWA. Plant species observed within the non-native grassland community on the study area include non-native grasses such as ripgut brome, slender oats, and red brome, and weedy species such as shortpod mustard, Jimson weed, and common sunflower.

c. Disturbed

Disturbed areas are characterized by a lack of significant vegetative cover, as the result of previous human disturbance or significant natural disturbance. Although such areas may exhibit patches of sparse ruderal vegetation and an occasional scattering of native plant specimens, this type of "habitat" is not a plant community and is considered to be of little or no value to wildlife. This land type occupies 20.2 acres of the Conservation Buffer Area. Disturbed areas within the CDFW Conservation Buffer Area are associated with dirt access roads and the area surrounding the existing natural gas compressor station.

d. Urban/Developed

The urban/developed area includes any form of human disturbance that has resulted in permanent impacts to natural communities. This land use type comprises approximately 14.7 acres of the project area. By definition, urban/developed areas include roads, buildings and structures, pavement, concrete, landscape vegetation, and windrow vegetation. The urban/developed community within the CDFW Conservation Buffer is limited to the SDG&E compressor station area and associated paved access roads.

e. Riversidean Sage Scrub (RSS)

Riversidean sage scrub is a native plant community that is widespread throughout Riverside County and typically consists of low-growing, drought deciduous and evergreen shrubs that occur on steep and/or gentle sloping topography. This community may be found on xeric sites with severely drained soils, or clays that release stored soil moisture slowly. Stands of RSS range from fairly open to dense,

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

and are typically dominated by California sagebrush and California buckwheat, and are often found integrated with chaparral, scrub, grassland and ruderal type plant communities.

There is one area of 10.8 acres within the CDFW Conservation Buffer that contains RSS. This is located in the extreme southwestern corner of the CDFW Buffer Area along Davis Road. The dominant species observed within the RSS plant community in the area include native shrubs such as brittlebush, California buckwheat, black sage, and coastal goldenbush. Other species observed include four-winged saltbush, scale broom, and California aster, in addition to non-native grasses such as ripgut brome, slender oat, red brome, and non-native ruderal species such as short-pod mustard.

f. Mule Fat Scrub

Mule fat scrub is a riparian scrub community that is strongly dominated by mule fat and is typically associated with intermittent stream channels and moderate depth to the water table. Mule fat scrub is a widespread natural community throughout California and usually occurs below an elevation of 2,000 feet. Mule fat scrub occupies approximately 6.1 acres of the CDFW Conservation Buffer Area within a portion of Drainage Feature 9 south of Alessandro Boulevard. The mule fat scrub in the project area is generally characterized by dense stands of mule fat with various shrubs, weeds, and non-native grasses sparsely intermixed. Areas of mule fat scrub within the drainage features on site are relatively undisturbed and contain little trash dumping, agricultural activities, or the presence of domesticated animals. The mule fat scrub plant community on the study area provides moderate quality habitat for a number of common wildlife species.

The dominant species observed within the mule fat scrub community are mule fat and tree tobacco. Other species observed include cheeseweed, wild radish, Russian thistle, common sunflower, and short-pod mustard, in addition to non-native grasses such as ripgut brome, slender oat, and red brome. Drainage Feature 9 also contains scattered occurrences of scale broom and four-winged saltbush.

g. Ornamental

The ornamental area includes a dense stand of salt cedar. This vegetation community is found within one of two catch basins within the study area. This land use type comprises approximately 3.3 acres of the study area. The vegetation in catch basin is likely naturally occurring and likely began growing several decades ago. The ornamental area is not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds and common terrestrial wildlife that have adapted to urban, agricultural, or other disturbed areas associated with development.

4.4.1.6 Vegetation, Off-site Analysis in the Indirect Impact Zone

~~Nine~~Seven plant communities/land use types occur within the 1,636.6-acre off-site analysis zone. This area was evaluated as an additional 1,000-foot zone beyond the boundaries of the project area to consider potential off-site indirect impacts associated with noise, light, water quality, and air quality concerns beyond the boundary of the actual project area. ~~Only the northern mixed chaparral community is not represented (see Figure 4.4.1).~~

The study~~Plan~~ communities associated with the Indirect Impact Zone include non-native grassland, extensive agriculture, RSS, disturbed, urban/developed, mule fat scrub, and non-vegetated channel (see Figure 4.4.1). This area contains land that has been previously disturbed as a result of development and off-road vehicle trails, ~~minor portions of the duck club ponds, and non-native~~

grassland covered hills east of Gilman Springs Road and general open space areas in the southwestern portion of the survey area.

a. ~~Non-native Grassland~~

~~Non-native grassland occupies approximately 1,241.1 acres of the CDFW Conservation Buffer Area and is the dominant vegetation type. Plant species observed within the non-native grassland community in the Off-site Analysis Zone include non-native grasses such as ripgut brome, slender oats, and red brome, and weedy species such as shortpod mustard, Jimson weed, and common sunflower.~~

b. ~~Urban/Developed~~

~~The urban/developed area includes any form of human disturbance that has resulted in permanent impacts to natural communities. It occupies 136.1 acres and is scattered throughout the CDFW Conservation Buffer Area associated with the residential community south of Cactus Avenue in the extreme southwestern portion of this area.~~

c. ~~Extensive Agriculture~~

~~Approximately 118.2 acres of extensive agriculture is present within the buffer. It is located on the east side of Gilman Springs Road, just south of the future Eucalyptus Street intersection.~~

d. ~~Disturbed~~

~~Disturbed areas are characterized by a lack of significant vegetative cover, as the result of previous human disturbance or significant natural disturbance. Although such areas may exhibit patches of sparse ruderal vegetation and an occasional scattering of native plant specimens, this type of “habitat” is not a plant community and is considered to be of little or no value to wildlife. Disturbed areas occupy 58.8 acres of the Off-site Analysis Zone and include dirt access roads and off-road vehicle trails on the east side of Gilman Springs Road.~~

e. ~~Riversidean Sage Scrub~~

~~Riversidean sage scrub occupies 39 acres of the Off-site Analysis Zone and is in small patches scattered throughout the CDFW Conservation Buffer Area and on the east side of Gilman Springs Road.~~

f. ~~Mule Fat Scrub~~

~~Mule fat scrub occupies approximately 32.1 acres of the Off-site Analysis Zone and is found within a drainage course located west of Gilman Springs Road and south of the CDFW Conservation Buffer Area and just north of the margins of Mystic Lake.~~

g. ~~Southern Willow Scrub~~

~~There is a single 6.8-acre patch of southern willow scrub located in a drainage course located between the main portion of Mystic Lake and the duck ponds in the extreme southern portion of the buffer.~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~Non-vegetated channel occurs within the northeastern corner of the CDFW Conservation Buffer Area north of Gilman Springs Road (upper end of Drainage Feature 9) and accounts for 3.3 acres of habitat.~~

~~i. Open Water~~

~~Open water occurs in the southern portion of the CDFW Conservation Buffer Area south of the SDG&E area. These areas are specifically associated with the artificially created duck ponds located within the open space CDFW Conservation Buffer Area. These areas are characterized by open water with little to no vegetative cover and occupy 1.1 acres.~~

4.4.1.7 Wildlife in the Specific Plan Area

Despite the disturbed nature of the WLC planning area (i.e., 97% non-native vegetation), common wildlife species that have adapted to human-modified landscapes are present and were observed on site, including the red-tailed hawk (*Buteo jamaicensis*), house finch (*Carpodacus mexicanus*), mourning dove (*Zenaidia macroura*), common raven (*Corvus corax*), coyote (*Canis latrans*), desert cottontail (*Sylvilagus audubonii*), and California ground squirrel (~~*Spermophilus*~~*Otospermophilus beecheyi*). A complete list of species observed on site is included in Appendix B of the *MSHCP Consistency Analysis* contained in Appendix E to this EIR. Utilization of agricultural areas by wildlife varies greatly depending upon the type of crop and the time of the year. Due to the amount of agricultural activities over the past decades, there is a limited number of species that are present although many species discussed above occur along the margins of the agricultural fields and along the limited drainage areas. In addition to the more common species discussed above, the San Diego gopher snake (*Pituophis cantenifer annectens*), white-tailed kite (*Elanus leucurus*), barn owl (*Tyto alba*), loggerhead shrike (*Lanius ludovicianus*), and Botta's pocket gopher (*Thomomys bottae*) were recorded to occur within the WLCSP and the off-site facility areas. There is a robust passerine bird population at the site during the growing season with a severely limited number of mammals following the harvest, largely due to the extensive agricultural disking activities.

4.4.1.8 Wildlife in the CDFW Conservation Buffer Area

The adjacent San Jacinto Wildlife Area (SJWA) has a very high diversity and abundance of bird species, and is recognized nationally and internationally for its bird population. The amount and diversity of birds in the SJWA contributes to a large degree to the number of different kinds of birds observed in the agricultural areas on the project site and within the CDFW Conservation Buffer Area. Numerous bird and mammal species occur within these agricultural areas and fallow fields may provide foraging opportunities for raptors. The number of passerine birds is high and includes both year-round species and transitory birds associated with the SJWA. ~~There~~The number of mammals is limited probably due to the extensive agricultural pursuits of the past.

4.4.1.9 Wildlife, ~~Off-site~~ in the Off-site Analysis Indirect Impact Zone

MBA evaluated this area using direct observations, literature reviews, and information from studies performed on adjacent areas. The area adjacent to Gilman Springs Road on the south end of the planning area was examined by MBA biologists in 2007 (unpublished Burrowing Owl Survey Report, MBA). The distribution of wildlife species at this adjacent ~~4,636-acre~~ area was similar to the WLCSP and the CDFW Conservation Buffer Area, with a very limited distribution of mammals (primarily burrowing mammals) and a high incidence of passerine birds.

4.4.1.10 Wildlife in the SJWA and Mystic Lake

The SJWA is 20,000 acres of man-made wetlands and open water ponds and is the first state wildlife area to utilize reclaimed water to enhance its wetlands. It is located south of the project area and the CDFW Conservation Buffer Area. The SJWA contains several habitat areas, including wetlands, restored riparian habitat, grasslands, sage scrub, and marshes and provides habitat for the several threatened and endangered wildlife species including Stephens' kangaroo rat, Swainson's hawk, and bald eagle. The SJWA contains an important inland wetland, which provides habitat for many wetland plant species and wildlife species including aquatic birds, amphibians, and fish. According to the CDFW:

"The San Jacinto Wildlife Area public lands currently total about 20,000 acres. The Wildlife Area shares a common boundary with the 8,800-acre Lake Perris State Recreation Area. The majority of the Wildlife Area is located in unincorporated Riverside County. The northern portion of the Wildlife Area is included within the city limits of Incorporated City of Moreno Valley. Davis Road, an unimproved dirt road, bisects the Wildlife Area in a north-south direction. This roadway is maintained by DFG on the north and the County of Riverside on the south. Surrounding land users are primarily involved in agriculture principally dry land wheat farming and dairy operations. The private lands immediately north of the Wildlife Area are currently farmed and are included within the City of Moreno Valley jurisdiction. The 150 acre Double Bar "S" Horse Ranch represents the only substantial in-holding within the current Wildlife Area boundary. To the east lies Mystic Lake bed, the most northern portion of which has recently been incorporated into the Wildlife Area. The south eastern parts of the lake bed remain in private ownership and are used for agriculture when not inundated with flood waters from the San Jacinto River. Numerous privately owned hunt clubs (waterfowl and game bird hunting clubs) are also located on the current eastern boundary of the Wildlife Area. The unincorporated rural communities of Lakeview and Nuevo are located to the south. Much of the land on the immediate southern boundary of the Wildlife Area is currently farmed by the Amway Corporation Nutrilite Division."

The SJWA is a significant resource for avian species and other wildlife. In 1981–82, the State Wildlife Conservation Board initially purchased 15,000 acres of the Mystic Lake area as mitigation for habitat impacts associated with the construction of the State Water Project (SWP). This area was designated as the SJWA. In 1995, the Board acquired an additional 921 acres of upland farmland within the southern portion of the Moreno Highlands Specific Plan property to incorporate into the SJWA. In 2001, the Board acquired an additional 274 acres in this same area. This land was purchased to provide a buffer between the land surrounding Mystic Lake and the planned urban development within Moreno Valley. The Board action on this purchase indicated the land was to "facilitate restoration of historic water flows back into the lakebed and allow for reversion back to wetlands during wet years, and areas of low vegetation cover during dry years, all providing significant habitat for species using the SJWA, including a number of state and federally listed species."¹

CDFW Conservation Buffer Area. The entirety of the State-owned land south of the project area is referred to as the SJWA. However, the land purchased out of the Moreno Highlands Specific Plan is referred to in this EIR as the CDFW Conservation Buffer Area to denote the reason for its original purchase. The 1,195 acres acquired by the Wildlife Board during the past twenty years was intended to serve as an effective buffer between the SJWA and the development expected to occur north of the SJWA area (the present mixed-use Moreno Highlands Specific Plan). Currently, this acreage provides not only a buffer area, but also provides open space for raptor and bird foraging habitat, and is actively farmed under CDFW contract. Approximately 909 acres of the land within the project area

¹ Wildlife Conservation Board minutes from May 18, 2001.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

are identified as Conservation Area (total 1,085 acres) and are owned by the CDFW and support vegetation identified as “Extensive Agriculture” in Section 4.4.1.3, *Vegetation*. The proposed project will permanently designate this CDFW Conservation Buffer Area as Open Space under the City General Plan. It is anticipated the State would maintain its function as a buffer and also as foraging habitat for raptors as long as it is regularly tilled. There are no plans to alter the current agricultural activities on this property.

Mystic Lake. This is a large crescent-shaped, intermittent water body within the SJWA, which serves as a significant wetland habitat for numerous birds including migratory waterfowl such as ducks, grebes, and occasional geese. Seasonal upland game hunting is allowed within the SJWA and Lake Perris State Recreation Area. Other uses of the SJWA include wildlife observation, nature study, fishing, hiking, photography, field trials, hunting dog training classes, and conservation of wildlife and wildlife habitat. Bird species commonly found at various times of the year in the SJWA include a wide variety of ducks, shore birds and gulls, upland game species, and a variety of passerine birds including those found in the project area and the CDFW Conservation Buffer area.

4.4.1.11 Sensitive Biological Resources

Special status species are plant and animal species or subspecies for which there is concern for population sustainability or that are otherwise considered worthy of consideration for protection by the CDFW, USFWS, local agencies, or special interest groups, such as the California Native Plant Society (CNPS). In addition to species federally or State listed as ~~Endangered~~endangered or ~~Threatened~~threatened, these include species that are Candidates or Proposed for listing as ~~Endangered~~endangered or ~~Threatened~~threatened, plant species that are State listed as Rare, animal species designated as Fully Protected or Species of Special Concern by the State of California, and plant species designated as California Rare Plant Rank (RPR) 1A, 1B, or 2. California Rare Plant Ranks are assigned by a committee of government agency and non-governmental botanical experts, including experts from CNPS, and are not official State designations of rarity status. Legal protection for sensitive species varies widely, from the comprehensive protection extended to federally listed threatened and/or endangered species to species without legal protection at the current time.

4.4.1.12 Western Riverside County Multiple Species Habitat Conservation Plan

The MSHCP for western Riverside County is an element of the Riverside County Integrated Project (RCIP), which is an integration of land use, transportation, and conservation planning and implementation to develop a consensus for the future development of Riverside County. The MSHCP is designed to protect over 150 species and conserve over 500,000 acres of land in western Riverside County. The MSHCP was conceived, developed, and is being implemented specifically to address the direct, indirect, cumulative, and growth-related effects on covered species resulting from build out of planned land use and infrastructure, including the proposed project.

The MSHCP involves efforts by the County, State, and Federal governments, the fourteen cities in western Riverside County, and private and public entities engaged in construction activities that potentially affect the species covered under the MSHCP. The plan specifies an obligation of local projects, both public and private, to mitigate their impacts on species. The MSHCP includes incentives for conservation or the purchase of properties from willing sellers and will eventually result in a Conservation Area in excess of 500,000 acres, focusing on conservation of 146 species. The MSHCP Conservation Area includes approximately 347,000 acres of existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land.

The MSHCP Conservation Area¹ is made up of existing and proposed “Core” areas, or large assemblages of public land that contain important habitat and listed or sensitive species populations. The core areas are connected by a series of “linkages” or “corridors” identified across public and private lands to allow wildlife movement and genetic connectivity and diversity among the core areas. The MSHCP identifies conservation areas through a series of “criteria cells” within which certain biological resources (i.e., vegetation and/or physical features) should be preserved over the long term. The MSHCP also establishes various processes to evaluate land development proposals in light of its goals and requirements. The MSHCP also identifies when studies need to be performed within certain criteria cells to determine the presence or absence of listed or otherwise sensitive species of plants or animals.

The project site is located within the Reche Canyon/Badlands Area Plan of the MSHCP. Portions of the project area occur in 14 criteria cells of the MSHCP. Therefore, the project applicant, the City, and the County² are required to use the Habitat Acquisition Negotiation Strategy (HANS) process established in the MSHCP to identify and acquire habitat as part of the development review process. The HANS process involves negotiations between a landowner and the Western Riverside County Regional Conservation Authority (RCA) so the County can acquire land with important habitat or other biological resources while providing fair compensation and/or reasonable development opportunities on the remaining land for the landowner.

The southern portion of the project area (910 acres owned by the CDFW) is the northern portion of the SJWA, which is classified as “Public Conserved Land” under the MSHCP. MSHCP Proposed Core 3 is located to the north and east of the project area, and Existing Core H is located to the south. Small portions of the project area fall within both Core Areas (see Figure 4.4.3). No existing or proposed linkage or constrained linkage areas are within or adjacent to the project area.

The ~~2012~~2013 MBA report focused on sensitive resources that could potentially occur in the overall planning area, including nine Criteria Area plant species, burrowing owl (*Athene cunicularia*), and Los Angeles pocket mouse (*Perognathus longimembris brevinasus*).

4.4.1.13 Endangered, Threatened, and Special Status Species

It is typical to base the presence or likelihood of presence of sensitive species within a specific area on the following criteria:

- Direct observation of the species or its sign in the project area or immediate vicinity during site-specific surveys or reported in previous biological studies;
- Sighting by other qualified observers;
- Record reported by the Natural Diversity Data Base (NDDDB) published by the CDFW; and/or
- Presence or location of specific species lists provided by private groups (e.g., CNPS).

Threatened and Endangered Species. The USFWS and the CDFW list species as ~~Threatened~~threatened or ~~Endangered~~endangered under the Federal and California Endangered Species Acts (FESA and CESA, respectively). An ~~Endangered~~endangered species is one that is in danger of extinction throughout all or a significant portion of its range. A ~~Threatened~~threatened species is one that is likely to become endangered in the foreseeable future.

¹ Not to be confused with the Conservation Area within the WLC planning area

² Western Riverside County Regional Conservation Authority (RCA)

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The USFWS may designate “critical habitat” that identifies specific areas, both occupied and unoccupied, that are often necessary to the conservation of a listed species. To make a determination of Critical Habitat, biologists consider physical and biological habitat features needed for life and successful reproduction of the species which include:

- Space for individual and population growth and for normal behavior;
- Cover or shelter;
- Food, water, air, light, minerals, or other nutritional or physiological requirements;
- Sites for breeding and rearing offspring; and
- Habitats that are protected from disturbances or are representative of the historic geographical and ecological distributions of a species.

Critical Habitat areas may require special management considerations or protections. The project site is not located within any USFWS designated Critical Habitat area, and no ~~Threatened~~threatened or ~~Endangered~~endangered species were observed within the project site during the field surveys.

Table 4.4.B identifies ~~Threatened and Endangered~~special status plant species identified in the City’s *General Plan Final EIR*, and in searches of the CDFW’s *California Natural Diversity Data Base* (CNDDDB) and the CNPS’s *Electronic Inventory of Rare and Endangered Vascular Plants of California* that may potentially occur in the ~~WLC planning area and the WLCSP project area (land proposed for development)~~project survey area.

Note: Table 4.4.B was divided into two separate tables based on the updated biological resources report and various comments regarding the presence of sensitive plants and wildlife in the area. For the original Table 4.4.B please refer to Final EIR Volume IV, Section 4.4, Table 4.4.B.

Note: The following sections were reorganized from the original DEIR to be more consistent with the updated biological resource reports, but the data has not substantially changed.

Federally Endangered Plant Species. ~~Two~~As shown in Table 4.4.B, two federally endangered plant species, San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*) and slender-horned spineflower (*Dodecahema leptoceras*), were analyzed for their potential to occur in the project area and the off-site facilities. No evidence of these plant species was found during reconnaissance-level surveys. In addition, no suitable habitat for this species occurs on site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native, low-quality vegetation. No additional federally endangered plant species were analyzed for potential to occur in the project area and off-site facilities because no additional federally endangered plant species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the project area or off-site facilities to support other federally endangered plant species. Therefore, federally endangered plant species are not likely to occur in the project area or off-site facilities.

Federally Threatened Plant Species. As shown in Table 4.4.B, one federally threatened plant species, thread-leaved brodiaea (*Brodiaea filifolia*), was analyzed for its potential to occur in the project area. No evidence of this federally threatened plant species was found and no suitable habitat for this federally threatened plant species occurs on site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional federally threatened plant species were analyzed for their potential to occur in the project area because no additional federally threatened plant species are known to occur on, or in the vicinity of, the site. No suitable habitat was found during the site surveys to support other federally threatened plant species. Therefore, federally threatened plant species are not likely to occur in the project area.

Table 4.4.B: Sensitive Plant Species in the WLC Project Area (new table)

Species		Status		Preferred Habitat	Life Form	Bloom Period	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
		USFWS	CNPS					
<i>Atriplex coronata</i> var. <i>notator</i>	San Jacinto valley crownscale	FE	—	1B.1	Occurs in playas, chenopod scrub, grasslands, and vernal pools. Specifically found in dry alkali flats in the San Jacinto River Valley. Elevation limits: 1,200 to 1,500 feet.	Annual herb	Covered	Not Likely to Occur. No alkali flats occur in the WLCSP. Recorded approximately 2.5 miles southeast of the WLCSP (CNDDDB 2012) and 1.5 miles south of the study area boundary (RCA 2013).
<i>Brodiaea filifolia</i>	Thread-leaved brodiaea	FT	SE	1B.1	Occurs in coastal scrub, cismontane woodland, grasslands, and vernal pools. Usually associated with annual grassland and vernal pools in clay soils. Elevation limits: 75 to 2,500 feet.	Perennial herb bulbiferous	Covered	Not Likely to Occur. No clay soils or vernal pools occur in the WLCSP. Recorded approximately 5 miles south of the WLCSP (CNDDDB 2012) and 4 miles south according to the BMP (RCA 2013).
<i>Calochortus plummerae</i>	Plummer's mariposa lily	—	—	4.2	Occurs in coastal scrub, chaparral, grasslands, cismontane woodlands, and lower montane coniferous forests. Found in rocky and sandy soils, usually of granitic or alluvial material. Very common after fire. Elevation limits: 300 to 4,500 feet.	Bulbiferous herb	Not Covered	Moderate Potential to Occur. The portion of the WLCSP that contains sandy soils and chaparral/RSS along the western border of the project in an area slated as open space. Recorded approximately 2 miles east of the WLCSP. (CNDDDB 2012)
<i>Centromadia pungens</i> ssp. <i>laevis</i>	Smooth tarplant	—	—	1B.1	Occurs in grasslands, chenopod scrub, meadows, playas, and riparian woodland. Prefers alkali meadow and alkali scrub. Elevation limits: 0 to 1,500 feet.	Annual herb	Covered	Not Likely to Occur. No alkali soils occur in the WLCSP. Recorded approximately 3 miles west of the WLCSP (CNDDDB 2012) and 2.5 miles south by the BMP (RCA 2013).

 World Logistics Center Project

Table 4.4.B: Sensitive Plant Species in the WLC Project Area (new table)

Species		Status		Preferred Habitat	Life Form	Bloom Period	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
Scientific Name	Common Name	USFWS	CNPS					
<i>Chorizanthe parryi</i> var. <i>parryi</i>	Parry's spineflower	—	1B.1	Occurs in coastal scrub and chaparral. Found on dry slopes and flats, sometimes at interface of two vegetation types, on dry, sandy soils. Elevation limits: 150 to 5,000 feet.	Annual herb	Apr to Jun	Covered	Moderate Potential to Occur. The portion of the WLCSP that contains sandy soils and chaparral/RSS along the western border of the project in an area slated as open space. Recorded approximately 4.5 miles northwest of WLCSP. (CNDDDB 2012)
<i>Dodecahema leptoceras</i>	Slender-horned spineflower	FE	1B.1	Occurs in chaparral and alluvial fan sage scrub. Prefers flood deposited terraces and washes. Elevation limits: 600 to 2,300 feet.	Annual herb	Apr to Jun	Covered	Low Potential to Occur. The WLCSP contains several natural drainages; one contains a mixture of RSS and mule fat scrub. The remaining drainages are generally devoid of vegetation. Recorded approximately 7 miles northwest of the WLCSP. (CNDDDB 2012)
<i>Lasthenia glabrata</i> ssp. <i>coulteri</i>	Coulter's goldfields	—	1B.1	Occurs in coastal salt marshes, playas, grasslands, and vernal pools. Usually found on alkali soils in playas, sinks, and grasslands. Elevation limits: 1 to 4,500 feet.	Annual herb	Feb to Jun	Covered	Not Likely to Occur. No alkali soils, marshes, or vernal pools occur in the WLCSP. Observed approximately 2 miles south of WLCSP (CNDDDB 2012) and as close as 0.75 mile to the south of the WLCSP study area according to the BMP (RCA 2013).

Table 4.4.B: Sensitive Plant Species in the WLC Project Area (new table)

Species		Status		Preferred Habitat	Life Form	Bloom Period	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
Scientific Name	Common Name	USFWS	CNPS					
<i>Lepidium virginicum</i> var. <i>robinsonii</i>	Robinson's pepper-grass	—	4.3	Occurs in chaparral and coastal scrub on dry soils. Elevation limits: 1 to 3,000 feet.	Annual herb	Jan to Jul	Not Covered	Low Potential to Occur. The portion of the WLCSP that contains sandy soils and chaparral/RSS along the western border of the project in an area slated as open space. Recorded approximately 7 miles northwest of WLCSP. (CNDDDB 2012)
<i>Nama stenocarpum</i>	Mud nama	—	2B.2	Occurs in marshes, swamps, lakeshores, riverbanks, and intermittently wet areas. Elevation limits: 15 to 1,500 feet.	Annual/perennial herb	Jan to Jul	Covered	Not Likely to Occur. No lakes, marshes or riverine areas occur in the WLCSP. The drainage features onsite do not remain wet long enough to be considered suitable habitat. Recorded approximately 2.5 miles southeast of WLCSP. (CNDDDB 2012)
<i>Symphotrichum defoliatum</i>	San Bernardino aster	—	1B.2	Occurs in meadows, seeps, marshes, swamps, coastal scrub, cismontane woodland, lower montane coniferous forest, and grasslands. Found in vernal mesic areas near ditches, streams, and springs. Elevation limits: 6 to 6,000 feet.	Rhizomatous herb	Jul to Nov	Not Covered	Not Likely to Occur. The ditches and erosion features in the WLCSP are heavily disturbed. Recorded 2.5 miles northeast of the WLCSP. (CNDDDB 2012)

Table 4.4.B: Sensitive Plant Species in the WLC Project Area (new table)

Species		Status		Preferred Habitat	Life Form	Bloom Period	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
Scientific Name	Common Name	USFWS	CNPS					
<i>Trichocoronis wrightii</i> var. <i>wrightii</i>	Wright's trichocoronis	—	2B.1	Occurs in marshes and swamps, riparian forest, meadows, seeps, and vernal pools. Found in mud flats of vernal lakes, drying riverbeds, and alkali meadows. Elevation limits: 10 to 1,300 feet.	Annual herb	May to Sep	Covered	Not Likely to Occur. No marshes, riverine or vernal pool areas occur in the WLCSP. Recorded approximately 4 miles south of the WLCSP. (CNDDDB 2012)
U.S. Fish and Wildlife Service								
FE	Federal Endangered	California Department of Fish and Game						
FT	Federal Threatened	1A Plants presumed extinct in California.						
PE	Proposed Endangered	CE California Endangered						
PT	Proposed Threatened	1B Plants rare, threatened, or endangered in California, but more common elsewhere.						
FC	Federal Candidate	2 Plants rare, threatened, or endangered in California.						
FSC	Species of Concern*	3 Plants about which we need more information.						
	*No longer recognized as a federal designation.	4 Plants of limited distribution.						
Not Likely to Occur - There are no present or historical records of the species occurring on or in the immediate vicinity (within 3 miles) of the WLCSP and the diagnostic habitats strongly associated with the species do not occur on or in the immediate vicinity of the site.								
Low Potential to Occur - There is a historical record of the species in the vicinity of the WLCSP and potentially suitable habitat onsite, but existing conditions (e.g., density of cover, prevalence of non-native species, evidence of disturbance, limited habitat area, isolation) substantially reduce the possibility that the species may occur. The site is above or below the recognized elevation limits for this species.								
Moderate Potential to Occur - The diagnostic habitats associated with the species occur on or in the immediate vicinity of the WLCSP, but there is not a recorded occurrence of the species within the immediate vicinity (within three miles). Some species that contain extremely limited distributions may be considered moderate, even if there is a recorded occurrence in the immediate vicinity.								
High Potential to Occur - There is both suitable habitat associated with the species and a historical record of the species on or in the immediate vicinity of the WLCSP (within 3 miles).								
Species Present - The species was observed in the WLCSP at the time of the survey or during a previous biological survey.								

Source: Habitat Assessment, MSHCP Consistency Analysis, and HANS report, Michael Brandman Associates, September 2014.

Federally Proposed Endangered, Proposed Threatened, Federal Candidate, and Federal Plant Species of Concern. The USFWS has developed several categories for sensitive species not yet determined to have reached endangered or threatened status. Generally, federally proposed endangered or threatened species are species considered unofficially endangered or threatened (i.e., final regulatory action formally listing such species has not yet occurred). Federal candidate species are species who are candidates for becoming listed as endangered or threatened, and Federal species of concern are species whose numbers are considered low enough to have approached Federal candidate status.

Federally Protected Plant Species. As shown in Table 4.4.B, no Federal plant species of concern were analyzed for their potential to occur in the WLCSP and off-site facilities because no evidence of any Federal plant species of concern was found in the project area, nor was any suitable habitat found due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation.

Federally Endangered Wildlife Species. ~~Four~~As shown in Table 4.4.C, four federally endangered wildlife species were analyzed for potential to occur in the project area or off-site facilities: Riverside fairy shrimp (*Streptocephalus woottoni*), southwestern willow flycatcher (*Empidonax traillii extimus*), least Bell's vireo (*Vireo bellii pusillus*), and Stephens' kangaroo rat (*Dipodomys stephensi*). No evidence of any federally endangered wildlife species was found in the project area or off-site facilities. Stephens' kangaroo rat is the only federally listed wildlife species potentially occurring on site. Although no sign of Stephens' kangaroo rat was identified during the site surveys, it was determined that this species may range through the general area. This species is commonly found in ruderal and minimally disturbed areas. Low quality habitat was observed along existing roadsides.

Since the project area is within the known range of this species and low quality habitat was identified on site, there is a moderate potential for Stephens' kangaroo rat to occupy some portion of the WLC project area or off-site facilities.

No suitable habitat for Riverside fairy shrimp, southwestern willow flycatcher, and least Bell's vireo, occurs on site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional federally endangered wildlife species were analyzed in Table 4.4.BC for their potential to occur in the project area because no additional federally endangered wildlife species are known to occur on, or in the vicinity of, the site.

~~**Federally Threatened Plant Species.**~~ **Federally Threatened Wildlife Species.** As shown in Table 4.4.C, Coastal California gnatcatcher (*Polioptila californica californica*) is known to occur within moderate to high quality coastal sage scrub in the general area and some suitable habitat occurs on site for coastal California gnatcatcher. There is marginal Riversidean sage scrub in the north near SR-60 and Gilman Springs Road and in the proposed Open Space Area adjacent to the ~~LSSRA~~Lake Perris State Recreation Area (LPSRA) south of Brodiaea Avenue, west of Theodore Street and east of Redlands Boulevard. No additional federally threatened wildlife species were analyzed for their potential to occur in the ~~planning~~WLC project area.

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Common Name	Species			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
		Federal	State	Other			
Branchiopods							
<i>Streptocephalus woottoni</i>	Riverside fairy shrimp	FE	—	CDFW: CSC	Occurs in tectonic swales and earth slump basins in grassland and coastal sage scrub. Inhabits seasonally astatic pools filled by winter/spring rains. Hatches in warm water later in the season.	Covered	Not Likely to Occur. No vernal pools occur in the WLCSP. Observed farther than 5 miles south of the WLCSP.
Reptiles and Amphibians							
<i>Aspidoscelis hyperythra</i>	Orange-throated whiptail	—	—	CDFW: CSC	Inhabits low-elevation coastal scrub, chaparral, and valley-footfill hardwood habitats. Prefers washes and other sandy areas with patches of brush and rocks. Also near perennial plants where termites, its major food, can be found.	Covered	Low Potential to Occur. Limited coastal scrub is present in the WLCSP. Woody vegetation onsite is very sparse and is not considered sufficient to support the species. The nearest occurrence of the species was recorded approximately 0.3 mile north of the WLCSP; however, in the eighteen years since the observation, the previous site conditions have changed to become unsuitable habitat (CNDDDB 2012).
<i>Crotalus ruber ruber</i>	Northern red-diamond rattlesnake	—	—	CDFW: CSC	Inhabits chaparral, woodland, grassland, and desert habitats. Occurs in rocky areas and dense vegetation. Needs rodent burrows, cracks in rocks, or surface cover objects.	Covered	Not Likely to Occur. No rocky areas and dense native plant communities occur in the WLCSP and the site is regularly disturbed. Recorded approximately 1 mile south of the WLCSP; however, the observation occurred over 80 years ago (CNDDDB 2012). The BMP has recently found the species in the same area as the CNDDDB sighting (RCA 2013)
<i>Phrynosoma coronatum blainvillei</i>	Coast horned lizard	—	—	CDFW: CSC	Inhabits coastal sage scrub and chaparral in arid and semi-arid climates. Prefers friable, rocky, or shallow sandy soils.	Covered	Low Potential to Occur. The portion of the WLCSP that contains sandy soils or rocky soils and chaparral/RSS along the western border of the project in an area slated as open space. Recorded approximately 4 miles northwest of the WLCSP (CNDDDB 2012)

Final Programmatic Environmental Impact Report

 World Logistics Center Project

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Species		Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
	Common Name	Federal	State	Other				
<i>Spea hammondi</i>	Western spadefoot	—	—	CDFW: CSC		Occurs primarily in grassland habitats, but also found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.	Covered	Not Likely to Occur. No vernal pools or native woodlands occur in the WLCSP. Recorded approximately 2 miles south and west of the WLCSP (CNDDDB 2012). The BMP studies have occurrences approximately 0.7 mile south of the study area boundary (RCA 2013)
Birds								
<i>Agelaius tricolor</i>	Tricolored blackbird	—	—	CDFW: CSC		Highly colonial species. Requires open water, protected nesting substrate, and foraging areas with insect prey within a few miles of the colony.	Covered	Low Potential to Occur. No open water or protected nesting habitat is located in the WLCSP. Numerous nesting pairs were recorded within the wheat fields on the southeastern portion of the WLCSP in 1995. The wheat has since been removed and no suitable nesting vegetation remains (CNDDDB 2012).
<i>Aimophila ruficeps canescens</i>	Southern California rufous-crowned sparrow	—	—	CDFW: CSC		Resident in coastal sage scrub and sparse mixed chaparral. Frequents relatively steep, often rocky hillsides with grass and forb patches.	Covered	Low Potential to Occur. While sparse RSS and chaparral are present within the WLCSP, no steep slopes are present in the WLCSP. Recorded approximately 4 miles west of the WLCSP (CNDDDB 2012). The BMP database has the species less than 1.0 mile from the WLCSP study area boundary (RCA 2013).
<i>Amphispiza belli belli</i>	Bell's sage sparrow	—	—	CDFW: CSC		Nests in chaparral dominated by fairly dense stands of chamise. Found in coastal sage scrub in southern portion of range. Nests typically located on the ground beneath shrub or in shrub 6 to 18 inches above ground.	Covered	Not Likely to Occur. No dense stands chaparral or coastal sage scrub vegetation occurs in the WLCSP. Recorded approximately 4 miles northwest of the WLCSP (CNDDDB 2012) and according to the BMP 4 miles south of the WLCSP study area (RCA 2013).

 World Logistics Center Project

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Common Name	Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
		Federal	State	Other			
<i>Athene cunicularia</i>	Burrowing owl	—	—	CDFW: CSC	Occupies burrows in open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	Covered	Present. Despite the heavy disturbance the WLCSP contains flat topography with sparse, low-lying vegetation and various California ground squirrel burrows. Observed within the WLCSP in 2005; however, focused surveys conducted in 2010 and 2012 found the WLCSP and surroundings to be unoccupied. The 2013 survey of the WLCSP again found a pair of owls (MBA 2013b)
<i>Aquila chrysaetos</i>	Golden eagle	—	—	CDFW: FP	Open mountains, foothills, plains.	Covered	Low Potential to Occur. The WLCSP contains open flat area that is considered marginally suitable foraging habitat, but not suitable nesting habitat. Recorded approximately 1 mile south of the WLCSP (RCA 2013)
<i>Buteo swainsonii</i>	Swainson's hawk	—	ST	—	Grasslands and riparian areas	Covered	Low Potential to Occur. The WLCSP contains open flat area that is considered marginally suitable foraging habitat, but not suitable nesting habitat. Recorded approximately 1 mile south of the WLCSP (RCA 2013)
<i>Buteo regalis</i>	Ferruginous hawk	—	—	CDFW: CSC	Winters in open grasslands, sagebrush flats, desert scrub, low foothills, and fringes of piñon-juniper habitats.	Covered	Low Potential to Occur. The WLCSP contains open flat area that is considered marginally suitable foraging habitat, but not suitable nesting habitat. Recorded approximately 1 mile northeast of the WLCSP (CNDDDB 2012) and 2 miles south of the WLCSP according to BMP records (RCA 2013).

Final Programmatic Environmental Impact Report
 Volume 2 – Revised Draft EIR (Track Changes)
 World Logistics Center Project

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Species		Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
	Common Name	Federal	State	Other	Other			
<i>Coccyzus americanus occidentalis</i>	Western yellow-billed cuckoo	FC	SE	—	—	Riparian forest nester, along the broad, lower flood-bottoms of larger river systems. Specifically nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles, or wild grape.	Covered	Not Likely to Occur. No riparian plant communities occur in the WLCSP. Recorded approximately 5.5 miles northwest of the WLCSP (CNDDDB 2012).
<i>Elanus leucurus</i>	White-tailed kite	—	—	—	CDFW: FP	Nests in rolling foothills/valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodlands. Prefers open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	Covered	Present. The WLCSP contains suitable foraging habitat, but few dense-topped trees occur in the vicinity of the site. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDDB 2012). The BMP indicates that the species is found 1.0 mile from the WLCSP study area boundary (2013). Species was observed foraging within the southern portion of the survey area adjacent to the SJWA.
<i>Empidonax traillii eximius</i>	Southwestern willow flycatcher	FE	SE	—	—	Nests in riparian woodlands in southern California.	Covered	Not Likely to Occur. No riparian plant communities occur in the WLCSP. Recorded approximately 6.5 miles east of the WLCSP (CNDDDB 2012).
<i>Eremophila alpestris actia</i>	California horned lark	—	—	—	CDFW: CSC	Inhabits short-grass prairie, bald hills, mountain meadows, open coastal plains, fallow grain fields, and alkali flats.	Covered	Present. The WLCSP contains flat, fallow grain fields that constitute suitable nesting habitat. Observed in the WLCSP during the reconnaissance-level surveys (MBA 2012).

 World Logistics Center Project

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Common Name	Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
		Federal	State	Other			
<i>Falco columbarius</i>	Merlin	—	—	CDFW: CSC	Winters in seacoast, tidal estuaries, open woodlands, savannahs, edges of grasslands and deserts, farms and ranches. Clumps of trees or windbreaks are required for roosting in open country.	Covered	Low Potential to Occur. Portions of the WLCSP contain windbreak trees and open farmland. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDDB 2012). The BMP database has the species less than a mile south of the WLCSP study area (RCA 2013).
<i>Falco mexicanus</i>	Prairie falcon	—	—	CDFW: CSC	Inhabits dry, open terrain, either flat or hilly. Breeding sites located on cliffs.	Covered	Low Potential to Occur. The WLCSP contains marginally suitable foraging habitat but no suitable nesting habitat. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDDB 2012).
<i>Falco peregrinus anatum</i>	Peregrine falcon	FD	SE	CDFW: FP	Nests near wetlands, lakes, rivers, or other water; on cliffs, banks, dunes, mounds, and human-made structures. Nest consists of a scrape on a depression or ledge in an open site.	Covered	Low Potential to Occur. The WLCSP contains marginal nesting habitat. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDDB 2012). The BMP indicates the species is within 1.0 mile of the southern boundary of the study area (RCA 2013).
<i>Icteria virens</i>	Yellow-breasted chat	—	—	CDFW: CSC	Summer resident; inhabits riparian thickets of willow and other brushy tangles near watercourses. Specifically nests in low, dense riparian vegetation, consisting of willow, blackberry, wild grape. Forages and nests within 10 feet of ground.	Covered	Not Likely to Occur. No riparian plant communities occur in the WLCSP. Recorded approximately 5.5 miles northwest of the WLCSP (CNDDDB 2012).

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Species		Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
	Common Name	Federal	State	Other				
<i>Lanius ludovicianus</i>	Loggerhead shrike	—	—	CDFW: CSC		Inhabits broken woodlands, savannah, pinyon-juniper, Joshua tree and riparian woodlands, desert oases, scrub and washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.	Covered	Present. The WLCSP contains flat, open area that is suitable foraging habitat but not suitable nesting habitat. Observed by MBA during previous surveys, approximately within the WLCSP (MBA 2012).
<i>Plegadis chihii</i>	White-faced ibis	—	—	CDFW: CSC		Rookery sites include shallow freshwater marshes. Nests in dense tule thickets interspersed with areas of shallow water for foraging.	Covered	Not Likely to Occur. No marshes or bodies of water occur in the WLCSP. Recorded approximately 3 miles southeast of the WLCSP (CNDDDB 2012).
<i>Poliioptila californica californica</i>	Coastal California gnatcatcher	FT	—	CDFW: CSC		Obligate, permanent resident of coastal sage scrub below 2,500 feet in southern California. Prefers low coastal sage scrub in arid washes and on mesas and slopes.	Covered	Low Potential to Occur. There is limited and sparse coastal sage scrub vegetation occurs in the WLCSP. Recorded approximately 4 miles northwest of the WLCSP (CNDDDB 2012) and less than 0.5 mile of the WLCSP study area according to BMP (RCA 2013).
<i>Vireo bellii pusillus</i>	Least Bell's vireo	FE	SE	—		Summer resident in low riparian vegetation in the vicinity of water or in dry river bottoms; below 2,000 feet. Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, baccharis, and mesquite.	Covered	Not Likely to Occur. No riparian plant communities or significant riparian vegetation occur in the WLCSP. Recorded approximately 3 miles northeast of the WLCSP (CNDDDB 2012) and was recorded by the BMP at 2 miles from the closest WLCSP border (RCA 2013).

Mammals							
<i>Chaetodipus fallax fallax</i>	Northwestern San Diego pocket mouse	—	—	CDFW: CSC	Inhabits coastal scrub, chaparral, and grasslands. Prefers sandy, herbaceous areas, usually in association with rocks or coarse gravel.	Covered	Present. Sandy to loamy soils occur in the WLCSP. There are limited areas of RSS and chaparral and herbaceous areas are severely limited due to agricultural activities. Species was caught within Drainage 9 (MBA 2013).
<i>Dipodomys stephensi</i>	Stephens' kangaroo rat	FE	ST	—	Primarily found in annual and perennial grasslands, but also occurs in coastal scrub and sagebrush with sparse canopy cover. Prefers buckwheat, chamise, brome grass, and filaree. Will burrow into firm soil.	Covered under SKRHCP	Moderate Potential to Occur. The WLCSP contains areas similar to grasslands with very sparse canopy, but is heavily disturbed. Recorded approximately adjacent to the general WLCSP on the west and south (CNDDDB 2012).
<i>Lasius xanthinus</i>	Western yellow bat	—	—	CDFW: CSC	Occurs in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats below 1,800 feet. Roosts in trees.	Not Covered	Not Likely to Occur. No riparian or native plant communities occur in the WLCSP. Recorded approximately 3.5 miles southwest of the WLCSP (CNDDDB 2012).
<i>Lepus californicus bennettii</i>	San Diego black-tailed jackrabbit	—	—	CDFW: CSC	Inhabits coastal sage scrub habitats. Specifically, intermediate canopy stages of shrub, open shrub, herbaceous and tree, and herbaceous edge habitats.	Covered	Present Recorded within the MWD lands in the northern portion of the WLCSP during burrowing owl surveys (MBA 2013).
<i>Onychomys torridus ramona</i>	Southern grasshopper mouse	—	—	CDFW: CSC	Inhabits desert areas, especially scrub habitats with friable soils. Prefers low to moderate shrub cover. Feeds almost exclusively on arthropods, especially scorpions and orthopteran insects.	Not Covered	Not Likely to Occur. No shrub or scrub habitat occurs in the WLCSP. Additionally, the site is regularly disturbed by disking. Recorded approximately 4 miles southeast of the WLCSP (CNDDDB 2012).

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.4.C: Sensitive Wildlife Species in the WLC Project Area (new table)

Scientific Name	Common Name	Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
		Federal	State	Other			
<i>Perognathus longimembris brevinasus</i>	Los Angeles pocket mouse	—	—	CDFW: CSC	Inhabits lower elevation grasslands and coastal sage communities. Prefers open ground with fine sandy soils.	Covered	Low Potential to Occur. The sandy soils that occur in the WLCSP are limited to existing drainages with the proper coastal sage communities. Three years of trapping did not produce any Los Angeles pocket mice. Recorded approximately 3 miles south of the WLCSP (CNDDDB 2012). It was observed in BMP trapping within 2 miles of the study area (RCA 2013).
<i>Taxidea taxus</i>	American badger	—	—	CDFW: CSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats. Needs sufficient food, friable soils, and open, uncultivated ground. Preys on burrowing rodents.	Not covered	Low potential to occur. The WLCSP contains limited amounts of vegetation and the ground is cultivated. Recorded approximately 8.5 miles northwest of the WLCSP (CNDDDB 2012). RCA data lists the closest recorded occurrence, just outside the 1,000-foot buffer area. Most likely limited to the badlands area north and east of the project site.

Federal

- FE Federal Endangered
- FT Federal Threatened
- FSC Federal Species of Concern
- PFT Proposed Federal Threatened
- FC Candidate for Federal Listing
- FD Delisted

State

- SE State Endangered
- ST State Threatened

Other

- CDFW: CSC California Species of Concern
- CDFW: FP Fully Protected Species
- CDFW: P Protected Species

Not Likely to Occur - There are no present or historical records of the species occurring on or in the immediate vicinity (within 3 miles) of the WLCSP and the diagnostic habitats strongly associated with the species do not occur on or in the immediate vicinity of the site.

Low Potential to Occur - There is a historical record of the species in the vicinity of the WLCSP and potentially suitable habitat onsite, but existing conditions (e.g., density of cover, prevalence of non-native species, evidence of disturbance, limited habitat area, isolation) substantially reduce the possibility that the species may occur. The site is above or below the recognized elevation limits for this species.

