~~**2007 AQMP.** One of the purposes of the 2007 AQMP is to lead the Basin into compliance with the Federal 8-hour ozone and $PM_{2.5}$ standards. The 2007 AQMP was adopted by the SCAQMD on June 1, 2007 (SCAQMD 2007b). On July 13, 2007, the SCAQMD Board adopted the 2007 Final AQMP Transportation Conformity Budgets and directed the Executive Officer to forward them to the CARB for approval and subsequent submittal to the EPA. On September 27, 2007, the CARB adopted the State Strategy for the 2007 State Implementation Plan and the 2007 AQMP as part of the State Implementation Plan. On January 15, 2009, the EPA's regional administrator signed a final rule to approve in part and disapprove in part the SCAQMD 2003 1-hour ozone plan and the nitrogen dioxide maintenance plan. The parts of the plan that were approved strengthen the State Implementation Plan. The Clean Air Act does not require the disapproved portions of the plan, and the disapprovals do not start sanctions clocks.~~

~~The 2007 AQMP outlines a detailed strategy for meeting the Federal health-based standards for $PM_{2.5}$ by 2015 and 8-hour ozone by 2024 while accounting for and accommodating future expected growth. The 2007 AQMP incorporates significant new emissions inventories, ambient measurements, scientific data, control strategies, and air quality modeling. Most of the reductions will be from mobile sources, which are currently responsible for about 75 percent of all smog and particulate-forming emissions. The 2007 AQMP includes 37 control measures proposed for adoption by the SCAQMD, including measures to reduce emissions from new commercial and residential developments, more reductions from industrial facilities, and reductions from wood-burning fireplaces and restaurant char broilers.~~

~~**2012 AQMP.** The 2012 AQMP was adopted December 7, 2012 (SCAQMD 2012b). The purpose of the 2012 AQMP for the Basin is to set forth a program that will lead the Basin into compliance with~~

~~the Federal 24-hour PM$_{2.5}$ air quality standard, and to provide an update of the Basin's projections in meeting the Federal 8-hour ozone standards. The AQMP was adopted by the SCAQMD Board; therefore, it was submitted to the EPA as the State Implementation Plan (SIP) . Specifically, the AQMP will serve as the official SIP submittal for the Federal 2006 24-hour PM$_{2.5}$ standard . In addition, the AQMP will update specific elements of the previously approved 8-hour ozone SIP: 1) an updated emissions inventory, and 2) new control measures and commitments for emissions reductions to help fulfill the Section 182(e)(5) portion of the 8-hour ozone SIP.~~

~~The 2012 AQMP states, "The remarkable historical improvement in air quality since the 1970's is the direct result of Southern California's comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs."~~

~~The 2012 AQMP proposes Basin-wide PM$_{2.5}$ measures that will be implemented by the 2014 attainment date, episodic control measures to achieve air quality improvements (would only apply during high PM$_{2.5}$ days), Section 182(e)(5) implementation measures (to maintain progress toward meeting the 2023 8-hour ozone national standard), and transportation control measures. Most of the control measures focus on incentives, outreach, and education.~~

~~Proposed PM$_{2.5}$ reduction measures in the 2012 AQMP include the following:~~

- ~~Further NO$_X$ reductions from the SCAQMD's Regional Clean Air Incentives Market (RECLAIM) program. The RECLAIM program was adopted by the SCAQMD in October 1993 and set an emissions cap and declining balance for many of the largest facilities emitting NOx and SOx in the South Coast Air Basin. RECLAIM includes over 350 participants in its NOx market and about 40 participants in its SOx market. RECLAIM has the longest history and practical experience of any locally designed and implemented air emissions cap and trade program. RECLAIM allows participating facilities to trade air pollution while meeting clean air goals.~~
- ~~Further reductions from residential wood-burning devices.~~
- ~~Further reductions from open burning.~~
- ~~Emission reductions from under-fired char broilers.~~
- ~~Further ammonia reductions from livestock waste.~~
- ~~Backstop measures for indirect sources of emissions from ports and port-related sources.~~
- ~~Further criteria pollutant reductions from education, outreach, and incentives.~~

~~There are multiple VOC and NO$_X$ reductions in the 2012 AQMP to attempt to reduce ozone formation, including further VOC reductions from architectural coatings, miscellaneous coatings, adhesives, solvents, lubricants, and mold release products.~~

~~The 2012 AQMP also contains proposed mobile source implementation measures for the deployment of zero and near-zero emission on-road heavy-duty vehicles, locomotives, and cargo handling equipment. There are measures for the deployment of cleaner commercial harbor craft, cleaner ocean-going marine vessels, cleaner off-road equipment, and cleaner aircraft engines.~~

~~The 2012 AQMP proposes the following mobile source implementation measures:~~

- ~~On-road mobile sources:~~
  - ~~Accelerated penetration of partial zero-emission and zero-emission vehicles. This measure proposes to continue incentives for the purchase of zero-emission vehicles and hybrid vehicles with a portion of their operation in an all-electric range mode. The state Clean Vehicle Rebate Pilot program is proposed to continue from 2015 to 2023 with a proposed~~

~~funding for up to $5,000 per vehicle. The measure seeks to provide funding assistance for up to 1,000 zero-emission or partial-zero emission vehicles per year.~~

- ~~Accelerated penetration of partial zero-emission and zero-emission light-heavy and medium-heavy duty vehicles through funding assistance for purchasing the vehicles. The objective of the proposed action is to accelerate the introduction of advanced hybrid and zero-emission technologies for Class 4 through 6 heavy-duty vehicles. The state is currently implementing a Hybrid Vehicle Incentives Project program to promote zero-emission and hybrid heavy-duty vehicles. The proposed measure seeks to continue the program from 2015 to 2023 to deploy up to 1,000 zero- and partial-zero emission vehicles per year with up to $25,000 funding assistance per vehicle. Zero-emission vehicles and hybrid vehicles with a portion of their operation in an all-electric range mode would be given the highest priority.~~
- ~~Accelerated retirement of older light-, medium-, and heavy-duty vehicles through funding incentives.~~
- ~~Further emission reductions from heavy-duty vehicles serving near-dock rail yards This proposed control measure calls for a requirement that any cargo container moved between the ports of Los Angeles and Long Beach to the nearby rail yards be with zero-emission technologies. The measure would be fully implemented by 2020 through the deployment of zero-emission trucks or any alternative zero-emission container movement system such as a fixed guideway system. The measure calls for the CARB to either adopt a new regulation or amend an existing regulation to require such deployment by 2020.~~

- ~~Off-road mobile sources:~~
  - ~~Extension of the Surplus Off-Road Opt-In for NOx (SOON) provision for construction/industrial equipment, which provides funding to repower or replace older Tier 0 and Tier 1 equipment.~~
  - ~~Further emission reductions from freight and passenger locomotives calls for an accelerated use of Tier 4 locomotives in the Basin.~~
  - ~~Further emission reductions from ocean-going marine vessels while at berth.~~
  - ~~Emission reductions from ocean-going marine vessels.~~