Moderate Potential to Occur - The diagnostic habitats associated with the species occur on or in the immediate vicinity of the WLCSP, but there is not a recorded occurrence of the species within the immediate vicinity (within three miles). Some species that contain extremely limited distributions may be considered moderate, even if there is a recorded occurrence in the immediate vicinity.

High Potential to Occur - There is both suitable habitat associated with the species and a historical record of the species on or in the immediate vicinity of the WLCSP (within 3 miles).

Species Present - The species was observed in the WLCSP at the time of the survey or during a previous biological survey.
Source: Habitat Assessment, MSHCP Consistency Analysis, and HANS report, Michael Brandman Associates, September 2014.

Federally Proposed Endangered, Proposed Threatened, Federal Candidate, and Federal Species of Concern. The USFWS has developed several categories for sensitive species not yet determined to have reached endangered or threatened status. Generally, federally proposed endangered or threatened species are species considered unofficially endangered or threatened (i.e., final regulatory action formally listing such species has not yet occurred). Federal candidate species are species who are candidates for becoming listed as endangered or threatened, and Federal species of concern are species whose numbers are considered low enough to have approached Federal candidate status. The western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) is the only Federal Candidate Species with a potential to occur in this area, but this species is not likely to occur in the WLCSP and off-site facilities. In addition, it is a covered species under the MSHCP.

~~**Protected Plant Species.** No Federal plant species of concern were analyzed for their potential to occur in the WLCSP and off-site facilities because no evidence of any Federal plant species of concern was found in the project area, nor was any suitable habitat found due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation.~~

~~**Federally Protected Wildlife Species.** There were nowas only one Federal wildlife species of concern analyzed for their potential to occur in the WLCSP and off-site facilities. The (see the western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) is not likely to occur in the WLCSP and off-site facilities and is also a covered species under the MSHCP.~~

~~discussed above). No evidence of any other Federal wildlife species of concern was found in the project area nor does any suitable habitat occur due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional Federal wildlife species of concern were analyzed for potential to occur in the project area because no additional Federal wildlife species of concern are known to occur on, or in the vicinity of, the site. ~~Therefore,~~ Federal wildlife species of concern are not likely to occur in the project area and there is no potential impact to Federal wildlife species of concern.~~

~~**California State Endangered Plant Species.** TwoAs shown in Table 4.4.B, two California State endangered plant species were analyzed for their potential to occur in the WLCSP and off-site facilities: slender-horned spine-flower and thread-leaved brodiaea. No evidence of these State-listed plant species was found in the project area nor is there any suitable habitat for these State-listed plant species due to regular disking of the site and dominance of sparse, non-native low-quality vegetation. No additional State-listed plant species were analyzed for potential to occur in the project area because no additional State-listed plant species are known to occur on, or in the vicinity of, the site, nor was any suitable habitat found to support other State-listed plant species. Therefore, State-listed plant species are not likely to occur in the project area and there is no potential impact to State endangered plant species.~~

~~**California State Threatened Plant Species.** As shown in Table 4.4.B, no California State threatened plant species are known to occur on, or in the vicinity of, the project site and no suitable habitat occurs within the project are for any California State threatened plant species. Therefore, California State threatened plant species are not likely to occur in the project area and there is no potential impact to State threatened plant species.~~

~~**California State Endangered Wildlife Species.** FourAs shown in Table 4.4.B, four California State endangered wildlife species were analyzed for their potential to occur in the WLCSP and off-site facilities: western yellow-billed cuckoo, southwestern willow flycatcher, least Bell's vireo, and ~~American~~ peregrine falcon (*Falco peregrinus anatum*). No evidence of these California State endangered wildlife species was found in the project area. In addition, no suitable habitat for these species occurs within the project area due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional California State~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

endangered wildlife species were analyzed for potential to occur in the project area because no additional California State endangered wildlife species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the project area to support other California State endangered wildlife species. Therefore, California State endangered wildlife species are not likely to occur in the project area and there is no potential impact to State endangered wildlife species.

California State Threatened Plant Species. No California State Threatened Wildlife Species. ~~As shown in Table 4.4.C, two~~ California State threatened wildlife species was analyzed for its potential to occur in the project area: ~~the Stephens' kangaroo rat~~ Swainson's hawk (*Buteo swainsonii*) and Stephens' kangaroo rat. There is little to no nesting habitat within the WLCSP for Swainson's hawk and marginally quality foraging habitat. This species is known to occur with the adjacent SJWA and has a low potential to occur within the WLCSP project site. Although no sign of Stephens' kangaroo rat was identified in the project area, MBA concluded that this species may range through the general area. This species is known to occur in ruderal and minimally disturbed areas. Marginal habitat was observed along existing roadsides and within active pasture areas. Since the project area is within the known range of this species, and marginal habitat was identified on site, there is a moderate potential for Stephens' kangaroo rat to occupy some portion of the area.

No additional California State threatened wildlife species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the project area support other California State threatened wildlife species. Therefore, except for the Stephens' kangaroo rat, California State threatened wildlife species are not likely to occur in the project area and there is no potential impact to California State threatened wildlife species.

Special-Status Species. ~~Special-status species are plant and wildlife species that have been afforded legal protection under the FESA, CESA, or any other local regulations, or are considered rare, threatened, or endangered by any other resource agency, or organization in the scientific community. As it pertains to the technical reports prepared by MBA for the project (focused surveys) and the biological resources section of this EIR, the following describes applicable classifications of special-status species not listed above for FESA and CESA.~~

California State Fully Protected Species. The classification of Fully Protected was California's initial effort in the 1960s to identify and provide additional protection to those animals that were rare or faced possible extinction. The list of fully protected species included fish, mammals, amphibians, reptiles, birds, and mammals. Most fully protected species are currently listed as threatened or endangered species under the more recent endangered species laws and regulations.

Fully protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.

California State Fully Protected Wildlife Species. ~~Two~~ As shown in Table 4.4.C, three California State Fully Protected ~~wildlife~~ species were analyzed for their potential to occur in the project area: golden eagle (*Aquila chrysaetos*), white-tailed kite (*Elanus leucurus*) and American peregrine falcon. No suitable nesting habitat for golden eagle, white-tailed kite or ~~American~~ peregrine falcon occurs within the area due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. However, agricultural land does represent marginal quality foraging habitat within the WLCSP project areasite and adjacent CDFW Conservation Areas. No additional California State fully protected wildlife species were analyzed for their potential to occur in the project area because no additional California State fully protected wildlife species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the WLCSP and off-site facilities to support other California State fully protected wildlife species. Therefore, California State

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

fully protected wildlife species are not likely to occur in the project area and there is no impact to California State fully protected wildlife species.

California Rare Plants ~~Species~~ and Wildlife ~~California~~ Species of Concern. California Species of Concern (CSC) applies to animals not listed under the FESA or CESA, but are declining at a rate that could result in Federal or State listing or historically occur in low numbers and known threats to their persistence currently exist.

California Rare Plant Species. No California rare plant species are known to occur on, or in the vicinity of, the project area nor is any suitable habitat known to occur within the area. Therefore, no California rare plant species were analyzed for their potential to occur in the project area. Eleven special status plant species, as determine by the California Native Plant Society, were identified as potentially occurring within the project area. Three of the species (Plummer's mariposa lily [*Calochortus plummerae*], Robinson's pepper-grass [*Lepidium virginicum* var. *robinsonii*], and San Bernardino aster [*Symphotrichum defoliatum*]) are not covered by the MSHCP. Plummer's mariposa lily and Robinson's pepper-grass have a moderate to low potential to occur based on habitat type and soils requirements. These species were not identified during sensitive plant surveys (MBA 2010).

The 2010 sensitive plant survey was conducted based on the 2010 site boundary and the then-current existing conditions. Several areas within the current WLCSP were not surveyed because they were either not included in the proposed development footprint (such as the Off-site Improvement Areas) or were not within areas of suitable habitat. Therefore, areas that contained suitable habitat, but are outside of the proposed development footprint, or areas that were not accessible during the survey, were not included. Since all areas of the WLCSP were not surveyed, additional plant surveys are recommended on a project-by-project basis. There has been below-average rainfall in the area since the 2010 plant surveys were conducted. Project-level surveys will be required prior to submittal of the CEQA documents as part of the project-specific environmental review process.

The Sensitive Plant Focused Survey Report only discusses the plant communities in which focused plant surveys were conducted. Many of the areas within the Extensive Agricultural Areas and the Urban/Developed areas contain elements of Riversidean sage scrub, non-native grasslands, and riparian habitat, but not in a sufficient amount to be considered a separate plant community. The remaining nine plant communities found within the WLCSP, either do not provide suitable habitat or are not within the proposed project impact area; these plant communities will not be directly or indirectly impacted by project development.

Updated focused plant surveys will likely be warranted on a project-level basis, especially if existing site conditions change over time. If the agricultural fields are left fallow, suitable habitat for a number of sensitive plant species may develop. Therefore, additional focused plant surveys will be required on a project-by-project basis as specific developments are proposed and subsequent or supplemental CEQA documentation is prepared.

The potential habitat for these species is confined to RSS and sandy-rocky soils, which are confined to the proposed open space area in the southwestern portion of the Specific Plan area.

California ~~Wildlife~~ Species of Concern. Twenty-one California Wildlife Species of Concern were analyzed for their potential to occur in the WLCSP and off-site facilities:

- Orange-throated whiptail (*Aspidoscelis hyperythra*)
- Northern red-diamond rattlesnake (*Crotalus ruber ruber*)
- Coast horned lizard (*Phrynosoma coronatum*)
- Western spadefoot (*Spea hammondi*)

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Tricolored blackbird (*Agelaius tricolor*)
- Bell's sage sparrow (*Amphispiza belli belli*)
- Ferruginous hawk (*Buteo regalis*)
- Merlin (*Falco columbarius*)
- Yellow-breasted chat (*Icteria virens*)
- White-faced ibis (*Plegadis chihi*)
- Western yellow bat (*Lasiurus xanthinus*)
- Southern grasshopper mouse (*Onychomys torridus ramona*)
- American badger (*Taxidea taxus*)
- Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)
- Burrowing owl (*Athene cunicularia hypugaea*)
- California horned lark (*Eremophila alpestris actia*)
- Prairie falcon (*Falco mexicanus*)
- Loggerhead shrike (*Lanius ludovicianus*)
- Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*)
- San Diego black-tailed jackrabbit (*Lepus californicus bennettii*)
- Los Angeles pocket mouse (*Perognathus longimembris brevinasus*)

The project area contains suitable foraging habitat for loggerhead shrike, ferruginous hawk, merlin, prairie falcon, California horned lark, and burrowing owl but no suitable nesting habitat for ferruginous hawk, merlin, or prairie falcon. Suitable ground-nesting habitat occurs for burrowing owl and California horned lark. ~~Although no~~ No sign of burrowing owl was identified during focused surveys conducted in 2012. However, burrowing owl was identified within the southern portion of in the WLCSP project site and offsite facilities during focused surveys conducted in 2013 and, it was determined that this species may range through the general area. Several California horned larks and loggerhead shrikes were observed foraging within the area. No suitable habitat for western spadefoot, Bell's sage sparrow, yellow-breasted chat, white-faced ibis, western yellow bat, southern grasshopper mouse, and American badger occurs within the project area due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. The western yellow bat, southern grasshopper mouse and American badger are not covered under the MSHCP. However, since there is no suitable habitat for these species, no impact is expected to occur. The remaining species are covered under the MSHCP.

There is limited suitable habitat for orange-throated whiptail, northern red-diamond rattlesnake, coast horned lizard, southern rufous-crowned sparrow, northwestern San Diego pocket mouse, San Diego jackrabbit, and Los Angeles pocket mouse in the project area. These species are generally associated with ~~coastal sage scrub~~ RSS, which is limited to the north near SR-60 and Gilman Springs Road and in the proposed Open Space Area adjacent to the ~~LSSRA~~ PSRA between Theodore Street and Redlands Boulevard, just south of Brodiaea Avenue. Focused surveys for Los Angeles pocket mouse in 2005, 2010, 2012, and 2012~~2013~~ were negative. The orange-throated whiptail is not covered under the MSHCP. There is limited habitat for the orange-throated whiptail in an area that is currently proposed for open space in the southwestern corner of the Specific Plan area. The other species mentioned are covered under the MSHCP. There is a low potential for these species to occur.

No additional California wildlife species of concern were analyzed for potential to occur in the project area because none is known to occur on, or in the vicinity of, the site. No suitable habitat was found in the project area to support other California Wildlife Species of Concern. Therefore, except for the burrowing owl, loggerhead shrike, and California horned lark, California Wildlife Species of Concern are not likely to occur in the WLCSP and off-site facilities.

California Native Plant Society (CNPS). The CNPS is a non-profit organization whose collaborative efforts in research helps maintain an inventory of rare and endangered plants that occur throughout

California. The CNPS has developed its own classification system in defining the degree of endangerment for sensitive plant species that models that of the FESA and CESA. Plants considered to be rare, threatened, or endangered in California are designated as List 1B or List 2 plant species. Plants for which more information is needed to determine their status are designated List 3 species. Plants with limited distribution are designated as List 4 species.

CNPS Listed Plant Species. Eight CNPS List 1B plant species were analyzed for potential to occur in the project area: San Jacinto Valley crownscale, thread-leaved brodiaea, Plummer's mariposa lily, smooth tarplant (*Centromadia pungens* ssp. *laevis*), slender-horned spineflower, Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*), Robinson's peppergrass, and San Bernardino aster.

Two CNPS List 2 plant species, mud nama (*Nama stenocarpum*) and Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*), were analyzed for potential to occur in the project area.

One CNPS List 3 plant species, Parry's spineflower (*Chorizanthe parryi* var. *parryi*), was also analyzed for potential to occur in the project area.

No evidence of any CNPS List 1B, List 2, or List 3 plant species were observed in the project area. In addition, no suitable habitat for any of these species occurs due to historic agricultural activities, regular disking of the site, and dominance of sparse, low quality non-native vegetation.

No additional CNPS List plant species were analyzed for potential to occur in the WLCSP and off-site facilities because none is known to occur on, or in the vicinity of, the site. No suitable habitat was found in the project area to support other CNPS List plant species. Therefore, CNPS List plant species are not likely to occur in the project area.

Migratory Bird Treaty Act and Section 3503 of the State Fish and Game Code. The project area contains suitable nesting habitat for ground-nesting birds such as burrowing owl and horned lark. The few large trees on the site provide suitable habitat for other migratory birds.

Raptor Foraging Habitat. The project area contains flat, open areas with sparse vegetation, which provides marginal foraging habitat for some raptors species. Due to the regular, heavy disturbance associated with the various agricultural activities in the area, and the limited size of the site in relation to the expansive foraging habitat in the vicinity including the CDFW Conservation Buffer Area and the SJWA, LPSRA, and the Badlands to the east, the foraging habitat on site is considered marginally suitable and of poor quality (MBA 2013, pages 94-95).

4.4.1.14 MSHCP Consistency Analysis

a. Burrowing Owl

The burrowing owl is an avian species of special concern that is protected by the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code Section 3503. This species typically occurs in grassland and scrub habitats characterized by low-growing vegetation with an abundance of small mammal burrows, including the California ground squirrel. It often prefers areas with moderate disturbance and/or berms or drainage features. Reasons for burrowing owl population decline include habitat destruction, insecticide poisoning, rodenticide (particularly squirrel eradication), and shooting.

The project area contains potentially suitable habitat for burrowing owl, such as flat, open, valley floor plains occupied by non-native grasslands, fallow fields, and agricultural lands. Details of the methodologies for the focused surveys are discussed in Appendix D, Burrowing Owl Focused Surveys. Details for these focused surveys for burrowing owl may not match exactly with the project

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

area as the boundaries of the various studies have evolved over time. The 2012 studies for burrowing owl encompassed the 3,300 acres of the project area.

Burrowing owl was identified within the southern portion of the WLCSP project site during focused surveys conducted in 2013, and may continue to range through the general area. Focused surveys for burrowing owl conducted in June–July 2012 did not locate any owls (MBA 2012b). During focused surveys conducted by MBA in 2005 (covering approximately 1,778 acres of the project area), a single breeding pair of burrowing owls was observed within an ephemeral drainage feature (Drainage 4) that longitudinally traverses the western portion of the survey area. The owls were observed perching and in flight along the western bank of the drainage feature, immediately south of its intersection with Dracaea Avenue. Conditions in this area have changed over the 6-year period and this was no longer habitat due to changes in land use.

In addition, focused burrow and burrowing owl surveys conducted by MBA in 2006 (750 acres), 2007 (2,904 acres), 2010 (3,844714 acres), and 2012 (3,300 acres) did not ~~disclosed~~determine the presence of any burrowing owls. (Appendix D, Burrowing Owl Focused Surveys). Burrowing owls were recorded in 2008 (246 acres) just south of the Skecher's Logistic Center (Fierro, personal communication). A single burrowing owl was observed within the temporary detention basin located south of the Skecher's building during the March 2012 site visit.

The disked and fallow fields within the project area continue to provide suitable foraging habitat for burrowing owl. The area contains numerous California ground squirrel and desert cottontail burrows, which are potentially suitable for burrowing and nesting by the owls. Therefore, this species appears to be present within portions of the project area and the CDFW Conservation Buffer Area, although it may not be a permanent resident.

b. Los Angeles Pocket Mouse

Los Angeles pocket mouse (LAPM) is a California species of special concern that inhabits lower elevation grasslands and scrub communities within Los Angeles, San Bernardino, and Riverside Counties. Los Angeles pocket mouse is the smallest of the pocket mice subspecies and is adapted for arid or semi-arid environments and nocturnal activity. The primary habitat requirement for the subspecies is a suitable burrowing substrate of fine sandy soils. LAPM is commonly found in low elevation open grasslands, coastal sage scrub, and alluvial fan sage scrub. The subspecies is recorded to have been observed approximately 2 miles southeast of the study area (CDFW 2012).

The majority of the project area does not contain suitable habitat for LAPM due to regular disturbance associated with agriculture, and the absence of fine sand soils. Drainage Feature 9, however, is not subject to regular agricultural disturbance and contains Riversidean sage scrub appropriate soils; therefore, this drainage feature contains marginally suitable habitat for LAPM.

MBA conducted surveys for LAPM in 2005, 2010, 2012, and ~~2012~~2013. In 2005, MBA conducted focused trapping surveys for LAPM in the south-central and southeastern portions of the project area. A total of 121 traps were set throughout the drainage features. In 2010, MBA conducted focused trapping surveys in the same location as in 2005 and in two additional drainage features. A total of 122 traps were set among the three drainage features. Only Drainage Feature 9 has suitable RSS and soils, and the other two drainage features only contained suitable soils. The 2012 trapping effort was conducted in the same area as in 2010. No LAPM were trapped. No LAPM were trapped during the focused surveys in any of the three trapping sessions (2005, 2010, 2012, and ~~2012~~2013); therefore, MBA has determined that this species is absent from the project area and no additional trapping is required.

c. Criteria Area Species

The following ten Criteria Area Species were assessed for their potential to occur in the project area:

- Mud nama (*Nama stenocarpum*);
- Little mousetail (*Myosurus minimus apus*);
- Coulter's goldfields (*Lasthenia glabrata* sub. *coulteri*);
- Thread-leafed brodiaea (*Brodiaea filifolia*);
- Davidson's saltscale (*Atriplex serenana davidsonii*);
- Parish's brittlescale (*Atriplex parishii*);
- San Jacinto valley crownscale (*Atriplex coronata notatior*);
- Round-leafed filaree (*Erodium macrophyllum*);
- Smooth tarplant (*Hemizonia pungens laevis*) and
- Nevin's Barberry (*Mahonia nevinii*).

The thread-leafed brodiaea typically occurs on gentle hillsides, valleys, and floodplains in semi-alkaline mudflats; therefore, it is not likely to occur within the WLC planning area.

Most of these species are associated with in highly alkaline, silty-clay soils in association with the Traver-Domino-Willows soil association. In Riverside County, vernal pool plant species are most closely associated with the Willows soil series.

According to the biological assessment, San Jacinto valley crownscale, Parish's brittlescale, Davidson's saltscale, smooth tarplant, Coulter's goldfields, and little mousetail are not likely to occur on the project site due to the absence of vernal pools or vernal pool-like conditions, or alkaline conditions (e.g., alkali annual grassland components of alkali vernal plains or areas that have semi-regular inundation).

The project site does not contain friable clay soils, so round-leafed filaree is not expected to occur. Although small areas of the site contain sage scrub and chaparral vegetation, no alluvial scrub or rocky chaparral slopes occur; therefore, Nevin's barberry is not likely to occur on the project site.

Mud nama is associated with ponds, lakes, or regularly muddy embankments. Since these conditions are not present, it is unlikely this species occurs on the project site.

d. Narrow Endemic Plant Species

The following six Narrow Endemic Plant Species were assessed for their potential to occur on the project area:

- San Diego ambrosia (*Ambrosia pumila*);
- Wright's trichocoronis (*Trichocoronis wrightii wrightii*);
- California Orcutt grass (*Orcuttia californica*);
- spreading navarretia (*Navarretia fossalis*);
- many-stemmed dudleya (*Dudleya multicaulis*); and
- Munz's onion (*Allium munzii*).

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

As with the Criteria Area species, San Diego ambrosia, Wright's trichocoronis, California Orcutt grass, and spreading navarretia are not likely to occur on the site due to the absence of vernal pools, vernal pool-like conditions, or alkaline conditions (e.g., alkali annual grassland components of alkali vernal plains or areas that have semi-regular inundation). In addition, no clay soils occur within the project area; therefore, many-stemmed dudleya and Munz's onion are not likely to occur.

e. Riparian/Riverine Habitat and Vernal Pools

The project area contains two types of riparian vegetation: mule fat scrub and southern willow scrub. Both plant communities are isolated, disturbed, low in vegetative cover, and generally of poor habitat quality. Three drainage features and one catch basin contain riparian/riverine areas (see previously referenced Figure 4.4.2). One of these drainage features is outside of the project area on the east side of Gilman Springs Road, within one of the proposed debris basins.

The mule fat scrub community on site occurs intermittently within Drainage Feature 9; a small patch within Drainage Feature 7; and within the debris basin associated with Drainage Feature 8. Drainage Feature 9 and the catch basin are both narrow and bordered on each side by disked agricultural fields. Drainage Feature 9 also contains a narrow band of mule fat scrub, but is bordered by relatively undisturbed Riversidean sage scrub. Over time, the drainage feature has fragmented and currently contains isolated patches of riparian vegetation. Within the mule fat scrub community, tree tobacco and other non-native plant species, have established in approximately equal quantity as mule fat.

Drainage Feature 8 has a proposed debris basin across Gilman Springs Road. This small drainage has an area of mule fat scrub that is probably surviving based on the blockage of the drainage at the road. The mule fat scrub portions of the project area are poor in habitat quality due to the small size of the stands, the sparse vegetative cover within the communities, the isolation of the individual stands, and the disturbance from the adjacent agricultural uses. Given the above characteristics, riparian wildlife species have a low potential to occur. Despite the absence of suitable habitat for federally and State listed threatened or endangered species such as least Bell's vireo, southwestern willow flycatcher, or western yellow-billed cuckoo that commonly occur in riparian habitat, this drainage feature is considered riparian/riverine areas under the MSHCP because of the presence of mule fat and the subsurface connectivity to off-site riparian areas downstream.

Southern willow scrub occurs in a single isolated catch basin in the project area (Figure 4.4.2, Drainage Feature 14). The catch basin contains marginal vegetative characteristics and no hydrological characteristics that fit the MSHCP description for riverine/riparian areas. It exists as isolated, human-made, catch basin that receives nuisance flows and agricultural runoff from concrete cattle containment areas adjacent to the basin, which have subsequently been removed. It is located south of Alessandro Road and does not contain any upstream or downstream connection to any other drainage features. There is no evidence of prolonged ponding within this basin. Due to the high percolation rate, this area does not hold water long enough to provide the necessary hydrology associated with the creation and maintenance of a vernal pool. There are no drainage features that convey natural flows into these basins. Therefore, the basins only source of hydrology is from natural rainfall within the limits of the basin. Vegetation in the catch basin consists of southern willow scrub and includes plant species such as Fremont's cottonwood, black willow, sandbar willow, and mule fat. The plant community primarily consists of a moderate density of trees with a few understory plants.

Southern willow scrub is typically considered suitable habitat for a number of wildlife species that commonly occur in riverine/riparian habitats throughout southern California. These wildlife species include sensitive avian species such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. The southern willow scrub associated with Drainage 14 does not contain hydric

soils or wetland hydrology indicators. This basin is considered low in habitat quality because it is isolated, small in size, and lacks significant vegetation density. ~~Given these characteristics, riparian wildlife species have a low potential to occur. However, this basin is considered riparian/riverine habitat due to the presence of riparian vegetation and the loss of habitat will have to be evaluated under the MSHCP process.~~The vegetation within the basin is sparse, with a 30- to 40- percent canopy cover of native willows. The small patch of riparian habitat also contains about 50 percent native willows and 50 percent non-native ornamental trees such as Peruvian pepper tree (*Schinus molle*). The southern willow scrub habitat is 0.86 acre in size (rounded up to 1 acre in the document). There is no suitable habitat for any riparian/riverine avian species, such as least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*), due to the limited size of the basin. There is also no suitable habitat within the immediate vicinity (approximately 2 miles) and there is no direct habitat connection to any suitable offsite habitat. Based on these factors, there is no suitable nesting habitat and limited resting habitat for the listed riparian species covered under the MSHCP. Given these characteristics, riparian wildlife species have a low potential to occur.

The term “functioning riparian habitat,” describes a patch or area of riparian habitat that functions as a riparian habitat. It provides suitable habitat for plant and wildlife species that are commonly found in riparian habitats. Even low- quality riparian habitat may provide functional riparian habitat if it supports a population of riparian species. The riparian habitat onsite is extremely small and completely isolated from riparian habitat in the eastern portion of the City of Moreno Valley.

The riparian vegetation onsite does not support wildlife species commonly found within riparian habitat such as common yellow-throat (*Geothlypis trichas sinuosa*), yellow warbler (*Dendroica petechia brewsteri*), yellow-breasted chat (*Icteria virens*), and summer tanager (*Piranga rubra*), as described in the Birds as Indicators of Riparian Vegetation (no date) condition in the western U.S. Bureau of Land Management, Partners in Flight, Boise, Idaho. Therefore, even though the WLCSP contains small patches of riparian vegetation, it does not function as a riparian habitat. A few plants in an isolated area do not create a functional habitat.

MBA also conducted a vernal pool habitat assessment within the WLCSP and off-site facilities. As defined by the MSHCP, vernal pools are “seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season.” No vernal pools or ephemeral ponds were observed in the WLCSP or any of the off-site areas during the habitat assessment survey. In addition, no suitable habitat for any fairy shrimp species was identified within any of the project area.

f. Urban/Wildlands Interface Analysis

This section addresses the indirect effects associated with locating development in proximity to MSHCP Conservation Areas. The project area is bordered to the east by Proposed Core 3 (MSHCP Section 6.1.1) and to the south by the SJWA and Existing Core H. Moreover, portions of the project area fall within the boundaries of these Conservation Areas.

The portion of the project area within the SJWA (i.e., Conservation Area) is currently used for agricultural land, but is owned by the CDFW and operated as conservation land as part of the SJWA. No development will occur in this area. The remaining portions of the project area that are on or adjacent to conservation areas will incorporate the design features and measures related to drainage features, toxics, lighting, noise, invasive plants, barriers, and grading/land development discussed below. These measures will make the proposed project consistent with the MSHCP, Section 6.1.4,

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Guidelines Pertaining to the Urban/Wildlands Interface. A detailed description of recommendations pertaining to an urban/wildlands interface is provided below for adjacency issues identified in the MSHCP. Additional discussion of indirect impacts of the project on the SJWA and Conservation Areas is included in Section 4.4.1.12, *Other Issues*, later in this section. This information is from Section 6.1.4 of the MSHCP, *Guidelines Pertaining to the Urban/Wildland Interface*.

Drainage Features. Development of the project area will include a comprehensive system of storm drains to handle runoff from the proposed project. The project drainage plan shows that drainage from the project area will be directed to the regional storm drain system and away from the adjacent open space, or treated by water quality and retention basins to maintain historical runoff rates and patterns onto downstream land, such as the Mystic Lake area.

The conceptual drainage plan for the WLCSP development consists of a series of collection basins throughout the development that will treat the first flush storm events and convey storm flows to a series of detention basins along the southern boundary of the WLCSP. The basins will be designed to provide a water quality treatment as well as provide an area for creation of riparian habitat. Based on the size of the proposed detention basins, only the inlet and outlet structures will require routine maintenance. This allows the majority of the detention basins to remain undisturbed, which allows for long-term conservation of the riparian habitat. The design, operation, and maintenance of the drainage system for the proposed project will be designed to regulate the discharge of water into any MSHCP Conservation Area under either of these design scenarios.

All development within the project area will be required to obtain a statewide general National Pollutant Discharge Elimination System (NPDES) construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program. The NPDES requirements are discussed in greater detail in Section 4.9, *Hydrology and Water Quality*.

Barriers. The WLCSP project will incorporate special edge treatments designed to separate development areas from MSHCP open space areas both to the south and across Gilman Springs Road (i.e., fencing). The Specific Plan indicates that native landscaping and fencing will be installed to minimize unauthorized public access to the south and across Gilman Springs Road, which will also help minimize impacts related to domestic animal predation and illegal trespass and dumping. Impacts to adjacent native areas across Gilman Springs Road will therefore be minimized. In addition, the landscaping palette for the Specific Plan uses native species and precludes invasive plants as shown in the MSHCP invasive species list (MSHCP Table 6-2). The Specific Plan shows a 250-foot setback along the SJWA boundary to the south, as well as walls/fencing and controls on lighting that will comply with the City's new Municipal Code section 9.08.100 to preclude light spillage off site greater than 0.25 foot-candles per square meter. Warehousing will have a minimum 11-foot solid wall along the SJWA boundary with landscaping to soften the appearance and which may eventually provide roosting or nesting opportunities for native birds. There will be no public pedestrian or vehicular access from the development onto the SJWA land to the south, and private access to MSHCP areas to the east across Gilman Springs Road will be limited by fencing along private property lines within the project site.

Access. The project will prohibit public access into all MSHCP conservation areas including those contained within SJWA and Existing Core H to the south of the project area. Private access to Proposed Core 3 (Section 6.1.1, Proposed Core 3) to the east of the WLC project area will be limited by fencing of private property limits, but the public may still be able to access these areas from public roads, including Gilman Springs Road.

Grading/Land Development. Project grading will not encroach into conservation land that will be designated as open space located within Existing Core H to the south or Proposed Core 3 (Section 6.1.1, *Proposed Core 3*) to the east of the WLC project area.

Fuels Management. Fuels management focuses on hazard reduction for humans and their property (MSHCP, p. 6-72). According to the Fuels Management Guidelines, for new development planned adjacent to all MSHCP conservation areas or other undeveloped areas, brush management shall be incorporated in the development boundaries and shall not encroach into the MSHCP conservation areas (MSHCP, p. 6-72). Any areas planted with fire-resistant, non-invasive plants must not encroach into the MSHCP conservation area. Accordingly, with implementation of these measures, the WLCSP project will be consistent with the MSHCP Fuels Management Guidelines.

g. Migratory Corridors/Linkages

The project area is adjacent to an existing migratory corridor across Gilman Springs Road (i.e., Criteria Cells 1290, 1389, and 1390) as designated by the MSHCP. While the open agricultural fields that presently occupy much of the project area are not designated as corridors or linkages in the MSHCP, the project site, including the CDFW property, supports extensive agricultural fields, which do not constitute native vegetation, but do provide some foraging value and may allow for migration or movement of wildlife through the general area even considering the level of repeated disturbance by agricultural activities. Wildlife movement through this area is generally planned to take place across the Mystic Lake property to the south. The northern (upland) portion of the SJWA (i.e., the CDFW Conservation Buffer Area) and the southern portion of the Specific Plan area do not provide suitable habitat or resources to support wildlife migration or regular wildlife movement.

4.4.1.15 MSHCP Conservation Criteria Areas

Figure 4.4.4 shows the location and relationship of the MSHCP conservation areas described in this section, as well as their relationship to the project area.

a. Core 3

NOTE: The following changes have been made due to revision to the Specific Plan project size.

The MSHCP establishes a number of “core” areas that contain or support important biological habitat or species. Some of the core areas are existing reserves, while others are proposed for preservation. This section analyzes the proposed project in relation to the nearby MSHCP core areas. The project area is located within the Reche Canyon/Badlands Area Plan and falls within both the Badlands North Area Plan Subunit and the SJWA/Mystic Lake Area Plan Subunit. No existing or proposed linkage, or constrained linkage areas are in the vicinity of the project. Proposed Core 3 (MSHCP Section 6.1.1) is located to the north and east of the project area and Existing Core H is located to the south (see previously referenced Figure 4.4.3). As shown in Table 4.4.4, portions of the project area fall within 12 Criteria Cells that are all associated with existing or proposed core areas. However, the following analysis will show that almost all criteria cells are within the CDFW-owned Conservation Buffer Area and thus will not be directly affected by the development within the Specific Plan. The project also proposes no development within the ~~7574.3~~ 7574.3-acre Open Space area in the southwestern corner of the Specific Plan.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.4.CD: MSHCP Criteria Cells within the Project Area

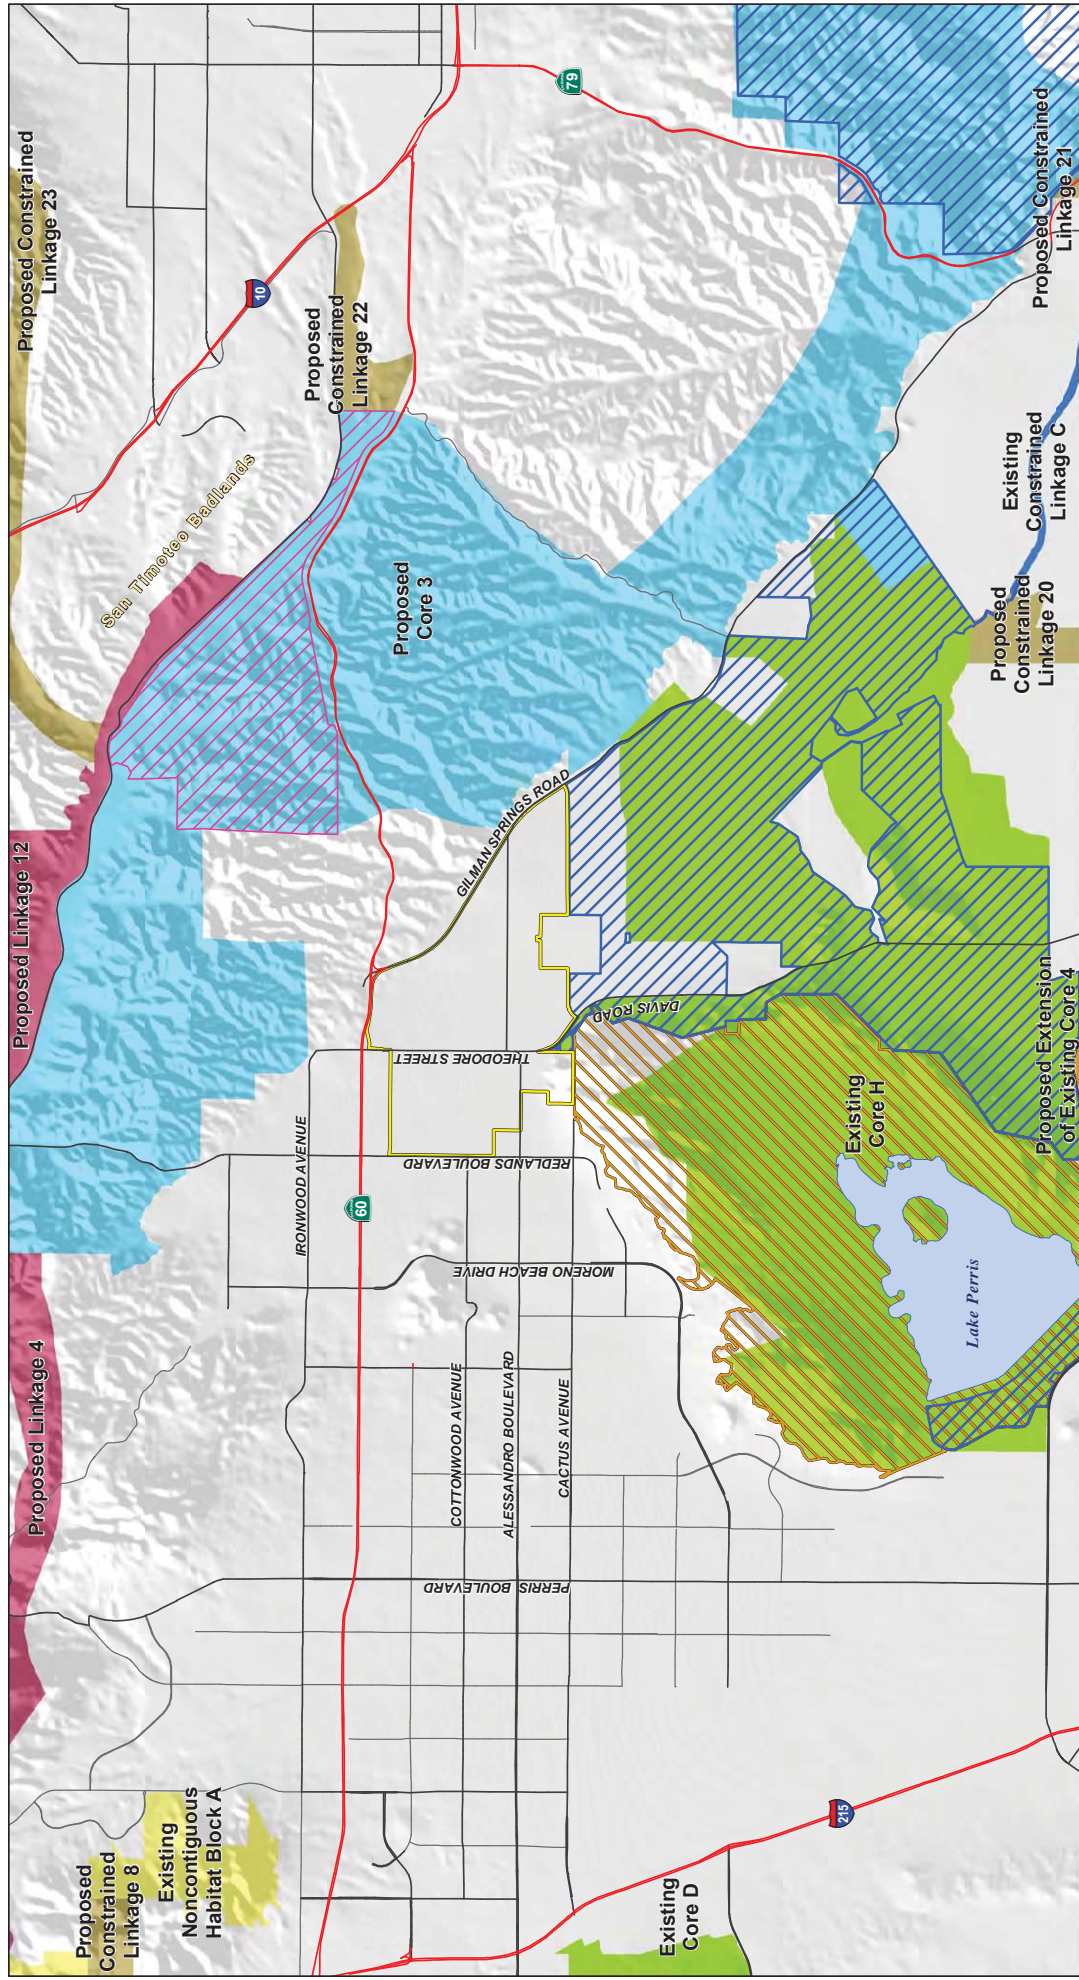

Area Plan Subunit within MSHCP	Cell Group	Criteria Cells
Badlands North Area Plan Subunit 3	Cell Group E	1390
	Cell Group X	1297
		1204
San Jacinto Wildlife Area/Mystic Lake Area Plan Subunit 4	Cell Group D	1364
		1370
		1377
		1386
		1389
		1482
		1483
		1477
		1577

The portions of the project area within Cell Group D are within the SJWA/Mystic Lake Area Plan Subunit 4. This Cell Group supports Existing Core H. Approximately 929 acres of the project area are within Cell Group D. This portion within Cell Group D is located within the SJWA. This area is currently owned by the State of California through a purchase in 2001 and is now designated as Public/Quasi-Public Conserved Land under the MSHCP (see Figure 4.4.3). Although this land is not considered to be mitigation for the proposed development, it does provide more than 900 acres of buffer between the project and the high quality habitat areas of the SJWA.

As shown in Figure 4.4.4, the CDFW-owned portion of the project area overlaps Cell Groups E and X, which are within the Badlands North Area Plan Subunit 3. These Cell Groups support Proposed Core 3. Approximately 52 acres of the CDFW area overlap Cell Group E, and approximately 114 acres of the CDFW Area occurs within Cell Group X. The project will not conflict with MSHCP Conservation Criteria because no development is planned within the CDFW area of the project (which is part of the SJWA). However, any development adjacent to the SJWA will need to address edge effects.

~~Figure 4.4.4: MSHCP Conservation Areas~~ Minimizing edge effects is considered a significant goal of Proposed Core 3. Approximately 56 acres of the project area occur within the western extent of Proposed Core 3. The portions of the Core along Gilman Springs Road are currently subject to edge effects associated with existing traffic, and the development of the project may incrementally increase these edge effects. All development in the southern portion of the project will need to implement measures that minimize edge effects associated with urban development in wildlands. The minimization efforts are addressed in Section 4.4.1.8g, *Urban/Wildlands Interface Analysis*, of this report.

The CDFW-owned land within the project area is located adjacent to the junction of Proposed Core 3 and Existing Core H. Development of the project will not impede the movement of wildlife or reduce the continuous area of the two cores, which are both goals of Proposed Core 3. Additionally, the portion of the project area located adjacent to the Core 3/Core H junction will remain undeveloped, facilitating connectivity between the two Cores. The project area occupies less than 0.1 percent of Proposed Core 3 and the goals of the Proposed Core 3 will be maintained.

THIS PAGE INTENTIONALLY LEFT BLANK

b. Existing Core H

Existing Core H consists of the Lake Perris State Recreation Area (LPSRA), SJWA, private lands, and lands with pre-existing conservation agreements (see previously referenced Figure 4.4.4). It provides resident habitat for several species, contains soils suitable for some Narrow Endemic plant species, supports vernal pool complexes and may provide a connection to Core Areas in the Badlands and the middle reach of the San Jacinto River. Maintenance of habitat quality, floodplain processes along the San Jacinto River, and conservation of vernal pool complexes are important for species covered by the MSHCP. The Core Area provides potentially suitable live-in habitat for small rodents and common mammals.

Approximately 113.1 acres of the project area are located within the northern extent of Existing Core H. The CDFW-owned Area in Existing Core H contains potentially suitable habitat for small rodents, common mammals, and burrowing owl. No vernal pool complexes or floodplain conditions occur on the project site and there is no suitable habitat for any narrow endemic plant species. The portion of the project area within Existing Core H will not be developed (i.e., the Conservation Buffer Area) because it is part of the SJWA. The WLC planning area occupies less than 0.2 percent of Existing Core H and the goals of this core area will be maintained.

c. Reche Canyon/Badlands Area Plan

The Reche Canyon/Badlands Area Plan of the MSHCP is in the northern portion of western Riverside County, south of the City of San Bernardino, west of The Pass Area Plan and the San Jacinto Valley Area Plan, north of the Mead Valley Area Plan and the Lakeview/Nuevo Area Plan, and east of the Highgrove Area Plan, the Cities of Norco and Riverside Area Plan, and the March Area Plan. The City of Moreno Valley sits entirely within the Reche Canyon/Badlands Area Plan. The Area Plan incorporates lands within the LPSRA and SJWA, and is separated into 4 Area Plan Subunits. The project area is located within portions of Area Plan Subunit 3: Badlands North and Area Plan Subunit 4: San Jacinto Wildlife Area/Mystic Lake (see Figure 4.4.4).

The target conservation acreage range for the Reche Canyon/Badlands Area Plan is 30,815 to 35,905 acres; it is composed of approximately 20,295 acres of existing Public/Quasi-Public Lands and 10,520 to 15,610 acres of Additional Reserve Lands. The target acreage range within the City of Moreno Valley is 80 to 130 acres. The City of Moreno Valley target acreage is included within the 10,520 to 15,610 acre target conservation range on Additional Reserve Lands for the entire Area Plan.

The Conservation Buffer Area portion of the WLC planning area includes approximately 910 acres of the SJWA, which is designated as Additional Reserve Land. All of this area is within the City of Moreno Valley, and preservation of the Conservation Area of the project will fulfill the MSHCP's target acreage range for the City.

d. Area Plan Subunit 3: Badlands, North

Area Plan Subunit 3 of the Reche Canyon/Badlands Area Plan includes lands within the northeastern and eastern portions of the Area Plan within the Badlands (see Figure 4.4.4). Area Plan Subunit 3 contains a total of 88 Criteria Cells organized into 16 Cell Groups and 4 independent cells. The MSHCP conservation objectives for Area Plan Subunit 3 include conserving land within the Badlands area, north to the vicinity of SR-60, south to southeastern extent of the SJWA, west to the eastern boundary of the SJWA, and east to the Laborde Canyon vicinity. Target acreage range required for Additional Reserve Lands within Area Plan Subunit 3 is 8,270 to 10,895 acres. Plant and Wildlife Planning Species within Area Plan Subunit 3 include:

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Nevin's barberry;
- Bell's sage sparrow;
- Cactus wren;
- Loggerhead shrike;
- Southern California rufous-crowned sparrow;
- Los Angeles pocket mouse;
- San Bernardino kangaroo rat;
- Stephens' kangaroo rat;
- Bobcat; and
- Mountain lion.

Under the MSHCP, additional biological issues and considerations are proposed for conservation for each Area Plan Subunit. The biological issues and considerations emphasized in Area Plan Subunit 3 include:

- Conserving large habitat blocks in the Badlands.
- Maintain Core Area for bobcat.
- Maintaining Core and Linkage Areas for mountain lion.
- Determining potential for populations of San Bernardino kangaroo rat along San Timoteo Creek.
- Maintain Linkage Area to SJWA for Stephens' kangaroo rat.
- Determine presence of potential Core Area for Los Angeles pocket mouse in San Timoteo Creek and tributaries to the Badlands.
- Maintain Core Area for Nevin's barberry.

The eastern boundary of the project area (i.e., Gilman Springs Road) is within Area Plan Subunit 3, the main focus of which is protection of bobcat and mountain lion habitat. The portions of the project area within Area Plan Subunit 3 are along the southwestern edge of the Subunit and collectively comprise approximately one percent of the target acreage range proposed for conservation. Since the project area encroaches on a limited portion of the boundary of the Area Plan Subunit, and since these portions of the project area are already subject to existing edge effects, impacts from development under the WLCSP does not conflict with the long-term conservation goals for bobcat or mountain lion habitat. It should be noted that the project site is across a major roadway (Gilman Springs Road) from the Badlands and the sensitive habitat contained in this Area Plan Subunit.

e. Cell Group E and Criteria Cell 1390

Conservation within Cell Group E will contribute to assembly of Proposed Core 3 and will focus on chaparral, coastal sage scrub, grassland, and Riversidean alluvial fan sage scrub habitat. Areas conserved within this Cell Group will be connected to habitat proposed for conservation in Cell Group X to the north, habitat proposed for conservation in Cell Group C also to the north, and to habitat proposed for conservation in Cell Group F to the south. Conservation within Cell Group E will range from 45 percent to 55 percent of the Cell Group focusing in the western portion (see Figure 4.4.4).

Within the westernmost portion of Cell Group E, and specifically within Criteria Cell 1390, the project area encroaches on 51.9 acres. This portion of the project area is already in public ownership, is within the northeastern portion of the SJWA which is Public/Quasi-Public Conserved Land and is designated to be conserved by the CDFW. The project proposes no development on this land, so it would be consistent with the MSHCP (see Figure 4.4.3). It should be noted that this area is already part of the SJWA and is not proposed for any development under the proposed project.

f. Cell Group X: Criteria Cells 1204 and 1297

Conservation within Cell Group X will contribute to assembly of Proposed Core 3 and will focus on chaparral, coastal sage scrub, and grassland habitat. Areas conserved within Cell Group X will be connected to habitat proposed for conservation in Cell Groups C to the east, V to the northeast, and to chaparral and grassland habitat proposed for conservation in Cell Group E to the south. Conservation within Cell Group X will range from 65 percent to 75 percent of the Cell Group focusing in the northeastern portion of the Cell Group (see Figure 4.4.4).

Within the southwestern portion of Cell Group X, and specifically within Criteria Cells 1204 and 1297, the project area encroaches on 114.2 acres. Under the MSHCP, conservation for Cell Group X is proposed for the northeastern portions of the Cell Group. The project area is not within the targeted conservation areas and, therefore, will not adversely affect the County's ability to achieve the goals of the MSHCP (see Figure 4.4.4).

g. Area Plan Subunit 4: San Jacinto Wildlife Area/Mystic Lake

Area Plan Subunit 4 of the Reche Canyon/Badlands Area Plan includes lands within the southeastern portions of the Area Plan within the SJWA. Area Plan Subunit 4 contains 26 Criteria Cells organized into 3 Cell Groups and 12 independent cells. The MSHCP conservation objectives for Area Plan Subunit 4 include conserving land within the SJWA and Mystic Lake (see Figure 4.4.4). The target acreage range required for Additional Reserve Lands within Area Plan Subunit 4 is 860 to 1,750 acres.

Plant and Wildlife Planning Species within Area Plan Subunit 4 include:

- California Orcutt grass
- Los Angeles pocket mouse
- Smooth tarplant (*Hemizonia pungens*)
- Thread-leaved brodiaea
- Wright's trichocoronis
- Stephens' kangaroo rat
- Loggerhead shrike
- Northern harrier (*Circus cyaneus*)
- Peregrine falcon (*Falco peregrinus*)
- Tricolored blackbird (*Agelaius tricolor*)
- White-tailed kite (*Elanus leucurus*)
- Black-crowned night heron (*Nycticorax nycticorax*)
- California horned-lark (*Eremophila alpestris actia*)
- Coulter's goldfields
- San Jacinto Valley crownscale
- Spreading navarretia
- Vernal barley (*Hordeum intercedens*)
- American bittern (*Botaurus lentiginosus*)
- Burrowing owl
- Bobcat
- Mountain plover (*Charadrius montanus*)
- Osprey (*Pandion haliaetus*)
- Prairie falcon (*Falco mexicanus*)
- White-faced ibis (*Plegadis chihi*)
- Davidson's saltscale (*Atriplex serenana* var. *davidsonii*)
- Double-crested cormorant (*Phalacrocorax auritus*)

The biological issues and considerations emphasized in Area Plan Subunit 4 include:

- Conservation of alkali playa and other habitat to augment existing conservation in the SJWA and Mystic Lake.
- Conservation of existing vernal pool complexes associated with the San Jacinto River floodplain in the SJWA and Mystic Lake area. Conservation should focus on vernal pool surface area and supporting watersheds.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Provide for a connection of intact habitat between the SJWA and the adjacent Badlands to the north.
- Conservation of Willow-Domino-Travers soils supporting sensitive plants such as San Jacinto Valley crownscale, Davidson saltscale, Coulter's goldfields, spreading navarretia, vernal barley and Wright's trichocoronis.
- Provide for and maintain a continuous linkage along the San Jacinto River from the southern to the southeastern boundary of the Reche Canyon/Badlands Area Plan.
- Maintain Linkage Area for bobcat.
- Maintain a Linkage Area for Stephens' kangaroo rat to SJWA.
- Determine the potential presence of potential Core Area for Los Angeles pocket mouse in connection between the Badlands and the SJWA.

The southern portion of the project area (i.e., the CDFW-owned Conservation Buffer Area) includes grasslands and agricultural lands that will be conserved as part of the northern portion of the SJWA. The project area is not within or along the San Jacinto River floodplain, and does not contain any alkali playa habitat or vernal pool complexes under the definition provided by the MSHCP.

There is no Willow-Domino-Travers soil within the project area; therefore, San Jacinto Valley crownscale, Davidson saltscale, Coulter's goldfields, spreading navarretia, vernal barley and/or Wright's trichocoronis are not likely to occur in the project area.

The project area is located immediately north of the Stephens' kangaroo rat preserve within the SJWA. The CDFW-owned portion of the project area adjacent to the SJWA is subject to regular disking and other disturbances associated with agricultural uses. The regular disturbances have resulted in an absence of suitable habitat for Stephens' kangaroo rat within the project area. The presence of a habitat linkage for this species within the project area is unlikely and population fragmentation is not anticipated.

Small portions of the project area contain suitable habitat for Los Angeles pocket mouse and burrowing owl; however, MBA's focused surveys concluded that the project area does not support the Los Angeles pocket mouse. The population of burrowing owl on site fluctuates from year to year, but they have been observed on site in the past and this EIR concludes this species may be present, especially in areas with suitable habitat or where agricultural fields become fallow for extended periods of time.

h. Cell Group D: Criteria Cells 1364, 1370, 1377, 1386, 1389, 1477, 1482, 1483, and 1577

Conservation within Cell Group D will contribute to assembly of areas proposed for conservation for Existing Core H (see Figures 4.4.4 and 4.4.3). Conservation within Cell Group D will focus on agricultural land. Conservation within this Cell Group will be approximately five percent of Cell Group D focused on the southern and western portion of the Cell Group. This cell group is already part of the SJWA and is being maintained as agricultural land by the CDFW (i.e., it constitutes the CDFW-owned Conservation Buffer Area).

Within Cell Group E, and specifically within Criteria Cells 1364, 1370, 1377, 1386, 1389, 1477, 1482, 1483, and 1577, the project area encroaches on 928.5 acres. Under the MSHCP, conservation for Cell Group D is proposed for the southern and western portions of the Cell Group. The project area includes approximately 60 percent of the northern portion of the Cell Group; therefore, future development of the project area is consistent with the conservation goals for this cell group. The majority of Cell Group D is within the northern extent of SJWA, a Public/Quasi-Public Conserved

Land. This area is part of the SJWA and designated as conserved by the CDFW. It is designated as the Conservation Area and is not proposed for development under the project. Any development within land adjacent to Cell Group D (and the SJWA) must incorporate urban edge design features to minimize any potential impacts to the SJWA.

4.4.1.16 ~~Species~~ **4.4.1.16 Federal Migratory Bird Act and California Department of Fish and Wildlife Protection by the MSHCP**

a. Nesting Birds

The extensive agriculture plant communities in the project area provide suitable nesting habitat for ground-nesting avian species such as western meadowlark (*Sturnella neglecta*) and burrowing owl. Suitable habitat for shrub and tree nesting species such as red-tailed hawk, black phoebe (*Sayornis nigricans*), and house finch occur along the edges of existing development surrounding the project area as well as isolated, remnant patches of vegetation in undisturbed portions of the project area. Therefore, portions of the project area provide suitable nesting habitat for migratory birds protected under the MBTA and California Fish and Game Code.

b. Stephens' Kangaroo Rat

The project area is located just north of the Core Reserve Area for the Stephen's Kangaroo Rat Habitat Conservation Plan (HCP), but is not located within a core area. However, the project area is located within the fee area of the HCP. The project would have to comply with the HCP's Implementing Agreement (IA) and pay the County's per-acre mitigation fee.

The CDFW-owned portion of the project area is located immediately north of Core Reserve Area for Stephens' kangaroo rat and is not proposed for development as it is owned by the State and is already part of the SJWA. Therefore, incorporating this area into the Core Reserve Area for Stephen's kangaroo rat will provide a setback from the areas proposed for development within the project.

c. USFWS Designated Critical Habitat

No USFWS designated Critical Habitat for any species is present within the project area.

d. Other Special Status Species

Based on the CDFW and CNPS database searches mentioned above, 26 special status species that are not listed as Threatened or Endangered have the potential to occur in the project vicinity (previously referenced Tables 4.4.AB and 4.4.C). Species that are not covered under the MSHCP or are not adequately conserved by the MSHCP at this time are also included in ~~Table 4.4.A. All but six of the species in Table 4.4.A are covered by the MSHCP, meaning that they are considered adequately conserved provided that the MSHCP is implemented as intended~~ those tables.

4.4.1.17 Special-Status Species Not Covered by the MSHCP

The vast majority of special-status species considered in this analysis are "covered" species under the MSHCP. However, 18 special-status species have the potential to occur in the general project vicinity and are not covered under the MSHCP or are not adequately conserved by the MSHCP at this time. Details regarding the potential occurrence of these non-covered species are included in the General Biological Resources and MSHCP Compliance Report prepared by MBA and included as

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Appendix E-1. Due to unsuitable habitat and conditions within the project limits, none of these 18 non-covered species is expected to occur in the project area (see ~~Table~~ previously referenced Tables 4.4.DB and 4.4.C). Neither additional surveys nor additional conservation measures will be required for the project to address these species.

Note: Table 4.4.D has been deleted in its entirety. Please refer to Volume IV of the Final EIR to see original Table 4.4.D in section 4.4.1.17.

a. Special-Status Wildlife

Note: The following changes have been made in response to the revised Habitat Assessment MSHCP Consistency Analysis and in response to Comment F-7A-34 in Letter F-7A from Lozeau Drury LLP.

The revised MBA report (2013) states that ~~one~~ no special-status wildlife species were observed during field surveys. This ~~was grasshopper sparrow in the southern sage scrub habitat area.~~ In addition ~~However~~, raptors are numerous in the agricultural fields on the project site and off site in the SJWA. None of the other special-status wildlife species was determined to be present within the WLC planning area because their habitat requirements are not present on the site; therefore, no further survey or study is required to determine likely presence, absence, or to assess project-related effects to these species.

While none of the bat species identified in the MSHCP Compliance Report (Appendix E-1) is expected to roost in the project area, the site does contain suitable foraging habitat for bat species that may roost in the surrounding region. The incremental loss of bat foraging habitat on the site would be compensated by participation in the MSHCP because the MSHCP mitigation fees are meant to purchase conservation lands to support species throughout western Riverside County.

b. Raptors and Other Avian Species

California Fish and Game Code, Sections 3503, 3503.5, 3505, and 3513, and the California Code of Regulations (Title 14, Sections 251.1, 652 and 783-786.6) have specific provisions for the protection of raptors (birds of prey). Furthermore, the MBTA protects the nests of migratory birds and raptors. There are a limited number of tall trees within the project site that would provide roosting or nesting habitat for raptors, such as hawks and owls, among other resident and migratory bird species. Two raptor species, red-shouldered hawk and American kestrel, have been observed in the area on a regular basis, suggesting at least these raptors may be roosting on site or nearby. The extensive open land within the project area provides foraging habitat for raptors and other avian species.

~~One of the species in previously referenced Table 4.4.B, grasshopper sparrow, was observed on the site during the burrowing owl survey. Fourteen other species, including burrowing owl~~ NOTE: The following changes have been made in response to the revised Habitat Assessment MSHCP Consistency Analysis and in response to Comment F-7A-34 in Letter F-7A from Lozeau Drury LLP.

Thirteen species have a low-to-moderate potential to occur on the site based on existing habitat quality. Burrowing owl is assumed to be present on site, especially in areas of suitable habitat and in agricultural fields that are left fallow for extended periods of time.

As previously indicated, the project site is within the MSHCP burrowing owl survey area, and habitat assessments and focused surveys were conducted. During the focused survey in 2005, one location within the project site contained burrowing owl sign (i.e., whitewash and bone fragments) and a pair was observed in this same area. Field surveys also identified suitable burrows in the project area that

may provide habitat for the western burrowing owl. Therefore, the species is considered to be present due to the presence of suitable habitat on site.

To confirm presence or absence of the burrowing owl in specific development areas of the project area, an MSHCP 30-day pre-construction protocol survey for burrowing owl will need to be conducted prior to any ground-disturbing activities. Figure 4.4.5 shows the location of burrowing owl habitat on the project site.

Of the species with potential to occur on the site, none is listed as threatened or endangered under State or Federal law, all are relatively widespread, and the project area does not contain high quality habitat for any of these species.

4.4.1.18 Other Issues

a. Setbacks

The MSHCP's urban/wildlands interface analysis encourages buffers or setbacks between development and areas with sensitive biological resources. The SJWA is considered an important resource due to the large number and diversity of birds that utilize it. Available research and MSHCP guidelines recommend a setback or buffer between the north boundary of the SJWA and the south boundary of development within the proposed project. Existing scientific and academic literature can provide guidance on the appropriate width of such a buffer under these types of conditions. Typical setbacks to protect wildlife from human presence (though not warehousing) ranges from 50 to 500 feet, but 200–250 feet appears adequate for the most sensitive or valuable wetlands.¹ As an example, Placer County has setback guidelines in its General Plan of a setback range of 100–400 feet between field crops and natural areas, and a setback range of 50–200 feet between rangeland/pastures and natural areas². In addition, the MSHCP and adopted guidelines of the USFWS and CDFW include a setback of 200 feet or more from nesting birds during construction activities. For example, typical burrowing owl mitigation says, "To adequately avoid active nests, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season."

In evaluating the potential impacts of project development on the SJWA and Mystic Lake, it will be important to consider that the CDFW Conservation Buffer Area was originally purchased by the State to provide a buffer between SJWA/Mystic Lake and future development within the Moreno Highlands Specific Plan (now the proposed project area).

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 4.4.5

LSA

THIS PAGE INTENTIONALLY LEFT BLANK

Note: The following information has been excerpted from the Jurisdictional Delineation Report prepared by MBA which was updated in 2014 to respond to comments from the resource agencies.

4.4.1.19 On-site Drainages

A formal jurisdictional delineation (JD) was conducted within the WLCSP and offsite facilities by MBA in September 2007 and again in March 2012. A total of 15 primary drainage features were identified during these combined surveys. A number of sub-drainages or tributaries were also identified. Jurisdiction for each drainage and/or sub-drainage or tributary was evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by USACE and RWQCB, respectively; the Porter Cologne Act as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by CDFW.

Based on comments received from the resource agencies, the 2013 JD report concludes that two drainage features (Drainage 12 and 15) have been determined to be jurisdictional waters of the U.S. under Section 404 and 401 of the CWA. Drainage 15 is included in this discussion because it may occur within two offsite utility improvements. Approximately 500 linear feet of the drainage feature was included in the survey area. Approximately 5,430 linear feet of Drainage 12 is included in the survey area (0.5 acres). This includes approximately 1,300 linear feet within the WLCSP, and the remaining 4,130 linear feet will be part of the offsite improvements. The remaining 13 drainage features are considered isolated features with no direct connectivity to downstream traditional navigable waters or have no significant nexus. Drainage features 1, 5, and 6 are roadside ditches that are also isolated features. Drainage features 3, 4, 10, 11, and 13 are upland swales with evidence of periodic erosion but no evidence of annual flows and no clearly defined bed and bank feature. No jurisdictional wetlands were identified within the entire WLCSP. However, the regulatory agencies make all final jurisdictional determinations.

Drainage features 3, 4, 10, 11, and 13 do not have a clearly defined bed and bank feature and do not have any riparian habitat or evidence of flows. These features are better described as upland swales with occasional eroded areas. Under the Porter Cologne Act, the RWQCB takes jurisdiction of drainage features that would normally be under USACE jurisdiction, but are considered isolated. Drainages 7, 8, 9, 12, and 15 were determined to be waters of the state and subject to the jurisdiction of both the CDFW and RWQCB. The jurisdictional limits of waters of the state are not required to have downstream connectivity. There are approximately 3.0 acres of waters of the state, which includes areas with a clearly defined bed and bank feature within the WLCSP and offsite facilities. However, the CDFW makes all final Section 1600 jurisdictional determinations.

Drainage 1: This feature is a roadside ditch that conveys nuisance flows on the east side of Redlands Boulevard. Currently the ditch is contained within a concreted-lined swale and has intermittent areas with an earthen bed and bank. This ditch has no vegetation and leaves the site in an underground storm drain facility. This roadside ditch typically conveys flows during any storm event because most of the drainage is currently paved. This feature does not contribute to the function or value of any downstream drainage features and is not considered a riparian/riverine feature (see Photos 9 and 10).

Drainage 2: This feature is an upland swale that conveys nuisance flows within an actively disked agricultural field and only receives flows every 5 to 7 years. This swale contains periodic sign of erosion, but is mostly an unvegetated swale with minimal evidence of flows. This drainage begins to sheet flow just north of Bay Avenue and has no hydrologic connection to any downstream drainage feature. This feature does not contribute to the function or value of any downstream drainage and is not considered a riparian/riverine feature (see Photos 11 and 12).

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Drainage 3: This feature is a temporary detention basin used to treat nuisance flow from the adjacent Skechers logistic facility. The flows within this feature are completely contained within the facility and there is no downstream connection to any other drainage features. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature (see Photo 13).

Drainage 4: The drainage feature previously originated from an underground storm drain beneath SR- 60. The previous flows from this feature have been redirected into the detention basin associated with Drainage 3. Drainage 4 currently conveys flows from local runoff within the WLCSP footprint and only receives flows every 5 to 7 years. This feature has evidence of a historic channel near the intersection of Dracaea Avenue and Sinclair Street. However, this feature sheet flows just south of Cottonwood Avenue and has no hydrologic connection to any downstream drainage features. This drainage does not contribute to the function or value of any downstream drainage features and is not considered a riparian/riverine feature (see Photos 14 and 15).

Drainage 5: This drainage is a roadside ditch located along the western side of Theodore Street. This drainage originates at the eastbound Theodore Street off-ramp from SR- 60. This feature conveys nuisance flows from Theodore Street and immediate vicinity during large storm events and may only receive flows every 5 to 7 years. This feature contains an intermittent bed and bank feature, but terminates just north of Alessandro Boulevard. This feature has no hydrologic connection to any downstream drainage. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature (see Photos 16 and 17).

Drainage 6: This feature is also a roadside ditch located along the eastern side of Theodore Street. This drainage originates from an underground storm drainage beneath SR- 60. It conveys nuisance flow from Theodore Street and immediate vicinity and may only receive flows every 5 to 7 years. This feature contains an intermittent bed and bank feature, but terminates southeast of Alessandro Boulevard within an active agricultural field. This feature has no hydrologic connection to any downstream drainage. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature (see Photos 18 and 19).

Drainage 10: This drainage is an isolated feature that contains some evidence of erosion and is caused by a change in slope within highly erosive soils. This feature terminates as the topography levels resulting in sheet flows. This feature contains a few scattered tree tobacco, but otherwise has no change in soils or vegetation. This feature has no hydrologic connection to any downstream drainage and may only receive flows every 5 to 7 years. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature (see Photo 20).

Drainage 11: This drainage is an isolated feature and similar to Drainage 10. This feature contains some evidence of erosion and is likely caused by runoff associated with Gilman Springs Road. This feature terminates as the topography levels resulting in sheet flows. This feature has no hydrologic connection to any downstream drainage and may only receive flows every 5 to 7 years. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature (see Photo 21).

Drainage 13: This drainage is an isolated feature and similar to Drainage 10. This feature contains some evidence of erosion and is likely caused by runoff associated with the steep hillsides to the south. This feature terminates as the topography levels resulting in sheet flows. This feature has no hydrologic connection to any downstream drainage and may only receive flows every 5 to 7 years. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature (see Photo 22).

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Drainages 1, 2, 3, 4, 5, 6, 10, 11, and 13 do not provide any function or value as drainage features and do not meet the minimum criteria to be designated as Riparian/Riverine areas. All of the above-mentioned drainage features, with the exception of Drainage 13, flow in a north-to-south direction and in a straight-line channel. Drainage 13 flows in a south-to-north orientation. All of these channels terminate as sheet-flow within the WLCSP or immediately offsite and do not reappear further downstream. These features have a parallel flow pattern and are artificially created to minimize flooding impacts to the surrounding agricultural lands within the WLCSP. None of these features has any downstream hydrologic connectivity to any downstream drainage features.

Project components affecting streambed and bank subject to CDFW jurisdiction, including riparian habitat, would require a Streambed Alteration Agreement (SAA) from CDFW.

When impacts are identified during project-specific applications, the proponent will apply for appropriate permits. Mitigation ratios will be determined following standard guidelines and mitigation will include a mixture of onsite habitat creation, offsite habitat creation, or the purchase of offsite mitigation credits at an established mitigation bank. Compensatory mitigation will be no less than a 1:1 replacement ratio to guarantee a no net loss of riparian habitat, but this mitigation ratio is negotiated during permit the acquisition process on a project-by-project basis.

The WLCSP also incorporates a number of potential offsite improvements. All offsite improvements east of Redlands Boulevard may potentially impact drainage features likely considered jurisdictional by USACE, RWQCB, and CDFW. Once these offsite improvements have been finalized, a project specific jurisdictional delineation will be required in order to document the existing conditions, potential impacts, and recommended mitigation measures.

The previous jurisdictional delineation report¹ conducted in 2012 concluded that the project area contained 14 drainage features including four roadside ditches, seven isolated drainage features, and three isolated features. All 14 drainage features lack direct connectivity to any downstream Traditional Navigable Waters (TNWs) or any other Relatively Permanent Waters (RPW). The four roadside ditches lack riparian vegetation and only convey nuisance flows from localized runoff from the adjacent road. These flows eventually revert to sheet flow within the survey area and have no direct connectivity.

According to the previous 2012 report, the three isolated features include an abandoned water quality detention basin and two abandoned basins associated with previous cattle activities. The water quality basin is a temporary facility that was constructed to treat drainage flows resulting from the construction of the Skechers facility. The two isolated basins were previously used to collect polluted runoff from the associated cattle facility. The facility included concrete-lined areas to contain cattle in a dairy operation. Animal waste would be collected in the basins to protect downstream water quality. The livestock facilities have been removed and the basins are no longer functioning.

The remaining seven drainage features originate on-site or immediately north of the survey area. These features are mostly human-made and are used to control downstream flows within a channel to reduce erosion impacts to adjacent agricultural fields. The soft soils within the project area are highly erosive and the depth of the erosional features varies from 2 feet to 30 feet. All seven drainage features eventually revert to sheet flow conditions into open grassland habitat with no direct connectivity downstream. These drainage features were 2012 report determined not to be subject to that the jurisdiction of the CDFW. These on-site features did not meet the minimum requirements to be considered jurisdictional by regulatory agencies due to the following:

¹ *Jurisdictional Delineation Report*, Michael Brandman Associates, April 23, 2012.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Lack of connectivity to any downstream waters of the US or waters of the State.
- Absence of a consistent bed and bank and/or ordinary high water mark (OHWM).
- Low biological resource value.
- The roadside ditches and agricultural drainages drain only upland areas and do not carry relatively permanent water flows.
- No jurisdictional wetlands occur within the project area.

Important Note. Although the previous JD report from 2012 concluded the onsite drainages were not jurisdictional, the 2013 JD report has amended that conclusion based on comments by the state and federal resource agencies. The 2013 JD report concludes there are two (2) drainage channels on the WLC site (Drainages 12 and 15) are considered jurisdictional by both federal and state agencies, while drainages 7, 8, and 9 are considered jurisdictional by the CDFW and the RWQCB. The location and extent of these on-site drainages in relation to the project site are illustrated in previously referenced Figure 4.4.2.

4.4.1.20 NOP/Scoping Comments

Local residents and representatives of several conservation groups related the biological resources of the San Jacinto Wildlife Preserve expressed concern about impacts of the project on the Preserve, including diesel particulates and other air pollutants, noise, night lighting, etc. At least one conservation group representative felt that project impacts should be identified for every species present in the area (see Section 2.6.1, *Notice of Preparation*). Copies of NOP comment correspondence is included in Appendix A.

The discussion of potential environmental impacts of the project on biological resources and the MSHCP that was requested by conservation groups has been addressed in previous sections, including indirect effects of diesel air pollutant emissions, lighting, noise, etc.

4.4.2 Existing Policies and Regulations

4.4.2.1 Federal Regulations

Federal Endangered Species Act (FESA). The FESA was enacted to protect any species of plant or animal that is endangered or threatened with extinction. Section 9 of the FESA prohibits “take” of federally threatened or endangered wildlife. Take, as defined under the FESA, means to harass, harm, pursue, hunt, wound, kill, trap, capture, collect, or attempt to engage in any such conduct (16 USC 1532[19]). Section 9 also prohibits the removal and reduction of endangered plants from lands under Federal jurisdiction, and the removal, cutting, digging, damage, or destruction of endangered plants on any other area in “knowing violation of State law or regulation.”

Section 9 of the FESA (16 USC 1538) prohibits take of a federally listed endangered species of fish or wildlife except pursuant to a permit and HCP approved under Section 10(a) of the FESA (16 USC 1539). The FESA prohibitions and requirements are different, however, for endangered species of plants. Section 9 prohibits the take of endangered plants only from areas under Federal jurisdiction, or if such take would violate state law.

Development proposed by the WLC project site is located on private land. For listed plants located on private land, formal consultation with the USFWS is required when a project has a Federal “nexus”

(i.e., a Federal permit is required or Federal funding is involved). In the absence of a Federal nexus, a project does not require a permit under the FESA for impacts to listed plants on private lands.

Clean Water Act. The USACE regulates discharges of dredged or fill material into waters of the United States. These waters include wetlands and non-wetland bodies of water that meet specific criteria, including a direct or indirect connection to interstate commerce. The USACE regulatory jurisdiction pursuant to Section 404 of the Federal Clean Water Act (CWA) is founded on a connection, or nexus, between the water body in question and interstate commerce. This connection may be direct (through a tributary system linking a stream channel with traditional navigable waters used in interstate or foreign commerce) or may be indirect (through a nexus identified in the USACE regulations). The USACE typically regulates as non-wetland waters of the U.S. any body of water displaying an ordinary high water mark (OHWM). In order to be considered a jurisdictional wetland under Section 404, an area must possess three wetland characteristics: hydrophytic vegetation, hydric soils, and wetland hydrology. Each characteristic has a specific set of mandatory wetland criteria that must be satisfied in order for that particular wetland characteristic to be met.

In 2006, the United States Supreme Court in the consolidated cases *Rapanos v. United States* and *Caravell v. United States*, Nos. 04-1034 and 04-1384 (*Rapanos*: June 19, 2006) addressed CWA jurisdiction over wetlands adjacent or abutting navigable, non-navigable and ephemeral tributaries and jurisdiction over permanent and relatively permanent non-navigable tributaries. According to the United States Supreme Court, the CWA does not assert jurisdiction over upland erosional features, gullies, and roadside ditches that have infrequent, low volume, and short duration of water flow. The USACE uses a significant nexus analysis. A water body is considered to have a “significant nexus” with a traditional navigable water (TNW)¹ if its flow characteristics and functions in combination with the ecologic and hydrologic functions performed by all wetlands adjacent to such a tributary, affect the chemical, physical, and biological integrity of a downstream traditional navigable water. Additional information is provided in the Environmental Protection Agency (EPA) memorandum titled “Clean Water Act Jurisdiction Following the U.S. Supreme Court’s Decision in *Rapanos v. United States & Caravell v. United States*,” dated June 5, 2007 (USACE 2007), and also the *U.S. Army Corps of Engineers Jurisdictional Determination Form Instructional Guidebook* (USACE and EPA 2007).

The Regional Water Quality Control Board (RWQCB) is responsible for the administration of Section 401 of the CWA, through water quality certification of any activity that may result in a discharge to jurisdictional waters of the U.S. The RWQCB may also regulate discharges to “waters of the State,” including wetlands, under the California Porter-Cologne Water Quality Control Act.

4.4.2.2 State Regulations

California Endangered Species Act (CESA). The CESA is similar to the FESA in that its intent is to protect species of fish, wildlife, and plants that are in danger of, or threatened with, extinction because their habitats are threatened with destruction, adverse modification, or severe curtailment, or because of overexploitation, disease, predation, or other factors.

“Take” as defined under CESA means hunt, pursue, capture, or kill, or attempt to hunt, pursue, capture, or kill. Under certain conditions, CESA has provisions for take through a 2081 Permit or a Section 2081 Memorandum of Understanding. The impacts of the authorized take must be minimized and fully mitigated. No permit may be issued if the issuance of the permit would jeopardize the continued existence of the species.

¹ A “traditional navigable water” includes all of the “navigable waters of the United States,” defined in 33 C.F.R. § 329 and by numerous decisions of the Federal courts, plus all other waters that are navigable-in-fact.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

California Environmental Quality Act. Section 15380(b) of the *CEQA Guidelines* provides that a species not listed on the Federal or State lists of protected species may be considered rare or endangered if the species can be shown to meet specified criteria. These criteria have been modeled after the definitions in FESA and CESA and § 2780–2781 of Article 1 of the California Fish and Game Code dealing with the California Wildlife Protection Act of 1990. This section was included in the guidelines primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on a species that has not yet been listed by either the USFWS or CDFW.

California Fish and Game Code Section 3503 and the Migratory Bird Treaty Act. Section 3503 of the California Fish and Game Code prohibits the destruction of bird nests except as otherwise provided for in the Fish and Game Code. The MBTA similarly protects the nests of migratory birds. These regulations apply to the individual nests of these species, but do not regulate impacts to the species' habitats.

Raptor Protection. The California Fish and Game Code (Fish and Game Code, Sections 3503, 3503.5, 3505 and 3513), and California Code of Regulations (Title 14, Sections 251.1, 652 and 783-786.6) have specific provisions for the protection of raptors (birds of prey).

Streambed Alteration Agreements. Sections 1600 et seq. of the California Fish and Game Code define the responsibilities of the CDFW and require public and private applicants to obtain an agreement for projects that would “divert, obstruct, or change the natural flow or bed, channel, or bank of any river, stream, or lake designated by the CDFW in which there is at any time an existing fish or wildlife resource or from which those resources derive benefit, or would use material from the streambed designated by the department.” CDFW wardens and/or unit biologists typically have the responsibility for formulating and issuing Streambed Alteration Agreements. The CDFW, through provisions of the Code (Sections 1601–1603), is empowered to issue agreements for any alteration of a river, stream, or lake where fish or wildlife resources may be adversely affected. Streams (and rivers) are defined by the presence of a channel bed and banks, and at least an intermittent flow of water. The CDFW regulates wetland areas only to the extent that those wetlands are part of a river, stream, or lake as defined by the CDFW.

Native Plant Protection Act (NPPA). Sections 1900–1913 of the California Fish and Game Code (Native Plant Protection Act) direct the CDFW to carry out the Legislature’s intent to “... preserve, protect and enhance endangered or rare native plants of this state.” The NPPA gives the California Fish and Game Commission the power to designate native plants as “endangered” or “rare” and protect endangered and rare plants from take.

4.4.2.3 Regional Regulations

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The continued loss of habitat to new development and the cumbersome process of environmental review and habitat mitigation on a project-by-project basis led to preparation of the MSHCP. The MSHCP is a multi-jurisdictional effort that provides a regional conservation solution to species and habitat issues. The underlying goal of the MSHCP is to protect multiple species by preserving a variety of habitat and providing linkages between different habitat areas and other undeveloped lands. The MSHCP allows Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of CESA and FESA. The overall goal of the MSHCP is to enhance and maintain biological diversity and ecosystem processes while allowing future economic growth.

The MSHCP was adopted on June 17, 2003. The MSHCP is a comprehensive, multi-jurisdictional Habitat Conservation Plan (HCP) focusing on the long-term conservation of species and their habitats

in western Riverside County. The MSHCP serves as an HCP pursuant to Section 10(a)(1)(B) of FESA as well as the Natural Communities Conservation Plan (NCCP) under the State of California. The USFWS issued a Biological Opinion for the MSHCP on June 22, 2004. The CDFW also issued the NCCP Approval and Take Authorization for the MSHCP. As long as adherence to the policies and requirements of the MSHCP is maintained, participants in the MSHCP, which include the County of Riverside and fourteen cities (including the City of Moreno Valley), are allowed to authorize “incidental take” of plant and wildlife species of concern.

The MSHCP will eventually result in an MSHCP Conservation Area in excess of 500,000 acres and focuses on conservation of 146 species including amphibians, reptiles, birds, mammals, invertebrates, and plants. The MSHCP Conservation Area includes approximately 347,000 acres on existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. The MSHCP Plan Area encompasses approximately 1.26 million acres (1,966 square miles); it includes all unincorporated Riverside County land west of the crest of the San Jacinto Mountains to the Orange County line, as well as the jurisdictional areas of the Cities of Temecula, Murrieta, Lake Elsinore, Canyon Lake, Norco, Corona, Riverside, Moreno Valley, Banning, Beaumont, Calimesa, Perris, Hemet, and San Jacinto. It provides a coordinated MSHCP Conservation Area and implementation program to preserve biological diversity and maintain the region’s quality of life.

The MSHCP serves as a HCP pursuant to Section 10(a)(1)(B) of FESA, as well as an NCCP under the NCCP Act of 2001. The MSHCP allows the City of Moreno Valley as well as other signatories of the Plan to authorize “Take” of plant and wildlife species identified within the Plan Area. The USFWS and CDFW have authority to regulate the Take of Threatened, Endangered, and rare Species. Under the MSHCP, the USFWS and CDFW can grant “Take Authorization” for otherwise lawful actions—such as public and private development that may incidentally Take or harm individual species or their habitat outside of the MSHCP Conservation Area—in exchange for the assembly and management of a coordinated MSHCP Conservation Area.

Of the 1.26 million acres covered by the MSHCP, 500,000 acres have been designated for preservation: 347,000 acres are already conserved as public or quasi-public land and another 45,270 acres have been acquired as habitat by the Regional Conservation Authority (RCA). According to the most recent RCA-MSHCP Annual Report, the City of Moreno Valley has a high-end goal of conserving 130 acres within its sphere of influence of the MSHCP; the City has already conserved 943 acres (RCA Annual Report 2010, Table 3). Altogether, Riverside County has reached 77 percent of the goal in the MSHCP.

Stephens’ Kangaroo Rat Habitat Conservation Plan (SKR HCP). The USFWS issued a permit to the Riverside County Habitat Conservation Agency on May 3, 1996, for incidental take of Stephens’ kangaroo rat (*Dipodomys stephensi*). The 30-year plan is designed to acquire and permanently conserve, maintain, and fund the conservation, preservation, restoration, and enhancement of Stephens’ kangaroo rat occupied habitat. The SKR HCP covers approximately 534,000 acres within the member jurisdictions (including the City of Moreno Valley), and includes an estimated 30,000 acres of occupied Stephens’ kangaroo rat habitat. The SKR HCP requires members to preserve and manage 15,000 acres of occupied Stephens’ kangaroo rat habitat in 7 Core Reserves encompassing over 41,000 acres. Currently 12,460 acres of occupied habitat exists within the Core Reserves.

4.4.2.4 City of Moreno Valley General Plan Policies

The specific policies outlined in the City’s General Plan Conservation Element related to biological resources include:

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Conservation Element

- Policy 7.4.1** Require all development, including roads, proposed adjacent to riparian and other biologically sensitive habitats to provide adequate buffers to mitigate impacts to such areas.
- Policy 7.4.3** Preserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels.
- Policy 7.4.5** The City shall fulfill its obligations set forth within any agreement(s) and permit(s) that the City may enter into for the purpose of implementing the Western Riverside County Multiple Species Habitat Conservation Plan.

4.4.3 Methodologies

The project area was assessed to determine consistency with the MSHCP focusing on conservation of species and their associated habitats in western Riverside County. The Riverside County Integrated Project (RCIP) Conservation Summary Report was first reviewed to determine habitat assessment and potential survey requirements for the study area. Geographic Information Systems (GIS) software was used to map the site in relation to MSHCP areas including Criteria Cells; conservation areas and linkages; Criteria Area Species Survey Areas for plant, bird, mammal, and amphibian species; Narrow Endemic Plants Survey Area; and survey requirements for inadequately covered species.

4.4.3.1 Literature Search

Prior to each field visit, a literature review to determine environmental conditions occurring on the study area and the surrounding area was conducted. The primary objective of the review is to evaluate the potential for suitable habitat for sensitive plant and wildlife species, as well as to determine the applicability of other MSHCP and CEQA requirements as they pertain to the proposed project. A compilation of sensitive plant and wildlife species recorded in the vicinity of the study area was derived from the CDFW's California Natural Diversity Data Base (CDFW 2012), a sensitive species and plant community account database. Additional recorded occurrences of plant species found on or near the planning area were derived from the California Native Plant Society's (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants of California database. The CNDDDB and CNPS search was based on the *Lakeview*, *Sunnymead*, and *El Casco*, California USGS 7.5-minute topographic quadrangles, encompassing 126 square miles. Additional recorded occurrences of these species found on or near the study area were derived from biota studies conducted for the MSHCP as well as studies conducted by MBA biologists for other projects over the years.

The MSHCP and CEQA also require an assessment to determine the potentially significant effects of the project on riparian/riverine areas and vernal pools. According to the MSHCP, the documentation for the assessment shall include mapping and a description of the functions and values of the mapped areas with respect to the species listed in the MSHCP's Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools. This assessment is independent from considerations given to waters of the U.S. and waters of the State under the Clean Water Act (CWA) and California Fish and Game Code. This assessment has been completed for all of the study area but not in the zone of potentially indirect effects.

As part of the MSHCP requirements, an Urban/Wildlands Interface Analysis is required to address the indirect effects associated with locating proposed development in proximity to MSHCP conservation areas. The development may result in edge effects, which could potentially affect biological resources

within the MSHCP Conservation Area. According to the MSHCP, the analysis should include an assessment of the potential indirect project impacts that may result from drainage features, toxics, noise, invasive species, barriers, access, and grading/development, as listed and described in the MSHCP's Section 6.1.4, *Guidelines Pertaining to Urban/Wildlands Interface*. For this study, the Urban/Wildlands Interface Analysis was extended eastward to include indirect effects adjacent to Gilman Springs Road.

4.4.3.2 Habitat Assessment Survey

MBA originally assessed the planning area in 2005 and has conducted numerous additional surveys since then. Details of the survey dates and specific survey areas are provided in the 2012 MBA report (DEIR Appendix E). The planning area, including the off-site facilities and the CDFW Conservation land, was surveyed to determine the plant communities present, the suitability for Narrow Endemic and Criteria Area plant species, the presence of riparian areas, and the presence of suitable habitat for burrowing owl and Los Angeles pocket mouse. Parameters assessed included soil conditions, presence of indicator species, slope, aspect, and hydrology.

4.4.3.3 Plants

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photographs. The plant communities within the planning area were classified according to the CDFW's List of Terrestrial Natural Communities (2003) and cross-referenced to descriptions provided in Holland's Preliminary Descriptions of the Terrestrial Natural Communities of California (1986) and Oberbauer's Terrestrial Vegetation Communities in San Diego County Based on Holland's Descriptions (1996). Common plant species observed during reconnaissance-level surveys in the planning area were identified by visual characteristics and morphology in the field and recorded in a field notebook. Uncommon and less familiar plants were identified off site using taxonomical guides. A list of all species observed on the study area was compiled from the survey data, shown in Appendix A of the MBA 2012 report (DEIR Appendix E).

4.4.3.4 Wildlife

Wildlife species detected during field surveys in the planning area by sight, calls, tracks, scat, or other sign recorded during surveys in a field notebook by all biologists working on the project. Field guides were used to assist with identification of species during surveys. Although common names of wildlife species are fairly well standardized, scientific names are used in this report and are provided in Appendix A of the ~~2012~~2013 MBA report (DEIR Appendix E).

4.4.3.5 Riparian/Riverine and Vernal Pool Habitat

Aerial photography was reviewed prior to conducting general surveys to identify any potential natural drainage features and water bodies that may qualify as riparian/riverine. In general, the surface drainage features indicated as blue-line streams on USGS topographic quadrangle maps that were observed or expected to exhibit evidence of flow, can potentially support riparian/riverine areas. The planning area was evaluated for any riparian/riverine and vernal pool habitat in 2005, 2007, 2012, and 20122013.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

4.4.3.6 Burrowing Owl

The project site is within the MSHCP burrowing owl survey area, and habitat assessments for burrowing owl (*Athene cunicularia hypugea*) were conducted 2005, 2006, 2010, 2012, and ~~2012~~2013 on various portions of the project site. Areas of suitable habitat, if present, were mapped onto an aerial photograph. Potential owl burrows, such as abandoned small mammal burrows, as well as manmade structures including earthen berms, cement culverts, cement, asphalt, rock, or wood debris piles, or openings beneath cement or asphalt pavement are generally mapped onto an aerial photograph. The site was determined to have suitable habitat in a number of widespread locations, and owls were observed in various locations during the MSHCP fieldwork, so a focused survey was recently conducted in ~~2012~~2013.

A focused western burrowing owl survey was conducted for the proposed project site on ~~five~~seven separate days in ~~2012~~2013. Under the MSHCP, the focused survey protocol was divided into two parts: 1) a Focused Burrow Survey; and 2) a Focused Burrowing Owl Survey. The focused survey was conducted during the breeding season (March 1–August 31) as defined under the MSHCP,¹ and also in accordance with the California Burrowing Owl Consortium’s (CBOC) *Burrowing Owl Survey Protocol and Mitigation Guidelines*.² Although the species was not observed during the most recent survey, it has been observed at other times in the past, and is assumed to be present due to the presence of suitable habitat and the fact they can occupy fallow agricultural fields relatively quickly. The MSHCP requires that pre-construction surveys be completed in areas of suitable habitat.

4.4.3.7 Los Angeles Pocket Mouse

Focused surveys for the Los Angeles pocket mouse (LAPM) (*Perognathus longimembris brevinasus*) were conducted in August 2005, June 2010, ~~and June 2012~~, and July 2013 (see DEIR Appendix E). The surveys were conducted according to the established USFWS protocols for Pacific pocket mouse (*Perognathus longimembris longimembris*), a similar species. The current protocol requires trapping for 5 consecutive nights: conducted when the animal is active aboveground at night, during a new moon phase, if possible. No LAPM were observed in the project area during the focused surveys, but there is marginal habitat located in Drainages 7 and 9. MBA concluded that the project area was not occupied by LAPM. However, future surveys may be needed for development in areas of the site that contain suitable habitat for the project to be consistent with the long-term conservation goals of the MSHCP.

4.4.3.8 Jurisdictional Determination Report

Prior to beginning the field delineation, a color aerial photograph, a topographic base map of the project area and the previously cited USGS topographic maps were examined to determine the locations of potential areas of USACE/CDFW/RWQCB jurisdiction. Potential jurisdictional areas were field-checked for the presence of definable channels³ and/or wetland vegetation, soils and hydrology. Suspected wetland habitats on the site were evaluated using the methodology set forth in the *U.S. Army Corps of Engineers 1987 Wetland Delineation Manual*⁴ (Wetland Manual) and the *2008 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region*

¹ Western Riverside County Multiple Species Habitat Conservation Plan, Volume I, Dudek & Associates, June 17, 2003.

² Burrowing Owl Survey Protocol and Mitigation Guidelines, California Burrowing Owl Consortium, 1993.

³ U.S. Army Corps of Engineers. 2008. A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the United States: A Delineation Manual. ERDC/CRREL TR-08-12: Cold Regions Research and Engineering Laboratory, U.S. Army Engineer Research and Development Center, Hanover NH.

⁴ Environmental Laboratory. 1987. *Corps of Engineers Wetlands Delineation Manual*, Technical Report Y-87-1, U.S. Army Engineer Waterways Experimental Station, Vicksburg, Mississippi.

(Version 2.0).¹ The limits of USACE/CDFW/RWQCB jurisdiction were recorded using sub-meter GPS technology while in the field.

4.4.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, biological resource impacts would occur if the proposed project would:

- Have a substantial adverse effect, either directly or indirectly or through habitat modification, on any species identified as endangered or threatened in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect, either directly or indirectly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or the USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native or resident migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or
- Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

4.4.5 Less than Significant Impacts

4.4.5.1 Jurisdictional Waters/Wetlands

Threshold — Would the proposed project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

~~Drainages in the project area were investigated and delineated by MBA in March 2012 and updated in 2013. A total of 15 primary drainage features were identified during this survey and a number of sub-drainages or tributaries were also identified. Jurisdiction for each drainage and/or sub-drainage or tributary was evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by USACE and RWQCB, respectively; Porter Cologne as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by the CDFW.~~

¹ U.S. Army Corps of Engineers. 2008. Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region. Ed. J.S. Wakeley, R.W. Lichevar, and C.V. Noble. ERDC/EL TR-08-28. Vicksburg, MS: U.S. Army Engineer Research and Development Center.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

All 15 drainage features identified in the 2013 document were assessed to determine the jurisdictional limits. Based on current conditions, two of the 15 features is subject to the jurisdiction of the USACE and/or RWQCB. In addition, no jurisdictional wetlands or isolated wetlands were identified. Drainage Features 1, 2, 4, 12, and 13 flow to the south and then southwest of the project area. These drainage features are contained in roadside ditches or otherwise sheet flow prior to leaving the project area.

Drainage Feature 12 and 15 are likely subject to USACE jurisdiction. However, if any portion of Drainage Features 12 and 15 are affected by WLC project construction activities or flood control improvements in the future, then regulatory permitting may be required.

There are two drainage features that are completely isolated, Drainage Features 3 and 14. Drainage Feature 3 is an isolated temporary water quality facility serving the new Skechers building. This feature was created in an existing upland area and will eventually be converted into an underground storm drainage system. The second feature (consisting of two small basins) was created in an upland area to contain polluted runoff from a now abandoned cattle operation. The eastern feature (Feature 14) is dominated by non-native tree species and contains no native riparian habitat. The western feature contains a mix of non-native trees and native riparian habitat. There is no evidence of ponding and the basin is no longer in use. These basins no longer serve any water quality function and are therefore not considered to be an isolated water of the State under the Porter Cologne Act.

The remaining seven features flow to the south and eventually revert to sheet flow conditions before reaching the San Jacinto Wildlife Area. Each drainage feature was walked until neither an ordinary high water mark (OHWM) nor a clearly defined bed and bank feature was present and the drainage course reverted to sheet flow onto open land. There was no evidence of flows downstream of the drainage where the OHWM was no longer present. Therefore, these features are hydrologically and physically isolated from any downstream RPW or TNW. Surface flows from the project area will eventually be conveyed into the SJWA. The SJWA's system of ponded areas was surveyed to document any downstream connectivity to any RPW or TNW. Based on current site conditions, the water within the SJWA is completely contained within the ponded area system with a large overflow area that conveys flows over a spillway in the southwest corner of the facility. There is no evidence of active flows within the spillway channel and all upstream flows are likely maintained within the SJWA exclusive of major flood events (50- to 100-year floods). Therefore, no significant impacts are expected in this regard, and no mitigation is required.

The MBA 2013 report concludes that two of the drainages on the project site are under the jurisdiction of the USACE (Drainages 12 and 15), and several additional drainages are under the jurisdiction of the CDFW and RWQCB (Drainages 7, 8, 9, 12, and 15). Additional analysis regarding impacts to drainages potentially under CDFW jurisdiction is presented in Section 4.4.6.3., *Riparian Habitat or Other Sensitive Natural Communities*.