~~The 2012 AQMP also relies upon the SCAG regional transportation strategy, which is in its adopted 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program, which contains the following sections:~~

1. ~~Linking regional transportation planning to air quality planning and making sure that the regional transportation plan supports the goals and objectives of the AQMP/SIP.~~
2. ~~Regional transportation strategy and transportation control measures: The RTP/SCS contains improvements to the regional multimodal transportation system including the following: active transportation (non-motorized transportation, e.g., biking and walking); transportation demand management; transportation system management; transit; passenger and high-speed rail; goods movement; aviation and airport ground access; highways; arterials; and operations and maintenance.~~
3. ~~Reasonably available control measure analysis.~~

~~**Diesel Regulations.** The Ports of Long Beach and Los Angeles and the CARB have adopted regulations aimed at reducing the amount of diesel particulate. These programs are the Ports of Los~~

~~Angeles and Long Beach "Clean Truck Program,[1] the CARB Drayage Truck Regulation,[2] and the CARB statewide On-road Truck and Bus Regulation.[3] Each of these regulatory programs will require an accelerated introduction of "clean trucks" into the statewide truck fleet that will result in substantially lower diesel emissions during the 2008 to 2020 timeframe.~~

- ~~*Airborne Toxic Control Measure for Diesel Particulate Matter from Portable Engines Rated at 50 horsepower and Greater.* Effective February 19, 2011, each fleet shall comply with weighted reduced particulate matter emission fleet averages by compliance dates listed in the regulation.~~
- ~~*CARB Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling* adopts new Section 2485 within Chapter 10, Article 1, Division 3, Title 13 in the California Code of Regulations. The measure limits the idling of diesel vehicles (i.e., commercial trucks over 10,000 pounds) to reduce emissions of toxics and criteria pollutants. The driver of any vehicle subject to this section: (1) shall not idle the vehicle's primary diesel engine for greater than five minutes at any location; and (2) shall not idle a diesel-fueled auxiliary power system for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools).~~
- ~~*CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks,* requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to 'neutral' or 'park,' and the parking brake is engaged. If the parking brake is not engaged, then the engine shutdown system shall shut down the engine after 900 seconds of continuous idling operation once the vehicle is stopped and the transmission is set to neutral or park." There are a few conditions where the engine shutdown system can be overridden to prevent engine damage. Any project trucks manufactured after 2008 would be consistent with this rule, which would ultimately reduce air emissions.~~
- ~~*CARB Regulation for In-Use Off-Road Diesel Vehicles.* On July 26, 2007, the CARB adopted a regulation to reduce diesel particulate matter and NO_X emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. All self-propelled off-road diesel vehicles over 25 horsepower (hp) used in California and most two-engine vehicles (except on-road two-engine sweepers) are subject to this regulation. This includes vehicles that are rented or leased (rental or leased fleets). Such vehicles are used in construction, mining, and industrial operations. The regulation:~~
  - ~~imposes limits on idling to no more than five consecutive minutes,~~
  - ~~restricts adding of older equipment (such as Tier 0 and Tier 1) into fleets,~~
  - ~~requires reporting and labeling, and~~
  - ~~requires disclosure of the regulation upon vehicle sale.~~

  ~~The CARB is enforcing that with fines up to $10,000 per day for each vehicle in violation. Performance requirements of the rule are based on a fleet's average NO_X emissions, which can be met by replacing older vehicles with newer, cleaner vehicles or by applying exhaust retrofits. The regulation was amended in 2010 to delay the original timeline of the performance requirements making the first compliance deadline January 1, 2014 for large fleets (over 5,000 horsepower), 2017 for medium fleets (2,501-5,000 horsepower), and 2019 for small fleets (2,500 horsepower or less).~~

~~**Toxic Air Contaminants.** A toxic air contaminant (TAC) is defined as an air pollutant that may cause or contribute to an increase in mortality (death) or serious illness, or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations. Hazardous Air Pollutants (HAPs) and TACs are used interchangeably in this discussion. HAPs are regulated by the EPA under the Federal Clean Air Act. TAC is the term used under the California Clean Air Act to regulate the same hazardous pollutants. These contaminants tend to be localized and are found in relatively low concentrations in ambient air. However, they can result in adverse chronic health effects if exposure to low concentrations occurs for periods of several years. Many of these contaminants originate from human activities, such as fuel combustion and solvent use.~~

~~In general, for those TACs that may cause cancer, there is no concentration that does not present some risk. In other words, there is no threshold level below which adverse health impacts are not expected to occur. This contrasts with the criteria pollutants carbon dioxide, nitrogen dioxide, particulate matter, and ozone for which acceptable levels of exposure can be determined and for which the State and federal governments have set ambient air quality standards. For this reason, thresholds for TAC impacts for regulatory purposes and for CEQA thresholds have been set based on the increase in risk of cancer of a specific amount at sensitive receptors located near the source of TAC emissions.~~

~~The California Almanac of Emissions and Air Quality presents the relevant concentration and cancer risk data for the ten TACs that pose the most substantial health risk in California based on available data. These TACs are as follows: acetaldehyde, benzene, 1.3-butadiene, carbon tetrachloride, hexavalent chromium, paradichlorobenzene, formaldehyde, methylene chloride, perchloroethylene, and diesel particulate matter (diesel PM).~~

~~TAC measurements, available at the SCAQMD Riverside Rubidoux monitoring station (14 miles northwest of the project site) can be used to characterize the “background” health risks from regional TAC emission sources. Table 4.3.F provides this summary of TAC levels in the project area and health risk information. This table lists the air concentration levels and associated health cancer risks for eight of the nine TACs reported by the CARB in its Almanac as measured at the Riverside-Rubidoux air monitoring station. Note that since diesel PM cannot be measured directly, the table does not provide estimates of either measured diesel PM or the cancer risk associated with diesel PM.~~

~~Past studies have indicated that diesel PM poses the greatest health risk among the TACs listed in Table 4.3.F. The principal concern regarding exposures to diesel PM lies in its small size and thus its ability to penetrate deep into lung tissues when inhaled. Diesel exhaust has been found to cause health effects from short-term or acute exposures and from long-term chronic exposures, such as repeated occupational exposures. The type and severity of health effects depends upon several factors including the amount of chemical you are exposed to and the length of time you are exposed. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel PM but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.~~

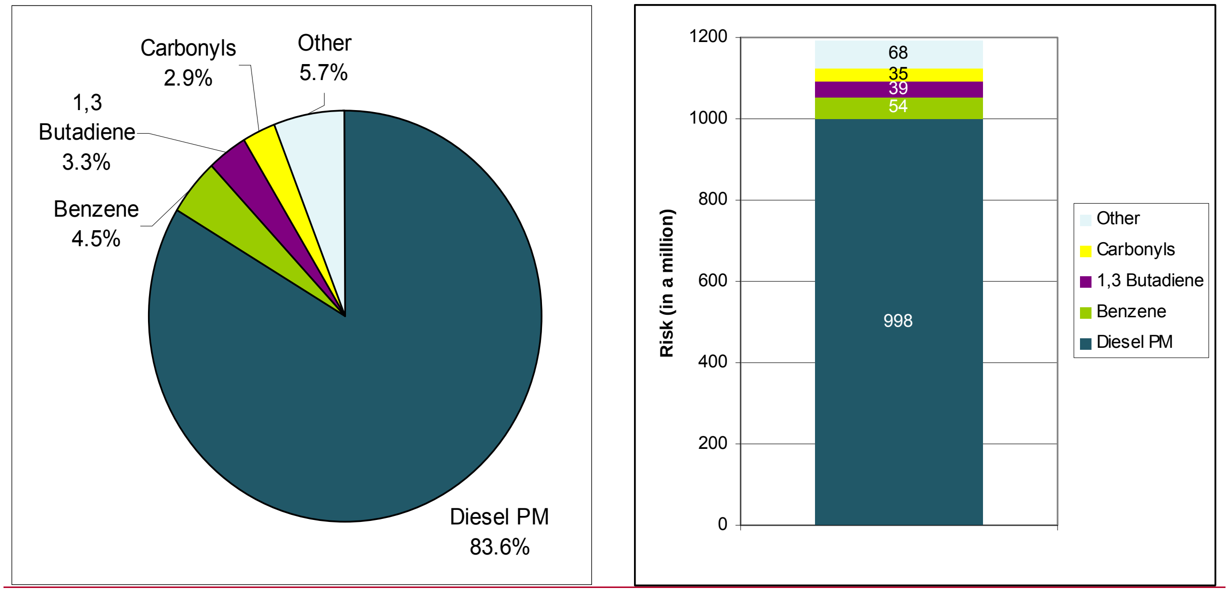
~~Long-term (chronic) exposure to diesel exhaust is likely to occur when a person works in a field where diesel is used regularly or experiences repeated exposure to diesel fumes over a long period of time. Human health studies demonstrate a correlation between exposure to diesel exhaust and increased lung cancer rates in occupational settings. Experimental animal inhalation studies of chronic exposure to diesel exhaust have shown that a range of doses causes varying levels of inflammation and cellular changes in the lungs. Human and laboratory studies have also provided considerable evidence that diesel exhaust is a likely carcinogen.~~

~~Several occupational and ambient studies have documented the health effects due to exposure to diesel PM. The California Office of Environmental Health Hazards Assessment (OEHHA), in its role in~~

~~assessing risk from environmental factors reviews such studies and makes recommendations on the way environmental risk should be evaluated through programs like the AB2588 Hot Spot Program. In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, 1950's era railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. However, all of these studies were based on exposure to exhaust from traditional diesel engines and prior to the advent of highly efficient emissions controls like the diesel particulate filter. Based on these studies, CARB identified diesel exhaust a toxic air contaminant in 1998.~~

~~In 2008, the SCAQMD released the third iteration of the Multiple Air Toxics Exposure Study (MATES-III). The MATES-III report includes monitoring of various air toxic compounds in the Basin, establishes and updates existing baseline toxic air contaminants, and simulates cancer risk in the Basin. The study focuses on the carcinogenic risk from exposure to air toxics. It does not estimate mortality or other health effects from particulate exposures. The SCAQMD MATES-III report indicates that overall in the Basin, diesel PM contributes 83.6 percent of the risk.~~

~~In 2014, the SCAQMD released the fourth iteration of the Multiple Air Toxics Exposure Study (MATES-IV). The MATES-IV is a follow up to the previous MATES studies and included an updated toxics air emission inventory, new air toxics air dispersion modeling, and enhanced air toxics monitoring. A key conclusion reached in the MATES-IV study was that the population weighted cancer risk in the Basin decreased by 57 percent from the MATES-III period in 2005 to the MATES-IV period in 2012 indicating that overall, cancer risks are declining in the Basin as a result of the implementation of emission controls principally on large diesel trucks. The MATES-IV study also concluded that diesel PM contributed 68 percent to the total cancer risk in the Basin with benzene and 1.3 Butadiene also making important contributions to cancer risk. Figure 4.2.15 summarizes the basin-wide cancer risks as derived from the MATES-IV study.~~



~~Figure 4.3.15: Summary of MATES IV Cancer Risks~~

~~Table 4.3.F: Toxic Air Contaminant Concentration Levels and Associated Health Effects (Riverside, California) (new table)~~

~~TAC~~	~~Concentration[A] / Health Risk[B]~~	~~2007~~	~~2008~~	~~2009~~	~~Health Effects~~
~~Acetaldehyde~~	~~Mean~~	~~1.08~~	~~0.99~~	~~1.22~~	~~Acetaldehyde is a carcinogen that also causes chronic non-cancer toxicity in the respiratory system. Symptoms of chronic intoxication of acetaldehyde in humans resemble those of alcoholism.~~ ~~The primary acute effect of inhalation exposure to acetaldehyde is irritation of the eyes, skin, and respiratory tract in humans. At higher exposure levels, erythema, coughing, pulmonary edema, and necrosis may also occur. Acute inhalation of acetaldehyde resulted in a depressed respiratory rate and elevated blood pressure in experimental animals.~~
	~~Health Risk~~	~~5~~	~~5~~	~~5~~	
~~Benzene~~	~~Mean~~	~~0.40~~	~~0.33~~	~~ID~~	~~Benzene is highly carcinogenic and occurs throughout California. Benzene also has non-cancer health effects. Brief inhalation exposure to high concentrations can cause central nervous system depression. Acute effects include central nervous system symptoms of nausea, tremors, drowsiness, dizziness, headache, intoxication, and unconsciousness.~~ ~~Neurological symptoms of inhalation exposure to benzene include drowsiness, dizziness, headaches, and unconsciousness in humans. Ingestion of large amounts of benzene may result in vomiting, dizziness, and convulsions in humans. Exposure to liquid and vapor may irritate the skin, eyes, and upper respiratory tract in humans. Redness and blisters may result from dermal exposure to benzene.~~ ~~Chronic inhalation of certain levels of benzene causes disorders in the blood in humans. Benzene specifically affects bone marrow (the tissues that produce blood cells). Aplastic anemia, excessive bleeding, and damage to the immune system (by changes in blood levels of antibodies and loss of white blood cells) may develop. Increased incidence of leukemia (cancer of the tissues that form white blood cells) has been observed in humans occupationally exposed to benzene.~~
	~~Health Risk~~	~~37~~	~~30~~	~~ID~~	
~~Chromium Hex~~	~~Mean~~	~~0.35~~	~~ID~~	~~ID~~	~~In California, hexavalent chromium has been identified as a carcinogen. There is epidemiological evidence that exposure to inhaled hexavalent chromium may result in lung cancer. The principal acute effects are renal toxicity, gastrointestinal hemorrhage, and intravascular hemolysis.~~ ~~The respiratory tract is the major target organ for chromium (VI) following inhalation exposure in humans. Other effects noted from acute inhalation exposure to very high concentrations of chromium (VI) include gastrointestinal and neurological effects, while dermal exposure causes skin burns in humans. Chronic inhalation exposure to chromium (VI) in humans results in effects on the respiratory tract, with perforations and ulcerations of the septum, bronchitis, decreased pulmonary function, pneumonia, asthma, and nasal itching and soreness reported. Chronic human exposure to high levels of chromium (VI) by inhalation or oral exposure may produce effects on the liver, kidneys, gastrointestinal and immune systems, and possibly the blood.~~
	~~Health Risk~~	~~52~~	~~ID~~	~~ID~~	