4.4.5.21 Adopted Policies and/or Ordinances

Threshold	Would the proposed project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
-----------	---

Table 4.4.E summarizes the City's General Plan and Municipal Code policies regarding biological resources and their consistency with the WLCSP.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Table 4.4.E: General Plan and Municipal Code Biological Resources Policies

Goals, Objectives, Policies, Ordinances		Project Consistency
City of Moreno Valley General Plan		
Objective 7.4	Maintain, protect, and preserve biologically significant habitats where practical, including the San Jacinto Wildlife Area, riparian areas, habitats of rare and endangered species, and other areas of natural significance.	No significant riparian or other biologically sensitive habitat is on or adjacent to the study area. The project is consistent with this objective.
Policy 7.4.1	Require all development, including roads, proposed adjacent to riparian and other biologically sensitive habitats to provide adequate buffers to mitigate impacts to such areas.	No significant riparian or other biologically sensitive habitat is on or adjacent to the study area. The project is consistent with this policy.
Policy 7.4.2	Limit the removal of natural vegetation in hillside areas when retaining natural habitat does not pose threats to public safety.	Limited stands of natural plant communities or stands of native vegetation occur in the study area within hillside areas. These areas are proposed as open space under the proposed action. The project is consistent with this policy.
Policy 7.4.3	Preserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels.	The study area contains 14 drainages and/or basins. As specific projects are designed within the WLCSP, consistency with the policy will have to be determined.
Policy 7.4.4	Incorporate significant rock formations into the design of hillside developments.	The study area is generally not a hillside area. Limited natural rock formations occur in a proposed open space area. The project is consistent with this policy,
Policy 7.4.5	The City shall fulfill its obligations set forth within any agreement(s) and permit(s) that the City may enter into for the purpose of implementing the Western Riverside County Multiple Species Habitat Conservation Plan.	See Consistency with Chapter 3.48 of the City of Moreno Valley Municipal Code below.
City of Moreno Valley Municipal Code		
Title 3 Revenue and Finance		
Chapter 3.48 MSHCP Fee Program (Ordinance 742 Section 1.1, 2007)	Establish a local development mitigation fee to assist in the maintenance of biological diversity and the natural ecosystem processes that support this diversity; the protection of vegetation communities and natural areas within the city and western Riverside County which are known to support threatened, endangered or key sensitive populations of plant and wildlife species; the maintenance of economic development within the city by providing a streamlined regulatory process from which development can proceed in an orderly process; and the protection of the existing character of the city and the region through the implementation of a system of reserves which will provide for permanent open space, community edges, and habitat conservation for species covered by the MSHCP.	MBA conducted an MSHCP Consistency Analysis for the proposed project in 2012 and found that the study area is within the MSHCP fee area. Impacts are potentially significant and mitigation is provided.

Table 4.4.E: General Plan and Municipal Code Biological Resources Policies

Goals, Objectives, Policies, Ordinances		Project Consistency
<i>Title 8 Buildings and Construction</i>		
Chapter 8.60 Threatened and Endangered Species (Ordinance 502 Section 2.1, 1996)	Adopt and require certain implementation measures as required by the Stephens' Kangaroo Rat Habitat Conservation Plan (SKRHCP), the Section 10(a) Permit and the Management Authorization; and to adopt and impose an impact and mitigation fee to provide funds to the Riverside County Habitat Conservation Authority to implement the terms of the SKRHCP.	The study area is located within the known range of SKR. The study area is also located within the SKRHCP fee area and not in the SKRHCP Core Reserve Area. Impacts are potentially not consistent; however mitigation is provided.

Sources: City of Moreno Valley General Plan, 2006; City of Moreno Valley Municipal Code.

This analysis indicates the proposed project is consistent with local policies and ordinances protecting biological resources that apply to the project area. Compliance with State and Federal regulations to ensure protection and preservation of significant biological resources, and the implementation of the MSHCP are the applicable policies/programs that the project must implement. As there are no other local policies or ordinances regarding the protection of biological resources identified by the City or other local jurisdiction applicable to the project site, no impact would occur and no mitigation is required.

4.4.5.32 Habitat Fragmentation/Wildlife Movement

Threshold	Would the proposed project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
-----------	--

Habitat fragmentation occurs when a single, contiguous habitat area is divided into two or more areas, or where an action isolates the two or more new areas from each other. Isolation of habitat occurs when wildlife cannot move freely from one portion of the habitat to another or to/from one habitat type to another. Habitat fragmentation may occur when a portion of one or more habitats is converted into another habitat, as when scrub habitats are converted into annual grassland habitat because of frequent burning. Wildlife movement includes seasonal migration along corridors, as well as daily movements for foraging. Examples of migration corridors may include areas of unobstructed movement for deer, riparian corridors providing cover for migrating birds, routes between breeding waters and upland habitat for amphibians, and between roosting and feeding areas for birds.

The project area contains no significant cover of native plant communities and currently experiences heavy disturbance associated with agricultural activities. Additionally, the project area is adjacent to SR-60 and Gilman Springs Road on the north and east and is bordered by urban development on the west. The nearest linkage area as identified under the MSHCP is Proposed Linkage 5 and is located approximately 3 miles north of the project and approximately 3.6 miles south of the project is Proposed Constrained Link 20. The development of the project area will not impede the movement of any wildlife; therefore, the proposed project will not affect any wildlife movement corridor.

The Conservation Buffer Area located in the southern portion of the project area is owned by the CDFW and currently regularly disked as part of the SJWA's agricultural operations. It currently provides foraging habitat for various resident and migratory wildlife species. The portion of the project area adjacent to the SJWA lands has been actively farmed for decades and is regularly disked. The Conservation Buffer Area is designated as open space in the proposed project and no development is proposed for this area.

According to the project biological report, although the project area does not contain any designated wildlife movement corridors or MSHCP linkages—# (i.e., MSHCP, City General Plan, etc.), it is likely that wildlife moves through adjacent properties such as the SJWA and the Mystic Lake area to the south, the Badlands area to the east and the Lake Perris State Recreation Area to the southwest. The project biological report concluded that development of the project as proposed would not directly have any significant impact on wildlife movement in the area, and would not fragment habitat or adversely affect wildlife movement through the surrounding areas. ~~Therefore, impacts in this regard~~ The biological report also determined that the proposed project would not impede or minimize any significant wildlife corridor for the target species associated within the Reche Canyon/Badlands Area plan, which include Bell's sage sparrow (*Amphispiza belli belli*), cactus wren (*Campylorhynchus brunneicapillus sandiegensis*), loggerhead shrike (*Lanius ludovicianus*), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), bobcat (*Lynx rufus*), Los Angeles pocket mouse (*Perognathus longimembris brevinasus*), mountain lion (*Felis concolor*), San Bernardino kangaroo rat (*Dipodomys merriami parvus*), Stephens' kangaroo rat (*Dipodomys stephensi*), and Nevin's barberry (*Berberis nevinii*). In addition, although not required, Drainage 429 is being designed to allow for wildlife movement between the Badlands and the SJWA (e.g., relatively natural channel conditions with 50-foot setbacks on either side of the channel through the WLCSP property. These project design features will maintain a wildlife travel path along Drainage 9. Therefore, impacts related to wildlife movement are less than significant, and no mitigation is needed.

4.4.6 Significant Impacts

4.4.6.1 Endangered and Threatened Species

Impact 4.4.6.1: *The project may have significant impacts on listed species.*

Threshold	Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as endangered or threatened in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
-----------	---

Of the special-status plant and animal species that have the potential to occur within the general vicinity of the project area, 17 plant and animal species are designated as endangered or threatened by State and/or Federal authorities (Table 4.4.F). None of these species was observed or is believed to be present on the project site; it is possible the listed birds may utilize the SJWA on a seasonal basis.

Table 4.4.F: Endangered/Threatened Species Within the Project Area

Species	Status Designation	Potential for Occurrence
Munz's onion <i>Allium munzii</i>	Federal: Endangered State: Threatened	Not Expected
San Diego ambrosia <i>Ambrosia pumila</i>	Federal: Endangered State: None	Not Expected
Marsh sandwort <i>Arenaria paludicola</i>	Federal: Endangered State: Endangered	Low
Nevin's barberry <i>Berberis nevinii</i>	Federal: Endangered State: Endangered	Not Expected
Thread-leaved brodiaea <i>Brodiaea filifolia</i>	Federal: Endangered State: Threatened	Not Expected
Slender-horned spineflower <i>Dodecahema leptoceras</i>	Federal: Endangered State: Endangered	Not Expected

Table 4.4.F: Endangered/Threatened Species Within the Project Area

Species	Status Designation	Potential for Occurrence
Spreading navarretia <i>Navarretia fossalis</i>	Federal: Threatened State: None	Not Expected
California Orcutt grass <i>Orcuttia californica</i>	Federal: Endangered State: Endangered	Not Expected
Vernal pool fairy shrimp <i>Brachinecta lynchi</i>	Federal: Threatened State: Special Animal	Not Expected
Riverside fairy shrimp <i>Streptocephalus woottoni</i>	Federal: Endangered State: Special Animal	Not Expected
Quino checkerspot butterfly <i>Euphydryas editha quino</i>	Federal: Endangered State: Special Animal	Not Expected
California tiger salamander <i>Ambystoma californiense</i>	Federal: Threatened State: Species of Special Concern	Not Expected
Southwestern willow flycatcher <i>Empidonax traillii extimus</i>	Federal: Endangered State: Special of Special Concern	Not Expected
Coastal California gnatcatcher <i>Poliophtila californica californica</i>	Federal: Threatened State: Special of Special Concern	Not Expected
Least Bell's vireo <i>Vireo belli pusillus</i>	Federal: Threatened State: Special of Special Concern	Not Expected
San Bernardino kangaroo rat <i>Dipodomys merriami parvus</i>	Federal: Threatened State: Special of Special Concern	Not Expected
Stephens' kangaroo rat <i>Dipodomys stephensi</i>	Federal: Endangered State: Threatened	Not Expected

Source: MSHCP Compliance Report, Michael Brandman Associates. April 23, 2012 Appendix E-1.

The potential for occurrence determination was based on the results of focused biological resource surveys, and/or the lack of suitable habitat in the project limits for the referenced species. No Federal or State endangered/threatened species were detected on the project site during the focused biological resource surveys. However, to err on the side of caution, it is reasonable to conclude that, at a minimum, indirect impacts to listed species may be significant, and mitigation is required.

Project or Specific Plan Design Features. The proposed World Logistics Center Specific Plan provides for a number of project design features to address the interface between the project and the SJWA. These features include enhanced landscaping along the southern boundary, restrictions on site lighting, restrictions on native/drought-tolerant landscape materials, the installation of special drainage facilities, restrictions on public access, special architectural standards for building elevations facing the SJWA, restrictions on the orientation of adjacent buildings, signage restrictions, and other development guidelines intended to create an interface area that is sensitive to the unique relationship between the project and the SJWA.

The Specific Plan establishes a 250-foot wide development setback from the southernmost property line along the SJWA boundary, and an additional 150-foot building setback (i.e., in addition to the setback provided by the CDFW Conservation Area) to help minimize potential impacts on biological resources of the SJWA.

It is important to note that the 910-acre area immediately south of the project was purchased by the State of California largely to serve as a buffer between the habitat area and future development to the north (at that time, the Moreno Highlands Specific Plan). The acquisition of this buffer area created a State-owned 3,000-foot wide separation between the project and the SJWA at that time.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

The Specific Plan includes development restrictions that may affect off-site areas such as the SJWA, including architecture and building design, landscaping, and off-site lighting:

- *Architecture and Building Restrictions (Specific Plan Section 4.1).* Sections 4.1.2 and 4.1.3 require ground- and roof-mounted equipment to be screened from off-site view.
- *Landscaping Restrictions (Specific Plan Section 4.2).* Section 4.2.4 provides “screening criteria” “Special Edge Treatment Areas” in terms of adjacent land uses, including the SJWA (Section 4.2.4.3) ~~Page 58 of the Specific Plan shows the landscaping treatment along the SJWA boundary, while page 60 shows the treatment along~~ and Gilman Springs Road (Section 4.2.4.4).
- *Off-site Lighting (Specific Plan Section 4.3).* Section 4.3.1.3 indicates one of the main objectives of the project lighting is “... all lighting in the vicinity of the San Jacinto Wildlife Area shall be designed to confine all direct light rays to the project site and preclude the visibility of direct light rays from the wildlife area” (page ~~784-42~~). The project will also have to comply with the City’s new Dark Sky Lighting Ordinance, which reduces spillover light to 0.25 foot-candles at five feet from the adjacent property lines.

The Specific Plan provides for a 250-foot development setback and an additional 150-foot building setback adjacent to the CDFW Conservation Buffer Area. The development setback area would include landscape areas, drainage facilities, site fencing and walls, etc. According to available research previously presented in Section 4.4.1.18a, a 250-foot development setback is adequate for a project-SJWA buffer and is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and also the distance established in nesting bird surveys for setbacks from human activity. In addition, the Specific Plan requires solid walls along the property line, which will help provide an additional buffer from building lighting and noise and effectively mitigate potential direct and indirect impacts on the SJWA.

Roadkill. As development occurs within the WLCSP, some local wildlife will be injured or killed by the additional vehicles and trucks on SR-60, Gilman Springs Road, Redlands Boulevard north of Eucalyptus Avenue, and all internal WLCSP roads. There is no accurate way to quantify this impact, since there are no data on existing roadkill on these roadways. However, it is reasonable to assume this impact will increase linearly (from current levels) as project-related traffic increases. It should be noted that development within the Specific Plan along the west side of Gilman Springs Road will be separated from the roadway by fencing or walls as appropriate; this will help restrict human access to Gilman Springs Road and native areas along the east side of the roadway, and may incrementally reduce roadkill along Gilman Springs Road. Native wildlife will still experience incremental adverse impacts from roadkill along Gilman Springs Road as the WLC project develops in the future, but these impacts would be less than significant as long as the County coordinates with the RCA and takes wildlife movement between Core H and proposed Core 3 into account when designing and improving Gilman Springs Road.

Operational Noise. The northern portion of the SJWA will experience increased, fluctuating sound levels during construction and operation (e.g., vehicle traffic and truck loading and unloading), but truck traffic and human activity will result in an incremental increase in overall ambient sound over the long term. In addition, it is possible construction activities on the project site, including areas adjacent to the SJWA, may be subject to construction activity on a 24-hour-per-day, 7-day-per-week schedule. The calculations in Table 4.4.G were provided by the project noise consultant (Mestre Greve Associates) specifically for the southern boundary area of the project.

The portion of the SJWA immediately south of the Specific Plan site (i.e., the Conservation Buffer Area) is vacant and regularly disked for dry farming. This area is quiet, with L_{eq} levels during the day of 35.8 dB and nighttime levels of 40.8 dB. Noise levels in this north SJWA area are affected by road

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

noise from Gilman Springs Road to the east and from noise generated at the existing natural gas facilities.

Table 4.4.G: Noise Levels along the Project Southern Boundary

Noise Conditions	Daytime (dB)			Nighttime (dB)		
	L _{min}	L _{eq}	L _{max}	L _{min}	L _{eq}	L _{max}
Warehousing Noise						
50 feet	38.3	48.6	63.1	38.3	48.6	63.1
100 feet	37.5	47.8	62.3	37.5	47.8	62.3
250 feet	34.4	44.7	59.2	34.4	44.7	59.2
500 feet	30.6	40.9	55.4	30.6	40.9	55.4
Warehousing Noise Plus Ambient¹						
50 feet	38.3	49.3	63.1	38.3	48.8	63.1
100 feet	37.5	48.6	62.3	37.5	48.1	62.3
250 feet	35.9	46.2	59.2	34.4	45.2	59.2
500 feet	35.9	43.9	55.4	30.6	42.1	55.4
Change in Ambient Noise Levels²						
50 feet	2.4	8.5	12.8	8.3	13.0	12.0
100 feet	1.6	7.8	12.0	7.5	12.3	11.2

500 feet	0.0	3.1	5.1	0.6	6.3	4.3

1 Distances are in feet, noise levels are in dBA.

2 L_{eq} noise added logarithmically, L_{max} and L_{min} will not add in this situation.

Highest L_{max} and highest L_{min} were used.

Source: Project noise report and tabular noise data email, Mestre Greve Associates, May 2012.

The noise data in Table 4.4.G indicate that warehousing activity would raise ambient noise levels (measured at 50 feet) by 8 dB during the day and 13 dB at night. If a physical setback or buffer were implemented in this area to reduce impacts such as noise, the project noise consultant has estimated the noise levels for distances from 50 to 500 feet shown in Table 4.4.G.

These calculations show that the increase in noise levels from development would be close to 3 dB at a distance of 500 feet, resulting in overall noise levels (ambient plus development) of 43.9 dB measured at a distance of 500 feet (L_{eq}) during the day and 45.2 dB at 500 feet at night.

In addition to regular background noise contributions from traffic on Gilman Springs Road and the compressors at the SDG&E plant that run 24 hours per day, the SDG&E compressor plant has regular “blow-down” events, which is an automatic pipeline pressure relief process. When these occur, noise levels in the CDFW Conservation Buffer Area adjacent to the compressor plant property lines may reach 130 dB or higher, which is equivalent to a jet plane landing or a train horn at 100 feet. For more information on “blow-down” effects to humans, see Section 4.12, *Noise*, and 4.8, *Hazards and Hazardous Materials*. It should be noted that the pump noise and the blow-down events have been occurring regularly for many years, along with their potential impacts on SJWA wildlife; however, these utility facilities already exist and are not part of any development proposed within the WLC project.

Based on available information, it is reasonable to conclude that increased noise from human activity (project construction, traffic on local roads, loading and unloading of trucks, etc.) related to the proposed project will not have significant impacts on local wildlife in the SJWA area. Available

research indicates that increased noise levels near wildlife areas can contribute to behavioral changes such as increased startling in birds, which can be especially harmful during nesting periods, hunting pattern changes or avoidance which decrease habitat value and use, sleep pattern disruption, and decreased overall health from noise stress. These impacts can affect mammals, birds, and other species present within the SJWA. For these reasons, human activity should be set back from the SJWA to help minimize these impacts. The WLCSP indicates there will be a 250-foot minimum development setback and an additional 150-foot building setback along the southern boundary of the Specific Plan area to act as a buffer between the WLCSP and the SJWA. With implementation of the two setback areas (total 400 feet) and proposed solid walls along the SJWA boundary, the anticipated increase in noise from the proposed project will not have a significant impact on wildlife and would not require mitigation.

Construction Noise. Development within the WLCSP and off-site facilities must incorporate landscape elements including trees, shrubs, and groundcover, which would assist in off-site noise reduction. A noise analysis has been prepared for the project to quantify potential short-term and long-term noise impacts that could occur as a result of development of the parcel adjacent to open space areas. Based on recent studies (Landrum and Brown 2012), noise contours would exceed 60 dBA (L_{eq}) roughly 1,000 feet into the CDFW Conservation Buffer Area during construction of the southernmost areas of Phase 2. There is no projected change in noise contours associated with the operation of the facility over those of the no project condition. Therefore, any noise-related impacts would be temporary in nature and generally limited to construction of Phase 2 facilities along the southern boundary of the WLC.

Invasive Species. The WLCSP landscaping palette does not include any of the invasive plant species listed in Section 6.1.4 of the MSHCP (Table 6-2), but there should be mitigation to ensure that no on-site landscaping along the southern boundary of the site conflicts with MSHCP invasive plant guidelines.

Lighting. Lighting associated with planned warehouse development of the eastern and southern portions of the WLCSP would have various direct and indirect impacts on local wildlife, depending on the species and the nature of light exposure. There is some scientific and academic research on the effects of night lighting on various species, even though the subject species and lighting conditions vary widely. This section generally compares the results of this research to the relationship of the project and the SJWA.

Some available research¹ states that night lighting can have a wide range of adverse effects on wildlife, including mammals, birds, bats, amphibians, insects, fish, even plants. Effects range from reduced health by upsetting diurnal rhythms, reduced clutch size, egg size, or survival success of nesting birds, to actual mortality from increased predation under higher ambient light levels. Bats and certain insects are also attracted to outdoor night lighting, which may adversely affect their survival or cause them to become dependent on the lighting. Small mammals would also be attracted to these areas and might suffer increased predation or roadkill crossing streets.

Future development within the Specific Plan will have to comply with the off-site lighting restrictions outlined in Section 4.3 of the Specific Plan, including the requirement that direct light rays from all lighting fixtures be directed downward, illuminate only the building or space intended, and do not spill onto adjacent properties” (~~Specific Plan Section 5.4.2.2, page 127~~) (Section 9.08.100 Lighting 5.5.2.1). This will also apply to project-related development in Planning Areas 10 and 12, which will help minimize lighting impacts on biological species in the adjacent SJWA land.

¹ *Ecological Consequences of Artificial Night Lighting*. C. Rich and T. Longcore (ed), 2006.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

All on-site lighting will also have to comply with the new night lighting guidelines in Section 9.08.100 of the City's Municipal Code, which limits off-site impacts to 0.25 foot-candles per square meter. As development occurs within the Specific Plan, adherence to these design guidelines and restrictions will help ensure that night lighting increases will not result in significant indirect lighting impacts on native wildlife within the SJWA.

For example, the Specific Plan requires that streetlights, parking lot lighting, and other project-related illumination sources be positioned, directed, and shielded to avoid "direct light spill" into MSHCP conservation areas including those contained within Existing Core H to the south of the project area, and Proposed Core 3 (Section 6.1.1, Proposed Core 3) to the east of the project area. Lighting installed according to the WLC Specific Plan will be consistent with MSHCP guidelines. The project will also have to comply with the City's new Dark Sky Lighting Ordinance, which reduces spillover light to 0.25 foot-candles at five feet from the adjacent property lines. However, due to the size of the WLC project and its proximity to the SJWA, additional mitigation may be necessary for cumulative lighting impacts on the SJWA.

In addition to night lighting issues associated with construction and operation, the proposed facilities are to include roof-mounted photovoltaic panels to provide electricity for the facilities and aid in the sustainability of the project and reduce additional GHG emissions. There is a potential for glare from these panels to confuse migratory birds into attempting to land in the area of the panels. However, the project design calls for the use of low glare and high solar transmission films to increase solar capacity and prevent unnecessary glare, so this impact would be less than significant.

Toxics, Water. Development plans for the project will include Water Quality Best Management Practices (BMPs) such as vegetated earthen channels, storm drain stenciling, street sweeping, and education. The BMPs recommended for the proposed WLCSP are described in more detail in Section 4.9.6.1, *Construction-Related Water Quality Impacts*, and Section 4.9.6.2, *Operational Water Quality Impacts*. (Detention basins will be designed to filter potential toxics from storm water. Section 4.9.6.2, *Operational Water Quality Impacts*, also requires the regular removal of any contaminated materials from the detention basins to protect downstream water quality.) These BMPs will be implemented as part of the storm water pollution prevention measures for the project, in accordance with all appropriate NPDES requirements.

Development of the project will result in the additional use of hazardous materials in limited quantities associated with normal logistics use such as janitorial and cleaning products, solvents, herbicides, and insecticides. However, compliance with regulations, standards, and guidelines established by the Environmental Protection Agency (EPA), State, County, and local agencies relating to the storage, use, and disposal of hazardous waste will reduce the potential risk of hazardous materials exposure.

Development plans for the project will include Water Quality BMPs such as vegetated earthen channels, storm drain stenciling, street sweeping, and education. Detention basins will be designed to filter potential toxics from storm water. These BMPs will be implemented as part of the storm water pollution prevention measures for the project, in accordance with all appropriate NPDES requirements.

Toxics, Air Pollution and Diesel Exhaust. Local wildlife (i.e., within the SJWA) may be exposed to vehicular exhaust and diesel particulates and toxic air contaminants from truck exhaust as the project builds out. New development will produce significant amounts of diesel-related air pollutants that will be released into the atmosphere, including gases and particles of various sizes.

Most of the available (and most applicable) research is on diesel pollutant impacts on humans. Although the physiology of many animals is very different than humans, data on health effects from diesel pollution may nonetheless be somewhat instructive when attempting to assess diesel impacts

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

on wildlife. Potential health effects on wildlife obviously depend on the species involved,¹ but in general health effects from air pollution/diesel exhaust include impaired cardiac and lung or respiratory function,² reduced heart function or longevity, decreased clutch size or hatching success, increased incidence of cancer and other mutagenic or teratogenic effects, ingestion of air deposited particulates, reduction in overall biodiversity, reproductive failure, etc. In general, impacts on higher animals are most commonly attributed to food loss and reproductive effects, rather than to direct toxic effects on adults. There are relatively few examples of higher animals suffering direct toxic effects from either atmospheric acidity or gaseous air pollution. However, a number of mammals are known to build up high levels of heavy metals and other pollutants in their systems from air pollution.³

Diesel emissions⁴ contain thousands of pollutant species, and the composition depends on the fuel, vehicle, and driving conditions. The main public health concerns are from fine and ultrafine particulate matter, black or elemental carbon, polyaromatic hydrocarbons (PAHs) like phenanthrene, metallic ashes, gases like nitrogen dioxide, aldehydes like acetaldehyde, acrolein, and crotonaldehyde, volatile organic compounds like benzene and 1,3-butadiene, etc. One of the research limitations is that some health effects from these pollutants take a long time, in some cases even a lifetime, to exhibit themselves. These pollutant species can also be emitted from other sources, so in complex urban environments, it can be difficult to trace individual sources of air pollution. In this case, air quality is relatively good and the only major activity is agriculture, so the increase in most of these pollutant species would predominantly be the result of new warehouse uses within the project. Research⁵ suggests that wildlife may be more susceptible to air pollutant impacts than humans, due to their smaller size, higher respiration rates, smaller lung capacities, ingestion of local plant materials that have also been exposed, higher metabolic rates, etc., although some factors like shorter lifespans would reduce the length of exposure over time. For these reasons and for the purposes of this analysis, it is assumed that animals within the SJWA would be at least as susceptible to health effects from air pollution, including diesel exhaust compared to humans.

In 2002, the EPA compiled a wide range of scientific studies on the health effects of diesel exhaust, including non-carcinogenic effects⁶ of diesel exhaust on laboratory animals. Studies found that diesel particulate matter (diesel PM) had a limited effect on the survival and growth of rats and mice when exposed to diesel PM for short periods of time. However, rats, mice and hamsters all experienced increased lung to body-weight ratios when exposed to 1.5 mg/m³ diesel PM concentrations for extended periods of time. Several studies looked at behavior effects in animals, and found that juvenile rats exposed to diesel emissions (DE) exhibited a decreased ability to move around on their own, and negatively affected their learning in adulthood.

Extended exposure to diesel emissions caused negative effects on the pulmonary functions of rats, hamsters, cats and monkeys. Depending on the species, DE levels of 1.5–11.7 mg/m³ affected lung mechanical properties, diffusing capacity, lung volumes, and ventilator performance of the subject animal. The ability of rats to clear their airways was also severely impaired by diesel PM concentrations of 1 mg/m³ or greater. Data on the effect of diesel PM on airway clearance in other animals were limited, but the pathological effects of diesel PM seemed to be dependent on the relative rates of pulmonary deposition and clearance (rate of breathing) of the subject animal. The studies also showed that diesel PM can reduce an animal's resistance to respiratory infections. Diesel PM can begin to impair an animal's immune system in as little as 2–6 hours with exposures of 5–8

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

mg/m³ of diesel PM. The testing data also suggested that diesel PM may be a factor in increased allergic reactions in animals.

When comparing filtered versus non-filtered DE, studies found that diesel particulates are the main cause of noncancerous health effects. However, they could not determine if diesel PM acts additively with the gas, or whether it combines with the gases to create different effects. The studies also found that other airborne contaminants (e.g., criteria pollutants) can be altered by diesel PM when absorbed by the diesel particles and increase the physical health effects caused by the diesel PM and other contaminants. These increased health risks were only found in laboratory settings. There was no evidence for DE interacting with other contaminants in normal urban atmospheric settings except for the impaired ability of animals to resist respiratory tract infections. No other noncancerous effects were found in any of the studies.

Chapter 7 of the EPA document includes studies that concluded diesel emissions also have carcinogenic effects on animals. Studies indicated that DE and/or diesel PM did result in increased cases of cancer in laboratory animals as well as humans. Rats experienced a trend of increased tumor growth when exposed to concentrations of DE exceeding 1×10^4 mg \times hr/m³. Because tumors were induced at high concentrations it is believed that they are caused by the lungs experiencing particle overload. The studies also examined the effect of filtered exhaust and discovered that it did not cause tumors. They concluded that filtered exhaust either was not a carcinogenic or had low cancer potency.

In addition to pollutants associated with diesel trucks, passenger vehicles produce additional air pollutants including carbon monoxide, nitrogen oxides, particulates,¹ etc. These pollutants will also have indirect impacts on wildlife resources of the SJWA. Two impacts of most concern would be ozone degradation (e.g., plants having an unusual dry or “burned” look) and the deposition of additional nitrogen, both of which can disrupt plant growth cycles.

Direct air pollutant impacts on wildlife within the northern end of the SJWA will be reduced somewhat because prevailing winds are mainly to the southeast with the remainder mostly to the east (i.e., very little to the south), based on data from the project air quality study (MBA 2012). However, some diesel and other project-related air pollutants will still be expected to disperse toward the SJWA, including gases and particulates, from trucks and passenger vehicles, when prevailing winds are absent.

There appears to be little academic or scientific research on the specific impacts of diesel air pollutant emissions on wildlife (i.e., not laboratory animals) in natural settings, or specific setbacks for wildlife protection areas from warehouse distribution centers or other sources of diesel pollution. Most available research is too limited or specific regarding the type of pollutant and/or the species considered to be affected (e.g., impacts of one pollutant on one species). The portion of the SJWA adjacent to the WLCSP property is upland agricultural fields which may be used by foraging birds. Indeed, the northern portion of the SJWA land serves as an existing buffer and it was acquired by the CDFW in 1994 for that purpose. Additional buffer areas imposed as mitigation are discussed below.

Based on available scientific data, it is reasonable to conclude that the proposed project, due to its size and expected amount of truck traffic, will have potentially significant impacts on wildlife within the SJWA and east across Gilman Springs Road from project air pollution, including diesel truck exhaust.

¹ “Pulmonary and cardiovascular of traffic-related particulate matter from roadside and diesel engine exhaust particles.” M. Gerlofs-Nijland et al. *Inhalation Toxicology*, 2010.

Research by the California Air Resources Board (CARB)¹ indicates that 80 percent of the particulates generally settle out of the atmosphere within 1,000 feet of emission sources. Therefore, diesel particulate deposition may occur within approximately 1,000 feet of truck activities within the project, which would extend part way into the CDFW Conservation Buffer Area. This demonstrates one benefit of the State acquiring this Conservation Buffer Area (i.e., to reduce potential impacts of future development to the north from the SJWA and Mystic Lake to the south). In addition, the Specific Plan establishes an additional 250-foot setback along the SJWA boundary, which provides additional buffering from potential air pollutant impacts.

Toxics, Health Risk Assessment. A Health Risk Assessment (HRA) (MBA 2012) was completed for the project primarily prepared for human health risks associated with airborne hazards. An HRA is a guide that helps to determine if current or future exposure to a chemical or substance could affect the health of a population. The State of California Office of Environmental Health Hazard Assessment (OEHHA) develops methods for conducting health risk assessments. As defined under the Air Toxics “Hotspots” Information and Assessment Act of 1987 [“AB 2588” (Chapter 1252, Statutes of 1987), California Health and Safety Code Section 44306], “A health risk assessment means a detailed comprehensive analysis prepared pursuant to Section 44361 to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure” (Office of Environmental Health Hazard Assessment 1987).

The HRA of toxic air contaminants builds upon the assessment methodology described above but requires one additional step beyond that for *assessment* of the local pollutants. This step involves applying a risk characterization model to the results from the air dispersion model to estimate potential health risks at each sensitive receptor location.

Table 4 in the HRA (MBA 2012) provides a discussion on the air pollutants that could potentially be present as a result of the construction and/or operation of the proposed facilities and the most relevant effects from pollutant exposure to humans. No standards for impacts to wildlife have been established. Since air is not stationary, there is a potential that air quality concerns associated with the project will not be confined to the project site itself and thus would disperse into “wildland” areas. The primary wind direction near the project site is to the southeast, as shown in Exhibit 5 in the HRA (MBA 2012). The wind direction would send any air hazards toward the Badlands MSHCP Criteria Cells and points to the east across Gilman Springs Road.

Health risks within the context of this analysis are represented as the increase in cancer risk associated with exposure to diesel particulate matter emissions from project operations. These diesel particulate matter emissions arise from both exhaust and idling of diesel trucks while operating on and near the project site. The methodology applied in calculating cancer risk from diesel particulate matter has been published by the SCAQMD and the California OEHHA.

The methodology basically assumes that a person is exposed continuously to a project’s emissions for a period of 350 days per year, 24 hours per day over a 70-year lifetime period. In this regard, cancer risk is expressed as the probability of an individual developing cancer due to exposure to diesel particulate matter emissions at the above-referenced durations from the project, out of a population of 1 million individuals. Thus, a receptor calculated to have a cancer risk of 1 in one million means that this receptor has a probability of 1 in 1 million of developing cancer from the continuous exposure to diesel particulate matter. The SCAQMD has established a significance threshold of 10 in 1 million for cancer risk attributable to exposure to a project’s emissions. No such threshold exists for wildlife and a number of factors vary from the criteria established for human populations. The average

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

life of migratory waterfowl ranges from 10 to 20 years. This might represent the most long-lived of the species in the vicinity of the project site. These species are also not present year round and may spend as little as 100 days in the project area on the SJWA.

Specific Plan Design Features. The Specific Plan requires a 250-foot development setback and an additional 150-foot building setback along the southern boundary of project development and the CDFW Conservation Buffer Area. In addition, the Specific Plan calls for native landscaping in the setback area and a wall along the north side of the 250-foot setback zone. The separation between planned development along the east side of Gilman Springs Road will be set back from the roadway. This setback, plus the width of the roadway and related shoulder areas, will be sufficient to separate the proposed project from the MSHCP criteria cell areas east of Gilman Springs Road, so no additional setback is needed in that area.

Mitigation Measures. The following measures are proposed to mitigate potential direct and indirect impacts to listed species due to the project's proximity to the SJWA site, even with the presence of the CDFW Conservation Buffer Area:

~~4.4.6.1A~~ All development projects on lots adjacent to the CDFW property shall provide a minimum 250-foot setback between the CDFW property line and any building or vehicular circulation area (excluding emergency access drives). Permitted uses within or adjacent to this setback area include landscaping, drainage and water quality facilities, fences and walls, maintenance access drives, and similar related uses. Prior to issuance of any discretionary permit in the WLCSP for development adjacent to the CDFW Conservation Buffer Area, development plans shall establish a minimum 250-foot clear setback along the southern property line of the WLC Specific Plan, both east and west of the SDG&E natural gas compressor plant. For the purposes of this measure, the term "clear" shall refer to all existing or future roads, industrial buildings or related improvements, walls, truck travel areas, etc. The only allowed uses within the 250-foot setback area are landscaping per the WLCSP, drainage or water quality basins, or relocation of any impacted plant or animal species from development areas within the Specific Plan. In addition, development plans shall also establish a minimum 150-foot setback from the north edge of the clear zone to the closest logistics warehouse building. This will provide a total minimum building setback of 400 feet from the northern edge of the CDFW Conservation Buffer Area to new warehouse buildings within the Specific Plan.

~~Development adjacent to the 250-foot open space setback shall have a minimum six-foot tall chain link fence to help separate warehouse activity from the buffer area. Any chain link fencing installed on any properties adjacent to the 250-foot buffer area shall have metal mesh installed below and above ground level to prevent animals from accessing new development areas. In addition, all truck activity areas within 750 feet of the southern boundary of the site shall be enclosed by minimum 11-foot tall solid block walls to help reduce noise and lighting impacts on the CDFW Conservation Area to the south. This measure shall be implemented to the satisfaction of the City Planning Division.~~

~~A landscape plan for the 250-foot setback area shall be submitted with any development proposal for lots adjacent to the CDFW property. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the Specific Plan. No plant species listed in Section 6.1.4 of the MSHCP shall be installed within the setback area. In conjunction with development adjacent to the CDFW Conservation Buffer Area, cottonwood trees shall be planted along the southern boundary of the 250-foot "clear" setback zone, consistent with the WLCSP landscaping plan and plant palette. This~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~measure shall be implemented to the satisfaction of the City Planning Division in consultation with the SJWA Manager.~~

4.4.6.1A All Plot Plan applications within Planning Areas 10 and 12 (i.e. adjacent to the San Jacinto Wildlife Area as shown in Final EIR Volume 2 Figure 4.1.6B) shall provide a 250-foot setback from the southerly property line. Permitted uses within this setback area include landscaping, drainage and water quality facilities, fences and walls, utilities and utility structures, maintenance access drives, and similar related uses. No logistics buildings or truck access/parking/maneuvering facilities are permitted in this setback area.

In addition, logistics buildings within Planning Areas 10 and 12 may not be located within 400 feet of the southerly property line. All development proposals in Planning Areas 10 and 12 shall include a minimum six-foot tall chain link fence or similar barrier to separate warehouse activity from the setback area. This fence/barrier shall have metal mesh installed below and above ground level to prevent animals from moving between the development area and the setback area.

Within Planning Areas 10 and 12, all truck activity areas adjacent to the 250-foot buffer area along the southern property line shall be enclosed by minimum 11-foot tall solid walls to reduce noise and lighting impacts on the adjacent property. This measure shall be implemented to the satisfaction of the Planning Official.

A preliminary landscape plan for the 250-foot setback area shall be submitted with all Plot Plan applications for lots adjacent to the California Department of Fish and Wildlife property. Precise landscape plans shall be submitted with any grading permit for said lots and must be approved prior to the issuance of any building permit on said lots. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the World Logistics Center Specific Plan. No plant species listed in Section 6.1.4 of the Western Riverside County Multiple Species Habitat Conservation Plan shall be installed within the setback area. Cottonwood trees shall be planted within the setback area consistent with the World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development Division Manager.

~~**4.4.6.1B** Prior to the approval of a Plot Plan for any development project, the applicant shall submit a biological assessment prepared by a qualified biologist surveying the project site for any non-covered MSHCP listed or sensitive species of plant or animal. If any such species are found, appropriate conditions shall be added to any project approval to address the treatment of such species. This measure shall be implemented to the satisfaction of the City Planning Division.~~

4.4.6.1B Each Plot Plan application in Planning Areas 10 and 12 shall provide runoff management and water quality facilities adequate to minimize downstream erosion, maintain water quality standards and retain pre-development flows in a manner meeting the approval of the City Engineer. All drainage improvements shall be designed to minimize runoff and erosional impacts on adjacent property. This measure shall be implemented to the satisfaction of the Land Development Division Manager of Public Works.

~~**4.4.6.1C** Any development projects on lots adjacent to the CDFW property shall provide runoff management and water quality facilities adequate to minimize downstream erosion, maintain water quality standards and retain pre-development flows in a manner meeting the approval of the City Engineer, in consultation with the City Planning Department. Prior~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~to issuance of any discretionary approvals in the WLCSP, the project developer shall demonstrate whether any detention facilities for their development area are needed in the 250-foot setback identified in Mitigation Measure 4.4.6.1A. No project developer shall install plant species listed in Section 6.1.4 of the MSHCP. Any drainage improvements constructed within this setback shall be designed to minimize runoff and erosional impacts on the SJWA land to the south, to the extent practical. This measure shall be implemented to the satisfaction of the City Planning Division.~~

The 250-foot setback identified in **Mitigation Measure 4.4.6.1A**, and the presence of the CDFW Conservation Buffer Area, will effectively mitigate potential indirect impacts of air pollutants, including diesel particulate matter, on wildlife within the SJWA. Compliance with the off-site lighting guidelines of the Specific Plan, compliance with the night lighting standards in Section 9.08.100 of the City Municipal Code, and implementation of Aesthetics **Mitigation Measure 4.1.6.4B** ~~(low pressure sodium lights on south sides of buildings facing SJWA)~~**4A** will help reduce lighting impacts on the SJWA to less than significant levels. In addition, Aesthetics **Mitigation Measure 4.1.6.1E** (painting the south sides of buildings facing the SJWA green) will help soften the appearance of buildings that face the SJWA, and Agricultural **Mitigation Measure 4.2.6.1A** (right to farm ordinance) will help maintain raptor and other bird foraging until the WLCSP property is developed.

In addition, **Mitigation Measure 4.4.6.2A** will help assure that potential impacts to listed or sensitive plant species remain at less than significant levels.

Level of Impact After Mitigation. Compliance with the Specific Plan, Municipal Code, and implementation of the recommended **Mitigation Measures 4.4.6.1A through and 4.4.6.1C1B** will help reduce project impacts to listed species to less than significant levels.

4.4.6.2 Adopted Habitat Conservation Plans

Impact 4.4.6.2: *Implementation of the project may conflict with portions of the MSHCP for Western Riverside County.*

Threshold	Would the proposed project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?
-----------	--

The project site is subject to the provisions of two HCPs: the SKR HCP and the MSHCP. Impacts related to these HCPs are discussed in this section.

a. Stephens' Kangaroo Rat Habitat Conservation Plan

The project site is within the SKR HCP Fee Area. The SKR is relatively widespread throughout the SKR HCP Fee Area, but the main blocks of occupied habitat are concentrated in several Core Areas that must be conserved. The proposed project site is not within an SKR Core Area. The SKR also requires species-specific monitoring and management to ensure its long-term viability in the SKR HCP, including tracking population densities and maintaining sparse, open grassland habitats.

The long-term SKR HCP provides Take Authorization for the SKR within its boundaries. The core reserves established by the SKR HCP will be managed as part of the MSHCP Conservation Area consistent with the provisions of the SKR HCP. Focused surveys for Stephens' kangaroo rat will not be required for this project because the project lies within the SKR Fee Area; therefore, no requirements under the SKR HCP other than payment of a local mitigation fee are required.

b. Summary of Western Riverside County Multiple Species Habitat Conservation Plan Impacts

The project area is located within the Reche Canyon/Badlands Area of the MSHCP. Development of the project area would not conflict with the conservation goals established by the MSHCP for Cell Group X or Cell Group E. In addition, no conflict from development would occur in relation to the Reche Canyon/Badlands Area Plan, the Area Plan Subunit 4, the Area Plan Subunit 3, Proposed Core 3, or Existing Core H.

The WLCSP and the proposed offsite facilities occur immediately adjacent and within the vicinity of Core H and proposed Core 3. RCA staff commented that they believed any increase in truck traffic associated with the proposed project along Gilman Springs Road could significantly affect wildlife movement between Core H and proposed Core 3 and requested mitigation to offset those impacts. However, the appropriate mitigation for increased traffic on Gilman Springs Road is payment of the project's fair share of the improvements to Gilman Springs Road, including provisions for wildlife movement or crossings. The design and improvement of Gilman Springs Road is a County project that is not under the control of the project applicant.

No development is proposed within the portion of the project area that lies within Cell Group D and the SJWA. This area is already owned by the State and managed by the CDFW. However, development that will be adjacent to the SJWA property may cause significant indirect impacts to species within the SJWA, which will require mitigation (i.e., designing an appropriate buffer along this “urban edge” will help minimize potential impacts on the SJWA).

The project area is not adjacent to any Cores or Linkages identified in the MSHCP. However, it is adjacent to the SJWA and is subject to the project guidelines provided in MSHCP Section 6.1.4 (Guidelines Pertaining to the Urban/Wildlands Interface). The project is also required to adhere to the Best Management Practices (BMPs) found in Appendix C of the MSHCP.

The project does not propose to alter land use in any way that would adversely affect Cores, Linkages, or Reserve Assembly within the Reche Canyon/Badlands Area Plan.

The project is not located within any Amphibian, Mammalian, or Special Linkage Areas identified by the MSHCP. The project is in an area requiring burrowing owl surveys, is within the MSHCP Criteria Area Species Survey Area (CASSA), and is within the Narrow Endemic Plant Species Survey Area (NEPSSA).

The MSHCP and its Implementation Agreement contain a fee mitigation program pursuant to which local agencies collect development impact fees and remit such fees to the Riverside Conservation Authority (RCA). These fees are in turn used to acquire lands that are suitable for habitat preservation for species covered by the MSHCP. Payment of the local MSHCP mitigation fee will be required of the project prior to the issuance of building permits.

From available information, potential indirect impacts to avian and other biological resources within Mystic Lake and the SJWA will be reduced to less than significant levels by the creation of a 250-foot on-site setback or buffer area in **Mitigation Measure 4.4.6.1A**, which will be in addition to the existing setback provided by the CDFW Conservation Buffer Area just south of the proposed development area.

Participation in the MSHCP and contribution of MSHCP provides compensation for the loss of raptor foraging habitat due to approved projects. Typically, a project proponent would participate as outlined

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

in the MSHCP, so that loss of raptor foraging habitat is typically considered to be less than significant and no mitigation is required.

Narrow Endemic Plant Species. No Narrow Endemic plant species are anticipated to occur in the project area, but compliance with Mitigation Measure 4.4.6.2A will assure there will be no significant impacts to these plant species, and no additional action is required.

Criteria Area Plant Species. No Criteria Area plant species are anticipated to occur on the project area, but compliance with Mitigation Measure 4.4.6.2A will assure there will be no significant impacts to these plant species, and no additional action is required.

Riparian/Riverine Areas and Vernal Pools. ~~A single catch basin and portions of Drainage Features 7 and 8, 9, 12, and 15 contain riparian plant species and are hence considered riparian/riverine areas, as designated by the MSHCP. The project area does not contain habitat suitable for covered riparian species, such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. No vernal pools or ephemeral ponds were observed on the project area and no suitable habitat for any fairy shrimp species was identified on site. No additional mitigation regarding vernal pools or vernal pool species is required. A programmatic-level DBESP was prepared by MBA in 2013 to outline specific requirements for project related impacts to these features in the future. A project-specific DBESP will be required during each development project.~~

c. Nitrogen Deposition

Nitrogen deposition is the term used to describe nitrogen-based pollutants that are deposited as a result of emissions from future project related activities. The pollutants are typically in the form of nitrogen oxide (NO_x) and ammonia (NH₃)-derived pollutants, primarily nitric acid (HNO₃). Although there are many types of nitrogen-based pollutants resulting from project-related emissions, HNO₃ is typically the easiest to measure and is used in determining nitrogen deposition rates. Mechanisms by which nitrogen deposition can lead to impacts on sensitive species include (1) direct toxicity, (2) changes in species composition among native plants, and (3) enhancement of invasive species (Fenn et al. 2003; Weiss 2006a). Direct toxicity refers to impacts associated with direct contact with the nitrogen pollutants. There is no scientific documentation that links direct toxicity to impacts associated with sensitive plant and wildlife species. Therefore, direct toxicity is not considered a significant impact.

An increase in available nitrogen promotes the growth of non-native weedy species, which alone is not considered a significant impact. The increased dominance and growth of invasive annual grasses is especially prevalent in low-biomass vegetation communities that are naturally nitrogen-limited, such vegetation communities that occur in the project vicinity include coastal sage scrub and vernal pools (Weiss 2006a). An increase in nitrogen deposition does not inhibit the growth of native plants, but promotes the rapid growth of non-native invasive species that could out-compete native plants for available water and nutrients. If the increase of non-native plant species is detrimental to the growth of native plants, the result may be a conversion from a native plant community to a non-native plant community. This change in habitat is only considered a significant impact if that change occurs in suitable habitat for a federally threatened or endangered species within USFWS-designated critical habitat.

In addition, vernal pools were identified by Weiss (2006a) as a California ecosystem that may be sensitive to nitrogen deposition. Nitrogen deposition in vernal pools stimulates plant growth (including non-native species in adjacent uplands) and the nitrogen is rapidly assimilated by plants and

invertebrates within the pools (biomass and dissolved organic nitrogen) (Hobson and Dahlgren 1998). Because of the isolated nature of vernal pools, the nitrogen pollutants accumulate over time and provide a more concentrated level of nitrogen for non-native plants. Since vernal pools are known to provide suitable habitat for a number of federally threatened or endangered species, impacts to vernal pools caused by nitrogen deposition may be considered a significant impact. There are no vernal pools within the project site.