~~Table 4.3.F: Toxic Air Contaminant Concentration Levels and Associated Health Effects (Riverside, California) (new table)~~

~~TAC~~	~~Concentration[A] / Health Risk[B]~~	~~2007~~	~~2008~~	~~2009~~	~~Health Effects~~
~~Para-Dichlorobenzene~~	~~Mean~~	~~ID~~	~~ID~~	~~ID~~	~~In California, para-dichlorobenzene has been identified as a carcinogen. Acute exposure to 1,4-dichlorobenzene via inhalation results in irritation to the eyes, skin, and throat in humans. In addition, long-term inhalation exposure may affect the liver, skin, and central nervous system in humans (e.g., cerebellar ataxia, dysarthria, weakness in limbs, and hyporeflexia).~~
	~~Health Risk~~	~~ID~~	~~ID~~	~~ID~~	
~~Formaldehyde~~	~~Mean~~	~~2.88~~	~~2.88~~	~~3.12~~	~~The major toxic effects caused by acute formaldehyde exposure via inhalation are eye, nose, and throat irritation and effects on the nasal cavity. Other effects seen from exposure to high levels of formaldehyde in humans are coughing, wheezing, chest pains, and bronchitis. Chronic exposure to formaldehyde by inhalation in humans has been associated with respiratory symptoms and eye, nose, and throat irritation. Animal studies have reported effects on the nasal respiratory epithelium and lesions in the respiratory system from chronic inhalation exposure to formaldehyde. Occupational studies have noted statistically significant associations between exposure to formaldehyde and increased incidence of lung and nasopharyngeal cancer. This evidence is considered "limited" rather than "sufficient" due to possible exposure to other agents that may have contributed to the excess cancers. EPA considers formaldehyde to be a probable human carcinogen (cancer-causing agent) and has ranked it in EPA's Group B1. In California, formaldehyde has been identified as a carcinogen.~~
	~~Health Risk~~	~~21~~	~~21~~	~~23~~	
~~Methylene Chloride~~	~~Mean~~	~~0.19~~	~~0.2~~	~~ID~~	~~Case studies of methylene chloride poisoning during paint-stripping operations have demonstrated that inhalation exposure to extremely high levels can be fatal to humans. Acute inhalation exposure to high levels of methylene chloride in humans has resulted in effects on the central nervous system, including decreased visual, auditory, and psychomotor functions, but these effects are reversible once exposure ceases. Methylene chloride also irritates the nose and throat at high concentrations. The major effects from chronic inhalation exposure to methylene chloride in humans are effects on the central nervous system, such as headaches, dizziness, nausea, and memory loss. In addition, chronic exposure can lead to bone marrow, hepatic, and renal toxicity. EPA considers methylene chloride to be a probable human carcinogen and has ranked it in EPA's Group B2. California considers methylene chloride to be carcinogenic.~~
	~~Health Risk~~	~~0.7~~	~~0.7~~	~~ID~~	
~~Perchloroethylene~~	~~Mean~~	~~0.035~~	~~0.024~~	~~ID~~	~~In California, perchloroethylene has been identified as a carcinogen. Perchloroethylene vapors are irritating to the eyes and respiratory tract. Following chronic exposure, workers have shown signs of liver toxicity, as well as kidney dysfunction and neurological disorders.~~
	~~Health Risk~~	~~1~~	~~1~~	~~ID~~	
~~Diesel PM~~	~~Mean~~	~~No Monitoring Data Available~~			~~In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provided strong evidence that long-term occupational exposure to diesel exhaust increases~~
	~~Health Risk~~				

~~Table 4.3.F: Toxic Air Contaminant Concentration Levels and Associated Health Effects (Riverside, California) (new table)~~

~~TAC~~	~~Concentration[A] / Health Risk[B]~~	~~2007~~	~~2008~~	~~2009~~	~~Health Effects~~
					~~the risk of lung cancer. Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. This research was based on studies prio to the advent of modern diesel engines with high efficiency emissions controls.~~ ~~Note: Since then the Health Effects Institute study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.~~

~~ID = Insufficient data~~
~~A = Concentrations for Hexavalent Chromium are expressed as $\mu g/m^3$, and concentrations for Diesel PM are expressed as $\mu g/m^3$. Concentrations for all other TACs are expressed as ppb.~~
~~B = Health Risk represents the number of excess cancer cases per million people based on a lifetime (70-year) exposure to the annual average concentration. Total Health Risk represents only those compounds listed in this table and only those with data for the year. There may be other significant compounds for which monitoring and/or health risk information are not available~~
~~Source: CARB 2011 for the SCAQMD Riverside-Rubidoux air monitoring station.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~The risk basin-wide population weighted cancer risk is 367 per million based on average at fixed monitoring sites estimated during the MATES-IV study. This level of risk means that on average an estimated 367 individuals in the basin could contract cancer out of a population of one million individuals exposed to all sources of toxic air contaminants over a lifetime of 70 years. A comprehensive air dispersion model and a detailed air toxics emission inventory were then used to estimate cancer risks at other locations where no monitoring sites were deployed. A 10-year research program (CARB 1998) demonstrated that diesel PM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to diesel PM poses a chronic health risk.~~

~~In addition to increasing the risk of lung cancer, exposure to diesel exhaust can have other health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. Diesel exhaust has been major source of fine particulate pollution as well, and studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems.~~

~~Diesel PM differs from other TACs in that it is not a single substance but a complex mixture of hundreds of substances. Although diesel PM is emitted by diesel-fueled, internal combustion engines, the composition of the emissions varies, depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present. Unlike the other TACs, however, no ambient monitoring data are available for diesel PM because no routine measurement method currently exists. The CARB has made preliminary concentration estimates based on a diesel PM exposure method. This method uses the CARB emissions inventory's PM_{10} database, ambient PM_{10} monitoring data, and the results from several studies to estimate concentrations of diesel PM. Within the Basin, in addition to diesel PM, there are emissions of benzene, formaldehyde, acetaldehyde, naphthalene, ethylbenzene, acrolein, toluene, hexane, propylene, and xylene from a variety of sources located within the Basin that contribute to health risks.~~

~~The average cancer risk in the project area is estimated to be 213 in a million based on the MATES-IV and ranges from 198 in a million at the southeast corner of the project to 239 in a million in the northern portion of the project as shown in Figure 4.3.16.~~

~~As shown in Figure 4.3.17, nearly all areas of the Basin experienced decreases in cancer risk during the time period from MATES–III time period of 2005 to the MATES-IV time period of 2012. The project area also experienced a decrease in cancer risk of between 100 and 400 in one million from the years 2005 to 2012.~~

~~Figure 4.3.17 depicts the cancer risk estimates as a "snapshot in time." That is, the cancer risks are derived from air dispersion models and are based on the emissions of various TACs during the years 2005 and 2012. The basic tenet used to estimate cancer risk assumes that the public will be exposed to these TAC emissions during an entire 70-year lifetime of continuous exposure. However, the SCAQMD, CARB, and the EPA have adopted numerous regulations that have resulted in significant reductions in pollutant emissions with the attendant reductions in prevailing air quality levels since 2012 as noted earlier. The benefits of substantial additional emission reductions derived from the adoption and application of SCAQMD, CARB, and EPA regulations are not reflected in the estimate of 70-year lifetime cancer risks referred to in Figure 4.3.17.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Additionally, in January 2015, a major new study[1] evaluated the health impacts of “new technology diesel exhaust” (NTDE). Beginning in 2001, USEPA and CARB begin issuing a series of regulations that require new diesel-powered vehicles and equipment to use the latest emissions control technology. This technology relies on two components. The first is a diesel particulate filter, which is capable of reducing particulate matter emissions by over 90% (required for new engines beginning in 2007). The second technology is selective catalytic reduction, which reduces emissions of nitrogen oxides by over 90% (required for new engines beginning in 2010). Diesel emissions from engines equipped with this technology is referred to as NTDE. As a result of the advances in emission control technology, USEPA, CARB, and other government and industry stakeholders commissioned a series of studies called the Advanced Collaborative Emissions Study (ACES). ACES has been guided by an ACES Steering Committee consisting of representatives of HEI and the Coordinating Research Council (CRC: a nonprofit organization that directs engineering and environmental studies on the interaction between automotive or other mobility equipment and petroleum products), along with the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others. The Health Effects Institute (HEI), funded in part by USEPA, was selected to oversee Phase 3 of ACES.~~

~~Phase 3 of ACES evaluated whether emissions from new technology diesel engines cause cancer or other health effects. Specifically, it evaluated the health impacts of a 2007-compliant engine equipped with a diesel particulate filter. HEI found chronic exposure to NTDE did not induce tumors or pre-cancerous changes in the lung and did not increase tumors that were considered to be related to NTDE in any other tissue in laboratory rats. The study also confirmed that the concentrations of particulate matter and toxic air pollutants emitted from NTDE are more than 90% lower than emissions from traditional older diesel engine. Rats are the most sensitive laboratory animal species for evaluation of older technology diesel engines (pre-model year 2007), because of their sensitivity to high concentrations of particles (present in older technology diesel engines), compared with other species (including humans).~~

~~The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.~~

~~Conservative Nature of Health Risk Assessments.~~ ~~Moreover, the current methodological protocols required by the SCAQMD and CARB when studying the health risk posed by diesel PM assume the following (from the California Air Pollution Control Officers Association 2009): (1) 24-hour constant exposure; (2) 350 days a year; (3) for a continuous period lasting 70 years. These are overly conservative assumptions that are not replicated in reality. Most people are indoors for 18–20 hours a day (at their place of employment or home) and most people do not live in the same location for a 70-year period. In fact, less than 10 percent of the population has a continuous residency at the same location of greater than 30 years (American Community Survey 2011). Thus, the health risk assessments prepared pursuant to the current protocols overestimate the risk of cancer associated with diesel PM exposure.~~

~~Alternate Views on Diesel PM Risk.~~ ~~Some researchers, such as Dr. James E. Enstrom (2008), believe that the risk from diesel PM is exaggerated. Enstrom calls into question some of the basic research on the declaration of diesel exhaust as a toxic air contaminant. In particular, the article states the following:~~

> *~~There is substantial new epidemiologic evidence relevant to the health effects of diesel exhaust that was not considered when the 1998 toxic air contaminant declaration was made. For instance,~~*

~~[1] Health Effects Institute, 2015: HEI Research Report 184, Advanced Collaborative Emissions Study (ACES): Lifetime Cancer and Non-Cancer Assessment in Rats Exposed to New-Technology Diesel Exhaust, published in January. Website: http://pubs.healtheffects.org/getfile.php?u=1067~~

> ~~*the 2007 paper by Francine Laden et al. measured death rates during 1985–2000 among 54,000 members of the unionized U.S. trucking industry. … This cohort, which included 36,000 diesel truck drivers, had death rates from all causes and all cancer that were substantially below the rates among US males. Furthermore, unlike earlier evidence that was used in the TAC declaration, this cohort did not have a substantially elevated lung cancer death rate.*~~

~~Dr. Enstrom also indicates that the premature mortality calculation in the report, "Quantification of the Health Impacts and Economic Valuation of Air Pollution from Ports and Goods Movement in California," is exaggerated. Dr. Enstrom's analysis "found no relationship between $PM_{2.5}$ and mortality in elderly Californians during 1983–2002."~~

~~4.3.2.4 Local Policies~~

~~**City of Moreno Valley General Plan Policies.** Chapter 9 of the City's General Plan defines goals and policies related to air quality within the City of Moreno Valley. The specific policies of the General Plan that are relevant to the proposed project are as follows:~~

~~**Objective 6.7**~~	~~Reduce mobile and stationary source air pollutant emissions.~~
~~**Policy 6.7.1**~~	~~Cooperate with regional efforts to establish and implement regional air quality strategies and tactics.~~
~~**Policy 6.7.2**~~	~~Encourage the financing and construction of park and ride facilities.~~
~~**Policy 6.7.4**~~	~~Locate heavy industrial and extraction facilities away from residential areas and sensitive receptors.~~
~~**Policy 6.7.5**~~	~~Require grading activities to comply with South Coast Air Quality Management District's Rule 403 regarding the control of fugitive dust.~~
~~**Policy 6.7.6**~~	~~Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code.~~

~~4.3.3 Methodology~~

~~The *Air Quality, Greenhouse Gas, and Health Risk Assessment Report* for the DEIR (Michael Brandman Associates, January 2013)[1] evaluated the air quality impacts associated with the development of the proposed project including the following:~~

- ~~Determine the short-term construction air quality impacts on both on-site and off-site sensitive receptors based on SCAQMD assessment methodologies and significance thresholds;~~
- ~~Determine the long-term air quality impacts, including vehicular traffic, on both on-site and off-site sensitive uses based on SCAQMD assessment methodologies and significance thresholds; and~~
- ~~Determine the required mitigation measures to reduce short-term and long-term on-site air quality impacts from all sources.~~

~~A revised Air Quality, Greenhouse Gas, and Health Risk Assessment Report (revised analysis) was prepared by Michael Brandman Associates – FirstCarbon Solutions (MBA-FCS) in 2015, which estimated the impacts from the reduced size of the project and also refined and updated the methodology used in the analysis, as discussed below.~~

---

[1] ~~*Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, Michael Brandman Associates, January 2013.~~