Although non-native plant invasions have affected the vernal pools in the region (the closest recorded occurrence of vernal pool habitat is approximately 3.5 miles to the south), these invasions generally occur in years when precipitation is sparse. In wetter years, the number of non-native plants is reduced since the non-native upland species are intolerant of inundation and the invasion cycle may be reset in some cases. This means that the established non-native plants are not adaptable to an aquatic habitat and die-off during prolonged periods of inundation. Even though the non-native plant species will have an abundance of available nitrogen and optimum growing conditions, the prolonged inundation periods prohibit non-native invasive species growth.

The WLC will consist of mobile, non-point pollution sources (diesel trucks), which will result in a highly random dispersion of emissions that will occur in a broad, regional fashion. Because of the way in which nitrogen is generated by the WLC project, its overall patterns for dispersion, and the multi-variant parameters that would need to be taken into consideration for such an analysis, there is no established scientific basis or standards to study the effects of nitrogen dispersion for non-point pollution sources; hence, project-specific conclusions or mitigation would be overly speculative for the purposes of this EIR.

Specific Plan Design Features. The project is consistent with the major MSHCP requirements relative to core areas, criteria cells, threatened and endangered species. In addition, the project complies with the MSHCP guidelines for urban/wildland interface, riparian/riverine areas, or related buffers (with implementation of **Mitigation Measure 4.4.6.1A**). In addition, future development will be required to demonstrate that it is also consistent with all MSHCP requirements, including indirect impacts such as lighting, noise, and air pollution effects.

Regulatory Compliance. Stephens' kangaroo rats have a low potential to occur within the study area. While the study area is not within the SKR Core Reserve Area, the SKR HCP Implementing Agreement requires payment for loss of habitat within defined areas. The entire study area lies within the fee area. An assessment of individual actions for development within the WLCSP would be required prior to any implementation. The number of acres of disturbance associated with the development and any off-site improvements shall require payment to comply with the SKR HCP. In addition, prior to issuance of a grading permit on each project, applicants will be required to pay the mandatory mitigation fee for the MSHCP. The mitigation fee is a per unitacre fee based on a percubic feet fee based on commercial or industrial development.

Mitigation Measures. In addition to payment of SKR and MSHCP impact fees, the following measures will help ensure that potential impacts to sensitive species are reduced to less than significant levels:

~~**4.4.6.2A** Prior to the approval of any Plot Plans for development within the project area, the applicant shall submit a biological assessment of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, or thread-leaved brodiaea) are present on the proposed development site. If plants are found in the proposed development area, they~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

may be relocated to the 250-foot clear setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, an appropriate impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species on the WLC project site. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the County RCA.

4.4.6.2A Each Plot Plan application shall include a focused plant survey of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter’s goldfields, smooth tarplant, Plummer’s mariposa lily, or thread-leaved brodiaea) are present. If any of the listed plants are found, they may be relocated to the 250-foot setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, at the applicant’s discretion, an impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species. This measure shall be implemented to the satisfaction of the Planning Official.

~~**4.4.6.2B** Prior to the approval of any tentative maps for development within the WLCSP, the applicant shall conduct a Joint Project Review (JPR) with the Resource Conservation Agency (RCA). All cell groups shall be provided on tentative maps, and an application shall be completed and processed by the applicant.~~

4.4.6.2B Prior to the approval of any tentative maps for development including or adjacent to any Criteria Cells identified in the Western Riverside County Multiple Species Habitat Conservation Plan, the applicant shall prepare and process a Joint Project Review (JPR) with the Riverside County Resource Conservation Agency (RCA). All criteria cells shall be identified on all such tentative maps. This measure shall be implemented to the satisfaction of the City Planning Division and Riverside County Resource Conservation Agency (“RCA”).

In addition, the previously outlined **Mitigation Measures 4.4.6.1A through and 4.4.6.1C1B** will also help reduce potential direct and indirect impacts to biological resources covered by the MSHCP.

Level of Impact After Mitigation. With implementation of **Mitigation Measures 4.4.6.1A through, 4.4.6.1C and 1B, 4.4.6.2A, and 4.4.6.2B**, potential impacts related to MSHCP consistency will be reduced to less than significant levels.

4.4.6.3 Jurisdictional Delineation, Riparian Habitat or Other Sensitive Natural Communities

Impact 4.4.6.3: *The project has the potential to result in significant impacts to jurisdictional land, riparian habitat and sensitive natural communities and may require subsequent permits from various resource agencies.*

Threshold	<p><u>Would the proposed project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?</u></p> <p>Would the proposed project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and</p>
-----------	--

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Wildlife Service?

Drainages in the project area were investigated and delineated by MBA in March 2012 and updated in 2013. A total of 15 primary drainage features were identified during this survey and a number of sub-drainages or tributaries were also identified. Jurisdiction for each drainage and/or sub-drainage or tributary was evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by USACE and RWQCB, respectively; Porter Cologne as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by the CDFW.

All 15 drainage features identified in the 2013 document were assessed to determine the jurisdictional limits. Based on current conditions, two of the 15 features is subject to the jurisdiction of the USACE and/or RWQCB. In addition, no jurisdictional wetlands or isolated wetlands were identified. Drainage Features 1, 2, 4, 12, and 13 flow to the south and then southwest of the project area. These drainage features are contained in roadside ditches or otherwise sheet flow prior to leaving the project area.

Drainage Feature 12 and 15 are likely subject to USACE jurisdiction. However, if any portion of Drainage Features 12 and 15 are affected by WLC project construction activities or flood control improvements in the future, then regulatory permitting may be required.

There are two drainage features that are completely isolated, Drainage Features 3 and 14. Drainage Feature 3 is an isolated temporary water quality facility serving the new Skechers building. This feature was created in an existing upland area and will eventually be converted into an underground storm drainage system. The second feature (consisting of two small basins) was created in an upland area to contain polluted runoff from a now-abandoned cattle operation. The eastern feature (Feature 14) is dominated by non-native tree species and contains no native riparian habitat. The western feature contains a mix of non-native trees and native riparian habitat. There is no evidence of ponding and the basin is no longer in use. These basins no longer serve any water quality function and are therefore not considered to be isolated waters of the State under the Porter Cologne Act.

The remaining seven features flow to the south and eventually revert to sheet flow conditions before reaching the San Jacinto Wildlife Area. Each drainage feature was walked until neither an ordinary high water mark (OHWM) nor a clearly defined bed and bank feature was present and the drainage course reverted to sheet flow onto open land. There was no evidence of flows downstream of the drainage where the OHWM was no longer present. Therefore, these features are hydrologically and physically isolated from any downstream RPW or TNW. Surface flows from the project area will eventually be conveyed into the SJWA. The SJWA's system of ponded areas was surveyed to document any downstream connectivity to any RPW or TNW. Based on current site conditions, the water within the SJWA is completely contained within the ponded area system with a large overflow area that conveys flows over a spillway in the southwest corner of the facility. There is no evidence of active flows within the spillway channel and all upstream flows are likely maintained within the SJWA exclusive of major flood events (50- to 100-year floods).

The MBA 2013 report concludes that two of the drainages on the project site are under the jurisdiction of the USACE (Drainages 12 and 15), and several additional drainages are under the jurisdiction of the CDFW and RWQCB (Drainages 7, 8, 9, 12, and 15).

Riparian or riverine areas are lands that contain habitat dominated by trees, shrubs, and persistent emergents, which occur close to or depend upon soil moisture from a nearby water source; or areas with fresh water flowing during all or a portion of the year. Unvegetated drainages (ephemeral streams) may be included if alterations to that drainage have the potential to affect Covered Species and Conservation Areas.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~One catch basin and portions of Drainage Feature 7 and, 8, 9 on, 12, and 15 within~~ the WLC project are considered riparian/riverine areas, as defined by MSHCP. If impacts to any of these areas cannot be avoided, a DBESP report and relevant mitigation will be required by the RCA.

The project area does not contain habitat suitable for sensitive riparian species, such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. Additionally, no vernal pools or ephemeral ponds were observed on the project area and no suitable habitat for any fairy shrimp species was identified on site.

Raptor Foraging Habitat. The WLCSP and off-site facilities contain flat, open areas with sparse vegetation, which could be considered foraging habitat for some raptor species. Due to the regular, heavy disturbance associated with the various agricultural activities in the WLCSP and off-site facilities resulting in a rather limited prey base, and the limited size of the site in relation to the expansive foraging habitat in the near vicinity including both the CDFW Conservation Buffer Area and the SJWA, ~~LSSRALPSRA~~ and the extensive Badlands to the east, the foraging habitat on site is considered marginally suitable and an adverse but not significant impact to raptor foraging habitat is anticipated.

Project or Specific Plan Design Features. The WLCSP does not contain any design features related to riparian habitat or other sensitive natural communities.

NOTE: The following changes have been made in responses to Comments A-1-1 in Letter A-1 from the U.S. Army Corps of Engineers, and A-6-12 in Letter A-6 from the U.S. Fish and Wildlife Service and et. al.

Mitigation Measures. The ~~Jurisdictional Delineation (JD)~~ prepared for the project in ~~2012~~2013 is programmatic in nature because no specific development activity or building plans are proposed at this time. The 2012 JD determined the on-site drainages were not under the jurisdiction of the USACE, but one or more may be under the jurisdiction of the CDFW. Therefore, **Mitigation Measure 4.4.6.3A** will help ensure there will be no significant impacts to riparian areas associated with Waters of the U.S. or Waters of the State as a result of future development within the project.

In addition to the previously identified **Mitigation Measures 4.4.6.1A** through **4.4.6.1C**, the following measures have been identified to reduce the significance of potential impacts to riparian/riverine habitat:

~~**4.4.6.3A** Prior to the approval of any Plot Plans proposing development adjacent to any on-site drainage channels identified in the project programmatic Jurisdictional Delineation (MBA 2012), the developer shall retain a qualified biologist to prepare a site-specific jurisdictional delineation and submit it to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the development plan will not affect identified jurisdictional areas, no USACE permitting is required. However, permitting through the Regional Water Quality Control Board (RWQCB) and CDFW (i.e., Streambed Alteration Agreement) may still be required for this development.~~

~~The applicant shall consult with USACE, CDFW and RWQCB to establish the need for permits based on the results of the 2012 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions.~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~Any development adjacent to Drainage 9 shall be designed with the channel in its relatively natural condition, and shall provide a minimum 25-foot open space setback from the top of each bank. Any landscaping of this setback area shall use only native species to help protect resources residing within or traveling through these drainages between the SJWA and the Badlands, and to protect any riparian vegetation along this drainage. This measure shall be implemented to the satisfaction of the City Planning Division.~~

~~**4.4.6.3A** Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.~~

~~The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.~~

~~Mitigation will consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat will be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat will be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of Moreno Valley (MM BIO-2b and MM DBESP 1 through 3).~~

~~**4.4.6.3B** As an alternative to Mitigation Measure 4.3.6.3A, the project developer shall retain a qualified biologist to prepare a Determination of Biologically Equivalent or Superior Project (DBESP) relative to development along Drainage 9 in order to maximize protection or preservation of the drainage, otherwise the DBESP must demonstrate why protection or preservation is not possible. This measure shall be implemented to the~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~satisfaction of the City Planning Division in consultation with the County Resource Conservation Agency (RCA).~~

~~The DBESP shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the MSHCP as well as CDFW and USFWS guidelines. The DBESP shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of on-site preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at off-site or on-site locations.~~

4.4.6.3B As required by the Resource Conservation Agency (RCA), a program-level Determination of a Biological Equivalent or Superior Preservation (DBESP) for impacts to Riverine/Riparian habitat has been prepared and shall be approved by the Resource Conservation Agency prior to project approval. The Determination of a Biological Equivalent or Superior Preservation includes a general discussion of mitigation options for impacts to riverine/riparian areas as well as general location and size of the mitigation area and includes a monitoring program.

If impacts to riparian habitat within the World Logistics Center Specific Plan (WLCSP) cannot be avoided at the time of specific development, then a separate project-level Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared to identify project-specific impacts to riparian habitat and incorporate mitigation options identified in Mitigation Measure 4.4.6.3A.

A project-level Determination of a Biological Equivalent or Superior Preservation for each specific development shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the Western Riverside County Multiple species Habitat Conservation Plan (MSHCP). The project-level Determination of a Biological Equivalent or Superior Preservation shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of onsite preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at offsite or onsite locations. Therefore, mitigation required for compensation for impacts to riparian/ riverine areas will require a minimum of 1:1 mitigation ratio of riparian/riverine mitigation land.

As outlined in the WLC programmatic DBESP, erosion control improvements will be installed within Drainage 9 to reduce sediment transport, and additional riparian habitat will be enhanced within this drainage following the installation of the erosion control improvements (MM DBESP 4 and 5).

Note: The following Mitigation Measure has been added in response to Comment F-1-6 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society.

4.4.6.3C Prior to issuance of any grading permit for any offsite improvements that support development within the World Logistics Center Specific Plan, the developer shall retain a qualified biologist to prepare a jurisdictional delineation (JD) for any drainage channels affected by construction of the offsite improvements. This jurisdictional delineation shall be submitted to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the offsite improvements will not affect any identified jurisdictional areas, no United States Army Corps of Engineers permitting is required. However, permitting through the Regional Water Quality Control

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Board (RWQCB) and California Department of Fish and Wildlife (i.e., Streambed Alternation Agreement) may still be required for these improvements. The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife and Regional Water Quality Control Board to establish the need for permits based on the results of the 2012 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with any altered offsite drainages shall be in agreement with the permit conditions. Any landscaping associated with these offsite improvements shall use only native species to help protect biological resources residing within or traveling through these drainages per Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Table 6.1.2. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the U.S. Fish and Wildlife Service, U.S. Army Corps. of Engineers, and the California Department of Fish and Wildlife.

Level of Significance after Mitigation. With implementation of **Mitigation Measures 4.4.6.1A** through, ~~4.4.6.1C and 1B, 4.4.6.3A, and 4.4.6.3B~~**3A through 4.4.6.3C**, potential impacts to riparian habitat or other sensitive natural communities, including on-site drainages, will be reduced to less than significant levels.

4.4.6.4 Candidate, Non-listed Sensitive, or Special-Status Species

Impact 4.4.6.4: *The proposed project has the potential to affect the burrowing owl, designated “species of special concern” by the California Department of Fish and Wildlife.*

Threshold	Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
-----------	--

Critical Habitat. No USFWS designated Critical Habitat for any species is located within the project area; therefore, no further action with regard to Critical Habitat is necessary.

Los Angeles Pocket Mouse. Focused surveys for the LAPM were conducted in August 2005, June 2010, ~~and June 2012, and July 2013.~~ Suitable habitat was found within Drainage Feature 9, one of the main drainage features located in the eastern end of the project area. In its MSHCP Consistency Report, MBA concluded that LAPM is absent from the project area. However, the Specific Plan indicates this drainage will remain in its present natural condition, except for the southern end as it becomes the Street H channel and outlets to the SJWA land to the south. Extensive surveys were completed in 2005, 2010, ~~and 2012, and 2013,~~ which concluded that Los Angeles pocket mouse was not present. ~~However, to ensure that no impacts occur, Mitigation Measure 4.4.4.6E has been added below.~~

~~**Migratory or Nesting Birds.**~~ In addition, there is no suitable habitat between the known occurrence of Los Angeles pocket mouse and the WLCSP. The known populations of Los Angeles pocket mouse are located within the southern portion of the SJWA, which is more than 2 miles from the southern WLCSP boundary. The area between the known recorded occurrences of Los Angeles pocket mouse and the WLCSP is actively disked farmland. Therefore, there is no habitat connectivity between the known occurrences of Los Angeles pocket mouse and the WLCSP. However, to ensure that no impacts occur, Mitigation Measure 4.4.6.4E has been added below.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Migratory or Nesting Birds. The 2013 MBA report found the extensive agriculture plant communities in the WLCSP and offsite facilities provide suitable nesting habitat for ground-nesting avian species such as western meadowlark (*Sturnella neglecta*) and burrowing owl. Suitable habitat for shrub and tree nesting species such as red-tailed hawk, black phoebe (*Sayornis nigricans*), and house finch occur along the edges of existing development surrounding the WLCSP and offsite facilities as well as isolated, remnant patches of vegetation in undisturbed portions of the WLCSP and offsite facilities. Therefore, portions of the WLCSP and offsite facilities and immediately adjacent to the WLCSP and off-site facilities provide suitable nesting habitat for migratory birds protected under the MBTA and California Fish and Game Code.

The project area contains suitable nesting habitat for several tree-, shrub-, and ground-nesting avian species. Therefore, MBA recommends construction activities avoid the avian nesting season, from February to August, if possible. If construction activity must take place during the nesting season, a pre-construction nesting bird survey should be conducted prior to any ground disturbance activities. The survey can be conducted in conjunction with the pre-construction survey for burrowing owl.

If passerine birds are found to be nesting or if there is evidence of nesting behavior within 250 feet of the impact area, a 250-foot setback will be required around the nest where no vegetation disturbance will be permitted. For raptor species such as hawks and owls, this buffer should be expanded to 500 feet. A qualified biologist will be required to closely monitor nests until it is determined that they are no longer active, at which time construction activity in the vicinity of nests could continue. Construction activity may proceed within the buffer area at the discretion of the biological monitor.

Burrowing Owl. For those species that are not covered by the take and incidental take provisions of the MSHCP (e.g., burrowing owl), the MSHCP requirements dictate that further protective action be taken. While no burrowing owls were identified within the project's proposed area of disturbance, because suitable habitat is present within the project area for the burrowing owl and because the species is highly mobile, a potential exists that, at some future date prior to project development, this species may occupy the development sites. This is a potentially significant impact requiring mitigation.

All burrowing owl observations within the project site are associated with artificially created berms. The recorded sightings have been within a bank of an existing drainage feature, a berm within the recently constructed detention basin associated with the Skechers Building (Drainage 3), and a roadside berm just south of Alessandro Boulevard.

The proposed detention basins will be constructed with similar manufactured berms. Based on historic observations of burrowing owl within the project site, it is reasonable to assume that construction of similar berms will continue to provide optimum burrow habitat for resident burrowing owls.

In addition, since there have been no recorded occurrences of burrowing owl in the northern portion of the SJWA there is no concern for competition with other burrowing owls. It is reasonable to assume that the created detention basins will provide more than a sufficient amount of foraging habitat to support a single pair of burrowing owl. Since the southern 250-feet of the WLCSP will not contain any building development and construction activities will be restricted to detention basins and associated access roads, it would be more appropriate to include the buffer area in a deed restriction rather than a conservation easement.

Plant Survey Areas. The project limits are within MSHCP Survey Area 10 of the NEPSSA and MSHCP Survey Area 9 of the CASSA for plant species. The MSHCP requires that a habitat site assessment (HSA) be conducted for all proposed developments within Narrow Endemic Plant Species' (NEPSSAs) and Criteria Area Sensitive Plant Species' (CASSAs). The HSA for most

NEPSSA and CASSA plants must be done during a normal rainfall year and/rainy season. If it is determined during the HSA that suitable soils and/or growing conditions are present on site to support identified NEPSSA species, a focused plant survey is required during the plant species blooming period.

Habitat suitability of the site for NEPSSA and CASSA species is detailed in the General Biological Resources and MSHCP Compliance Report (EIR Appendix E). None of the species analyzed in the NEPSSA or CASSAs is anticipated to occur on the WLC project site. The implementation of the WLC project would not affect the habitat or result in a direct impact for any special status plant species.

Project or Specific Plan Design Features. The WLCSP does not contain any design features relative to sensitive species or birds, other than the landscape palette that contains all native and/or drought-tolerant plants that may be utilized by birds tolerant of human activity.

The following mitigation measures have been changed in response to Comments A-6-17 in Letter A-6 from the U.S. Fish and Wildlife Service, and Comment B-3-33 in Letter B-3 from the California Department of Fish and Wildlife.

Mitigation Measures. The following measures have been identified to reduce the significance of potential impacts to special status bird species:

Listed or Sensitive Species:

The previously identified **Mitigation Measures 4.4.6.1A** through **4.4.6.1D** will reduce potential impacts on listed or otherwise sensitive plant or animal species or critical habitat to less than significant levels, other than the following which are addressed with additional measures:

Migratory/Nesting Birds

4.4.6.4A Pursuant to the Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code (CFGC), site preparation activities (removal of trees and vegetation) shall be avoided during the nesting season of potentially occurring native and migratory bird species (generally February 1 to August 31). If site preparation activities must occur during the nesting season, a pre-activity field survey shall be conducted by a qualified biologist prior to issuance of grading permits for such development. The survey shall determine if active nests of species protected by the ~~MBTA~~Migratory Bird Treaty Act or ~~CFGC~~California Fish and Game Code are present in the construction zone. If active nests of these species are found, the developer shall establish an appropriate buffer zone with no grading or heavy equipment activity within of 500 feet from an active listed species or raptor nest, 300 feet from other sensitive or protected bird nests (non-listed), 250 feet from passerine birds, or 100 feet for sensitive or protected songbird nests. All construction activity within the vicinity of active nests must be conducted in the presence of a qualified biological monitor. Construction activity may encroach into the buffer area at the discretion of the biological monitor in consultation with CDFW. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, ~~Mitigation Measure~~mitigation measure 4.4.6.4B shall also apply. This measure shall be implemented to the satisfaction of the City Planning Division.

4.4.6.4B If it is determined that project-related grading or construction will affect nesting ~~special status avian~~migratory bird species, no grading or heavy equipment activity shall take place within the limits established in Mitigation Measure 4.4.6.4A until it has been determined by a qualified biologist that the nest/burrow is no longer active, and all

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

juveniles have fledged the nest/burrow. This measure shall be implemented to the satisfaction of the City Planning Division.

4.4.6.4C The loss of foraging habitat for golden eagle and white-tailed kite will be mitigated by payment of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) fee and the creation of a landscaped buffer area adjacent to the San Jacinto Wildlife Area property (SJWA). First, the payment of the Western Riverside County Multiple species Habitat Conservation Plan fee will be required on a project-by-project basis. Second, a 250-foot setback as described in Mitigation Measure 4.4.6.1A will be established within the World Logistics Center Specific Plan area. This area will reduce impacts to raptor species foraging in the adjacent San Jacinto Wildlife Area open space areas.

Burrowing Owl

~~4.4.6.4DC~~ Prior to issuance of any grading permits, a pre-construction clearance survey for burrowing owl shall be prepared and conducted by a qualified biologist and submitted to the City. This survey shall be required and conducted no more than thirty (30) days prior to initiation of any grading or ground disturbing activities within the project area.

In the event no burrowing owls are observed within the limits of ground disturbance, no further mitigation is required.

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the study disturbance area during the 30-day pre-construction survey, ~~consultation with the CDFW and USFWS shall take place and no construction activity shall take place within~~ maintain a 500-foot of an-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the California Department of Fish and Wildlife (CDFW) shall take place and an appropriate avoidance distance established. No disturbance to active burrows shall occur without appropriate permitting through the ~~MBTA~~ Migratory Bird Treaty Act and/or ~~CDFW~~ California Department of Fish and Wildlife.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the ~~CDFW and USFWS~~ California Department of Fish and Wildlife. A relocation plan may be required by California Department of Fish and Wildlife if active and/or passive relocation is necessary. The relocation plan will outline the basic process and provides options for avoidance and mitigation. Artificial burrows -may be constructed within the buffer area south of the World Logistics Center Specific Plan. Construction activity may occur within 500 feet of the ~~active nests~~ burrows at the discretion of the biological monitor in consultation with CDFW.

~~If active nests are identified in a development area, the nests shall be avoided or the owls actively or passively relocated to the 250-foot setback area in the southern portion of the Specific Plan site (see Mitigation Measure 4.4.6.1A). This setback area shall be considered a “conservation area” for burrowing owl or other species of animals or plants that need to be relocated from the portions of the WLCSP site to be developed. In the event no burrowing owls have been identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are~~

identified within the limits of ground disturbance, Mitigation Measure 4.4.6.4D shall apply. To avoid active nests adequately, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season. This measure shall be implemented to the satisfaction of the City Planning Division.

~~4.4.6.4D~~ If active burrowing owl burrows are detected outside the breeding season, passive and/or active relocation may be undertaken following consultation with and approval by the CDFW and/or USFWS. The installation of one-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and back filled to ensure that animals do not re-enter the holes/dens. Owls may also be actively relocated on site to the 250-foot clear buffer zone along the southern boundary of the WLCSP, as outlined in Mitigation Measure 4.4.6.1A. This measure shall be implemented to the satisfaction of the City Planning Division.

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot buffer area or other suitable on-site or off-site areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor

Los Angeles Pocket Mouse

4.4.6.4E Prior to the approval of any Plot Plans proposing the development of land including or adjacent to Drainage 9, a protocol survey for the Los Angeles Pocket Mouse (LAPM), including 100 feet upstream and downstream of the affected reach shall be prepared by a qualified biologist and submitted to the City. If the affected drainage is not occupied, the area is considered not to be occupied and development can continue without further action. If the species is found within the specific survey area, no development shall occur until an appropriate mitigation fee is paid or appropriate amount of land set aside on the project site or off site to compensate for any loss of occupied LAPM Los Angeles Pocket Mouse habitat. Alternatively, individuals may be relocated to the 250-foot setback zone along the southern boundary of the property identified in Mitigation Measure 4.4.6.1A, or other appropriate areas as determined by the USWFS United States Fish and Wildlife Service. If necessary, this measure shall also be coordinated with Mitigation Measure 4.4.6.2B regarding preparation and processing of a DBESP report Determination of a Biological Equivalent or Superior Preservation report. This measure shall be implemented to the satisfaction of the City Planning Division.

Resource Management

4.4.6.4F Prior to approval of any discretionary permits for development ~~along the southern border of the WLCSP~~ within Planning Areas 10 and 12, a Biological Resource Management Plan (BRMP) shall be prepared to prescribe how the 250-foot ~~“safe zone”~~ setback area outlined in Mitigation Measure 4.4.6.1A will be ~~managed~~ developed and maintained ~~to provide a buffer and resources for wildlife of the adjacent SJWA~~. This plan will identify frequent and infrequent vegetation management requirements (i.e., removal of invasive plants) and the planting and maintaining trees along both the north and south sides of the detention

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~basins to provide roosting and nesting opportunities for raptors and other birds. The BRMP~~The Biological Resource Management Plan will also describe how relocation of listed or sensitive species will occur from other locations as outlined in Mitigation Measures 4.4.6.2A, 4.4.6.4D, and 4.4.6.4E.

~~Preparation and implementation of the BRMP~~The Biological Resource Management Plan shall be ~~to~~reviewed and approved by the satisfaction of the City Planning Division Official in consultation with the ~~SJWA San Jacinto Wildlife Area Manager. The BRMP~~The Biological Resource Management Plan shall cover all the land within the 250-foot setback zone ~~along the entire southern boundary of the WLCSP within Planning Areas 10 and 12~~Implementation of the plan shall be supervised by the Riverside Land Conservancy or a qualified conservation organization or biologist, to the satisfaction of the City Planning Division.

4.4.6.4G Mitigation Measure 4.4.6.1A specifies that a landscape plan shall be submitted with any development proposal for lots adjacent to the ~~CDFW~~California Department of Fish and Wildlife (CDFW) San Jacinto Wildlife Area (SJWA) property prior to issuance of a precise grading permit. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the Specific Plan. No plant species listed in Section 6.1.4 or Table 6.2 of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) shall be installed within the setback area. In conjunction with development adjacent to the ~~CDFW Conservation Buffer Area San Jacinto Wildlife Area (SJWA)~~, cottonwood trees shall be planted within along the southern boundary of the 250-foot “clear” setback zone area, consistent with the ~~WLCSP landscaping plan and World Logistics Center Specific Plan~~plant palette (per DBESP MM 8).

During construction, the runoff leaving construction areas will be directed to onsite detention basins and away from downstream drainage features located offsite. All projects within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (as outlined in MM 4.9.6.2B). Regarding the 250-foot setback area, pedestrian and vehicular access to areas of riparian/riverine habitat will be prohibited except for controlled maintenance access. Finally, no grading shall be permitted within conserved riparian/riverine habitat areas except for grading necessary to established or enhance habitat areas (DBESP MM 6, 7, 9, and 10).

4.4.6.4H As outlined in Mitigation Measure 4.4.6.1A, development adjacent to the 250-foot open space setback shall have a six-foot chain link fence or similar barrier to help separate human activity and the buffer area. Any chain link fencing installed on any properties adjacent to the 250-foot buffer area shall have metal mesh installed below and above ground level to prevent animals from accessing new development areas.

4.4.6.4I The individual property owner and/or Property Owners Association (POA) as appropriate shall be responsible for maintaining the various onsite landscaped areas, open improved or natural drainage channels, and detention or flood control basins in a manner that provide for fuel management and vector control pursuant to standards maintained by the City Fire Marshall and County Department of Environmental Health- Vector Control Group. This measure requires the individual owner or Property Owners Association (POA) to manage vegetation in and around these areas or improvements so as to not represent a fire hazard as defined by the City Fire Department through the substantial buildup of combustible materials. This measure also requires the individual owner or Property Owners Association to manage vegetation and standing water in drainage channels and basins such that they do not encourage or allow vectors to occur (primarily

rats and mosquitoes). Runoff shall not be allowed to stand in channels or basins for more than 72 hours without treatment or maintenance to prevent establishment of mosquitoes per published County vector control guidelines and “Best Management Practices for Mosquito Control on California State Properties” which is available from the California West Nile Virus website at <http://www.westnile.ca.gov/resources>. This measure shall be implemented by the Property Owners Association in consultation with the City Fire Department and Riverside County Department of Environmental Health – Vector Control Group.

4.4.6.4J A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the World Logistics Center Specific Plan adjacent to Western Riverside County Multiple Species Habitat Conservation Plan Conservation Areas. The Fuel Management Plan shall be prepared by the project proponent and submitted for approval to the prior to plot plan approval for those projects on the southern and eastern Western Riverside County Multiple Species Habitat Conservation Plan boundary. Per the Western Riverside County Multiple Species Habitat Conservation Plan guidelines, the Fuel Management Plan shall include the following:

- A plant palette of adequate plant species that may be planted within the Fuel Management Area, which will be approved by a biologist familiar with the plant requirements of the area.
- A list of non-native invasive plants that are prohibited from installation.
- Maintenance activities and a maintenance schedule.

Fuel modification zones shall be mapped and include an impact assessment as required under California Environmental Quality Act guidelines for a project-level analysis. The plan shall demonstrate that the adjacent Western Riverside County Multiple Species Habitat Conservation Plan Areas are adequately protected from expected fire risks.

4.4.6.4K Prior to approval of any plot plans for development adjacent to the SJWA, the applicant shall demonstrate that direct light rays have been contained within the development area, per requirements of the MSHCP Section 6.0 which states, “Night lighting shall be directed away from the MSHCP Conservation Area to protect species within the MSHCP Conservation Area from direct night lighting.” This measure shall be implemented to the satisfaction of the City Planning Division.

Level of Significance after Mitigation. Implementation of the above-listed mitigation measures would reduce impacts to burrowing owl, migratory bird species, and Los Angeles pocket mouse to less than significant levels.

4.4.7 Cumulative Impacts

The cumulative area for biological resources is the Western Riverside County MSHCP area. The MSHCP establishes a comprehensive, multi-jurisdictional program focused on the conservation of 146 species and their habitats in western Riverside County. As stated in its Conservation Element, the City reviews all public and private development and construction projects and other land use plans/activities within the MSHCP area to ensure compliance with the conservation criteria procedures and mitigation requirements set forth in the MSHCP. As a signatory to the MSHCP Implementing Agreement, the City has been issued “Take Authorization,” which allows the

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

implementation of land use decisions consistent with the MSHCP without individual authorization by State or Federal authorities. As required by the MSHCP, focused biological resource studies have been conducted to assess potential impacts associated with development of the proposed uses. Where impacts to special status bird species and jurisdictional areas have been identified, mitigation has been identified to reduce the project specific impacts to a less than significant level. Additionally, the MSHCP and its Implementation Agreement contain a fee mitigation program pursuant to which local agencies collect development impact fees and remit such fees to the RCA. These fees are in turn used to acquire lands which are suitable for habitat preservation for species covered by the MSHCP. In fact, habitat lands created by the MSHCP also have biological benefits for species technically not covered by the MSHCP, such as the burrowing owl. Habitat acquired by the MSHCP may be suitable as owl habitat. The latest adjustment of the MSHCP fee mitigation (July 1, 2009) allows the collection of fees of \$6,597 per acre of industrial development. The payment of required MSHCP is a standard requirement for all development occurring within the MSHCP area.

This EIR determined that indirect impacts of the project on the SJWA would be less than significant with mitigation, and the regional (cumulative) implications of the project can be addressed through the fee payment program of the MSHCP because it provides a regional and comprehensive approach to conservation planning. For example, future development that impacts Drainage 9 would be required to prepare a DBESP report consistent with MSHCP requirements. Through the implementation of the stated mitigation for project-specific impacts, and the payment of required MSHCP mitigation fees, no significant cumulative effect on biological resources would result from the development of the proposed uses with implementation of the identified program mitigation measures.

4.5 CULTURAL AND PALEONTOLOGICAL RESOURCES: TABLE OF CONTENTS

NOTE TO READERS. This section has been revised in response to public comments received on the Programmatic DEIR which have resulted in project changes, updates to technical studies, and revisions to DEIR sections and proposed Mitigation Measures.

4.5 CULTURAL AND PALEONTOLOGICAL RESOURCES

This section identifies and evaluates the potential of the proposed project to have adverse effects on archaeological, historical, and paleontological resources. The resources of concern include, but are not limited to, prehistoric and historic artifacts, burials, sites of religious or cultural significance to Native American groups, and historic structures. This section provides a detailed discussion of impacts potentially attributable to the proposed project, and criteria used to determine impact significance to cultural resources.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,948~~ 3,814 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately 70 percent of the area (~~2,740~~ 2,610 acres) for logistics warehousing (new LD and LL-LS zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the ~~2,740~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. ~~The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses~~

The analysis contained in this section is based on the following technical study prepared for the proposed project:

- Cultural Resources Assessment, Michael Brandman Associates, original dated April 12, 2012, updated September 2014 (Appendix F).

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- Copies of City correspondence illustrating City compliance with SB 18 tribal consultation requirements (Appendix A).

In addition to this technical study, the analysis contained in this section is also based on the following reference documents:

- Moreno Valley General Plan Conservation Element, adopted October, 2006.
- Moreno Valley General Plan Environmental Impact Report, certified July, 2006.

4.5.1 Existing Setting

4.5.1.1 Archaeological Resources

Archaeological resources are those associated with prehistoric cultural sites, prehistoric isolates, and the remnants of historic cultural sites that lack substantive building remnants (termed “historic archaeological sites”) such as roads and trails. Prehistoric cultural resources consist of those physical properties that predate the advent of written records in a particular region that are considered important to a culture, subculture, or community for scientific or humanistic reasons. These include geographic districts, structures, sites, objects, and other physical evidence of past human activity. Similar to prehistoric cultural resources, historic cultural resources in a particular geographic region are considered important to a culture, subculture, or community, and postdate the advent of written records. An archaeological records search was conducted through the Eastern Information Center (EIC) at the University of California, Riverside by the project archaeologist, Michael Brandman Associates (MBA).

The results of this records search indicated that the project site and surrounding area contain a number of Native American (NA) sites, mainly milling features and slicks associated with the uplands of the nearby Mount Russell Range. The area also contains several historic sites mainly remnant artifacts and foundations of historic homestead/farmstead buildings and/or ranch complexes.

4.5.1.2 Historic Resources

The following is excerpted and summarized from Viola Hamner’s “In the Beginning”, a history of life in Moreno Valley (Hamner 2003):

Our valley was once called San Jacinto Plains. It was so named because the land was considered a part of the huge Rancho San Jacinto, dating back to mission times. It has been described as part of the tableland that stretches between Box Springs and the San Jacinto Mountains, and between the Badlands and Temecula.

Great bands of sheep and herds of cattle from the rancho roamed our valley and munched the grasses and weeds. Indian made trails and camped near the hills. Just as new, the hills turned brown during the summer months and into the spring, the undisturbed land became a billowy lake of blossoms...

When the huge Alessandro Tract on the western part of our valley was recorded in August 1887, and the town of Alessandro was established, our valley became known as Alessandro Valley or Alessandro Plains. After 1890 when the town of Moreno was established, it became known as Moreno Valley as well as Alessandro Valley.

Then in 1890 appeared Frank E. Brown and his Bear Valley and Alessandro Development Company, coming in like a great wind, and in one big swoop, changed our valley forever... Brown and his partner Edward Judson, devised a plan to build a dam and transport water to their land from Big Bear Mountain. They then founded the successful colony of Redlands. They concluded that if they built the Bear Valley Dam higher, there would be enough water in the big reservoir to establish another colony in what is now Moreno Valley.

Brown and his investors bought and subdivided thousands of acres of land throughout the valley.

In April 1891, the precious Bear Valley water finally arrived. It traveled down the mountain and through pipelines, tunnels, and ditches for a distance of forty miles... With only a promise of water, the excited settlers started to improve their parcels.

For several years, there was great hope and planting activity in the valley. Then, in 1894, a series of misfortunes befell the valley, including several years of drought and a lack of irrigation water as a result of losing a water rights decision with Redlands. It turned out the Big Bear Dam had not been built large enough to handle drought conditions.

The drought continued and by 1898, Big Bear Lake was virtually dry. Depopulation of Moreno Valley began, and some settlers moved to nearby towns, taking their houses with them. An English writer described it as a "Valley on Wheels." Even the three-story Hotel de Moreno (at the corner of Alessandro Avenue and Redlands Boulevard). "Some businesses continued to operate in the town of Moreno. The General Store and Post Office continued on for over 100 years. The town may have withered, but it never died.

Over the years, other settlers who could afford it, dug their own wells and continued to raise citrus. In the spring, the sweet smell of orange blossoms gave delightful encouragement. Olives and other crops were planted, but most of the acreage in Moreno Valley was filled with "amber fields of grain." The dry-land farming had only the winter rains to sustain them.

The author then refers to the "second coming or the second spurt of development. This began with the subdivision of the Sunnymead Orchard Tract in 1912, the establishment of Alessandro Flying Field (March Field) in 1918, and the subdivision of the Edgemont Tract in 1923."

Finally, the author refers to the "third coming when huge parcels of open land were turned into housing tracts, starting in the 1960's, resulting in an explosion of population. The city of Moreno Valley was founded in November 1984. It encompassed the Moreno, Sunnymead, and Edgemont areas. It became the 20th City in Riverside County and the second largest in population at that time."

4.5.1.3 Paleontological Resources

The project site is located at the northern end of the Peninsular Range Geomorphic Province California Geologic Survey (2002), a 900-mile long northwest-southeast trending structural block that extends from the tip of Baja California to the Transverse Ranges and includes the Los Angeles Basin. This region is characterized by a series of mountain ranges separated by northwest-trending valleys sub-parallel to faults branching from the San Andreas Fault. The trend of topography is similar to that of the Coast Ranges Geomorphic Province located to the north, but the geology is more like that of the Sierra Nevada, with granitic rock intruding on the older metamorphic rocks. It contains extensive pre-Cretaceous (greater than 65 million years ago) igneous and metamorphic rocks covered by limited exposures of post-Cretaceous sedimentary deposits.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Specifically, the project site is located on the Perris Block, which extends from the southern foot of the San Gabriel and San Bernardino Mountains southeast to the vicinity of Bachelor Mountain and Poly Butte. It is bounded on the southwest by the Elsinore Fault Zone and on the northeast by the San Jacinto Fault. The surface of the Perris Block consists of granitic exposures that have been tectonically tilted eastward, leaving granitic outcrops elevated and exposed on the west side of the Perris Block (Jurupa Hills) and allowing Pleistocene sediments to cover the east side, filling the eastern San Bernardino, Lakeview, Perris, and San Jacinto Valleys.

The project site lies between the plutonic batholith of Mt. Russell, the San Jacinto fault zone and the Pliocene-era non-marine sedimentary rocks of The Badlands.¹ Within the project limits, Holocene alluvial sediments and isolated Pleistocene alluvial sediments have been mapped across much of the site, with a small outcrop of Cretaceous granitic bedrock on the surface in the southwestern portion of the site. It is possible that deposits of middle to late Pleistocene (300,000 to 10,000 years ago) alluvium are present just below the surface in isolated locations of the site, but there are no surface expressions of this older formation on the surface within the project site.

Artificial Fill. Artificial fill consists of sediments that have been removed from one location and transported to another by human activity. Artificial fill will sometimes contain modern debris such as asphalt, wood, bricks, concrete, metal, glass, plastic, and plant material. Artificial fill can contain fossils, but since these fossils have been removed from their original location, it is unlikely to contain in-situ fossils. Artificial fill can be found in isolated areas on the project site, mainly associated with former ranch/farm sites or existing residences and farms.

Holocene Alluvial Fan Deposits. Holocene Alluvial Fan Deposits are also known as Recent to Young Alluvial Fan Deposits. They are found at the mouths of canyons or along the sides of hills that flank river and stream valleys (e.g., the Badlands to the east and northeast). They represent deposition by small streams that flow out of mountains and hills. They were deposited during the early to late Holocene and range in age from the recent to 10,000 years before the present. Although Holocene alluvium can contain remains of plants and animals, generally not enough time has passed for the remains to become fossilized. In addition, the remains are contemporaneous with modern species, and these remains are usually not considered to be significant. These deposits are too young to contain in-situ fossils and have low paleontological sensitivity; however, it should be noted that although an area may be mapped with younger alluvium on the surface, deposits of older alluvium are often encountered at shallow depths below the surface, and these older sediments can and do contain fossils.

Pleistocene Alluvial Fan Deposits. Pleistocene Alluvial Fan Deposits are also known as Old Alluvial Fan Deposits and Very Old Alluvial Fan Deposits. Like the Holocene Alluvial Fan Deposits described above, they are found at the mouths of canyons and along the sides of hills that flank river and stream valleys, they are older than the Holocene deposits. The Old Alluvial Fan Deposits were deposited during the late to middle Pleistocene (10,000–300,000 years ago) and the Very Old Alluvial Fan Deposits were deposited during the middle to Early Pleistocene (300,000–1.8 million years ago). Within the subsurface of the project area, sediments from the middle to late Pleistocene likely exist at depths (i.e., possibly as shallow as 5 feet). In addition, as early to middle Pleistocene alluvial sediments are mapped as occurring just to the east and west of the project area, it is also likely that these older sediments may be encountered as well. Fossils are known in similar Pleistocene deposits from excavations for roads, housing developments, and quarries within the Southern California area. These sediments have the potential to contain in-situ fossils and have a high paleontological sensitivity.

¹ *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

Heterogeneous Granitic Rocks. Heterogeneous mixtures of granitic rocks contain some metamorphic rocks such as schist and gneiss. Granitic rocks range in composition from hornblende-rich quartz diorite to leucocratic tonalite and from potassium feldspar-free rocks to granodiorite and quartz diorite. Because of its igneous origin, granitic rocks do not contain paleontological resources. Surface bedrock deposits are found in the upland areas near the southwest portion of the project site, associated with the Mount Russell Range surrounding Lake Perris.

Summary. A paleontological locality search indicated that there was a low potential for significant paleontological resources to be encountered by construction excavation on the project site at the depths planned for the project, although it is possible that Pleistocene alluvial deposits, which have a higher potential to contain fossils, may be found in some locations during project grading.

4.5.1.4 Ethnographic Context

The Moreno Valley General Plan EIR states that the Luiseño and Cahuilla peoples occupied the region during the Late Prehistoric period. Unfortunately, there is a lack of definitive archaeological evidence linking the prehistoric site complexes located within the City limits of Moreno Valley to any single modern tribal group. It is likely that northern Luiseño and western Cahuilla peoples accessed this area during the late prehistoric period for resource gathering. Areas located at the base of Mt. Russell would have been a logical place for a trade route, as it would link prehistoric site complexes at the north end of the City with the marshy areas at the north end of the San Jacinto Valley. Serrano peoples may have also used the San Jacinto Valley to link with their more southern groups.

a. Cahuilla

The Cahuilla Indians occupied the San Timoteo valley prior to contact with Spanish Mission padres and military personnel, which places the project area near their traditional use areas. Of all the southern California Indians, the Cahuilla existed within the most geographically diverse region, constrained only by water supplies and topography. Currently, it is thought that a migration of Shoshonean peoples from the Great Basin occurred approximately 1,000 to 600 years ago, with populations moving into much of desert and coastal Southern California. Included among these migrants were the forbearers to the modern Cahuilla. The prehistoric Cahuilla were characterized by the occupation of sedentary villages in subsistence territories that permitted them to reach the majority of their resources within a day's walk. Villages were commonly located near reliable sources of water. During October to November, much of the village population moved to temporary camps in the mountains to harvest acorns and hunt game.

Inland groups also had fishing and gathering spots on the coast that they visited annually. In comparison with the Gabrielino and Luiseño, the Cahuilla appear to have had a lower population density and a less rigid social structure. The Cahuilla patterns may have been relatively stable until mission secularization in 1834, due to the policy of the Catholic Mission fathers or padres to maintain imported European traditional style settlement and economic patterns.

b. Luiseño

The Luiseño, belong to the Shoshonean linguistic family, which is also shared by Cahuilla, Gabrielino, and Serrano among others.¹ Luiseño villages could be found from the Pacific Ocean inland to the western base of the San Jacinto River and near Fallbrook. The villages were typically established near defined water and food sources and in good defensive locations, so these villages were commonly located along valley bottoms, streams, or coastal strands. The Luiseño characteristically

¹ *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

lived in sedentary villages, therefore one clan or family occupied several food-gathering locations and aggressively guarded these areas against other clans.

c. Serrano

The project area is considered to be in an area historically used by the Serrano. All indigenous groups adjacent to the eastern San Bernardino Mountains were decimated by the Spanish, but some Serrano survived for many years thereafter in the far eastern San Bernardino Mountains due to the ruggedness of the terrain and the dispersed population. It is believed Serrano families inhabited the *Guachama Ranchería* or *Politana* in the early 1800s. This village apparently housed the Rancho San Bernardino *estancia* after about 1819. Their range is generally thought to have been located in and east of the Cajon Pass area of the San Bernardino Mountains, north of Yucaipa, west of Twentynine Palms and south of Victorville. Like all prehistoric Californians, the range of this group was determined by reliable water sources. A Serrano village typically consisted of a collection of families centered about a ceremonial house, with individual families inhabiting willow-framed huts with tule thatching. Considered hunter-gatherers, the Serrano exhibited a sophisticated technology devoted to hunting small animals and gathering roots, tubers, and seeds of various kinds. Today, Serrano descendants are found mostly on the Morongo and San Manuel reservations.

4.5.1.5 Local History

a. Spanish Period (A.D. 1769 to 1821)

The earliest record of exploration of the Moreno Valley area is from the journal of Juan Bautista de Anza, a Spanish explorer who traveled from Mexico City through the San Jacinto Valley, passing by Mystic Lake and through the Moreno Valley area, on his way to Monterrey and San Francisco in 1774.

Father Junipero Serra was sent to Alta California to create a chain of Missions and Mission outposts to bring Christianity to the indigenous population, and create a foundation for colonization of the region. Located between the previously established presidios in Monterey and San Diego, Serra had military assistance in his quest and the San Bernardino area came under the early control of Spanish soldier Pedro Fages and Father Francisco Garces. In 1819, Rancho San Bernardino was established. This followed a decision by the heads of the mission system to expand their agricultural holdings into the interior and later establish a chain of additional Missions in the desert interior. A decision was made to create an *estancia*, or a ranch headquarters with a chapel that was occasionally visited by padres at the *Guachama Ranchería*. Work on the San Bernardino *Asistencia* was started about 1830, and it was not yet finished when the project was abandoned in 1834. The rancho traditions were kept once Mexico established control over the area, but without the original authority of the Mission padres.

b. Mexican Period (A.D. 1821 to 1848)

After years of internal fighting, Mexico achieved its independence from Spain in 1821 and Alta California became the northern frontier of the State of Mexico. The Mission padres were then forced to swear allegiance to Mexico in 1822. Secularization of the missions took place over the next decade and the former mission lands were transferred to the large Mexican families that had settled in the area. Affiliated with Mission San Luis Rey, the Rancho San Jacinto was formed on December 21, 1842 and granted to Jose Antonio Estudillo. This rancho provided Estudillo with twice as much land, 8 square leagues, or 46,080 acres, as he had petitioned for the previous August. Lands north of the modern Alessandro Boulevard were not claimed by any family, probably because little reliable water existed in the area, except for the Mystic Lake cienega, and because it was a two-day ride from the

closest Missions, San Gabriel, and San Luis Rey. The property was petitioned for division by Estudillo's brother-in-law Miguel de Pedrona, soon after and a small portion of The Badlands north of Hemet was added to form the Rancho San Jacinto Nuevo y Potrero.