~~4.3.3.1 Construction~~

~~Construction-related emissions are expected from various activities associated with the construction of the project such as rough grading, infrastructure construction, asphalt paving, building construction, architectural coatings, and construction workers commuting. Construction emissions for construction worker vehicles traveling to and from the project site, in addition to vendor trips (construction materials delivered to the project site) and haul trips (dump trucks and concrete trucks) were also accounted for in the analysis. Localized air quality in the project area would be affected by both heavy-duty construction equipment usage on site as well as local traffic due to the equipment delivery and construction worker commuting. The anticipated construction equipment and construction schedule are identified in Section 3.0,~~ ~~*Project Description*~~~~, in Table 3.C. The SCAQMD CEQA methodology[1] was used to analyze the criteria pollutant emissions from these activities.~~

~~*Note: In response to comments received on the DEIR, the following revisions have been made to the construction emissions analysis:*~~

- ~~*New Version of CalEEMod*~~~~. The construction emissions in the DEIR were estimated with the approved model at the time, CalEEMod version 2011.1.1, which uses emission factors from the outdated OFFROAD2007 and EMFAC2007 emission models. Since publication of the DEIR, a new version of CalEEMod has been released, version 2013.2, uses construction emission factors from OFFROAD2011 and mobile source emissions from EMFAC2011. The new version of CalEEMod has lower construction equipment load factors, which are also used in this revised analysis.~~
- ~~*Extended Construction Period.*~~ ~~In the DEIR, construction was assumed to occur over 10 years; in response to comments to reduce emissions, the revised analysis construction schedule is assumed to occur over 15 years.~~
- ~~*Refined Building Phasing.*~~ ~~The DEIR had all building construction activities lumped together. For better understanding and clarification, building construction activity was subdivided in this revised analysis into the following sub-phases: building-concrete; building-wet utilities; building-electrical; and building-landscaping to more accurately describe construction activities.~~
- ~~*Mass Grading Duration.*~~ ~~In the DEIR, grading covered 12 months (for the unmitigated version) and 24 months (for the mitigated version). For the revised analysis, each planning area is graded separately over a total of approximately 58 months to reflect a more realistic grading plan.~~
- ~~*On-Site On-road Vehicle Emissions.*~~ ~~On-site travel and idling emissions from concrete trucks, haul trucks, service/support trucks, and delivery trucks were not included in the DEIR but are included for the revised analysis.~~
- ~~*Equipment for Grading.*~~ ~~The construction equipment and haul truck deliveries for the mass excavation and fine grading phases now vary per planning area (since there are varying sizes of each planning area), whereas in the DEIR, one equipment fleet was assumed for the mass grading and finish grading phases. In addition, because the grading duration has been extended and due to variations in the grading fleet based on the size of the planning area, less equipment is required. The overall construction equipment horsepower-hours per day has decreased in the revised analysis.~~
- ~~*Onsite Equipment Fleet for Non-Grading Phases.*~~ ~~The duration for construction has been extended; therefore, the peak number of equipment has decreased. In addition, the types and daily horsepower hours for the equipment has changed.~~
- ~~*Onsite Equipment Hours per Day.*~~ ~~The revised analysis assumes that the onsite equipment are in the on position for 10 hours per day as a project design feature. The analysis in the DEIR~~

---

[1] ~~*CEQA Air Quality Handbook*~~~~, April 1993 and subsequent additions to the Handbook.~~

~~assumed 15 hours per day for the unmitigated version and 10 hours per day for the mitigated version. Because construction has been spread out over more time, there is no need for the equipment to operate 15 hours per day; therefore, the equipment hours per day has been added as a project design feature that sets the maximum hours per day is 10 hours per day for the onsite equipment. This means that each piece of construction equipment is assumed to be on for 10 hours per day. This would also apply to the onsite equipment used during concrete pouring, which would most likely occur during the night. This is a conservative scenario as the CalEEMod default assumes construction equipment would be on for 6 to 8 hours per day. This is used to calculate maximum daily emissions which are required for the regional analysis, because project emissions can occur on any day of the week. However, in order to calculate annual average emissions, it is necessary to base emissions upon a realistic work schedule. The revised analysis assumes a more realistic annual average use of construction equipment by assuming that the maximum equipment would occur for five days per week (instead of six days per week as in the DEIR). In this way, an annual average and daily emission inventories were estimated.~~

- ~~*Tier 4 Equipment.* The analysis in the DEIR assumed the CalEEMod default construction equipment tier levels for the unmitigated version and for the mitigated version, assumed Tier 3 engines for years prior to 2017 and Tier 3 with diesel particulate matter filters for years after 2017. The revised analysis assumes that for the mitigated emissions, all equipment over 50 horsepower Tier 4 as required by a revised mitigation measure.~~
- ~~*VOC Emissions from Striping Pavement.* The DEIR did not include these emissions because these emissions have been recently integrated within CalEEMod.~~

~~4.3.3.2 Operation~~

~~Air quality in the project area would be affected by long-term air emissions from stationary sources and mobile sources related to the proposed project once it commences operations. The stationary source emissions would come from consumption of natural gas and emergency generators while mobile source emissions would come from vehicular emissions from automobiles and trucks traveling to, from, and within the project site and from on-site forklifts and yard trucks.~~

~~A key piece of information required to estimate the project's operational emissions deals with an estimate of the number of trips and types of vehicles (i.e., cars and trucks) generated by the project during a peak hour and on a daily basis. To determine mobile source emissions associated with the project, the trip generation rates were derived from the *Traffic Impact Analysis Report* for the project prepared by Parsons Brinckerhoff .~~

~~Appendix E of the CalEEMod Manual states the following regarding trip rates for large warehouses and distribution centers, and demonstrates that the trip rate applied for this project is appropriate, since the project is a Specific Plan containing more than 10 warehouse buildings:~~

> ~~*In the case that air quality is evaluated for multiple warehouses (>10), such as in an analysis for a general plan, the average rate of 1.44 trips per TSF [thousand square feet] from the ITE [Institute of Transportation Engineers] 8th Edition Trip Generation manual is acceptable. This lower value may be more appropriate as on average, a small portion of warehouses can be expected to operate at varying levels of service, including some warehouses experiencing temporary partial or complete vacancy.* (SCAQMD 2013, CalEEMod manual,[1] pages 14-15)~~

~~Additionally, the SCAQMD is currently working with the Institute of Transportation Engineers to provide enhanced information and guidance regarding vehicle trips associated with warehouse~~

~~[1] South Coast Air Quality Management District. 2013. CalEEMod, Appendix E, Technical Source Documentation. Website: http://www.aqmd.gov/docs/default-source/caleemod/caleemod-appendixe.pdf?sfvrsn=2http~~

~~operations. SCAQMD staff is recommending truck trip rates from the Institute of Transportation Engineers for high cube warehouse projects located in SCAQMD. Consistent with CEQA Guidelines, the SCAQMD states that an EIR may use a non-default trip rate if there is substantial evidence indicating another rate is more appropriate for the air quality analysis. The trip generation rate applied in this assessment for high cube warehouses (1.68 trips per thousand square feet) is greater than the average rate of 1.44 trips per thousand square feet recommended in CalEEMod thereby providing a more conservative estimate of vehicle trips (i.e., larger number of trips) and hence higher estimate of air quality impacts than the SCAQMD-recommended trip rate.~~