There is historical evidence a road led from the Rancho San Jacinto headquarters northwest along the base of The Badlands to the springs in the Box Springs Mountains east of what is now Riverside, then over to roads near the Santa Ana River. The route, which likely followed the current alignment of Gilman Springs Road, has been used for travel for over 160 years. The primary purpose of the interior ranchos was to raise cattle and sheep; however, beyond the Mystic Lake *ciénega* west of Eden Hot Springs, little reliable water was found north of San Jacinto. The trail likely brought travelers along the base of Mt. Russell as this would shorten the trip to Box Springs. The upper San Jacinto Valley proved marginal in terms of food production for Native Americans, a factor that limited agricultural growth expansion well into the 1950s.

c. Moreno Valley Before 1893

Theodore Street was the eastern border of the old Bear Valley and Alessandro Development Company (BV&A) development. BV&A conceptualized the town of Moreno and the community of Alessandro in 1889. Frank Elwood Brown, an engineer who moved to California in 1876, was the co-founder with Hiram Edward Judson of the town of Redlands. In 1890, Brown and other investors formed the BV&A to "plat out new towns, bring Bear Valley water to the [Moreno] Valley, and open another large area to agricultural and town site development".¹ Brown and Judson began growing citrus in Redlands between 1878 and 1882 using meager local water supplies. Brown formed the Bear Valley Land and Water Company (BVLWC) in the early 1880s and constructed the Big Bear Dam in 1883. After successfully creating Big Bear Lake, at that time the largest man-made reservoir in the world, water began flowing from the dam through a series of flumes and canals to Redlands orchards in 1885. This demonstration led locals to believe that the area could be successfully irrigated using water brought in from the mountains to the north.

The potential for Big Bear Lake seemed enormous because the winters between 1875 and 1885 were some of the wettest winters on record. Brown assumed that the abundance of water stored in the reservoir in those years was typical and would continue as such. With little knowledge of precipitation fluctuations in southern California, water supplies appeared unlimited and Brown and others fostered grandiose schemes for attracting moneyed investors. Between 1889 and 1890, Brown began trading stocks from his own companies to develop land south of Redlands and consolidate his water rights. After organizing the BV&A in 1889, Brown and his associates bought all of the BVLWC stock individually. They then incorporated the Bear Valley Irrigation Company (BVIC), which bought all of the original BVLWC stock, including the dam, from the BV&A.²

Frank Brown hoped to duplicate the success of the City of Redlands, which by 1890 was a thriving commercial citrus center located along an established railroad right-of-way. Turning his attention to the valley south of Redlands, a 280-acre town site was named the Town of Moreno. Initially, the town was to have been named New Haven, after New Haven, Connecticut where many of the investors, including Brown, were from. However, to honor Brown, the name Moreno, which is the Spanish word for "brown," was chosen. North-south streets in the BV&A development in Moreno and Alessandro were named for the corporation leaders, while east-west streets were named for plant and tree species common in California at the time. Hopes were high that Moreno would prosper and local newspapers in 1891 declared that "Moreno will be a rail road town in the future [which has] every advantage of the most favored locality in Southern California and the disadvantages of none."

¹ *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012 [September 2014](#).

² *Ibid.*

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

In April 1891, it was estimated that between 1,500 and 2,000 people went to the new town site of Moreno to purchase town lots being sold at public auction. In the following eight months, a Congregational Church, four brick commercial buildings, a lumberyard, two brickyards, a cement pipe works, and a school were constructed with as many as “thirty houses being built at one time.”

By 1893, the Hotel de Moreno, three stories high and encompassing an entire city block, was operational and doing a brisk business with people needing a place to stay while developing their land. Investors interested in Moreno Valley land were from nearby locations, Los Angeles, San Diego, San Bernardino, and from as far away as Wisconsin, Pennsylvania, and New York. A map was created to show potential buyers what types of irrigation systems would be built and where the land was located.¹

d. Moreno Valley After 1893

Moreno had become a small boomtown with new businesses developing, and orchards and crops being planted on nearby fields. The success for both local businesses and the farmers depended on the availability and consistency of water. Although Brown had studied the feasibility of bringing water into the Valley and had initially been successful piping water from Bear Valley, by 1893 Brown and others realized that without a higher dam, the reservoir could not hold enough water to meet the irrigation needs of Redlands and Moreno. To worsen the situation for Moreno, Redlands was the town for whom the reservoir was initially built and therefore had first rights to the water. A legal suit won by Redlands in 1894, in effect permanently shut off the water to Moreno, although a local judge ordered that domestic water to Moreno homes must be reinstated.²

In addition to the lack of water, it is likely that the Recession (Panic) of 1893 forced many potential farmers in southern California to reconsider their options, and new farmers went out of business. The Panic was caused by railroad overbuilding and speculation, much of which was driven by westward expansion into California. According to several sources, over 15,000 businesses and 500 banks failed during this period, many of them in California. The Northern Pacific Railway, the Union Pacific Railroad, and the Atchison, Topeka & Santa Fe Railroad all failed. The resultant depression lasted for three years and farmers went bankrupt nationwide; good economic times did not resurface until about 1899. By that time, the speculative land boom in this part of Southern California was over.

The City remained a rural agricultural community for many decades, until after World War II. The expansion of the Federal freeway system and housing boom following the war led to the start of suburbanization in the Moreno Valley area that slowly converted agricultural land to new homes, shopping centers, etc. In the 1990s at one time, Moreno Valley was one of the fastest-growing communities in the nation. The older agriculture-oriented towns of Alessandro and Moreno gave way to suburban residential neighborhoods. By 2010, “Moreno” had suburban development to the west and agricultural fields to the east.

Alessandro Boulevard. In connection with the development of the Town of Moreno in the 1890s as part of the Bear Valley and Alessandro Development Company’s real estate venture, Alessandro Boulevard was constructed across much of the project site. The roadway has been in continuous use in largely its same location since that time. In 1988, the City adopted Resolution CPAB 88-2 recognizing the landmark status of this roadway and providing for the preservation of its 120-foot right-of-way through the City.

4.5.1.6 NOP/Scoping Comments

The Sierra Club expressed concern about how the project would affect Native American sites in this area, as well as the agricultural history of this area. In addition, Susan Nash provided information about the route that Juan Bautista de Anza took through the San Jacinto Valley and the project site on his travels from San Diego to points north. These comments are addressed in this section of the EIR.

4.5.2 Existing Policies and Regulations

4.5.2.1 Federal Regulations

National Historic Preservation Act (NHPA) of 1966 (as amended), Section 106. The NHPA declares a national policy of historic preservation to protect, rehabilitate, restore, and reuse districts, sites, buildings, structures, and objects significant in American architecture, history, archaeology, and culture. The NHPA established the National Register of Historic Places (National Register), State Historic Preservation Offices (SHPOs) and programs, and the Advisory Council on Historic Preservation. This Act applies to all properties on or eligible for inclusion in the National Register. The Section 106 review process requires consultation to mitigate damage to “historic properties” (defined per 36 CFR 800.16[1] as places that qualify for the National Register), including Native American traditional cultural places (TCPs). Evaluation of cultural resources consists of determining whether it is significant (i.e., whether it meets one or more of the criteria for listing in the National Register). These eligibility criteria are defined in 36 CFR 60.4 as follows:

The quality of significance in America history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association:

- A. That is associated with events that have made a significant contribution to the broad patterns of our history;
- B. That is associated with the lives of persons significant in our past;
- C. That embodies the distinctive characteristics of a type, period or method of construction, or that represents the work of a master, or possesses high artistic values, or that represents a significant and distinguishable entity whose components may lack individual distinction; and/or
- D. That has yielded, or may be likely to yield, information important to prehistory or history.

4.5.2.2 State Regulations

California Environmental Quality Act. An “historic resource” includes, but is not limited to, any object, building, site, area, place, record, or manuscript that is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California.¹ CEQA mandates that lead agencies consider a resource “historically significant” if it meets the criteria for listing in the California Register of Historic Resources (California Register). Such resources meet this requirement if they (1) are associated with events that have made a significant contribution to the broad patterns of California history, (2) are associated with the lives of important persons in the past, (3) embody distinctive characteristics of a type, period, region, or method of construction, and/or (4) represent the

¹ Public Resources Code, Section 5020.1(j).

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

work of an important creative individual or possesses high artistic value.¹ These criteria mimic the criteria utilized to determine eligibility for the National Register.

In addition, Public Resources Code Section 21083.2 and *CEQA Guidelines* Section 15064.5(f) recognize that historical or unique archaeological resources other than potential Native American burials may be accidentally discovered during project construction. This guideline recommends that immediate evaluation defined by qualified archaeologists be included in mitigation measures. This guideline also recommends that if the find is determined to be a historical or unique archaeological resource, that contingency funding and time allotments sufficient to allow for implementation and avoidance measures be available.

Senate Bill 18. Signed into law in September 2004, and effective March 1, 2005, SB 18 permits California Native American tribes recognized by the Native American Heritage Commission (NAHC) to hold conservation easements on terms mutually satisfactory to the tribe and the landowner. The term “California Native American tribe” is defined as “a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC.”

The bill also requires that, prior to the adoption or amendment of a city or county’s general plan, the city or county consult with California Native American tribes for the purpose of preserving specified places, features, and objects located within the city or county’s jurisdiction. SB 18 also applies to the adoption or amendment of specific plans. This bill requires the planning agency to refer to the California Native American tribes specified by the NAHC and to provide them with opportunities for involvement.

California Health and Safety Code. The California Health and Safety Code Section 7050.5 states that if human remains are discovered on site, no further disturbance shall occur until the County Coroner has made a determination of origin and disposition. If the Coroner determines that the remains are not subject to his or her authority and if the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the NAHC. This regulation is applicable to any project where ground disturbance would occur.

4.5.2.3 City of Moreno Valley General Plan Policies

The General Plan defines goals and policies related to cultural resources within the City of Moreno Valley. The Chapter 9 Goals and Policies section provides the following guidelines to City staff:

Objective 7.6: Identify and preserve Moreno Valley’s unique historical and archaeological resources for future generations.

Policies in Response to Objective 7.6:

- 7.6.1) Historical, cultural and archaeological resources shall be located and preserved, or mitigated consistent with their intrinsic value.
- 7.6.2) Implement appropriate mitigation measures to conserve cultural resources that are uncovered during excavation and construction activities.
- 7.6.3) Minimize damage to the integrity of historic structures when they are altered.
- 7.6.4) Encourage restoration and adaptive reuse of historical buildings worthy of preservation.

² Public Resources Code, Section 5024.1(c).

7.6.5) Encourage documentation of historic buildings when such buildings must be demolished.

To help define when a cultural resource becomes “significant” within the context of Moreno Valley history, a professional cultural resource manager must conduct an assessment with consideration of an appropriate threshold. Certain cultural resources will have an intrinsic value to the City. City policy suggests that significant cultural resources uncovered during project-related excavation and construction activities should be preserved and/or mitigated to the extent feasible consistent with their intrinsic value.

Prehistoric sites on Mount Russell are located within lands under the jurisdiction of the City and the County of Riverside are part of an unofficial prehistoric district known as the Wolfskill Ranch North Complex, and its general location has been published in the Moreno Valley General Plan Final EIR.¹ Page 5.10-14 of the Moreno Valley General Plan Final EIR notes that the North Complex is located on Open Space and that a project’s potential effect to all prehistoric cultural resources in the City, including those of the Wolfskill complex, is considered a significant impact.

4.5.3 Methodology

4.5.3.1 Phase 1 Research

a. Cultural Resource Assessment

Over the past ten years, a number of cultural resource assessments have been conducted on the project site and in surrounding areas. The following information summarizes the results of those surveys as described in Tables 1 and 2 from the Cultural Resources Assessment conducted for the project. There are 45 archaeological Native American and historical resource sites in the general area of the project, with most being milling features or slicks in the Mount Russell area.²

Table 4.5.A lists 11 sites were identified in the southwest portion of the project site, which is designated “Open Space” in the Specific Plan and will not be disturbed. These sites are all milling features associated with the Mount Russell Range and will not be affected by development of the project.

Table 4.5.A: Cultural Resources Identified in the Southwest Portion of the Project Site

CA-RIV-610	CA-RIV-3238	CA-RIV-3345	CA-RIV-8006
CA-RIV-860	CA-RIV-3343	CA-RIV-3346*	CA-RIV-8007**
CA-RIV-2993	CA-RIV-3344	CA-RIV-3347	

* Includes a midden.

** Renamed from CA-RIV-2775, 2776, and 2777.

It should be noted that the cultural assessments for the project do not show the specific locations of the cultural resource sites. This information is restricted from the public, and is considered confidential and protected under CEQA, to protect the resources from illegal or inappropriate damage or theft. The project’s Cultural Resources Assessment fulfills the requirements of CEQA as outlined in Section 4.5.6.2, *Significant Impacts*. (See, e.g. *Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200.)

¹ City of Moreno Valley General Plan EIR, 2006

² *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012 September 2014.

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

The project's cultural assessments also found five sites within the project area during previous excavations for the MWD pipeline (four sites) and the EMWD Gilman tunnel (the fifth site CA-RIV-6200) that will not be affected by development within the project:¹

- CA-RIV-6065 (P33-8168);
- CA-RIV-6066 (P33-8169);
- CA-RIV-6067 (P33-8170);
- CA-RIV-6068 (P33-8171); and
- CA-RIV-6200 (P33-8709).

All of these sites are buried prehistoric Native American artifacts found during trench work except CA-RIV-6200, which was a deeply buried hearth (21 feet below ground surface). All of these resources remain in their original locations and will not be disturbed by the development of the project.

Four (4) historic-era cultural resource sites were identified within the project site in areas that could be affected by development as outlined in Tables 1 and 2 from the project cultural assessment:²

- CA-RIV-4201H (historic foundation remnants and trash);
- CA-RIV-4210H (old farm location);
- CA-RIV-5862 (historic era 2-room farmhouse); and
- P33-11621 (historic farmstead in the open space area of the project).

CA-RIV-4201H consists of historic foundation remnants and historical trash (e.g., bottles, nails, and broken dishes) along Virginia Street. Old topographic maps and photographs show a historic farm complex here. This site was Phase 2 tested by MBA in 2011 and found to be not significant according to CEQA criteria. CA-RIV-4210H consists of a historic structure, foundations, and trash deposits. Old topographic maps and photographs show a farm complex at this location. The MBA report indicates this site was Phase II-tested and found to be not significant under CEQA. CA-RIV-5862 consists of a historic era two-room farm structure, but it is on MWD property and is not considered a significant cultural resource under CEQA. P33-11621 is a historic farmstead but is within the open space property in the southern portion of the project site and will not be directly affected by construction within the project.³

In addition, there are seven rural residential properties within the project site that may contain historic buildings or resources, but these are private property and MBA staff did not access them and no detailed assessment was conducted. The Specific Plan designates these properties as "Light Logistics" and they will eventually be developed. There is evidence that at least one structure located east of Redlands Boulevard and north of Brodiaea Avenue was built around 1900. These sites will be investigated in connection with any development proposals affecting these properties.

In November 1988, the Cultural Preservation Advisory Board (CPAB) of the City of Moreno Valley designated the entire length of Alessandro Boulevard as a City Historical Landmark (Resolution CPAB 88-2). At that time, the CPAB made the alignment, right-of-way, and name of Alessandro part of the historical designation. Alessandro Boulevard was first established in 1890 and over the years has served as a San Bernardino County Road, Riverside County Road, a California State Highway, part of the transcontinental U.S. Route 60, part of the "Jack Rabbit Trail," and a City boulevard

¹ Ibid.

² Ibid.

³ *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

(Hamner 2003). Resolution CPAB 88-2 was adopted to ensure the maintenance, enhancement, or protection of a street of historical significance. Over the years, various portions of Alessandro Boulevard have been modernized to enhance traffic flow throughout the City, but the original routing has remained unchanged.

4.5.3.2 Phase II Testing

Based on the results of Phase I survey work on a portion of project-related lands (i.e., plowed and vacant parcels) performed in August and September of 2005, Phase II testing of certain prehistoric cultural resources, located in the southwest portion of the site, was undertaken in the summer of 2006. A monitor representing the Soboba Band of Luiseño Indians was in attendance. Additional properties in the Specific Plan were surveyed in the summer and fall of 2007. The last pieces of agricultural land within the Specific Plan boundary were surveyed in July 2011. Known as the Lee Property, these exhibited two previously recorded historic-era cultural resources. MBA also re-located prehistoric archaeological site CA-RIV-3347 during the July 2011 survey. The Phase I surveys had revealed three historic-era cultural resource sites, ten prehistoric-era cultural resource sites, and six isolated artifacts located within the boundaries of the project, but not in areas planned for development within the Specific Plan. Each resource was recorded.

In early 2006, a subsurface significance-testing program (Phase II testing) on a series of nine prehistoric cultural resources located at the southwest portion of the project site was conducted to determine if these resources should be considered significant under CEQA. The Phase II-tested sites included:

- CA-RIV-610
- CA-RIV-860
- CA-RIV-3238
- CA-RIV-3343
- CA-RIV-3344
- CA-RIV-3345
- CA-RIV-3346
- CA-RIV-8006
- CA-RIV-8007

NOTE: The following changes have been made due to revision to the Specific Plan project size.

All of these sites are milling features, and CA-RIV-8006 and -8007 are milling slicks. The testing work revealed that only one of these sites exhibited evidence of intact subsurface cultural resources (CA-RIV-3346). For this reason, CA-RIV-3346 should be considered a significant cultural resource for the purposes of CEQA.¹ MBA also determined that the other eight prehistoric sites lacked additional subsurface resources.² The MBA report concluded that development of the Specific Plan would not impact the nine prehistoric sites, so no further research on these sites was recommended unless the project created proposed physical disturbance (grading) of these areas.³ The 74.3 acres of open space shown in the Specific Plan (previously referenced Figure 3.8) encompasses all of the nine prehistoric sites identified by MBA. Therefore, development under the project will not have a significant impact on archaeological resources.

Several buried and isolated prehistoric resources were detected during the monitoring phase of the Highland Fairview Corporate Park Project,⁴ located adjacent to the northern edge of the Specific Plan. Likewise, several buried sites adjacent to Davis Road were detected in connection with the 1998 Inland Feeder Project by MWD. Given previous finds in the project area, MBA concluded that certain portions of the project site have a “high” and “moderate” probability of containing significant

¹ Ibid.

² Ibid.

³ Ibid.

⁴ *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

buried cultural resources, while other areas of the project site have a “low” probability of containing significant buried cultural resources. The high probability areas are within 1,000 feet of the base of the southwestern foothills, while the moderate probability areas are within 2,000 feet of the same area.

4.5.3.3 Native American Consultation (SB 18)

MBA contacted the NAHC in March 2011 requesting a Sacred Lands File search for the project area in order to determine if there were records of cultural resources in the area. The response from the NAHC was received on March 25, 2011, indicating that no sacred lands or traditional cultural properties are known to the NAHC within the 3,814,714 acres of the project area, including the Specific Plan area, Conservation Areas, and Public Facilities. However, other cultural sites have been found in the uplands outside of the project area (i.e., Lake Perris National Recreation Area to the southwest and the San Jacinto Wildlife Area to the south).

Pursuant to SB 18, on February 29, 2012, MBA sent information-request letters to each of the 11 tribal entities identified by the NAHC (see previously referenced Table 2.C for a summary of the correspondence in this regard). In response, two tribes requested government-to-government consultation under SB 18 during the 90-day notification period (Pechanga and Soboba). The City met with the Pechanga Tribe on May 30, 2012, and with the Soboba Tribe on November 27, 2012. No other Native American entities requested a government-to-government consultation meeting. In addition, several tribes provided information to the City regarding cultural resources to be included in the EIR but did not include a consultation request.

4.5.3.4 Paleontological Contacts

MBA contacted Eric Scott of the Division of Geological Sciences of the San Bernardino County Museum on June 2005 requesting a paleontological records check of the original Moreno Highlands Specific Plan area. Mr. Scott’s paleontological review showed that the project area rests entirely on exposures of Holocene (Recent) alluvium and granitic bedrock. Both the alluvium and the bedrock have low potential for fossil deposits to be uncovered during grading. However, the Holocene alluvium rests upon a veneer of Older Pleistocene alluvium and San Timoteo Formation deposits, both of which are highly sensitive for fossil resources.

MBA’s monitoring work at the Highland Fairview Corporate Park project, located north and adjacent to this project area, included monitoring for paleontological resources. During construction of the Highland Fairview Corporate Park, it was shown that shallow soils (0 to 20 feet) did not contain paleontological resources. Therefore, MBA recommends that full-time paleontological monitoring on this project should take place only in those portions of the project where earthmoving occurs 20 feet or more below existing grade.

4.5.4 Thresholds of Significance

4.5.4.1 Importance of Cultural Resources

Prior to determining whether a cultural resource is significant under *CEQA Guidelines* and therefore subject to mitigation, a threshold of significance must be developed prior to testing/evaluation. This procedure is recommended by the Office of Historic Preservation (OHP)/State Prehistoric Preservation Officer (SHPO). The threshold of significance is simply a point where the qualities of significance are defined during the analysis such that the resource can be defined as a historical resource. An adverse effect to a historic resource is regarded as the physical demolition, destruction,

relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource will be reduced such that it no longer meets the significance criteria. In lay terms, should an analysis show that future development will destroy elements that make the cultural resource historical, but leave non-unique elements intact, then the significance of the resource will be lost and there must be mitigation for that loss.

CEQA Section 15064.5, Determining the Significance of Impacts to Archaeological and Historical Resources, states that:

“Generally, a resource shall be considered by the lead agency to be ‘historically significant’ if the resource meets the criteria for listing on the California Register of Historical Resources (Pub. Res. Code §5024.1, Title 14 CCR, Section 4852) including the following:

- (A) Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- (B) Is associated with the lives of persons important in our past;
- (C) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- (D) Has yielded, or may be likely to yield, information important in prehistory or history.”

If a prehistoric cultural resource is tested, it is traditionally held that buried features such as hearths, burials, and middens could hold analytical information that will pass the significance threshold and make the site eligible for the cultural resource under Criterion D alone (listed above) For resources created after the historic period began (post-1769 AD) and which are at least 45 years old, analysis of the condition and integrity of exposed features may cause the resource to pass Criterion A, B, C, and/or D thresholds (shown above).

For buildings and other structures at least 45 years old, the completeness and integrity of the structural architecture may cause the site to pass Criterion A, B, and/or C thresholds. The threshold should be associated with the site context or theme. If sets of unusual artifacts, buried but unusual buildings, or human remains are detected during tests of cultural resources in the project site, or if a historical review of the resource finds that it was once associated with a person and/or event of historical significance at the State/National level, such resources will likely be considered potentially significant for California Register/National Register listing. In the event that the significance of the historical resource will be reduced below the threshold because of development, feasible mitigation must be developed.

4.5.4.2 Definition of Cultural Resource Sites and Isolates

Prehistoric and historic cultural resources can vary in form and function from area to area, but it is a “site” as opposed to isolated artifacts and certain features that must be considered significant. Prehistoric and historic cultural resource sites are defined in this study as three or more items, such as lithics, stone tools, glass, cans, etc., that are not from a single source or material found within a 10 square meter area. There is no limit to the physical size of a site.

Sites that could qualify as significant are typically more than 45 years old or have the potential to be more than 45 years old. These definitions assume that items found in an area with a diversity of materials can represent more than a single activity at a location. Discrete components of a site may be identified to represent repeated activity, such as milling stations, hearths, or isolated structures. Isolated artifacts and certain isolated features do not meet these minimal criteria. Isolates could

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

consists of one or two cans, stone flakes, one metate fragment or fence posts, brass section markers, or well heads. Potential impacts to isolates need not be mitigated.

4.5.4.3 CEQA Thresholds

Based on Appendix G of the *CEQA Guidelines*, the effects of a project on cultural resources are considered to be significant if the project would:

- Cause a substantial adverse change in the significance of a historical resource as defined in *CEQA Guidelines* Section 15064.5;
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to *CEQA Guidelines* Section 15064.5;
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; and/or
- Result in any disturbance of human remains, including those interred outside of formal cemeteries.

4.5.5 Less than Significant Impacts

The following impacts were determined to be less than significant. In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.

4.5.5.1 Human Remains

Threshold	Would the proposed project disturb any human remains, including those interred outside of formal cemeteries?
-----------	--

The project site is currently undeveloped. No evidence suggesting the project site has been utilized in the past for human burials has been identified. In the unlikely event that human remains are discovered during grading or construction activities within the project site, compliance with State law (Health and Safety Code § 7050.5) (HSC § 7050.5) would be required. These requirements are imposed on any construction activity in which human remains are detected, and include the following provisions:

- There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:
 - The coroner of the county in which the remains are discovered must be contacted to determine that no investigation of the cause of death is required; and
 - If the coroner determines the remains to be Native American:
 - The coroner shall contact the Native American Heritage Commission within 24 hours.
 - The NAHC shall identify the person or persons it believes to be the most likely descended from the deceased Native American.
 - The most likely descendant may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with

appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code § 5097.98 (PRC § 5097.98), or

- Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further and future subsurface disturbance pursuant to PRC § 5097.98(e).
 - The NAHC is unable to identify a most likely descendant.
 - The most likely descendant is identified by the NAHC, fails to make a recommendation within 48 hours of being granted access to the site; or
 - The landowner or his authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner.

There is a small possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. In the event of an accidental discovery or recognition of any human remains, California State Health and Safety Code § 7050.5 dictates that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to CEQA regulations and PRC § 5097.98. Compliance with existing State law would ensure that impacts related to the discovery of buried human remains would be less than significant and no mitigation is required.

4.5.6 Significant Impacts

The following potential impacts were determined to be potentially significant. In each of the following issues, mitigation measures have been recommended to reduce the significance of impacts.

4.5.6.1 Archaeological Resources

Impact 4.5.6.1: *The proposed project has the potential to affect known or previously undetected subsurface archaeological resources.*

Threshold	Would the proposed project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?
-----------	--

NOTE: The following changes have been made due to revision to the Specific Plan project size.

Review of all cultural resource factors in and near the project site suggests that the project site is sensitive for archaeological resources in the southwestern portion of the site and the Specific Plan has set aside these ~~7574.3~~ acres as open space (Planning Area 30) to permanently protect these resources. There is no evidence that any other cultural resources are located in or near the project area; however, two tribes indicated a desire to consult with the City under SB 18 regarding the potential of such resources on the site.

The nine prehistoric cultural resources located near the southwestern portion of the project site were Phase II tested for significance: CA-RIV-610, CA-RIV-860, CA-RIV-3238, CA-RIV-3343, CA-RIV-3344, CA-RIV-3345, CA-RIV-3346, CA-RIV-8006, and CA-RIV-8007. Of these nine sites, only CA-RIV-3346 (milling features and a “midden”) is considered a significant resource under *CEQA Guidelines* because it exhibited evidence of intact subsurface cultural resources (MBA ~~2012~~2014). The project cultural assessment concluded that all the identified prehistoric sites are outside of the

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

development area of the Specific Plan and thus there would be no significant impact to archaeological resources from the proposed development.

Unknown Cultural Resources. It is possible that unknown cultural resources could be discovered during project-related construction. The land within 1,000 feet of exposed granitic bedrock outcrop areas in the southwesterly corner of the project is considered to have “high” sensitivity, while areas located within 2,000 feet of this area are considered to have “moderate” sensitivity. The remainder of the site is considered to have “low” sensitivity for cultural resources. As set forth below, a qualified archaeologist should be retained by the City to monitor any earthmoving in the areas of high and moderate sensitivity.

In addition, a number of project-related improvements, including the SR-60/Theodore Street interchange, SR-60/Gilman Springs Road interchange, three reservoir sites, water, sewer, and storm drain connections, debris basins, etc. are off site and cultural surveys will be conducted when specific sites are identified for these off-site improvements.

Project or Specific Plan Design Features. The 7574.3-acre open space area in the southwest corner of the WLCSP encompasses the entire foothill area some of which is considered sensitive for archaeological resources. This area is designated as Open Space in the Specific Plan and only the extension of Cactus Avenue and passive open space uses and a recreational trail will be permitted. ~~A public multi-use trail is proposed to be established in this Open Space area. The alignment of this trail will be established to avoid disturbance of these updated cultural report by MBA determined that potential impacts to cultural resources from constructing Cactus Avenue through this area could be reduced to less than significant levels by the implementation of the mitigation measures already proposed for project grading (MM 4.5.6.1C through 4.5.6.1E).~~

The following mitigation measure had been revised in response to Comments A-3-23 in Letter A-3 from the Pechanga Temecula Band of Luiseño Mission Indians, A-5-6 in Letter A-5 from Soboba Band of Luiseño Indians, et al.

Mitigation Measures. The following measures are proposed to help reduce potential impacts on known, unknown, or potential archaeological or historical resources to less than significant levels. The wording of the measures has been changed from the Original DEIR to address specific comments made by the Pechanga Tribe. The Tribe did request that the survey area limitations outlined in Mitigation Measures 4.5.6.1C and 4.5.6.1D be removed. After consultation with the project archaeologist the measures have been modified to refer to specific planning areas within the WLC Specific Plan as shown below:

4.5.6.1A ~~Prior to the approval of any grading or other discretionary permit for any of the “Light Logistics” parcels, the parcels shall be evaluated for significance by a qualified archaeologist since they were not available for survey during preparation of the EIR. A Phase II. A Phase I~~ Cultural Resources Assessment shall be conducted by the project archaeologist and an appropriate tribal¹ representative(s) on each of the “Light Logistics” parcel ~~prior to development to determine if it contains significant archaeological or historical resources.~~

~~A Phase II significance evaluation shall be completed for any of these sites that are determined to in order to determine if they contain significant archaeological or historical resources based on the results of the Phase I assessment. Cultural resources~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

include but are not limited to stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. ~~If a particular resource is~~ All resources determined to be significant, ~~it~~ prehistoric or historic shall be ~~adequately~~ documented using DPR523 forms for archival research/storage in the Eastern Information Center (EIC). If the particular resource is determined to be not significant, no further ~~documented~~ documentation is required. ~~Any artifacts~~ If prehistoric resources ~~are~~ determined to be significant, ~~they~~ shall be considered for relocation or archival documentation, ~~as appropriate, depending on whether the building or buildings are determined to be significant under CEQA.~~ If any ~~building~~ resource is determined to be significant, a Phase ~~III~~ III recovery study shall be conducted to recover remaining significant cultural artifacts. ~~If necessary, a feasibility study shall be conducted to determine if a significant structure can be relocated effectively to off-site parcels. The study shall also identify if there~~ If prehistoric archaeological/cultural resources are appropriate parcels available within or close to the Moreno area of the City. If the structure discovered during the Phase 1 survey and it is determined that they cannot be feasibly relocated, or there is not an appropriate parcel to relocate the structure to, the structure shall be demolished after complete archival recordation ~~avoided through site design, they shall be subject to a Phase 2 testing program. The project archaeologist and in consultation with appropriate tribal group(s), shall determine the significance of the resource(s) and determine the most appropriate disposition of the resource(s) in accordance with applicable laws, regulations and professional practices (per Cultural Report MM CR-1, MM CR-2, MM CR-7 Table 3, pg.74).~~

- 4.5.6.1B** ~~Prior to the approval/issuance of any grading or ground-disturbing permit by the City for construction of off-site improvements for the WALKS, the developer requesting the permit shall retain~~ qualified archaeologist shall be retained to prepare a Phase I cultural resource assessment (CRA) of the project site if an up to date Phase I cultural resource assessment is not available for the site at the time of development per Cultural Report MM CR-5, Table 3, pg.74).

Appropriate tribal representatives as identified by the City shall be invited by the Project Archaeologist to participate in this assessment.

If archaeological resources are ~~uncovered~~ or discovered during construction activities, no further excavation or disturbance of the area where the resources were found shall occur until a qualified archaeologist evaluates the find. If the find is determined to be a unique archaeological resource, appropriate action shall be taken to ~~include but not be limited to:~~ (a) planning: (a) plan construction to avoid the archeological sites; (the preferred alternative); (b) capping cap or covering cover archeological sites with a layer of soil before building on the affected site project location; or (c) excavation excavate the site to adequately recover the scientifically consequential information from and about the resource. ~~Work~~ At the discretion of the project archaeologist, work may continue on other parts of the project site while the unique archaeological resource mitigation takes place. This measure shall be implemented to the satisfaction of the ~~City Planning Division Official.~~

If the ~~qualified project archaeologist, in consultation with the monitoring Tribe(s),~~ determines that the find is a unique archaeological resource, the resource site shall be evaluated and recorded in accordance with requirements of the State Office of Historic Preservation (OHP). If the site resource is determined to be significant, ~~an adequate amount of data at the specific site shall be collected by the qualified archaeologist and the findings of the report shall be submitted to the City. If the site find~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~is not determined to be not significant the site need not be mitigated for as described above no mitigation is necessary.~~

Should a future project-level analysis show that cultural resource site CA-RIV-3346 will be directly or partially impacted by project-level construction, an Addendum cultural resource report must be prepared and include an analysis of the alternatives associated with mitigation for impacts to this resource following CEQA Guidelines Section 15126.4(b)(3). This information must be included in any project-level CEQA compliance documentation. It should be noted that Phase 3 data recovery is an acceptable mitigation action under CEQA Guidelines Section 15126.4(b)(3)(C) (per Cultural Report MM CR-3, Table 3, pg.74).

Should it be determined through a future project-level EIR analysis that prehistoric cultural resource sites CA-RIV-2993 and/or CA-RIV-3347 shall be directly impacted by future construction, these sites must be Phase 2 tested for significance (per Cultural Report MM CR-4, Table 3, pg.74).

4.5.6.1C ~~Prior to the issuance of any discretionary approvals for development within 3,750 feet of the southwest corner of the site, the project developer shall retain grading permits a qualified archaeologist shall be retained to monitor all grading as this area has been identified as having moderate and shall invite tribal groups to high sensitivity for cultural resources to participate in the monitoring. Project-related archaeological monitoring shall include the following requirements per Cultural Report MM CR-6, MM CR-8, Table 3, pg.74):~~

- ~~1. All construction related earthmoving shall be monitored to a depth of ten (10) feet below grade by the Project Archaeologist or his/her designated representative. Once 50 percent all areas of the earth to be moved has development project that have been examined cut to 10 feet below existing grade have been inspected by the monitor, the Project Archaeologist may, at his or her discretion, terminate monitoring if and only if no buried cultural resources have been detected;~~
- ~~2. If buried cultural resources are detected, monitoring shall continue until 100 percent of virgin earth within the permit specific project area has been disturbed and inspected by the Project Archaeologist or his/her designated representative.~~
- ~~3. Grading shall cease in the area of a cultural artifact or potential cultural artifact as delineated by the Project Archaeologist or his/her designated representative. A buffer of at a minimum 25 feet around the cultural item shall be established to allow for assessment of the resource. Grading should may continue in other areas of the site while the particular find are investigated; and~~
- ~~4. If prehistoric cultural artifacts resources are uncovered during grading, they shall be Phase 2 tested by the Project Archaeologist, and evaluated for significance in accordance with §15064.5(f) of the CEQA Guidelines, and curated in a museum chosen by the City if the resource(s) are determined to be significant. Appropriate actions for significant resources as determined by the Phase 2 testing include but are not limited to avoidance or capping, incorporation of the site in green space, parks, or delineation into open space. If such measures are not feasible, Phase 3 data recovery excavations of the finds (Phase III recovery) recovery of the significant resource will be required, and curation of recovered artifacts and/or reburial, shall be required. A mitigation-monitoring report associated with Phase 2 testing or Phase 3~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

data recovery must accompany be delivered to the City and, if necessary, the museum where any ~~archived~~ recovered artifacts have been curated.

5. No further grading shall occur in the area of the discovery until the City approves specific actions to protect identified resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the City where they would be afforded long-term preservation to allow future scientific study.
6. The developer shall make reasonable efforts to avoid, minimize, or mitigate significant adverse impacts on cultural resources ~~on the WLCSP property, and the SHPO~~ The State Historic Preservation Office (SHPO) and local Native American tribes will be consulted and the Advisory Council on Historic Preservation will be notified within 48 hours of the find in compliance with 36 CFR 800.13(b)(3). This measure shall be implemented to the satisfaction of the ~~City-Planning Division~~ Official.

4.5.6.1D Prior to the issuance of any grading ~~within 3,750 feet of the southwest corner of the site, the City and the applicant permit~~ the project archaeologist shall invite interested Tribal Group(s) representatives to monitor grading activities. Qualified representatives of the Tribal Group(s) shall be granted access to the project site to monitor grading as long as they provide 48-hour notice to the developer of their desire to monitor, so the developer can make appropriate safety arrangements on the site. This measure shall be implemented to the satisfaction of the ~~City-Planning Division~~ Official.

4.5.6.1E It is possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources (archaeological or historical). In the event that buried cultural resources are discovered during grading and no Project Archaeologist or Historian is present, grading operations shall stop in the immediate vicinity of the find and a qualified archaeologist shall be retained to determine the most appropriate course of action regarding the resource. The Archaeologist shall make recommendations to the City on the actions that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with §15064.5 of the *CEQA Guidelines*. Cultural resources could consist of, but are not limited to, stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area ~~should~~ shall be recorded on appropriate California Department of Parks and Recreation forms and evaluated for significance in terms of CEQA criteria. If the resources are determined to be unique historic resources as defined under §15064.5 of the *CEQA Guidelines*, ~~mitigation measures shall be identified by the Archaeologist and recommended to the City. Appropriate~~ appropriate protective actions for significant resources ~~could include~~ such as avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds shall be implemented by the project archaeologist and the City.

No further grading shall occur in the area of the discovery until the City and project archaeologist approve the measures to ~~protect~~ address these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the City where they would be afforded long-term preservation to allow future scientific study.

~~In addition, reasonable efforts to avoid, minimize, or mitigate adverse effects to the property will be taken and the SHPO and Native American tribes with concerns about the~~

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

~~property, as well as the Advisory Council on Historic Preservation will be notified within 48 hours in compliance with 36 CFR 800.13(b)(3)~~

Level of Significance After Mitigation. Adherence to **Mitigation Measures 4.5.6.1A** through **4.5.6.1E** will reduce potential impacts to archaeological resources to less than significant levels.

4.5.6.2 Historic Resources

Impact 4.5.6.2: *The proposed project has the potential to directly or indirectly affect local historical resources.*

Threshold	Would the proposed project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5 of the <i>State CEQA Guidelines</i> ?
-----------	--

The California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion in the California Register, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;
2. It is associated with the lives of persons important to local, California, or national history;
3. It embodies the distinctive characteristics of a type, period, region, or method or construction, or represents the work of a master, or possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

The California Register requires that a resource possess integrity, which is defined as “the authenticity of a historical resource’s physical identity evidenced by the survival of characteristics that existed during the resource’s period of significance” (California Office of Historic Preservation 1999). To retain integrity, a resource should have its original location, design, setting, materials, workmanship, feeling, and association. Which of these factors is most important depends on the particular criterion under which the resource is considered eligible for listing (California Office of Historic Preservation 1999).

The prehistoric sites recorded within or adjacent to the project boundaries are typical example of common resource type; a prehistoric milling complex lacking temporally diagnostic artifacts or a “single-use resource extraction and processing location.” Although broadly associated with prehistoric Native American occupation, the sites do not represent unique archaeological information. The sites are not associated with significant events or persons, and do not embody distinctive characteristics of a type, period, or method of construction, nor do they appear to have the potential to yield information important in prehistory. Therefore, they do not meet any of the above criteria and are not eligible for listing in the California Register. However, they do constitute locally important examples of Native American activity and are not considered a historical resource under CEQA. Impacts to these sites relative to Native American resources are addressed in more detail in Section 4.5.6.1, *Archaeological Resources*.

The project site contains two previously identified historic sites: CA-RIV-4201H and CA-RIV-4210H. Both of these are historic-era homesteads and previously contained farm buildings and related out-buildings. They were located in the eastern portion of the Specific Plan, but MBA could find no

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

remains of these facilities or related artifacts. The MBA report concludes the buildings were demolished and/or their materials removed for disposal or reuse at some point in the past.

There are seven rural residential structures and associated out-buildings currently present on the project site, and one (APN 478-220-009) near Redlands Boulevard contains a farm building that was built around 1900 and may be one of the oldest surviving buildings of the historic Moreno community.¹ No other evidence of past structures or unique features was identified; however, access to the seven rural residential properties was not available at the time of survey, and it appears from general observations, historical aerial photographs, and historical records that one or more of these buildings may be older than 40 years. Without more information, there is a possibility that removal of these buildings could represent a significant impact to historic structures, features, or resources, and mitigation is required.

Local Historical Resources: Alessandro Boulevard. In connection with the development of the Town of Moreno in the 1890s as part of the Bear Valley and Alessandro Development Company's real estate venture, Alessandro Boulevard was constructed across much of the project site. The roadway has been in continuous use in largely its same location since that time. In 1988, the City adopted Resolution CPAB 88-2 recognizing the landmark status of this roadway and providing for the preservation of its 120-foot right-of-way through the City. Alessandro Boulevard was designated as a City Historic Landmark in 1988 "assure the maintenance, enhancement, or protection of a street of historical significance." Over the years, various portions of Alessandro Boulevard have been modernized to enhance traffic flow throughout the City, but the original routing has remained unchanged. Alessandro Boulevard within the WLCSP would retain its original alignment but the roadway would be enhanced to serve modern traffic needs. This has been done in multiple areas along Alessandro Boulevard in the past to better serve the needs of the community (i.e., Streets C and E originally indicated in the DEIR and Specific Plan that circulated for public review). See Figure 4.5.1. Based on these project revisions, the proposed WLCSP will not affect the integrity of the landmark status, as the significance of the Landmark status is associated with the original location of the boulevard since 1890 and the retention of the original name of the boulevard across the City. These aspects would remain and the impacts would not be considered significant since the California Register requires that a resource possess integrity, which is defined as "the authenticity of a historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance" (California Office of Historic Preservation 1999). To retain integrity, a resource should have its original location, design, setting, materials, workmanship, feeling, and association. Which of these factors is most important depends on the particular criterion under which the resource is considered eligible for listing (California Office of Historic Preservation 1999). Alessandro Boulevard integrity is retained in the original location; however, design, setting, materials feeling have changed over time through modifications to the road throughout the City, and thus the impacts of the WLCSP would not be significant in the context of the overall conditions of Alessandro Boulevard.

Approximately 1,350 feet of Alessandro Boulevard east of Merwin Street would be closed to through traffic to keep trucks from using Alessandro Boulevard through the residential neighborhoods to the west of the WLC. Eliminating vehicular use of this portion of Alessandro Boulevard would not have a significant impact on the landmark status of the road, as the name and the original routing would be retained. These are the two key characters of the landmark status. This portion of road would be designed to keep access open to non-vehicular users, including pedestrians and bicyclists. Both the original route and name would be retained in keeping with the main aspects of the landmark designation.

THIS PAGE INTENTIONALLY LEFT BLANK

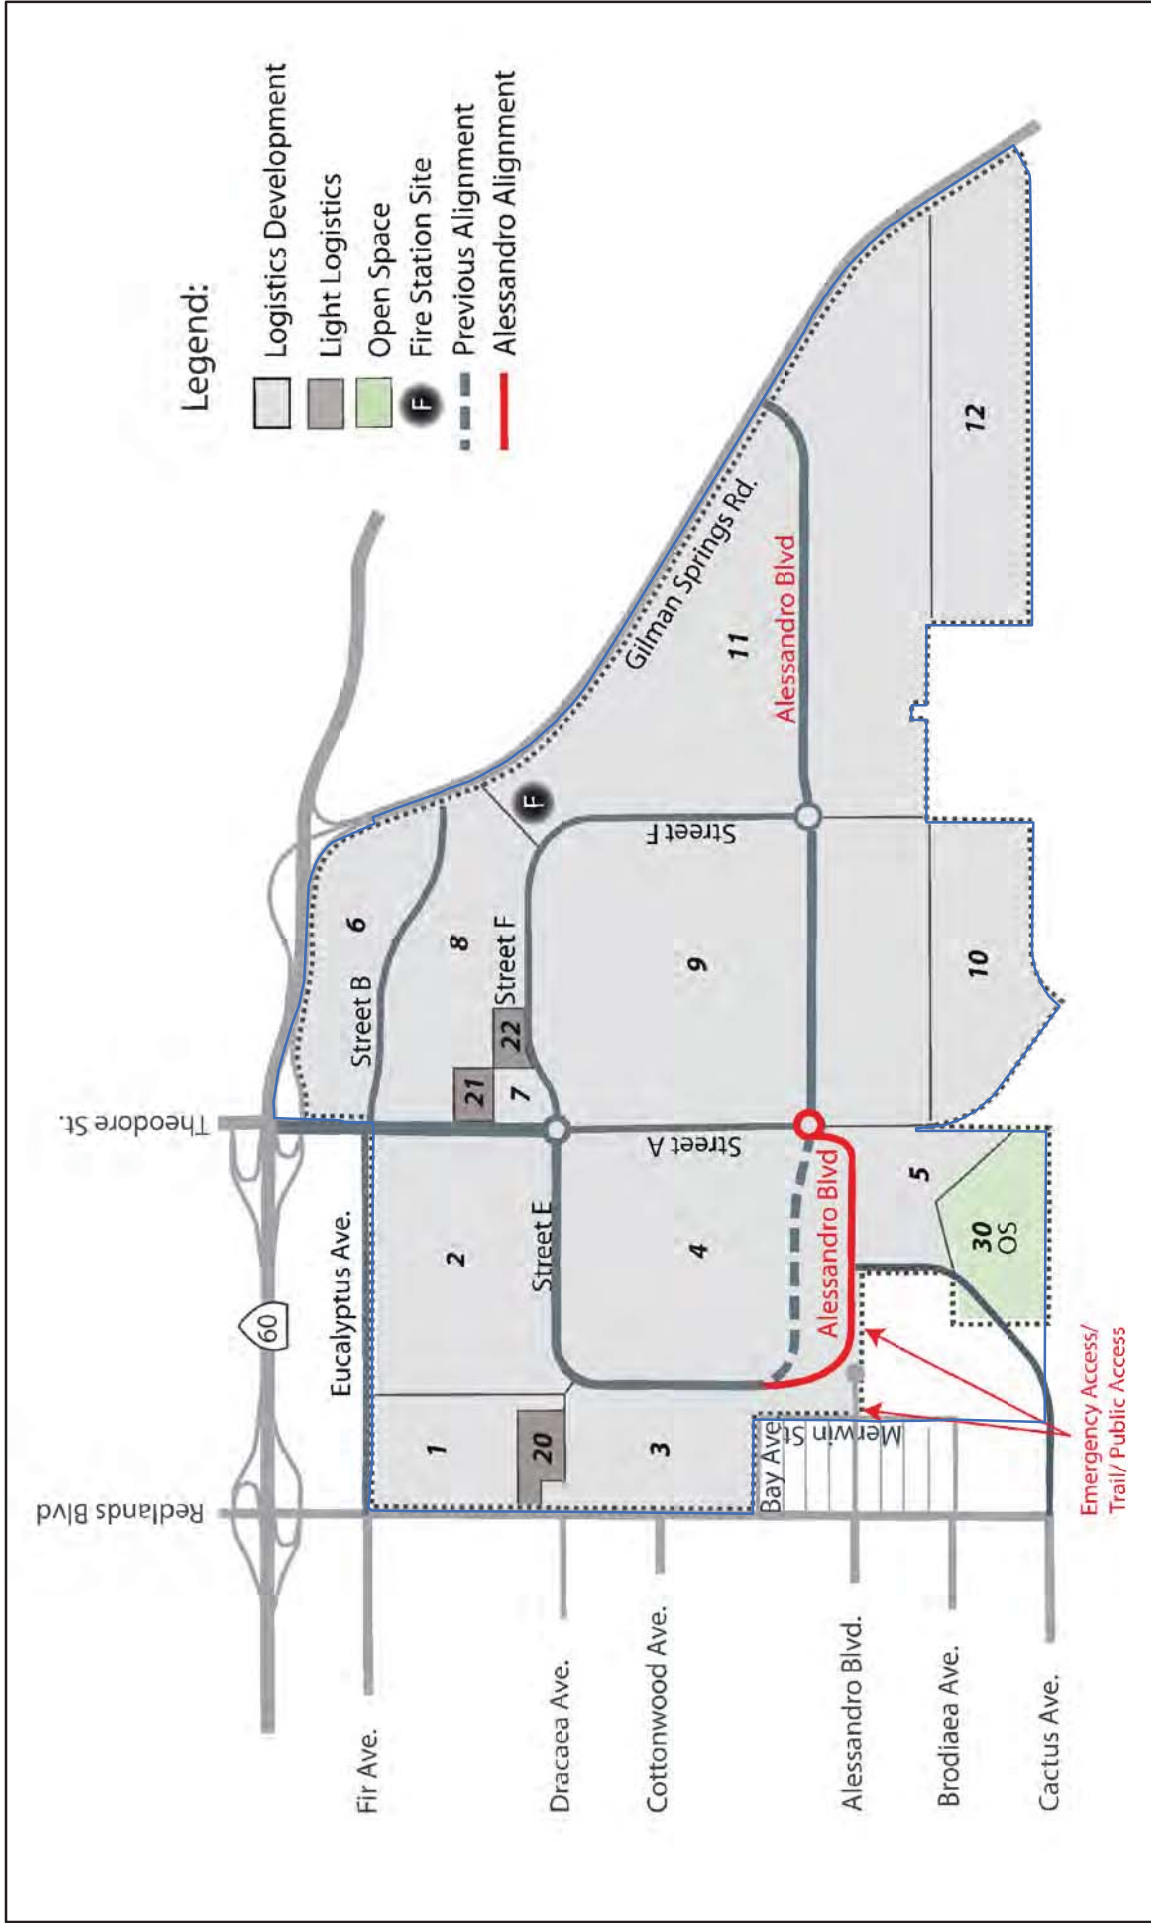

FIGURE 4.5.1

LSA

THIS PAGE INTENTIONALLY LEFT BLANK

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

In recognition of the historical significance of Alessandro Boulevard and in compliance with Resolution CPAB 88-2, the project will retain and protect the Alessandro Boulevard right-of-way through the project. The conceptual circulation plan for the WLC contained in the Specific Plan (Exhibit 3-1) incorporates nearly all of the current Alessandro alignment. Where the ultimate roadway right-of-way varies from the historic right-of-way, the historic right-of-way will be retained and may be improved with walks, trails, landscaping or similar compatible improvements. Prior to approval of any development including or adjacent to the historic Alessandro Boulevard right-of-way, a concept plan for its entire length shall be submitted to and approved by the Planning Commission. These requirements are contained in the Specific Plan in Section 12.9 “Alessandro Boulevard – Historical Landmark.” Retaining Streets C and E as proposed in the DEIR would have resulted in a potentially significant impact to a historical resource (Alessandro Boulevard), Mitigation Measure 4.5.6.2C has been introduced to keep Alessandro Boulevard in its original alignment. Therefore, any impact is less than significant.