~~The EPA AERMOD air dispersion model, the Caltrans CALINE4 model, the CalEEMod, and the CARB EMFAC 2014 mobile source emission factor model were used to assess the project's impact on air pollutant emissions and concentrations.~~

~~Emission factors for the year 2012 are used for the "worst-case" scenario. Phase 1 of the project used emission factors from the year 2022, and Phase 2 of the project used emission factors for the year 2035. For the mitigated version, the emission factors were modified to reflect the mitigation measure that requires the use of model year 2010 or newer trucks for all diesel trucks associated with the project.~~

~~*Note: In response to comments received on the DEIR, the following revisions have been made to the regional operational emissions analysis:*~~

- ~~*Trip Lengths for Motor Vehicle Emissions*. Forecasted traffic volumes contained in the revised Traffic Impact Analysis were used to estimate the project's motor vehicle emissions instead of an arbitrary 50 miles per truck trip length and the CalEEMod default trip lengths for local trips used in the DEIR. The traffic model provided estimates of project traffic volumes for nearly 500 individual freeway and surface street roadway segments segregated by vehicle class as passenger cars, light heavy duty trucks, medium heavy duty trucks, and heavy-heavy duty trucks. This revised methodology provides a much more accurate estimate of the project's operational mobile source vehicle miles traveled and resulting emissions.~~
- ~~*Updated Emission Factors for Motor Vehicles.* In the DEIR, regional motor vehicle emissions were estimated by CalEEMod using the EMFAC2007 mobile source emission model and EMFAC2011 emission model for the localized and health risk analysis. On December 30, 2014, the CARB released an updated version of its emission factor model, EMFAC2014. The CARB indicates that the EMFAC2014 mobile source emission model will be used henceforth to estimate on-road mobile source emissions in California. The EMFAC2014 model is an updated version of the EMFAC2014 model that was used in the DEIR. The EMFAC2011 mobile source emission model was applied to all vehicle classes in the revised analysis.~~
- ~~*Decrease in Operational Square Footage.* The number of vehicle trips was revised to reflect a reduction of the project size from 41.6 million square feet to 40.6 million square feet and the redistribution of land use building square footage between the high cube logistics warehouse and light logistics land uses. In addition, a fire station land use was also added.~~
- ~~*Additional On-site Emissions Sources.* Additional sources of operational emissions were also accounted for in this revised analysis including standby diesel generators, fork lifts, and yard trucks.~~
- ~~*On-site Existing Emissions Estimated.* The existing agricultural emissions were estimated in the revised analysis; they were not estimated in the DEIR.~~

~~4.3.3.3 Localized Construction/Operation~~

~~SCAQMD has developed the Localized Significance Threshold (LST) methodology that can be used to determine whether or not a project may generate significant adverse localized air quality impacts that substantially affect sensitive receptors. LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable Federal or State AAQS and are developed based on the ambient concentrations of that pollutant for each source receptor area identified by the SCAQMD. SCAQMD's current guidelines, *Final Localized Significance Threshold Methodology* (June 2003) and subsequent additions, were adhered to in the assessment of local air quality impacts from the proposed project. The local emissions of concern from construction and operational activities as defined by the SCAQMD are~~ ~~NO_X, CO, PM_{10}, and $PM_{2.5}$~~ ~~combustion emissions from construction equipment and fugitive~~ ~~PM_{10}~~ ~~dust from construction site preparation activities.~~

~~*Note: In response to comments received on the DEIR, the following revisions have been made to the localized significance threshold analysis:*~~

- ~~*Revisions to the Traffic Volumes.* The operational assessment of localized impacts reflects the changes in traffic volumes associated with the reduction in the project size and realignment of roadway segments that are within and border the project's boundaries.~~
- ~~*Changes in Construction Schedule.* The analysis in the DEIR assumed a construction schedule of 10 years, whereas the revised assessment is based on a 15-year construction schedule. The changes in construction schedule both by year and location within the project were accounted for under the revised, extended project development schedule for estimating the emissions subject to the LST assessment.~~
- ~~*Emission Source Configuration.* The analysis in the DEIR of the off-road construction equipment exhaust was represented in the air dispersion model as a large area source that covered the construction area. The revised analysis represents the off-road construction exhaust emission source as a series of contiguous volume sources, which is consistent with the SCAQMD methodology for LST assessments.~~
- ~~*Operational Truck Idling.* The analysis in the DEIR assumed that each heavy-duty truck that accessed the site during operation idled for a total of 15 minutes per day. In the revised analysis, each truck was assumed to idle for 5 minutes per day consistent with the California Air Resources Board's Air Toxic Control Measure that limits such idling to 5 minutes and requirements specified in the World Logistics Center Specific Plan. For the mitigated assessment, each truck was assumed to idle for 3 minutes per day.~~

~~The localized significance threshold analysis evaluated three conditions:~~

- ~~Project Phase 1 (2012): this condition assumes that Phase 1 of the project is fully built out in 2012, the year that the Notice of Preparation for the project was published.~~
- ~~Project Phase 1 and Phase 2 Full Build Out (2012): this condition assumes that Phase 1 and Phase 2 of the project are fully built out in 2012, the year that the Notice of Preparation for the project was published.~~
- ~~Proposed Development Schedule: this condition examines the proposed development schedule of the two-phased project three analysis years were examined under this condition for potential localized air quality impacts:~~
    - ~~2021, the year when the projected construction schedule would result in construction activities in the western portion of the project adjacent to and across from the existing residential areas along Redlands Boulevard and when a substantial portion of Phase I operations would occur (approximately 56 percent of entire project floor space);~~

- ~~2027, the year when the project emissions from both project construction and operation are at their highest combined levels for several pollutants; and when construction activities would occur adjacent to the existing residences along Gilman Springs Road and~~
- ~~2035[1] when the Phase 1 and Phase 2 of the project are fully operational.~~

~~Project Phase 1 (2012) represents an interim step during which Phase 1 of the project (approximately 56 percent of the total size of the project) is completely built out in 2012. This analysis simply looks at the situation of what would happen if Phase 1 of the project were built in its entirety with no reductions in motor vehicle emissions that would occur in the future as a result of emission control programs that have already been adopted. This assessment also provides consistency with the project traffic impact analysis and noise reports which examine the Project Phase 1 (2012) condition. The project impact results are compared to the existing air quality levels in 2012 and only consider the project's operational emissions and not construction emissions.~~

~~Project Phase 1 and 2 Full Build Out 2012 represents a worst-case scenario since the project could not be physically built out in its entirety in a single year and does not reflect the fact that the project would be developed over a time period of 15 years depending on market demands for warehouse space. This assumption also does not account for the fact that emissions from mobile sources, prior to mitigation, particularly from heavy duty diesel trucks are expected to decline significantly over the next 10 to 15 years as a result of emission controls already mandated by the CARB specifically for these vehicles. This assessment also provides consistency with the project traffic impact analysis and noise reports which examine the full Project Phase 1 and Phase 2 (2012) Build Out (2012) condition. The project impact results are compared to the existing air quality levels in 2012 and only consider the project's operational emissions and not construction emissions.~~