In addition, historical evidence indicates Juan Bautista de Anza traveled through the project area (i.e., along the base of Mt. Russell from south to northwest), which should be acknowledged as part of the trail proposed within the Specific Plan.

Specific Plan Design Features. The Specific Plan was revised to show the realignment of Streets C and E to follow the historical alignment of Alessandro Boulevard and the eastern extension of Cactus Avenue through a part of the on-site Open Space area.

NOTE: The following mitigation measure had been revised in response to Comments A-3-23, A-5-6, et al (see FEIR Volume 1, Table 2.A).

Mitigation Measures. Mitigation Measure 4.5.6.1A requires surveying the seven occupied parcels for archaeological resources since these properties could not be surveyed at the time the EIR was prepared. These surveys will identify the potential for significant historical resources on these properties. In addition, the following measure will further reduce the potential impacts of the project on historical resources:

4.5.6.2A If any historic resources are found during implementation of Mitigation Measure 4.5.6.1A, the Project Archaeologist or Historian (as appropriate) shall offer any artifacts or resources to the Moreno Valley Historical Society (MVHS) or the Eastern Information Center/County Museum or the Western Science Center in Hemet as appropriate for archival storage. From the time any artifacts are turned over to the Moreno Valley Historical Society or other appropriate historical group, the developer shall have no further responsibility for their management or maintenance. ~~This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the Moreno Valley Historical Society.~~

In addition, the following measure is proposed to acknowledge the route of Juan Bautista de Anza through the project area as an important historical event:

4.5.6.2B As part of construction of the trail segment connecting Redlands Boulevard to the California Department of Fish and Wildlife property, the developer shall contribute \$5,000 to the City for the installation of a historical marker acknowledging the passing of Juan Bautista de Anza through this area during his exploration of California. This measure shall be incorporated into trail plans for this segment which will be subject to review and approval by the City Park and Recreation Department in consultation with the Moreno Valley Historical Society.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

4.5.6.2C Streets C and E shall follow the historical alignment of Alessandro Boulevard and shall be named Alessandro Boulevard.

Level of Impact After Mitigation. Implementation of the Specific Plan as revised and Mitigation Measures 4.5.6.1A, 4.5.6.2A, 4.5.6.2B, and 4.5.6.2C will help reduce potential impacts to historical resources to less than significant levels.

4.5.6.3 Paleontological Resources

Impact 4.5.6.3: *The proposed project has the potential to affect previously undetected subsurface paleontological resources.*

Threshold	Would the proposed project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?
-----------	---

As described in the *Paleontological Resources Assessment*, no paleontological resources were observed during the field survey. The majority of the project site is underlain by a thin veneer of Holocene alluvium that caps Pleistocene alluvial sediments. In addition, there is a small outcrop of Cretaceous granite that is exposed on the surface, and likely within the subsurface in some areas as well. The results of the assessment indicate that there are no known paleontological resources located within the project limits or within a one mile radius around the project site. The Holocene Alluvium that is exposed on the surface has a low sensitivity for containing paleontological resources. The Cretaceous granitic rocks that are exposed in a small area of the project have no sensitivity for containing paleontological resources. However, the Pleistocene Alluvium that exists in the subsurface of the project has produced paleontological resources in many areas of the Inland Empire and Southern California area.

The portions of the site underlain by older Pleistocene alluvium and San Timoteo Formation rock units should be assigned a “moderate” paleontological sensitivity because these deposits have yielded paleontological resources in other areas in the past. Overall, the project site is considered to have a moderate paleontological sensitivity; therefore, impacts are considered potentially significant and mitigation is required.

Specific Plan Design Features. The Specific Plan does not contain any policies regarding paleontological resources.

Mitigation Measures. The following mitigation measures have been identified to address potential impacts to paleontological resources that may be located within the project limits:

4.5.6.3A Prior to the issuance of any grading permits, for development within the WLCSP, the project developer shall retain a City-approved Paleontologist shall be retained to conduct paleontological monitoring as needed for all grading related to development. Development monitoring shall include the following actions:

1. Monitoring must occur in areas where excavations are expected to exceed twenty (20) feet in depth, in areas where fossil-bearing formations are found during grading, ~~This monitoring must be conducted by a qualified Project Paleontologist and~~ in all areas found to contain, or are suspected of containing, fossil-bearing formations.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

2. ~~Paleontological~~ To avoid construction delays, paleontological monitors shall be equipped to salvage fossils ~~as they are unearthed to avoid construction delays and to~~ and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates if they are unearthed.
3. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of ~~abundant or large~~ specimens.
4. Monitoring may be reduced if the potentially fossiliferous units described herein are not present, or, if present, are determined upon exposure and examination by ~~a~~ qualified the Project Paleontologist to have low potential to contain fossil resources . ~~The sole discretion to reduce monitoring rests with the City.~~

This measure shall be implemented to the satisfaction of the ~~City~~ Planning Division. It ~~should be noted that the~~ Official. The Project Paleontologist and the Project Archaeologist described in Mitigation Measure 4.5.6.1C may be the same person if ~~they meet~~ the/she meets the qualifications of both positions per Cultural Report MM PR-1, Table 4, pg.76).

4.5.6.3B Prior to the issuance of any ~~grading~~ permits for the construction of ~~any~~ off-site improvements ~~necessary for development in the WLCSP, the project developer shall~~ retain, a qualified paleontologist shall conduct an assessment for paleontological resources on each off-site improvement location. If any site is determined to have a potential for exposing paleontological resources, the project paleontologist shall monitor off-site grading/excavation, subject to coordination with the City. Development monitoring shall include the following mitigation measures: monitor ~~off-site grading/excavation,~~ subject to ~~coordination with the City. Development permits shall include the following mitigation measures:~~

1. Monitoring must occur in areas where excavations are expected to reach fossil-bearing formations during grading. This monitoring must be conducted by ~~a~~ qualified the Project Paleontologist in all areas found to or suspected of containing fossil-bearing formations.
2. To avoid construction delays, the Project Paleontologist shall be equipped to salvage fossils ~~as they are unearthed to avoid construction delays and to~~ and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates as they are unearthed.
3. The Project ~~Monitor~~ Paleontologist shall be empowered to temporarily halt or divert equipment to allow removal of ~~abundant or large~~ specimens.
4. Monitoring may be reduced if the potentially fossiliferous units described herein are not present, or, if present, are determined upon exposure and examination by ~~a~~ qualified the Project Paleontologist to have low potential to contain fossil resources. ~~The sole discretion to reduce monitoring rests with the City.~~

Level of Significance After Mitigation. Adherence to **Mitigation Measures 4.5.6.3A** and **4.5.6.3B** will reduce potential impacts to paleontological resources to less than significant levels.

4.5.7 Cumulative Impacts

The cumulative area for cultural resources is the City of Moreno Valley and the western portion of Riverside County. Implementation of the proposed project and related off-site improvements would require measures to identify, recover, and/or record any cultural and/or paleontological resource that may occur within the project limits. Although unlikely to occur, potential impacts associated with human remains would be reduced to a less than significant level through adherence to existing State law. With implementation of the recommended mitigation measures, potential impacts to archaeological or paleontological resources from future development will be reduced to less than significant levels. Since this region contains archaeological, historical, and paleontological resources that have been found in the past, future development in the surrounding region may impact these resources as well. However, implementation of the mitigation measures outlined in this document, and other CEQA documents for development projects in the area, will help reduce potential impacts to cultural resources to less than significant levels. With implementation of the project-level mitigation for future development identified in Section 4.5.6, the proposed project will not have significant impacts related to cultural resources, and will also not make any significant contributions to cumulatively considerable impacts relative to cultural resources. Therefore, no additional mitigation is required.

THIS PAGE INTENTIONALLY LEFT BLANK

NOTE TO READERS. *This section has been revised in response to public comments received on the Programmatic DEIR which have resulted in project changes, updates to technical studies and revisions to EIR sections and proposed Mitigation Measures.*

4.6 GEOLOGY AND SOILS

This section describes the location of the proposed project relative to the known geologic features and soil conditions and qualitatively evaluates potential impacts. Additionally, this chapter evaluates whether development on the proposed project site would significantly be affected by fault rupture, seismic shaking, erosion or unstable slopes, liquefaction, settlement, expansive soils, or other soil or geologic conditions.

NOTE: The following changes have been made due to revision of the Specific Plan project size.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,948~~ 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately 70 percent of the area (~~2,740~~ 2,610 acres) for logistics warehousing (new LD and LL, ~~LS~~ zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the ~~2,740~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner. The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. ~~The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.~~

The following documents were prepared to analyze the geologic impacts of the proposed WLC project:

- *Preliminary Geotechnical Evaluation for Environmental Impact Report the World Logistics Center Specific Plan South of Highway 60 Between Redlands Boulevard and Gilman Springs Road City of Moreno Valley, California.* Leighton and Associates, Inc. original dated January 23, 2013 updated September 2014. (Appendix G).

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- *Response to NOP Comments for the World Logistics Center Specific Plan.* Leighton and Associates, Inc. May 2012 (Appendix G).
- *“Preliminary Geotechnical Report, Tentative Parcel Map 35629, Moreno Valley, California, Project No. 111061-108,”* by Leighton and Associates, Inc. June 15, 2007.
- *“Update Preliminary Geotechnical Report, Tentative Parcel Map 35629, Highland Fairview Corporate Park, City of Moreno Valley, California, Project No. 111061-108,”* by Leighton and Associates, Inc. April 30, 2008.
- *“Update Geotechnical Report, Moreno Highlands Specific Plan Area, Southeast Corner of Highway 60 and Redlands Boulevard, City of Moreno Valley, California, Project No. 111061-108,”* by Leighton and Associates, Inc. July 21, 2008.
- *“Preliminary Geotechnical Evaluation for Environmental Impact Report, “The Highlands Specific Plan,” South of Highway 60 between Redlands Boulevard and Gilman Springs Road, City of Moreno Valley, California, Project No. 111061-127,”* by Leighton and Associates, Inc. December 13, 2011.

In addition, the analysis contained in this section is based on the following reference documents:

- Moreno Valley General Plan, Safety Element, July 11, 2006;
- U.S. Department of Agriculture, Natural Resources Conservation Service, Soil Survey Geographic (SSURGO) database for Western Riverside Area, California, September 15, 2003; and
- Geotechnical reports, comments, and responses to comments on geotechnical issues from the Westridge, Skechers, and ProLogis Environmental Impact Reports (various dates).

4.6.1 Existing Setting

The City lies within the Perris Block, a structural unit that is located within the Peninsular Range Geomorphic Province, one of the major geologic provinces of southern California. The Perris Block is a large mass of granitic rock generally bounded by the San Jacinto Fault, the Elsinore Fault, the Santa Ana River, and a non-defined southeast boundary. The Perris Block has had a history of vertical land movements of several thousand feet due to shifts in the Elsinore and San Jacinto Faults. The materials within the valley area are characterized by Pliocene-Pleistocene-aged alluvium ranging from relatively thin (20 feet to 200 feet) to intermediate thickness (up to 2,000 feet), which overlies the older granitic bedrock. The rocky, mountainous areas, including the Box Springs Mountains and the Mount Russell/Lake Perris State Recreation area, have underlying granitic bedrock that consists of quartz diorite, and displays granite rock outcrops and large boulders. The Badlands range, at the eastern end of the area, comprises deposits of what was once an inland sea later elevated and deformed by geologic processes, before becoming severely eroded to its present state. This area consists of folded semi-consolidated sedimentary sandstone, siltstone, and shale. The proposed project is located within the northern portion of the San Jacinto Valley, a fault-bounded tectonic basin that has evolved from movement along the San Jacinto fault system resulting in a down-dropped northwest-trending trough.

The existing setting for geology and soils includes faulting and seismicity, soils, and geologic and seismic hazards, which are discussed below.

4.6.1.1 Faulting and Seismicity

Pursuant to Public Resources Code Section 2690 *et seq.* Leighton & Associates prepared a geotechnical report that analyzes the seismic hazards underlying the project site. Much of the information set forth below and throughout this document is taken from that report. The proposed project site, like the rest of Southern California, is located within a seismically active region as a result of being located near the active margin between the North American and Pacific tectonic plates. The principal source of seismic activity is movement along the northwest-trending regional fault systems such as the San Andreas, San Jacinto, and Elsinore Fault Zones. Currently, these fault systems accommodate up to approximately 55 millimeters per year (mm/yr) of slip between the plates. The on-site San Jacinto Fault Zone is estimated to accommodate slip of approximately 12 mm/yr. However, geodetic measurements between 1973 and 1981 show that the San Jacinto and San Andreas Faults currently have comparable strain rates. It has been estimated that an average slip rate of as much as 20 mm/yr occurs for the San Jacinto Fault. The San Jacinto Fault zone presents a substantial seismic hazard in Southern California.

By definition of the California Geological Survey, an active fault is a fault, which has had surface displacement within Holocene time (about the last 11,000 years). This definition is used in delineating Earthquake Fault Zones as mandated by the Alquist-Priolo Geologic Hazards Zones Act of 1972 and as most recently revised in 2007 as the Alquist-Priolo Earthquake Fault Zoning Act and Earthquake Fault Zones. The intent of this act is to require fault investigations on sites located within Earthquake Fault Zones to ensure that certain inhabited structures are not constructed across the traces of active faults. The nearest Alquist-Priolo zoned “active faults” is the on-site Claremont Segment of the San Jacinto Fault Zone (see Figure 4.6.1). The western portion of the site is crossed by the City of Moreno Valley Seismic Zone and the postulated trace of the Casa Loma Fault. The nearest off-site fault zones include Casa Loma Segment of the San Jacinto Fault Zone, located 1.6 miles to the south, the San Andreas Fault Zone, located 12.7 miles northeast, and the Glen Ivy Segment of the Elsinore Fault is located approximately 22.7 miles to the southwest of the site.

4.6.1.2 Soils

Based on the *Soil Survey of Western Riverside County*, the project area contains 20 different soil-mapping units belonging to 10 different soil series. (See Table 4.6.A below and Figure 4.2.1 in Section 4.2.) A soil series is a group of soils with similar profiles. These profiles include major horizons with similar thickness, arrangement, and other distinct characteristics. The project site is dominated by San Emigdio loam (SgA and SgC) and San Emigdio fine sandy loam (SeC2), with smaller inclusions of Arbuckle loam (AkC), Badland (BaG), Gorgonio loamy sand (GhC), Greenfield sandy loam (GyA, GyD2), Hanford coarse sandy loam (HcC and HcD2), Metz loamy sand (MdC and MeD), Metz loamy fine sand (MfA), Metz gravelly sandy loam (MID), Ramona sandy loam (RdD2), Rockland (RtF), San Emigdio fine sandy loam (SeA and SeD2), and San Timoteo loam (SmE2).¹

4.6.1.3 Geologic and Seismic Hazards

Geologic and seismic hazards discussed in this subsection include the following:

- Surface rupture;
- Ground shaking;
- Liquefaction;
- Subsidence and seismic settlement;
- Landslides/slope stability; and
- Compressible, expansive and collapsible soils.

Surface Rupture. Surface rupture occurs where displacement or fissuring occurs along a fault zone. While primary ground damage due to earthquake fault rupture typically results in a relatively small percentage of the total damage in an earthquake, the location of structures or facilities too close to a rupturing fault can cause profound damage. It is difficult to reduce the hazards of surface rupture through structural design. The primary method to avoid this hazard is to either set structures and facilities away from active faults, or avoid their construction in close proximity to an active fault.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

Faults throughout southern California have formed over millions of years. Some of these faults are considered inactive under present geologic conditions, and other faults are known to be active.¹ Such faults have either generated earthquakes in historic times (200 years), or show geologic and geomorphic indications of movement within the last 11,000 years. Faults that have moved in the relatively recent geological past are generally presumed to be the most likely candidates to generate damaging earthquakes in the lifetimes of residents, buildings, or communities. As previously identified, the Claremont Segment of the San Jacinto Fault Zone is located on the eastern portion of the site; therefore, ground surface rupture is an identified seismic hazard within the project limits.

Ground Shaking. The vast majority of earthquake damage is caused by ground shaking. Source effects include earthquake size, location, and distance. The bigger and closer the earthquake is, the more severe the damage will be. The exact way that rocks and other earth materials move along the fault can also influence shaking, as can the subsurface orientation of the fault.

Path effects are caused by seismic waves that change direction as they travel through the earth's contrasting layers, just as light bounces (reflects) and bends (refracts) as it moves from air to water. Sometimes this can focus seismic energy at one location, and cause damage in unexpected areas.

Site effects are brought about by seismic waves that slow down in the loose sediments and weathered rock at the surface of the earth. As they slow, their energy converts from speed to amplitude, which increases shaking. This is identical to the behavior of ocean waves. As the waves slow down near shore, their crests grow higher. Sometimes, too, seismic waves get trapped at the surface and resonate. Whether resonance will occur depends on the period (the length) of the incoming waves. Waves, soils and buildings all have resonant periods. When these match, tremendous damage can occur.

The primary threat associated with on-site and the nearby faults previously identified is the intensity of ground shaking that could be generated at the project site.

Liquefaction. Liquefaction occurs primarily in saturated, loose, fine-to-medium-grained soils in areas where the groundwater table is within 50 feet of the surface. Shaking suddenly causes soils to lose strength and behave as a liquid. Excess water pressure is vented upward through fissures and soil cracks, and a water-soil slurry bubbles onto the ground surface. The resulting features are called "sand boils," "sand blows," or "sand volcanoes." Liquefaction-related effects include loss of bearing strength, ground oscillations, lateral spreading, and flow failures or slumping. Based on Figure 6-3 of the Safety Element of the City's General Plan, the project site is not located in an area identified as having a liquefaction potential. Site-specific geotechnical studies by Leighton have concluded the project site has a very low potential for liquefaction.

Subsidence and Seismic Settlement. Ground subsidence is typically a gradual settling or sinking of the ground surface with little or no horizontal movement, although fissures (cracks and separations) can result from lowering of the ground surface.

The common causes of subsidence that can produce small or local collapses to broad regional subsidence include:

- Dewatering of peat or organic soils;
- Dissolution in limestone aquifers;

¹ The Alquist-Priolo Earthquake Fault Zoning Act defines *active faults* as those that show proven displacement of the ground surface within about the last 11,000 years. *Potentially active faults* are those that show evidence of movement within the last 1.6 million years.

- First-time wetting of moisture-deficient, low-density soils (hydrocompaction);
- Natural compaction;
- Liquefaction;
- Crustal deformation;
- Ground shaking;
- Subterranean mining; and
- Withdrawal of fluids (groundwater, petroleum, or geothermal).

Most of the damage caused by subsidence is the result of oil, gas, or groundwater extraction from below the ground surface, or the organic decomposition of peat deposits. Ground subsidence may occur as a response to natural forces such as earthquake movements, which can cause abrupt elevation changes of several feet or densification of low density granular soils during an earthquake event that may cause several inches of settlement.

Landslides/Slope Stability. Significant factors that contribute to slope failure include slope height and steepness, shear strength and orientation of weak layers in the underlying geologic units, and pore water pressures. There are no known landslides within the project area; however, a large older landslide has been mapped primarily off site on the northeasterly flanks of Mount Russell, near the southwest portion of the property. The landslide appears to have originated on the higher slopes (off site) and moved northeast, partially onto the subject property.

Alluvial Soil. Alluvial soil was encountered in all exploratory borings, fault trenches, and test pits excavated at the site.¹ The alluvial soils were deposited as part of a complex depositional environment and generally include interbedded fine sands and silts with varying amounts of clay. The yellow-brown to medium gray recent alluvial soils (younger alluvium) are found in drainages and believed to constitute the upper surficial materials (upper 3 to 10 feet). The deeper materials (older alluvium and older fan-deposits) are generally dark yellow-brown to dark gray and consist of silty fine sand to sandy silt with interbedded lenses of silt clay and sandy gravel. The alluvium along the southeastern side of the site is significantly denser and contains considerable amounts of coarser sands and gravel. Pertinent engineering characteristics of the encountered alluvium are summarized below:

- **Compressibility Characteristics.** The alluvium is generally loose in the upper 10 to 15 feet in most areas. At depths greater than 15 feet, the alluvium is generally medium dense. The results of testing by Leighton also indicate a high rebound potential during unloading for some of the tested alluvium. This rebound affect may cause some elevation rise in areas of significant excavation.
- **Expansive Soils.** Expansive soils generally have a significant amount of clay particles that can give up water (shrink) or take on water (swell). The change in volume exerts stress on buildings and other loads placed on these soils. The extent of shrink/swell is influenced by the amount and kind of clay in the soil. The occurrence of these soils is often associated with geologic units having marginal stability. The majority of the site materials are expected to have a low expansive potential; however, expansive soils are known to exist on site. The more expansive soils are expected to be localized and associated with interbedded silt and clay layers.

¹ *Preliminary Geotechnical Evaluation for Environmental Impact Report World Logistics Center Specific Plan South of Highway 60 Between Redlands Boulevard and Gilman Springs Road City of Moreno Valley, California.* Leighton and Associates, Inc. January 2013.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- **Collapse Potential.** Hydroconsolidation, or soil collapse, typically occurs in recently deposited Holocene (less than 10,000 years before present time) soils that were deposited in an arid or semi-arid environment. Soils prone to collapse are commonly associated with man-made fill, wind-laid sands and silts, and alluvial fan and mudflow sediments deposited during flash floods. Particles of these soils, which typically contain minute pores and voids, may be partially supported by clay or silt, or chemically cemented with carbonates. When saturated, collapsible soils undergo a rearrangement of their grains and the water removes the cohesive (or cementing) material, and a rapid, substantial settlement may occur. An increase in surface water infiltration (such as from irrigation) or a rise in the groundwater table, combined with the weight of a building or structure, may initiate settlement, causing foundations and walls to crack. Soil borings and laboratory testing conducted by Leighton determined that on-site soils have low to moderate potential for collapse with the exemption of dispersed areas just south of the extension of Eucalyptus Avenue.¹

4.6.1.4 Off-site Improvements

After the approximate locations of the various project-related off-site improvements were identified (e.g., reservoirs, and the Theodore Street/SR-60 interchange), the project geologist (Leighton) conducted a brief geotechnical assessment of the various off-site areas to identify the potential for geotechnical constraints (see Appendix G). Leighton concluded that none of the off-site improvement areas had substantial seismic or seismically related constraints, but did recommend additional testing and evaluation for localized soil constraints once specific improvement footprints had been established.

4.6.1.5 NOP/Scoping Comments

Several members of the public said the EIR should examine potential seismic and other impacts related to the San Jacinto Fault Zone, as well as the Casa Loma and Farm Road Faults. These comments were addressed by the project geologist and geotechnical consultant (Leighton) and are addressed in Sections 4.6.5 and 4.6.6 in relation to project impacts.

4.6.2 Policies and Regulations

4.6.2.1 State Regulations

Alquist-Priolo Earthquake Fault Zoning Act. The major State legislation regarding earthquake fault zones is the *Alquist-Priolo Earthquake Fault Zoning Act* (A-P Act). In 1972, the State of California began delineating “Earthquake Fault Zones” (called Special Studies Zones prior to 1994) around and along faults that are “sufficiently active” and “well defined” to reduce fault-rupture risks to structures for human occupancy (California Public Resources Code Sections 2621–2630). The boundary of an “Earthquake Fault Zone” is generally 500 feet from major active faults and from 200 to 300 feet from well-defined minor faults. The mapping of active faults has been completed by the State Geologist, and these maps are distributed to all affected cities, counties, and State agencies for their use in developing planning policies and controlling renovation or new construction.

Before a project can be permitted within an identified Earthquake Fault Zone, cities and counties must require a geologic investigation to demonstrate that proposed buildings will not be constructed across active faults. A site-specific evaluation and written report must be prepared by a licensed geologist. If

¹ Ibid.

an active fault is identified, a structure intended for human occupancy cannot be placed over the trace of the fault and must be set back from the fault.

The A-P Act only addresses the hazard of surface fault rupture and is not directed toward other earthquake hazards.

The Seismic Hazards Mapping Act. Passed in 1990, the Seismic Hazards Mapping Act (SHMA) addresses non-surface fault rupture earthquake hazards, including strong ground shaking, liquefaction, and seismically induced landslides. The California Geological Survey (CGS) is the principal State agency charged with implementing the 1990 SHMA. Pursuant to the SHMA, the CGS is directed to provide local governments with seismic hazard zone maps that identify areas susceptible to amplified shaking, liquefaction, earthquake-induced landslides, and other ground failures. The goal is to minimize loss of life and property by identifying and mitigating seismic hazards. The seismic hazard zones delineated by the CGS are referred to as “zones of required investigation.” Site-specific geotechnical hazard investigations are required by SHMA when construction projects fall within these areas.

Natural Hazards Disclosure Act. Effective June 1, 1998, the Natural Hazards Disclosure Act requires that sellers of real property and their agents provide prospective buyers with a “Natural Hazard Disclosure Statement” when the property being sold lies within one or more State-mapped hazard areas. If a property is located in a Seismic Hazard Zone as shown on a map issued by the State Geologist, the seller or the seller’s agent must disclose this fact to potential buyers.

4.6.2.2 Local Policies

City of Moreno Valley General Plan Policies. The City of Moreno Valley General Plan includes policies and goals related to geologic and seismic hazards. The following goals and policies are applicable to the proposed WLC project.

Safety Element

Goal 6.1 To achieve acceptable levels of protection from natural and man-made hazards to life, health and property.

Goal 6.2 To have emergency services which are adequate to meet minor emergency and major catastrophic situations.

Safety Element Objectives and Policies

Objective 6.1

Minimize the potential for loss of life and protect residents, workers, and visitors to the City from physical injury and property damage due to seismic ground shaking and secondary effects.

Policies:

6.1.1 Reduce the effects from fault rupture and liquefaction hazards through the identification and recognition of potentially hazardous conditions and areas as they relate to the San Jacinto fault zone and the high and very high liquefaction hazard zones. During the review of future development projects, the City shall require geologic studies and mitigation for fault rupture hazards in accordance with the Alquist-Priolo Special Study Zones Act. Additionally, future geotechnical studies shall contain calculations for seismic settlement on all alluvial sites identified as having high or very high liquefaction potential. Should the calculations show a potential for liquefaction, appropriate mitigation shall be identified and implemented.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

- 6.1.2 Require all new developments, existing critical and essential facilities and structures to comply with the most recent Uniform Building Code seismic design standards.

4.6.3 Methodology

The analysis of potential geologic and soil-related impacts is based upon the preliminary site specific geotechnical study prepared by Leighton and Associates, the City's Safety Element of the General Plan, literature prepared by the California Department of Mines and Geology (CDMG), information from the federal Natural Resources Conservation Service (NRCS), mapping published by the United States Geological Survey (USGS), and other documents such as the City's Building Code, and the City's Standard Design Guidelines, which were reviewed and summarized to establish existing conditions. In determining the level of significance, the analysis assumes that construction and operation of the proposed project would comply with relevant Federal and State laws and regulations, as well as City General Plan policies.

4.6.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts to geology and soils are based on *CEQA Guidelines* (2011). A project would have a significant impact related to geology and soils if it would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Maps issued by the State Geologist for the area or based on other substantial evidence of a known fault.
 - Strong seismic ground shaking.
 - Seismic-related ground failure, including liquefaction.
 - Landslides.
- Result in substantial soil erosion or the loss of topsoil;
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-site or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994 or most current edition), creating substantial risks to life or property; and/or
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.

4.6.5 Less than Significant Impacts

The following impacts were determined to be less than significant. In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards and policies would reduce potential impacts to a less than significant level.

4.6.5.1 Landslides and Rockfalls

Threshold	Would the proposed project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?
-----------	--

NOTE: The following changes have been made due to revision to the Specific Plan project size.

A large older landslide has been mapped primarily off site on the north easterly flanks of Mount Russell, near the southwest portion of the property. The landslide appears to have originated on the higher slopes off site, and moved northeast, partially onto the subject property. The Specific Plan designates 7574.3 acres in the southwestern portion of the property as open space. This 7574.3 acres includes the steepest slopes on site (i.e., the Mount Russell foothills), which will reduce the potential for significant landslide or rockfall impacts on the project to less than significant levels; therefore, no mitigation is needed.

4.6.5.2 Soil Erosion or Loss of Topsoil

Threshold	Would the proposed project result in substantial soil erosion or the loss of topsoil?
-----------	---

The proposed project includes the grading of approximately 2,684 acres for the construction of the proposed logistics buildings. In addition, the project proposes the construction of various infrastructure improvements both on site and off site. These improvements include the construction of on-site and off-site water, sewer, freeway interchange and roadway/intersection improvements, debris basins, reservoirs, water and sewer lines, utility substations, etc. These activities have the potential to cause erosion both on site and off site.

Development of the site would require the movement of on-site soils. Portions of the site have been and are being used for dry farming, and several rural residences are present. Prior to the issuance of grading permits, the project proponent will be required to prepare and submit detailed grading plans as each phase is developed. These plans will be prepared in conformance with applicable standards of the City's Grading Ordinance. Construction of off-site utility and roadway improvements will also result in the movement of soil. Plans are not available at this time for off-site improvements but that construction will be subject to the same permitting and plan checking processes.

Development of the site and related off-site improvements would involve the disturbance of more than one acre; therefore, the project is required to obtain a National Pollutant Discharge Elimination System (NPDES) permit. A Storm Water Pollution Prevention Plan (SWPPP) will also be required to address erosion and discharge impacts associated with the proposed on-site grading. Compliance with storm water regulations include minimizing storm water contact with potential pollutants by providing covers and secondary containment for construction materials, designating areas away from storm drain systems for storing equipment and materials and implementing good housekeeping practices at the construction site. The following SWPPP components will reduce potential impacts of soil erosion or loss of topsoil to less than significant levels:

- Protect all storm drain inlets and streams located near the construction site to prevent sediment-laden water from entering the storm drain system.
- Prevent erosion by implementing one or more of the following soil stabilization practices: mulching, surface roughening, permanent or temporary seeding.
- Limit vehicular access to and from the site. Stabilize construction entrances/exits to minimize the track out of dirt and mud onto adjacent streets. Conduct frequent street sweeping.

Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project

- Protect stockpiles and construction materials from winds and rain by storing them under a roof, secured impermeable tarp or plastic sheeting.
- Avoid storing or stockpiling materials near storm drain inlets, gullies or streams.
- Phase grading operations to limit disturbed areas and duration of exposure.
- Perform major maintenance and repairs of vehicles and equipment off site.
- Wash out concrete mixers only in designated washout areas at the construction site.
- Set-up and operate small concrete mixers on tarps or heavy plastic drop cloths.
- Keep construction sites clean by removing trash, debris, wastes, etc. on a regular basis.
- Clean up spills immediately using dry clean-up methods (e.g., absorbent materials such as cat litter, sand or rags for liquid spills; sweeping for dry spills such as cement, mortar or fertilizer) and by removing the contaminated soil from spills on dirt areas.
- Maintain all vehicles and equipment in good working condition. Inspect frequently for leaks, and repair promptly.
- Cover open dumpsters with secured tarps or plastic sheeting. Clean out dumpsters only in approved locations on the construction site.
- Arrange for an adequate debris disposal schedule to insure that dumpsters do not overflow.

A preliminary WQMP was prepared for the WLCSP and is included in Appendix J-2. The preliminary WQMP contains the following post-construction measures, which will help reduce potential impacts to soil erosion to less than significant levels and identifies measures to treat and/or limit the entry of contaminants into the storm drain system:

- *Maximize the permeable area.* A significant portion of the project will remain pervious for the purposes of landscaping, water quality treatment, and flood detention. By incorporating more pervious, lower Runoff Coefficient (C factor) surfaces into the project, lower volumes of runoff will be produced.
- *Incorporate landscaped buffer areas between sidewalks and streets.* Bioretention areas between sidewalks and streets will be incorporated and serve the dual purpose of landscaping and water quality treatment.
- *Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought-tolerant trees and large shrubs.* Although most of the project area will require mass grading, some existing native trees and shrubs will be preserved where feasible.
- *Use natural drainage systems.* The majority of the project site currently sheet flows to small earthen ditches. Under the proposed condition, most of these natural ditches will be removed, with the exception of one natural drainage course. This natural drainage path, located at the eastern portion of the project, will be maintained under the proposed condition.
- *Where soils conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.* Infiltration basins will be proposed where soil conditions are appropriate.
- *Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.* Detention basins and/or infiltration basins will be provided on site. The locations of these facilities will be shown in the project-specific WQMP.
- *Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.* Street,

sidewalk, and parking design will incorporate minimum street widths that still meet City requirements and emergency access requirements.

- *Reduce widths of street where off-street parking is available.* Street design will incorporate minimum street widths that still meet City requirements and emergency access requirements.
- *Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.* The use of impervious surfaces for decorative purposes will be minimized where possible.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

- *Conserve natural areas.* There are 1,205 acres of natural areas that will be designated as undisturbed open space. The proposed project designates 1,086 acres of CDFW land, and an additional 44 acres of natural areas maintained by utility companies, and ~~75~~74.3 acres within the WLC Specific Plan, for Open Space use.
- *Development sites will be designed to contain and infiltrate roof runoff, or direct roof runoff to vegetative swales or buffer areas, where feasible.* Runoff from impervious areas will sheet flow or be directed to Treatment Control BMPs.
- *Where landscaping is proposed, impervious sidewalks, walkways, and trails will be designed to drain into adjacent landscaping.* Streets, sidewalks, and parking lots will sheet flow to landscaping/bioretenion areas.
- *Increase the use of vegetated drainage swales in lieu of underground piping or imperviously lined swales.* Runoff from impervious areas will sheet flow to vegetated swales, bioretention areas, infiltration basins, and/or detention basins.
- *Rural swale system: street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings.* Streets will sheet flow to adjacent landscaping/bioretenion areas.
- *Urban curb/swale system; street slopes to curb, periodic swale inlets drain to vegetated swale/biofilter.* Streets will sheet flow to adjacent landscaping/bioretenion areas.
- *Design driveways to drain into landscaping prior to discharging to the MS4.* Driveways will sheet flow to adjacent landscaping/bioretenion areas.
- *Uncovered parking may be paved with a permeable surface, or designed to drain into landscaping prior to discharging to the MS4.* Parking lots will sheet flow to adjacent landscaping/bioretenion areas.

The WQMP is incorporated by reference and/or attached to the project's SWPPP as the Post-Construction Management Plan.

As soils covering the project site have a slight-to-high erosion hazard potential and because the project would be required to adhere to the City's Grading Ordinance, obtain an NPDES Permit, and prepare an SWPPP and a WQMP, construction and operational impacts associated with soil erosion hazards are considered to be less than significant, and no mitigation is required.

Grading for off-site improvements would require subsequent grading permits or related approvals from both the City and County of Riverside, depending on the improvement and its location. Most roadway and intersection improvements will occur within existing rights-of-way or on land that has been previously disturbed. The SWPPP and the WQMP establish performance standards for future development, and implementation the identified measures in those plans will reduce potential erosion impacts to less than significant levels (See also Section 4.9, *Hydrology and Water Quality*, for a discussion of potential issues associated with soil erosion during construction and project operations).

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

4.6.5.3 Septic Tanks

Threshold	Would the proposed project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?
-----------	--

All buildings within the project will be connected to existing wastewater facilities (sewer) owned and operated by the Eastern Municipal Water District. Septic tanks will not be used anywhere within the project. No mitigation is required.

4.6.5.4 Seismic-Related Ground Failure

Threshold	Would the proposed project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic ground failure?
-----------	--

NOTE: The following changes have been made due to revision to the Specific Plan project size.

Development of the proposed project will result in the construction of up to 4440.6 million square feet of logistics warehouse uses. The project site is located within Seismic Zone 4 as defined by the Uniform Building Code (UBC). Exhibit S4 of the Safety Element of the City's General Plan indicates that the project site is not located in an area susceptible to landslides or slope instability.

The project site lies on relatively flat terrain ($\pm 2\%$ grade) and no landslide areas or mass movement were observed onsite. The only steep topographical features are located in the southwest corner of the project area (see Section 4.6.6.3 below). This area is designated for Open Space uses and is not proposed for development.

The project does not propose any activity known to cause damage by subsidence (e.g., oil, gas, or groundwater extraction). Settlement generally occurs within areas of loose, granular soils with relatively low density. The project site is underlain by relatively dense alluvial and dense sedimentary bedrock materials at depth and the potential for settlement is considered low. Because the project site does not exhibit characteristics of a high potential for subsidence or settlement, impacts are considered less than significant. No mitigation is required.

The potential for liquefaction generally occurs during strong ground shaking within relatively cohesionless loose sediments where the groundwater is typically less than 50 feet below the surface. Because the project site does not exhibit characteristics of a high potential for liquefaction induced settlement (i.e., relatively dense soils with groundwater levels in excess of 100 feet), impacts are considered less than significant. No mitigation is required.

4.6.6 Significant Impacts

The following impacts were determined to be potentially significant. In each of the following issues, mitigation measures have been recommended to reduce the significance of the identified impacts.

4.6.6.1 Fault Rupture

Impact 4.6.6.1: *Future development permitted by the project would locate development in an area susceptible to fault rupture.*

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Threshold	Would the proposed project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Maps issued by the State Geologist for the area or based on other substantial evidence of a known fault.
-----------	--

Surface rupture occurs where displacement or fissuring occurs along a fault zone. While primary ground damage due to earthquake fault rupture typically results in a relatively small percentage of the total damage in an earthquake, the location of structures or facilities too close to a rupturing fault can cause profound damage. The primary method to avoid this hazard is to either set structures and facilities away from active faults, or avoid their construction in close proximity to an active fault.

Faults throughout southern California have formed over millions of years. Some of these faults are generally considered inactive under present geologic conditions and other faults are known to be active.¹ Such faults have either generated earthquakes in historic times (within the last 200 years) or show geologic and geomorphic indications of movement during the last 11,000 years. Faults that have moved in the relatively recent geological past are generally presumed to be the most likely candidates to generate damaging earthquakes in the lifetimes of residents, buildings, or communities.

The Seismic Hazards Mapping Act establishes a statewide public safety standard for mitigation of earthquake hazards. According to the Act the minimum level of mitigation for a project "should reduce the risk of ground failure during an earthquake to a level that does not cause the collapse of a building intended for human occupancy," though generally not to a level of no ground failure to all. Moreover, the California Building Code 2010 (CBC) establishes standards for seismic safety in the design and construction of buildings, and includes "significant building design and construction criteria that have been tailored for California earthquake conditions." It "provides standards that must be met to safeguard life or limb, health, property, and public welfare by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all buildings and structures within its jurisdiction." Chapter 18 of the UBC specifies the required level of soil investigation. It contains requirements applicable to buildings and foundations, which take into consideration reduction of potential seismic hazards.

The CBC requires geologic and earthquake engineering reports for all proposed construction, prepared by a California-certified engineering geologist in consultation with a California-registered geotechnical engineer, the purpose of which is to identify geologic and seismic conditions that may require project mitigations. (Cal. Code Regs., Title 24, §§ 1802.7.1, 1802.7.2.) The report must contain data which provide an assessment of the nature of the site and potential for earthquake damage based on appropriate investigations of the regional and site geology, project foundation conditions and the potential seismic shaking at the site. (Cal. Code Regs., Title 24, § 1802.7.2.) The CBC also requires a geotechnical report, which would provide evaluations of the soil conditions of the site and the potential geologic/seismic hazards affecting the site. The report must include site-specific evaluations of design criteria related to the nature and extent of foundation materials, groundwater conditions, liquefaction potential, settlement potential, slope stability, and potential site ground motion. (Cal. Code Regs., Title 24, § 1802.81.)"

City Ordinance 9.08.160 states "In accordance with provisions of the Alquist-Priolo Special Studies Zone Act (Division 2, Chapter 7.5 of the Public Resource Code) and the Public Health and Safety Element of the City General Plan, a geologic investigation shall be required for any development proposal involving structures for human occupancy within the special study zone for the San Jacinto

¹ The Alquist-Priolo Earthquake Fault Zoning Act defines *active faults* as those that show proven displacement of the ground surface within about the last 11,000 years. *Potentially active faults* are those that show evidence of movement within the last 1.6 million years.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Fault, as identified on the special studies zone maps prepared by the state of California Department of Conservation, or the Casa Loma Fault, as identified on the seismic zone map in the City General Plan. Geologic investigations shall be prepared by a geologist registered in the state of California and shall be reviewed for acceptance by a geologist registered in the state of California who is either an employee or under contract to the City. Geologic investigations shall consider ground shaking as the greatest potential risk and include a thorough evaluation of potential hazards based upon soils types, slope stability, proximity to fault lines and expected magnitude. Copies of all geologic investigations shall be kept on file in the office of the City building official.”

The western portion of the site is crossed by the City of Moreno Valley Seismic Zone, a postulated trace of the Casa Loma Fault and the Farm Road Strand. A detailed fault investigation was performed by Leighton for these projected faults. Although no active faulting was observed, some local discontinuous fracturing was observed and documented. Because of the potential for ground movements in this area, mitigation is required.

Specific Plan Design Features. The Specific Plan does not contain any policies that specifically address seismic limitations, but does acknowledge that all future development will require the preparation of site-specific geotechnical reports to ensure compliance with all applicable standards.

Mitigation Measures. State law prohibits the construction and placement of habitable structures¹ over the trace of an active fault pursuant to the Alquist-Priolo Act. The A-P Earthquake Fault Zone is located on the eastern border of the project site (refer to Figure 4.6.1). Trenching conducted by Leighton across the Claremont Segment of the San Jacinto Fault in the eastern area of the project site identified the location of a portion of the fault; however, the entire length of the fault through the project site was not trenched. Although no habitable structure can be located on an active fault per State law, fault rupture hazard represents a potential significant seismic hazard on site that would require mitigation. To ensure fault rupture impacts are appropriately mitigated, the following measures has been identified:

4.6.6.1A Prior to approval of any projects for future development between Redlands Boulevard and Theodore Street, south of Dracaea Avenue (projected east from Redlands Boulevard), and the area south of Alessandro from the western boundary along the Mount Russell toe of slope easterly into the site 1,500 feet, the City shall determine if a detailed fault study of the Casa Loma Fault Zone area is required based on available evidence. If necessary, any additional geotechnical investigations shall be prepared by a qualified geologist and determine if structural setbacks are needed, and shall identify specific remedial earthwork and/or foundation recommendations. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other

¹ California Code of Regulations, Section 3601 states, “A structure for human occupancy is any structure used or intended for supporting or sheltering any use of occupancy, which is expected to have a human occupancy rate of more than 2,000 person-hours per year.”

relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur. Structures intended for human occupancy shall not be located within any structural setback zone as determined by those studies. This measure shall be implemented to the satisfaction of the City Engineer in consultation with the Project Geologist.

4.6.6.1B

Prior to approval of any projects for ~~future~~ development within or adjacent to the San Jacinto Alquist-Priolo Earthquake Fault Zone, the City shall review and approve a geotechnical fault study prepared by a qualified geologist to confirm the alignment and size of any required building setbacks related to the fault zone. If necessary, this study shall identify a “special foundation or grading remediation zone” for the areas supporting structures intended for human occupancy where coseismic deformation (fractures) is observed. This zone shall be determined after subsurface evaluation based on proposed building locations. Specific remedial earthwork and foundation recommendations shall be evaluated as necessary based on proposed building locations. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur.

This study ~~will likely~~ may involve ~~future~~ trenching to adequately identify the location of the Claremont segment of the San Jacinto Fault Zone that crosses the eastern portion of the World Logistics Center Specific Plan property. This measure shall be implemented to the satisfaction of the City Engineer in consultation with the Project Geologist.

4.6.6.1C

Prior to the approval of ~~project~~ grading permits, or permits for construction of off-site improvements, ~~whichever comes first~~, the City shall review and approve plans confirming that the project has been designed to withstand anticipated ground shaking and other geotechnical and soil constraints (e.g., settlement). The project proponent shall submit ~~improvement~~ plans to the City or County as appropriate for review and approval prior to issuance of grading permits or issuance of permits for the construction of any offsite improvements related to the project. This measure shall be implemented to the satisfaction of the City Engineer

Level of Impact After Mitigation. Adherence to the measures identified in the geotechnical investigations, as well as other requirements identified and required by the City, will ensure fault rupture hazards are reduced to a less than significant level.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

4.6.6.2 Ground Shaking

Impact 4.6.6.2: *Future development permitted by the proposed project would locate development in an area susceptible to strong seismic ground shaking.*

Threshold	Would the proposed project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong ground shaking?
-----------	---

Southern California is a seismically active area and, therefore, will continue to be subject to ground shaking resulting from seismic activity on regional faults. Ground shaking from earthquakes associated with nearby and more distant faults is expected to occur during the lifetime of the project. The level of potential ground motion is considered moderate to high in the City of Moreno Valley and, therefore, in the project area.

Project or Specific Plan Design Features. The Specific Plan does not contain any policies that specifically address seismic limitations, but does acknowledge that all future development will require the preparation of site-specific geotechnical reports to ensure compliance with all applicable standards.

Mitigation Measures. In accordance with the City’s General Plan Safety Element (Objective 6.1),¹ project development will require geological and geotechnical investigations by State-licensed professionals. The geotechnical investigations will provide design considerations and earthwork recommendations to ensure that ground shaking impacts are appropriately mitigated. In addition, California Code of Regulations (CCR), Title 24, also known as the California Building Standards Code, contains building design and construction requirements relating to fire and life safety, and structural safety. The CBC also includes standards designed to ensure that structures within California are built to withstand expected levels of seismic activity for each earthquake region throughout the State. Specifically, Part 2 of Title 24, including Chapters 4, 16-18, and Appendix J provide guidance regarding grading, soils, and construction techniques related to seismic protection. These codes are provided to protect public safety and ensure that all structures built in the State can withstand anticipated seismic ground shaking and other related geotechnical and soils constraints.

To ensure ground shaking impacts are appropriately mitigated, the following measure is recommended:

4.6.6.2A ~~Prior to issuance of any building permits the City shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), City Building Code, and/or professional engineering standards appropriate for the seismic zone in which such construction may occur.~~

Prior to issuance of building permits for any portion of the project site, a site-specific, design level geotechnical investigation for each parcel shall be submitted to the City, which would comply with all applicable state and local code requirements, and includes an analysis of the expected ground motions at the site from known active faults using accepted methodologies. The report shall determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults. The report

¹ Moreno Valley General Plan, Chapter 9 Goals and Objectives, pg. 9-30.

shall also determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur.

In addition, adherence to **Mitigation Measure 4.6.6.1C** addresses impacts of off-site improvements in this regard.

Level of Significance After Mitigation. Adherence to the measures identified in the geotechnical investigations, as well as other requirements identified and required by the City, will ensure ground shaking hazards are reduced to a less than significant level.

4.6.6.3 Unstable Soils

Impact 4.6.6.3: *Future development permitted by the proposed project may locate development in an area with expansive soils.*

Threshold	Would the proposed project be located on expansive soil, creating substantial risks to life or property?
-----------	--

As previously identified, expansive soils generally have a substantial amount of clay particles, which can give up water (shrink) or absorb water (swell). The change in the volume exerts stress on buildings and other loads placed on these soils. The extent or range of the shrink/swell is influenced by the amount and kind of clay present in the soil. Expansive soils can be widely dispersed and they can occur in hillside areas as well as low-lying alluvial basins. On-site soils (Dv and Wb soils) are identified as having a moderate to low shrink-swell potential. Because the potential exists to locate development on moderately expansive soils, impacts are considered significant and mitigation is required.

Project or Specific Plan Design Features. The Specific Plan does not contain any policies that specifically address seismic limitations, but does acknowledge that all future development will require the preparation of site-specific geotechnical reports to ensure compliance with all applicable standards.

Mitigation Measures. In accordance with the City’s General Plan Safety Element (Implementation Measure I.E.1) and as indicated previously, development of the project will require geological and geotechnical investigations by State-licensed professionals. To ensure impacts from expansive soils

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

are addressed for specific development sites, adherence to **Mitigation Measures 4.6.6.3A** through **4.6.6.3C** will be required.

4.6.6.3A ~~Prior to the approval of a Each Plot Plan application for any development project or associated off-site improvements, a shall include a site-specific, design level geotechnical report evaluating investigation for each parcel, in compliance with all applicable state and local code requirements, and including an analysis of the expected soil hazards at the site and planned improvements shall be submitted to and approved. The report shall determine:~~

- ~~1. Structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults.~~
- ~~2. The final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements.~~

~~Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. These investigations shall identify any site-specific impacts from compressible and expansive soils based on the actual location of individual pads proposed in the future, so that differential movement can be further verified or evaluated in view of the actual foundation plan and imposed fill or structural loads. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur.~~

Compliance with this measure will ensure that future buildings are designed to protect the structure and occupants from on-site soil limitations, consistent with State Building Code requirements. This measure shall be implemented to the satisfaction of the City Engineer.

4.6.6.3B ~~Prior to issuance of any grading permit for development within the Specific Plan, any Any cut slopes in excess of five (5) feet in vertical height shall be constructed as “replacement fill slopes” per the project geotechnical report, due to the variable nature of the onsite alluvial soils. This measure shall be implemented to the satisfaction of the City Land Development Division and the City Engineer in consultation with the Project Geologist.~~

4.6.6.3C ~~Prior to issuance of any discretionary permit for development within the Specific Plan, additional geotechnical and soils site investigations will be required as appropriate~~

~~once site grading and foundations plans become available for individual building sites. These studies shall address if or to what degree compressible and/or expansive alluvium on or underlying individual pads is present, or if there is a potential for differential settlement. This measure shall be implemented to the satisfaction of the City Engineer.~~

~~4.6.6.3D~~ **4.6.6.3C** ~~Prior to issuance of any discretionary permit and d~~During all grading activities for development within the Specific Plan, a geotechnical engineer shall ~~observe and/or supervise~~ monitor site preparation, removal of unsuitable soils, mapping of all earthwork excavations, approval of imported earth materials, fill placement, foundation installation, and other geotechnical operations. Laboratory testing of subsurface materials to confirm compacted dry density and moisture content, consolidation potential, corrosion potential, expansion potential, and resistance value (R-value) shall be performed prior to and during grading as appropriate. This measure shall be implemented to the satisfaction of the City Engineer in consultation with the Project Geologist.

Level of Impact After Mitigation. Implementation of **Mitigation Measures 4.6.6.3A** through **4.6.6.3C**, and adherence to actions identified in subsequent geotechnical investigations, as well as other requirements identified and required by the City, will ensure that the potential impact from expansive soils are reduced to a less than significant level.

4.6.7 Cumulative Impacts

The cumulative area for geologic issues is the City of Moreno Valley and western Riverside County, within the larger context of southern California due to regional seismicity. The project area has potential geotechnical and soils constraints, as the entire southern California area contains a number of major regional and local faults, including the San Andreas, San Jacinto, and Elsinore Faults.

The presence of regional faults creates the potential for damage to structures or injury to persons during seismic events. However, City, County, and State regulations provide guidelines for development in areas with geologic constraints and ensure that the design of buildings is in accordance with applicable CBC standards and other applicable standards, which reduces potential property damage and human safety risks to less than significant levels. Anticipated development in the City and surrounding area in general will not have a cumulatively considerable impact on earth resources, nor will regional geotechnical constraints have a cumulatively considerable impact on the proposed WLC project or cumulative projects, as long as proper design and engineering are implemented based on available seismic and other geotechnical data. The proposed WLC project represents an incremental portion of this potential impact, so the project will not have cumulatively significant impacts in this regard.

Because it is reasonable to conclude that all development within seismically active areas will be required to adhere to applicable State regulations, CBC standards, and the design and siting standards required by local agencies, a less than significant cumulative impact would occur with implementation of the proposed WLC project.

NOTE TO READERS. This section has been revised in response to public comments received on the Programmatic DEIR which have resulted in project changes, updates to technical studies and revisions to EIR sections and proposed Mitigation Measures.

4.7 GREENHOUSE GAS EMISSIONS, CLIMATE CHANGE, AND SUSTAINABILITY

This section provides a discussion of global climate change, existing regulations pertaining to global climate change, and an analysis of greenhouse gas (GHG) emissions associated with the proposed project. This analysis examines the short-term construction and long-term operational impacts and evaluates the effectiveness of measures incorporated as part of the project design.

For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers ~~3,948~~ 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes ~~3,814~~ 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering ~~3,814~~ 3,714 acres, which redesignates approximately 70 percent of the area (~~2,740~~ 2,610 acres) for logistics warehousing (new LD and LL, ~~LS~~ zones) and the remaining ~~30~~ 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.

A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the ~~2,740~~ 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*. ~~The environmental impacts of all of these entitlements on the entire project area are addressed in this EIR and the accompanying technical reports and analyses.~~

This section analyzes the proposed project's potential climate impacts based on the following technical study:

- *Air Quality, Greenhouse Gas, and Health Risk Assessment Report World Logistics Center Specific Plan* (Michael Brandman Associates/FirstCarbon Solutions, original dated January 2013 revised dated April 2015) contained in Appendix D of this EIR.

4.7.1 Existing Setting

4.7.1.1 Global Climate Change

Global climate change is the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The term “global climate change” is often used interchangeably with the term “global warming,” but “global climate change” is preferred by some scientists and policy makers to “global warming” because it helps convey the notion that there are other changes in addition to rising temperatures.

Climate change refers to any significant change in measures of climate such as temperature, precipitation, or wind, lasting for decades or longer (U.S. Environmental Protection Agency [EPA], 2007). Climate change may result from:

- Natural factors, such as changes in the sun’s intensity or slow changes in the Earth’s orbit around the sun;
- Natural processes within the climate system (e.g., changes in ocean circulation); and/or
- Human activities that change the atmosphere’s composition (e.g., through burning fossil fuels) and the land surface (e.g., deforestation, reforestation, urbanization, and desertification).

The primary observed effect of global climate change has been a rise in the average global tropospheric¹ temperature of 0.36 degrees Fahrenheit (°F) per decade, determined from meteorological measurements worldwide between 1990 and 2005. Climate change modeling shows that further warming could occur, which would induce additional changes in the global climate system during the current century. Changes to the global climate system, ecosystems, and the environment of California could include higher sea levels, drier or wetter weather, changes in ocean salinity, changes in wind patterns or more energetic aspects of extreme weather, including droughts, heavy precipitation, heat waves, extreme cold and increased intensity of tropical cyclones (hurricanes). Specific effects in California might include a decline in the Sierra Nevada snowpack, erosion of California’s coastline, and seawater intrusion in the Delta.

Human activities, such as fossil fuel combustion and land use changes release carbon dioxide (CO₂) and other compounds, cumulatively termed greenhouse gases (GHGs). GHGs are effective in trapping infrared radiation that otherwise would have escaped the atmosphere, thereby warming the atmosphere, the oceans, and earth’s surface (EPA, 2007). Many scientists believe that “most of the warming observed over the last 50 years is attributable to human activities.”² The increased amounts of CO₂ and other GHGs are alleged to be the primary causes of the human-induced component of warming.

GHGs are present in the atmosphere naturally, released by natural sources, or formed from secondary reactions taking place in the atmosphere. They include CO₂, methane (CH₄), nitrous oxide (N₂O), and ozone (O₃). In the last 200 years, substantial quantities of GHGs have been released into the atmosphere. These extra emissions are increasing GHG concentrations in the atmosphere, enhancing the natural greenhouse effect, which is believed to be causing global climate change. While human-made GHGs include CO₂, CH₄, and N₂O, some (like chlorofluorocarbons [CFCs]) are completely new to the atmosphere.

¹ The troposphere is the zone of the atmosphere characterized by water vapor, weather, winds, and decreasing temperature with increasing altitude.

² Intergovernmental Panel on Climate Change (IPCC), *Climate Change 2007: The Physical Science Basis*, <http://www.ipcc.ch>.

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

GHGs vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The global warming potential is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere (“atmospheric lifetime”). The GWP of each gas is measured relative to CO₂, the most abundant GHG. The definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of CO₂ over a specified time period. GHG emissions are typically measured in terms of metric tons of “CO₂ equivalents” (mt CO₂e or MTCO₂e).

~~Natural sources of CO₂ include the respiration (breathing) of humans and animals and evaporation from the oceans. Together, these natural sources release approximately 150 billion tonnes of CO₂ each year, far outweighing the 7 billion tonnes of human-made emissions from fossil fuel burning, waste incineration, deforestation, and cement manufacture. Nevertheless, natural removal processes such as photosynthesis by land- and ocean-dwelling plant species cannot keep pace with this extra~~

Methane is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Human-made sources include the mining and burning of fossil fuels; digestive processes in ruminant animals such as cattle; rice paddies; and the burying of waste in landfills. ~~Total annual emissions of CH₄ are approximately 500 million tonnes, with human-made emissions accounting for the majority. As for CO₂, the major removal process of atmospheric CH₄—chemical breakdown in the atmosphere—cannot keep pace with source emissions, and CH₄ concentrations in the atmosphere are increasing.~~

~~Worldwide emissions of GHGs in 2008 were 30.1 billion metric tons of CO₂e³ and have increased considerably since that time. It is important to note that the global emissions inventory data are not all from the same year and may vary depending on the source of the emissions inventory data. 2010 were approximately 47,183 million mt CO₂e¹~~ Emissions from the top five countries and the European Union accounted for approximately 55 percent of the total global GHG emissions, according to the most recently available data. The United States was the number two producer of GHG emissions, contributing 14 percent of the emissions. The primary GHG emitted by human activities in the United States was CO₂, representing approximately 84 percent of total GHG emissions. CO₂ from fossil fuel combustion, the largest source of GHG emissions, accounted for approximately 80 percent of the GHG emissions.²

In 2009, the United States emitted approximately 6.6 billion mt CO₂e or approximately 25 tons per year (tpy) per person. Of the six major sectors nationwide (electric power industry, transportation, industry, agriculture, commercial, and residential), the electric power industry and transportation sectors combined account for approximately 62 percent of the GHG emissions; the majority of the electrical power industry and all of the transportation emissions are generated from direct fossil fuel combustion. Between 1990 and 2006, total United States GHG emissions rose approximately 14.7 percent.³

World carbon dioxide emissions⁴ are expected to increase by 1.9 percent annually between 2001 and 2025. Much of the increase in these emissions is expected to occur in the developing world where emerging economies, such as China and India, fuel economic development with fossil energy. Developing countries’ emissions are expected to grow above the world average at 2.7 percent annually between 2001 and 2025; and surpass emissions of industrialized countries near 2018.

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

The California Air Resources Board (CARB) is responsible for developing the California Greenhouse Gas Emission Inventory. This inventory estimates the amount of GHGs emitted into and removed from the atmosphere by human activities within the State of California and supports the Assembly Bill (AB) 32 Climate Change Program. The CARB's current GHG emission inventory covers the years 1990 through 2008 and is based on fuel use, equipment activity, industrial processes, and other relevant data (e.g., housing, landfill activity, and agricultural lands).

According to CARB emission inventory estimates, California emitted approximately 454 million mt CO₂e emissions in 2009.¹ The year 2009 saw a small decrease in statewide GHG emissions from 483 million mt CO₂e in 2008 driven by a noticeable drop in on-road transportation emissions. 2009 also reflects the beginning of the economic recession and fuel price spikes. As the economy recovers, GHG emissions are likely to rise again without other mitigation actions. California's net emissions of GHG decreased 1.3 percent from 459 mmt of CO₂e in 2000 to 453 mmt in 2009, with a maximum of 483.9 mmt in 2004. During the period from 2000 to 2009, California's GHG emissions per person decreased by 9.7 percent, but the emissions reductions were offset by the state's population increase of 9.0 percent. The CARB estimates that transportation was the source of approximately 38 percent of the State's GHG emissions in 2009, followed by electricity generation at 23 percent. Other sources of GHG emissions were industrial sources at 20 percent, residential plus commercial activities at 9 percent, and agriculture at 7 percent.

The most recent inventory of GHG emissions in California estimated 458.68 million mt CO₂e in 2012¹. This is a 1.7 percent increase in GHG emissions from 2011 and the first emissions increase since 2007. This increase was driven primarily by strong economic growth, the unexpected closure of the San Onofre Nuclear Generating Station, and drought conditions that limited in-state hydropower generation. Since 2000, GHG emissions have decreased by 1.6 percent (from 466 to 459 million mt CO₂e) after reaching a peak of 493 million mt CO₂e in 2004. The top contributor of emissions in 2012 was transportation, which contributed 37 percent of the emissions. The second highest sector was industrial (22 percent), which includes sources from refineries, general fuel use, oil and gas extraction, and cement plants. The CARB staff has projected statewide GHG emissions for the year 2020 will be 509.4 million mt CO₂e².

The methodology used to estimate the GHG emissions from transportation differs from that used to estimate the GHG emissions for the project. The California inventory is based on fuel sales in California, while the project inventory is based on trip generation rates provided by the Traffic Impact Analysis for the project and are conservative due to the fact that conservative trip generation rates were used to estimate vehicle trips.

~~The CARB staff has projected statewide GHG emissions for the year 2020, which represent the emissions that would be expected to occur with reductions anticipated from Pavley I and the Renewables Portfolio Standard (38 mmt CO₂e total), will be 507 million mt CO₂e.² GHG emissions from the transportation and electricity sectors as a whole are expected to increase at approximately 36 percent and 22 percent of total CO₂e emissions, respectively. The industrial sector consists of large stationary sources of GHG emissions and the percentage of the total 2020 emissions is projected to be 18 percent of total CO₂e emissions. The remaining sources of GHG emissions in 2020 are high global warming potential gases at 7 percent, residential and commercial activities at 9 percent, agriculture at 6 percent, and recycling and waste at 2 percent.~~

4.7.1.2 Effects of Global Climate Change

Climate change is a change in the average weather of the earth that is measured by alterations in wind patterns, storms, precipitation, and temperature. These changes are assessed using historical records of temperature changes occurring in the past, such as during previous ice ages. Many of the concerns regarding climate change use these data to extrapolate a level of statistical significance specifically focusing on temperature records from the last 150 years (the Industrial Age) that differ from previous climate changes in rate and magnitude.

The International Panel on Climate Change (IPCC) constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. In its Fourth Assessment Report, the IPCC predicted that the global mean temperature change from 1990 to 2100, given six scenarios, could range from 1.1 degrees Celsius (°C) to 6.4 °C. Regardless of analytical methodology, global average temperatures and sea levels are expected to rise under all scenarios (IPCC 2007a). The IPCC concluded that global climate change was largely the result of human activity, mainly the burning of fossil fuels. However, the scientific literature is not consistent regarding many of the aspects of global warming or climate change, including actual temperature changes during the 20th century, the accuracy of the IPCC report, and contributions of human versus non-human activities.

Effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme weather events, and degradation of air quality. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems. Heat-related problems include heat rash and heat stroke. In addition, climate-sensitive diseases may increase, such as those spread by mosquitoes and other disease-carrying insects. Such diseases include malaria, dengue fever, yellow fever, and encephalitis. Extreme events such as flooding and hurricanes can displace people and agriculture. Global warming may also contribute to air quality problems from increased frequency of smog and particulate air pollution.

Additionally, ~~according to the 2006 California Climate Action Team (CAT) Report~~ the following climate change effects, which are based on trends established by the IPCC, can be expected in California over the course of the next century:

- A diminishing Sierra snowpack declining by 70 percent to 90 percent, threatening the State's water supply. If GHG emissions continue unabated, more precipitation will fall as rain instead of snow, and the snow that does fall will melt earlier.
- A rise in sea levels resulting in the displacement of coastal businesses and residences. During the past century, sea levels along California's coast have risen about seven inches. If emissions continue unabated and temperatures rise into the higher anticipated warming range, sea level is expected to rise an additional 22 to 35 inches by the end of the century. Elevations of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. (Note: This condition would not affect the project area as it is a significant distance away from coastal areas.)
- An increase temperature and extreme weather events. Climate change is expected to lead to increases in the frequency, intensity, and duration of extreme heat events and heat waves in California. More heat waves can exacerbate chronic disease or heat-related illness.
- Increased risk of large wildfires if rain increases as temperatures rise. Precipitation, winds, temperature, and vegetation influence wildfire risk; therefore, wildfire risk is not uniform throughout the state. Changes in current precipitation patterns could influence that risk. As an example, wildfires in the grasslands and chaparral ecosystems of southern California are estimated to increase by approximately 30 percent toward the end of the 21st century because

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

more winter rain will stimulate the growth of more plant fuel available to burn in the fall. In contrast, a hotter, drier climate could promote up to 90 percent more *northern* California fires by the end of the century by drying out and increasing the flammability of forest vegetation.

- Increasing temperatures from 8 to 10.4°F under the higher emission scenarios, leading to a 25 percent to 35 percent increase in the number of days ozone pollution levels are exceeded in most urban areas (see below).
- Increased vulnerability of forests due to forest fires, pest infestation, and increased temperatures.
- Reductions in the quality and quantity of certain agricultural products. The crops and products likely to be adversely affected include wine grapes, fruit, nuts, and milk.
- Exacerbation of air quality problems. If temperatures rise to the medium warming range, there could be 75 to 85 percent more days with weather conducive to ozone formation in Los Angeles and the San Joaquin Valley, relative to today's conditions. This is more than twice the increase expected if rising temperatures remain in the lower warming range. This increase in air quality problems could result in an increase in asthma and other health-related problems.
- A decrease in the health and productivity of California's forests. Climate change can cause an increase in wildfires, an enhanced insect population, and establishment of non-native species.
- Increased electricity demand, particularly in the hot summer months.
- Increased ground-level ozone formation due to higher reaction rates of ozone precursors.

Note: The following text regarding specific consequences of climate change in Moreno Valley was in the 2013 report; minor revisions were made and it has been added to this section.

Consequences of Climate Change in Moreno Valley. The figure below displays a chart of measured historical and projected annual average temperatures in the Moreno Valley area. As shown in the figure, temperatures are expected to rise in the low and high GHG emissions scenarios.

Water for the project would be provided by the Eastern Municipal Water Department (EMWD). The EMWD 2010 Urban Water Management Plan considered the impact of climate change on water supplies as part of its long-term strategic planning. One of the outcomes of climate change could be more frequent limitations on imported supplies. To limit the impact of climate change, EMWD's long-term planning focuses on the development of reliable local resources and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD's service area.

The figure below displays the fire risk in Moreno Valley relative to 2010 levels. The figure displays the projected increase in potential area burned given three different 30-year averaging periods ending in 2020, 2050, and 2085 and two different scenarios (A2, B1). The data are modeled solely on climate projections and do not take landscape and fuel sources into account (there is very little combustible material in the project area). The data modeled the ratio of additional fire risk for an area as compared to the expected burned area. The data are shown in the figure below and indicate that under the low-emissions scenario, the additional wildfire risk is about 1, which means that wildfire risk is expected to remain about the same. Under the high-emission scenario, additional risk is variable with a slight increase. Other areas in California, such as the area near the border with Oregon, are projected to have a 9-fold increase in potential area burned.

Wildfire Risk in Moreno Valley

Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

4.7.1.3 Greenhouse Gases

The most common greenhouse gases include water vapor, carbon dioxide, methane, nitrous oxides, chlorofluorocarbons, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, ozone, and aerosols. Greenhouse gases defined by AB 32 include carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride.

Natural processes and human activities emit greenhouse gases. The presence of greenhouse gases in the atmosphere affects the earth's temperature. Many scientists believe that emissions from human activities, such as electricity production and vehicle use, have led to elevated concentrations of these gases in the atmosphere beyond the level of naturally occurring concentrations. Table 4.7.A lists greenhouse gases, the effects of each greenhouse gas, and some of the sources for each of the greenhouse gases.

Climate change is driven by radiative forcings and feedbacks. Radiative forcing is the difference between the incoming energy and outgoing energy in the climate system. In other terms, radiative forcing is the energy absorbed by the greenhouse gas that would otherwise be lost to space. Positive forcing tends to warm the surface while negative forcing tends to cool it. A feedback is a climate process that can strengthen or weaken a forcing. For example, when ice or snow melts, it reveals darker land underneath, which absorbs more radiation and causes more warming.

In order to attempt to quantify the impact of greenhouse gases, the gases are assigned global warming potentials. Individual greenhouse gas compounds have varying global warming potential and atmospheric lifetimes. Carbon dioxide, the reference gas for global warming potential, has a global warming potential of one. ~~The global warming potential of a greenhouse gas measure potential of how much a given mass of a greenhouse gas is estimated or aerosol to contribute trap heat in the atmosphere compared to global the reference gas, carbon dioxide, and is a measurement of the radiative forcing of a gas. There are positive (warming) and negative (cooling) forcings.~~ To describe how much global warming a given type and amount of greenhouse gas may cause, the carbon dioxide equivalent is used. The calculation of the carbon dioxide equivalent is a consistent methodology for comparing greenhouse gas emissions since it normalizes various greenhouse gas emissions to a consistent reference gas, carbon dioxide. Carbon dioxide as a molecule has a certain potential for warming; other molecules have a different potential. For example, methane's warming potential of 21 indicates that methane has 21 times greater warming effect than carbon dioxide on a molecule per molecule basis. A carbon dioxide equivalent is the mass emissions of an individual greenhouse gas multiplied by its global warming potential.

Note: The following information is added in response to comments received on the Draft EIR. In addition, black carbon is now estimated in the GHG inventory.

Black Carbon. A specific aerosol of concern is black carbon. Black carbon is a light absorbing component of particulate matter and is formed by the incomplete combustion of fossil fuels, biofuels, and biomass. The following is additional information on black carbon:

- Black carbon is emitted directly into the atmosphere in the form of fine particles (PM_{2.5}).
- Black carbon contributes to the adverse impacts on human health, ecosystems, and visibility associated with PM_{2.5}.
- Black carbon influences climate by: 1) directly absorbing light, 2) reducing the reflectivity ("albedo") of snow and ice through deposition, and 3) interacting with clouds.
- The direct and snow/ice albedo effects of black carbon are widely understood to lead to climate warming. However, the globally averaged net climate effect of black carbon also includes the effects associated with cloud interactions, which are not well quantified and may cause either

warming or cooling. Therefore, though most estimates indicate that black carbon has a net warming influence, a net cooling effect cannot be ruled out.

- Sensitive regions such as the Arctic and the Himalayas are particularly vulnerable to the warming and melting effects of black carbon.
- Black carbon is emitted with other particles and gases, many of which exert a cooling influence on climate. Therefore, estimates of the net effect of black carbon emissions sources on climate should include the offsetting effects of these co-emitted pollutants. This is particularly important for evaluating mitigation options.
- Black carbon's short atmospheric lifetime (days to weeks), combined with its strong warming potential, means that targeted strategies to reduce black carbon emissions can be expected to provide climate benefits within the next several decades.
- The different climate attributes of black carbon and long-lived GHGs make it difficult to interpret comparisons of their relative climate impacts based on common metrics.
- Based on recent emissions inventories, the majority of global black carbon emissions come from Asia, Latin America, and Africa. Emissions patterns and trends across regions, countries and sources vary significantly.
- Control technologies are available to reduce black carbon emissions from a number of source categories.
- Black carbon mitigation strategies, which lead to reductions in PM_{2.5}, can provide substantial public health and environmental benefits.

THIS PAGE INTENTIONALLY LEFT BLANK

Properties, Effects, and Sources

Description and Physical Properties	Health Effects	Sources
<p>H_2O is the most abundant, important, and variable greenhouse gas in the atmosphere; in the atmosphere it maintains a climate. Changes in its concentration are primarily considered to be a result of climate warming rather than a direct result of the atmosphere.</p>	<p>There are no health effects from water vapor. When some pollutants come in contact with water vapor, they can dissolve and then the water vapor can be a transport mechanism to enter the human body.</p>	<p>The main source of water vapor is evaporation from the sources include evaporation from other water bodies, sublimation from sea ice and snow, and transpiration from plant leaves.</p>
<p>CO_2 is an odorless, colorless natural greenhouse gas.</p>	<p>Outdoor levels of carbon dioxide are not high enough to result in negative health effects.</p>	<p>Carbon dioxide is emitted from natural and anthropogenic sources. It includes decomposition of dead organic matter; respiration of plants; evaporation from oceans; and volcanic outgassing from burning coal, oil, natural gas, and wood.</p>
<p>is an extremely effective GHG with a global warming potential of 21, though its concentration is less than carbon dioxide and its lifetime in the atmosphere is brief compared to other greenhouse gases.</p>	<p>There are no health effects from methane.</p>	<p>Methane has both natural and anthropogenic sources. It is produced in processes in low oxygen environments, such as in swamps, rice fields, and roots of the plants). Over the last 50 years, human activities using natural gas, and mining coal have added to the atmosphere. Other anthropogenic sources include fossil-fuel combustion.</p>
<p>H_2O, also known as laughing gas, is a colorless greenhouse gas. It has a global warming potential of 310.</p>	<p>Nitrous oxide can cause dizziness, euphoria, and sometimes slight hallucinations. In small doses it is harmless. In some cases, heavy and extended use can cause Olney's Lesions (brain damage).</p>	<p>Concentrations of nitrous oxide also began to rise at the beginning of the 19th century. In 1998, the global concentration was 314 ppb. Nitrous oxide is produced in soil and water, including those reactions that occur in addition to agricultural sources, some industrial processes such as nylon production, nitric acid production, and vehicle exhaust. It is used as an aerosol spray propellant. It is also used in potato chip bags to keep chips fresh. It is used in the production of nitrous oxide.</p>
<p>are gases formed synthetically by replacing all hydrogen atoms in methane (C_2H_6) with chlorine and/or fluorine atoms. CFCs are nontoxic, chemically unreactive in the troposphere (the level of air at the surface of the earth). Global warming potentials range from 3,800 to 8,100.</p>	<p>In confirmed indoor locations, working with CFC-113 or other CFCs is thought to have resulted in death by cardiac arrhythmia (heart frequency too high or too low) or asphyxiation.</p>	<p>CFCs have no natural sources, but were first synthesized in the 1930s for use as refrigerants, aerosol propellants, and cleaning solvents. Due to their ability to destroy stratospheric ozone, a global effort to halt their production was successful, so much so that levels of the major CFCs are declining. However, their long atmospheric lifetimes mean they will remain in the atmosphere for over 100 years.</p>
<p>are synthetic man-made chemicals that are used as a substitute for the greenhouse gases, they are one of three groups with the highest global warming potential (depending on the gas, ranges from 140 to 11,700). Prior to 1990, the only common PFCs were HFC-23. HFC-134a use is increasing due to its use as a refrigerant.</p>	<p>None.</p>	<p>HFCs are man-made for applications such as automobile air conditioning.</p>
<p>are stable molecular structures and do not break down through the atmosphere. Because of this, PFCs have very long lifetimes, ranging from 50,000 to 100,000 years. Two common PFCs are tetrafluoromethane (CF_4) and hexafluoroethane (C_2F_6). Global warming potentials range from 6,500 to 9,200.</p>	<p>None.</p>	<p>The two main sources of PFCs are primary aluminum and steel manufacturing.</p>
<p>is an inorganic, odorless, nontoxic, nonflammable gas. It has a global warming potential of 23,900. Concentrations in the 1990s were about 0.5 parts per billion. It has a lifetime of 3,200 years.</p>	<p>In high concentrations in confined areas, the gas presents the hazard of suffocation because it displaces the oxygen needed for breathing.</p>	<p>Sulfur hexafluoride is used for insulation in electric power equipment, in the magnesium industry, in semiconductor manufacturing, and in leak detection.</p>
<p>are fossil fuel burning biomass (plant material) and fossil fuel burning. They can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols.</p>	<p>Similar health effects associated with particulate matter (see Section 4.3. Air Quality, for a description of the health effects of particulate matter).</p>	<p>Sulfate aerosols are emitted when fuel containing sulfur is burned (in the form of black carbon or soot) is the result of incomplete combustion of fossil fuels. Although particulate matter regulations in the United States, global concentrations of sulfate aerosols are declining.</p>

4.7.1.4 Greenhouse Gas Inventories

The City of Moreno Valley estimated greenhouse gas emissions for the community for 2007 and 2010 and projected emissions for 2020 are shown in Table 4.7.B, which shows the reduced 2020 emissions are below the reduction target. The emissions shown are not actual emissions but are estimated using calculations and assumptions. The emissions represent emissions from the community of Moreno Valley (as opposed to the city government operations). Only select years were estimated based on data available.

Table 4.7.B: City of Moreno Valley Projected Greenhouse Gas Emissions

Source Category	Moreno Valley Greenhouse Gas Emissions (mt CO ₂ e per year)			
	2007	2010	BAU 2020	Reduced 2020
Transportation	517,098	513,581	788,267	421,561
Energy	287,261	277,230	356,192	251,372
Area	69,390	69,437	84,665	73,046
Water and Wastewater	21,595	16,831	20,216	14,158
Solid Waste	44,294	43,633	49,203	38,000
Total	939,638	920,712	1,298,543	798,137
Reduction Target	—	—	798,693	798,693

Notes: mt CO₂e = metric tons of carbon dioxide equivalents BAU = business as usual
Source: Table 9, City of Moreno Valley Greenhouse Gas Analysis, 2012.

The existing WLC project site is largely vacant with scattered dry farming that generates minimal greenhouse gas emissions. For the purposes of this analysis, a zero baseline will be assumed to identify the “worst case” emissions (i.e., GHG emissions from the entire WLC project without removal of any existing GHG emissions).

4.7.2 Regulatory Setting

4.7.2.1 International Regulation of Climate Change

Intergovernmental Panel on Climate Change (IPCC). In 1988, the United Nations created the IPCC to provide independent scientific information regarding climate change to policymakers. The IPCC does not conduct research itself, but rather compiles information from a variety of sources into reports regarding climate change and its impacts. The IPCC has thereafter periodically released reports on climate change, and in 2007 released its Fourth Assessment Report which concluded most global climate change was the result of human activity, mainly the burning of fossil fuels (see Section 4.7.1.1).

United Nations Framework Convention on Climate Change. On March 21, 1994, the United States joined a number of countries around the world in signing the United Nations Framework Convention on Climate Change (Convention). Under the Convention, governments gather and share information on greenhouse gas emissions, national policies, and best practices; launch national strategies for addressing greenhouse gas emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change.

Kyoto Protocol. The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing greenhouse gas emissions at average of five per cent against 1990 levels over the five-year period 2008-2012.

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

The Convention (discussed above) encouraged industrialized countries to stabilize emissions; however, the Protocol commits them to do so. Developed countries have contributed more emissions over the last 150 years; therefore, the Protocol places a heavier burden on developed nations under the principle of “common but differentiated responsibilities.” The United States has not entered into force of the Kyoto Protocol.

Moreover, since the United States declined to ratify the Kyoto Protocol in 1995, it has become increasingly clear that global climate change cannot be addressed without limiting GHG emissions from developing, as well as developed, countries. According to many sources, China has already surpassed the United States as the world’s largest GHG emitter and is building new coal-fired power plants at a rate of approximately one per week. A recent study conducted by economists at the UC Berkeley and UC San Diego estimated that China’s CO₂ emissions are growing by as much as 11 percent annually. In 2007, China released its first national plan on climate change, which includes goals related to increasing energy efficiency and increasing use of renewable resources. The plan, however, makes no commitments regarding reduction of GHG emissions.

Like China, India is already one of the top emitters of GHGs and continues to grow rapidly. India has recently pledged to take more action to fight global warming, for example, by pursuing solar energy, urging energy efficiency, and conservation, but it has not set any concrete goals in these areas, let alone pledged to reduce its carbon emissions. To the contrary, India’s emissions are projected to increase fourfold by 2030 (see “Melting Asia,” *The Economist*, June 5, 2008). Similarly, Brazil, the largest economy in South America, and another rapidly developing country, has no national policy requiring it to reduce carbon emissions. Brazil’s carbon emissions increased by more than 60 percent between 1990 and 2004, and are projected to continue to rise at a similar pace (see International Energy Agency, *World Energy Outlook 2006*).

The Kyoto Protocol expired in 2012. Formal negotiations to replace the protocol officially began in December 2007 at the UNFCCC Climate Change Conference in Bali, Indonesia (<http://unfccc.int/2860.php>). Whether a workable agreement can be reached, however, remains to be seen, as the United States continues to press for an agreement that requires firm commitments from developing nations, and countries like China and India continue to oppose binding targets (see <http://news.bbc.co.uk/2/hi/science/nature/7145608.stm>).

In addition, it should be noted that most mitigation measures that address greenhouse gas reduction typically parallel those that reduce the consumption of energy (i.e., electricity and natural gas). Reducing energy use in a market economy typically reduces the cost of energy. However, a reduced cost of energy can release pent-up demand (latent demand) for energy use, particularly in less developed portions of the world, such as Africa and Asia. As such, it is not clear how much energy use reduction in California or the U.S. would actually reduce worldwide energy use. The same would apply to measures to reduce greenhouse gas emissions.

4.7.2.2 Federal Regulations/Standards

Prior to the last decade, there have been no concrete Federal regulations of greenhouse gases or major planning for climate change adaptation. The following are actions regarding the Federal government, greenhouse gases, and fuel efficiency.

Greenhouse Gas Endangerment. *Massachusetts v. EPA* (Supreme Court Case 05-1120) was argued before the United States Supreme Court on November 29, 2006, in which it was petitioned that the EPA regulate four greenhouse gases, including carbon dioxide, under Section 202(a)(1) of the Clean Air Act. A decision was made on April 2, 2007, in which the Supreme Court found that greenhouse gases are air pollutants covered by the Clean Air Act. The Court held that the EPA

**Final Programmatic Environmental Impact Report
Volume 2 – Revised Draft EIR (Track Changes)
World Logistics Center Project**

Administrator must determine whether emissions of greenhouse gases from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding greenhouse gases under section 202(a) of the Clean Air Act:

- *Endangerment Finding:* The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases—carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride—in the atmosphere threaten the public health and welfare of current and future generations.
- *Cause or Contribute Finding:* The Administrator finds that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution, which threatens public health and welfare.

These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing greenhouse gas emissions standards for vehicles, as discussed in the section “Clean Vehicles” below.

~~The EPA denied ten petitions for Reconsideration of the Endangerment and Cause or Contribute Findings in 2010. Some of the petitioners included the Ohio Coal Association, Peabody Energy Company, and the State of Texas~~

In September 2011, the EPA Office of Inspector General evaluated the EPA's compliance with established policy and procedures in the development of the endangerment finding, including processes for ensuring information quality. The evaluation concluded that the technical support document should have had more rigorous EPA peer review.

In June 2012, a Federal appeals court rejected a lawsuit against the EPA. The suit alleged that the EPA violated the law by relying almost exclusively on data from the United Nations IPCC rather than doing its own research or testing data according to Federal standards. ~~The states include Virginia, Texas, Alabama, Florida, Hawaii, Indiana, Kentucky, Louisiana, Mississippi, Nebraska, North Dakota, Oklahoma, South Carolina, South Dakota, and Utah. Virginia intends to petition the Supreme Court to review the case The U.S. Chamber of Commerce and the National Association of Manufacturers (with others) filed petitions to the U.S. Court of Appeals – D.C. Circuit to rehear the case. The EPA and Department of Justice provided a response on October 12, 2012.~~

Clean Vehicles. Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the United States. On April 1, 2010, the EPA and the Department of Transportation's Highway Traffic and Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce greenhouse gas emissions and improve fuel economy for new cars and trucks sold in the United States.

The first phase of the national program would apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. The vehicles must meet an estimated combined average emissions level of 250 grams of carbon dioxide per mile, equivalent to 35.5 miles per gallon if the automobile industry were to meet this carbon dioxide level solely through fuel economy improvements. Together, these standards would cut carbon dioxide emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). The EPA and the National Highway Safety

Final Programmatic Environmental Impact Report

Volume 2 – Revised Draft EIR (Track Changes)

World Logistics Center Project

Administration are working on a second-phase rule to establish national standards for light-duty vehicles for model years 2017 and beyond.

On October 25, 2010, the EPA and the U.S. Department of Transportation proposed the first national standards to reduce greenhouse gas emissions and improve fuel efficiency of heavy-duty trucks and buses. For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20 percent reduction in carbon dioxide emissions and fuel consumption by the 2018 model year. For heavy-duty pickup trucks and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10 percent reduction for gasoline vehicles and up to a 15 percent reduction for diesel vehicles by 2018 model year (12% and 17% respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles (includes other vehicles like buses, refuse trucks, concrete mixers; everything except for combination tractors and heavy-duty pickups and vans), the agencies are proposing engine and vehicle standards starting in the 2014 model year, which would achieve up to a 10 percent reduction in fuel consumption and carbon dioxide emissions by the 2018 model year.

Mandatory Reporting of GHG. The Consolidated Appropriations Act of 2008, passed in December 2007, requires the establishment of mandatory GHG reporting requirements. On September 22, 2009, the EPA issued the Final Mandatory Reporting of Greenhouse Gases rule. The rule requires reporting of GHG emissions from large sources and suppliers in the United States, and is intended to collect accurate and timely emissions data to inform future policy decisions. Under the rule, suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions, are required to submit annual reports to the EPA.

This rule does not apply to high cube logistics developers within the WLC Project because, although the project would emit more than 25,000 mt CO₂e per year of GHGs, the rule only applies to the following categories: fossil fuel suppliers and industrial gas suppliers, direct GHG emitters, and manufacturers of heavy-duty and off-road vehicles and engines. The EPA's Applicability Tool was used to determine if the project developer would need to report the GHG emissions. The source categories that are required to report GHG emissions (i.e., production, manufacturing, electricity generation, and industrial waste landfills) did not apply to the project.

New Source Review Prevention of Significant Deterioration (GHG Tailoring Rule). The EPA issued a final rule on May 13, 2010, that establishes thresholds for greenhouse gases that define when permits under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit programs are required for new and existing industrial facilities. Operating permits are legally enforceable documents that permitting authorities issue to air pollution sources after the source has begun to operate. Title V Operating Permits are required from Title V of the Clean Air Act. This final rule “tailors” the requirements of these Clean Air Act permitting programs to limit which facilities will be required to obtain Prevention of Significant Deterioration and Title V permits. In the preamble to the revisions to the Federal Code of Regulations, the EPA states:

This rulemaking is necessary because without it the Prevention of Significant Deterioration and Title V requirements would apply, as of January 2, 2011, at the 100 or 250 tons per year levels provided under the Clean Air Act, greatly increasing the number of required permits, imposing undue costs on small sources, overwhelming the resources of permitting authorities, and severely impairing the functioning of the programs. EPA is relieving these resource burdens by phasing in the applicability of these programs to greenhouse gas sources, starting with the largest greenhouse gas emitters. This rule establishes two initial steps of the phase-in. The rule also commits the agency to take certain actions on future steps addressing smaller sources, but excludes certain smaller sources from Prevention of

Significant Deterioration and Title V permitting for greenhouse gas emissions until at least April 30, 2016.

EPA estimates that facilities responsible for nearly 70 percent of the national greenhouse gas emissions from stationary sources will be subject to permitting requirements under this rule. This includes the nation's largest greenhouse gas emitters—power plants, refineries, and cement production facilities.

On December 23, 2010, the EPA issued a series of rules that put the necessary regulatory framework in place to ensure that 1) industrial facilities can get Clean Air Act permits covering their GHG emissions when needed and 2) facilities emitting GHGs at levels below those established in the Tailoring Rule do not need to obtain Clean Air Act permits.

Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units. As required by a settlement agreement, the EPA proposed new performance standards for emissions of carbon dioxide for new affected fossil fuel-fired electric utility generating units on March 27, 2012. New sources greater than 25 megawatt would be required to meet an output based standard of 1,000 pounds of carbon dioxide per megawatt-hour. ~~based on the performance of widely used natural gas combined cycle technology.~~

Cap and Trade. Cap and trade refers to a policy tool where emissions are limited to a certain amount and can be traded, or provides flexibility on how the emitter can comply. Successful examples in the United States include the Acid Rain Program and the NO_x Budget Trading Program in the northeast. There is no Federal cap and trade program currently and no pending legislation exists to establish a cap and trade program.

Energy Policy and Conservation Act. The Energy Policy and Conservation Act of 1975 sought to ensure that all vehicles sold in the U.S. would meet certain fuel economy goals. Through this Act, Congress established the first fuel economy standards for on-road motor vehicles in the U.S. Pursuant to the Act, the National Highway Traffic and Safety Administration (NHTSA), which is part of the U.S. Department of Transportation (USDOT), is responsible for establishing additional vehicle standards and for revising existing standards. Since 1990, the fuel economy standard for new passenger cars has been 27.5 miles per gallon (mpg). Since 1996, the fuel economy standard for new light trucks (gross vehicle weight of 8,500 pounds or less) has been 20.7 mpg. The Corporate Average Fuel Economy (CAFE) program, administered by the EPA, was created to determine vehicle manufacturers' compliance with the fuel economy standards. The EPA calculates a CAFE value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information generated under the CAFE program, the USDOT is authorized to assess penalties for noncompliance. Please also refer to the subsection, "Clean Vehicles," above.

Energy Policy Act of 1992. The Energy Policy Act (EPAAct) of 1992 was passed to reduce the country's dependence on foreign petroleum and improve air quality. EPAAct includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. EPAAct requires certain Federal, State, and local governments and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are also included in EPAAct. Federal tax deductions will be allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the Act to consider a variety of incentive programs to help promote AFVs.

Energy Policy Act of 2005. The Energy Policy Act of 2005 includes provisions for renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and

rural community electrification; and establishes a Federal purchase requirement for renewable energy.

~~**Federal Regulation of Climate Change.** The United States has historically had a voluntary approach to reducing GHG emissions. However, on April 2, 2007, the United States Supreme Court ruled that the EPA has the authority to regulate CO₂ emissions under the Federal Clean Air Act (CAA). While there currently are no adopted Federal regulations for the control or reduction of GHG emissions, the EPA commenced several actions in 2009 that are required to implement a regulatory approach to global climate change.~~

~~On December 7, 2009, the EPA Administrator signed a final action under the CAA, finding that six greenhouse gases—CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆—constitute a threat to public health and welfare, and that the combined emissions from motor vehicles cause and contribute to global climate change. This EPA action does not impose any requirements on industry or other entities. However, the findings are a prerequisite to finalizing the GHG emission standards for light-duty vehicles mentioned below~~

~~On April 1, 2010, the EPA and NHTSA announced a final joint rule to establish a national program consisting of new standards for model year 2012 through 2016 light-duty vehicles that will reduce GHG emissions and improve fuel economy. EPA is finalizing the first-ever national GHG emissions standards under the CAA, and NHTSA is finalizing CAFE standards under the EPA Act. The EPA GHG standards require these vehicles to meet an estimated combined average emissions level of 250 grams of CO₂ per mile in model year 2016, equivalent to 35.5 mpg~~

4.7.2.3 State Regulations/Standards

California Code of Regulations Title 24, Part 6. Enacted in 1978, this part of the California Code established energy efficiency standards for residential and nonresidential buildings in response to a legislative mandate to reduce California's energy consumption. These standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The most recent standards (2013 Building Energy Efficiency Standards) were adopted and went into effect ~~January 1, 2010~~ July 1, 2014.¹ Such standards include the provision of cool roofs, demand control ventilation, skylights for day-lighting in buildings, thermal breaks for metal building roofs, and lighting power limits. These standards are expected to reduce the growth in electricity use of residential and non-residential buildings. Continual updates to Title 24 along with the State's implementation of AB 1493 and SB 1368 will have a major impact on the State's attainment of the AB 32 goals.

California Code of Regulations Title 24, Part 11. This part of the California Code is known as the California Green Building Standards Code (CALGreen Code) and was enacted to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts with positive environmental impacts and through encouragement of sustainable construction practices. The CALGreen Code is not intended to substitute for or be identified as meeting the certification requirements of any green building program that is not established and adopted by the California Building Standards Commission (CBSC). This update to Part 11 of Title 24 of the California Code of Regulations was effective January 1, 2011. Key