~~The Proposed Project Development condition represents the proposed project development including the localized impacts during construction and operation over the time period of 2015 to 2035. These results are compared to the existing air quality levels in 2012.~~

~~4.3.3.4 Health Risk Assessment~~

~~A Health Risk Assessment (HRA) is a guide that helps to determine whether current or future exposures to a chemical or substance in the environment could affect the health of a population. In general, risk depends on the following factors:~~

- ~~How much of a chemical is present in an environmental medium (e.g., air);~~
- ~~How much contact (exposure) a person has with the contaminated environmental medium; and~~
- ~~The inherent toxicity of the chemical.~~

~~The assessment of health impacts is a continuing evolution of science and regulation. Since December 2014, three major scientific and regulatory activities have come forward that will affect how such assessments are performed and what such impacts mean to society as described below.~~

- ~~On December 30, 2014, the ARB released its update to the Emissions Factor Model, EMFAC2014, which is used to estimated emissions from motor vehicles in California. The~~

~~[1] In some circumstances, references are made to the year 2035. The year 2031 is the proposed first year the project is fully built out. However, detailed traffic volumes were provided by the project traffic consultant for the long-term planning year 2035. For purposes of this assessment, project traffic volumes in 2031 were assumed to be the same as the forecast volumes in 2035.~~

~~EFAC2014 model represents the ARB's current understanding of motor vehicle technologies and regulatory implementation of rules aimed at reducing air emissions from motor vehicles. Of significance in this regard are the new projections of air emissions from heavy duty diesel engines. Based on the results of the EMFAC2014 model, emissions of diesel particulate matter range from 50 to 80 percent lower than previously estimated using the previous version of the EMFAC model, EMFAC2011. Since heavy duty trucks constitute nearly all of the project's diesel PM emissions, the incorporation of the emission information from the EMFAC2014 model is important in estimating the amount of diesel PM and in assessing the project's health risk impacts resulting from these emissions~~

- ~~On January 27, 2015, the Health Effects Institute (HEI), a joint private-government partnership, released a major peer-reviewed scientific report entitled *Effects of Lifetime Exposure to Inhaled New-Technology Diesel Exhaust in Rats*. This is the first study to conduct a comprehensive evaluation of lifetime inhalation exposure to emissions from heavy-duty 2007-compliant engines (referred to as "new technology diesel exhaust," or NTDE). The study evaluated the long-term effects of multiple concentrations of inhaled NTDE, which has greatly reduced particle emissions compared with "traditional-technology diesel exhaust" (TDE) in male and female rats on more than 100 different biologic endpoints, including tumor development, and compared the results with biologic effects seen in earlier studies in rats after exposure to TDE. Lifetime inhalation exposure of rats exposed to one of three levels of NTDE from a 2007-compliant engine, for 16 hours per day, 5 days a week, with use of a strenuous operating cycle that more accurately reflected the real-world operation of a modern engine than cycles used in previous studies, did not induce tumors or pre-cancerous changes in the lung and did not increase tumors that were considered to be related to NTDE. The importance of this study is that diesel PM emissions from new technology diesel engines does not cause any increase in the risk of lung cancer or other significant adverse health effects in study animals that, in fact are more sensitive to toxics exposures than humans. While this study focused on heavy duty truck emissions, the new clean diesel technology has the potential for impacting all sectors, including passenger cars, agriculture, construction, maritime and transportation. Previous studies directed at studying the effects of diesel PM on health were based on exposure studies that date 15 to 20 years ago when diesel emissions were significantly higher than the NTDE. It is also important to highlight that the U.S. Environmental Protection Agency (EPA), the California Air Resources Board, the U.S. Department of Energy (DOE) and the U.S. Federal Highway Administration are sponsors and/or reviewers of this study in conjunction with the manufacturers of emissions control equipment.~~

- ~~On March 6, 2015, the California Office of Environmental Health Hazards Assessment (OEHHA) adopted a new guidance for estimating health risks from toxic air contaminants that incorporated the importance of early-in-life sensitivities of young children to exposures to toxics air contaminants and recommends a lifetime exposure duration of 30-years. Within the context of this assessment, this new assessment guidance is referred to as the "Current OEHHA Guidance". The new guidance updates earlier guidance recommended by OEHHA and SCAQMD referred to in this assessment as the "Former OEHHA Guidance", which was used in the DEIR. The "Former OEHHA Guidance" is based on a lifetime exposure of 70 years and does not incorporate early-in-life age sensitivity factors. The importance of the "Current OEHHA Guidance" is that the guidance produces much more conservative estimates of cancer risks from toxic air contaminant exposures than the "Former OEHHA Guidance".~~

- ~~The HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study.~~

~~The following information is from the Health Risk Assessment contained in the revised *Air Quality, Greenhouse Gas, and Health Risk Assessment* (2015) contained in Appendix D. The text in this section is supported by references and discussion that can be found in the report in Appendix D.~~

~~*Note: In response to comments received on the DEIR, the following revisions have been made to the health risk assessment:*~~

- ~~*Revisions to the Construction Emissions.* This revised analysis reflected the numerous changes in construction equipment, load factors, schedule, and sequencing of construction by location within the project as discussed above.~~
- ~~*Revisions to Traffic Volumes.* The revised analysis made use of the revised traffic volume forecasts along nearly 500 individual roadway segments.~~
- ~~*Expanded Model Extent.* The geographic extent of the air dispersion model domain was expanded to include freeway segments to the ports of Los Angeles and Long Beach.~~
- ~~*Organic Gas Emissions Included.* The assessment of acute non-cancer hazards was expanded to examine the impacts of the toxic components of the project's total organic gas emissions from gasoline and diesel vehicles. The analysis in the DEIR focused on diesel PM to derive health impacts from the project.~~
- ~~*Calculated Cancer Population Burden.* The health risk assessment was extended to include the computation of cancer population burden attributed to the project's diesel PM emissions.~~
- ~~*Maximum Exposure Duration for Sensitive/Residential Receptors*. The analysis contained in the DEIR assumed a cancer risk exposure time period of 70 years for sensitive/residential receptors as representative of the "Former OEHHA Guidance" in estimating cancer risks. In this revised assessment, the cancer risk are presented using the "Current OEHHA Guidance." The "Current OEHHA Guidance" incorporates early-in-life exposure sensitivities and recommends an exposure duration of 30-year; the "Current OEHHA Guidance" reflects early age sensitivities[1] (i.e., weighting the effects of exposure more heavily for infants and teenagers than for adults) to toxic compounds and the US Census data showing that 90 percent of individuals live in their residence for 30 years or less; overall the "Current OEHHA Guidance" results in a more conservative analysis of cancer risks than "Former OEHHA Guidance" on performing health risk assessments.~~
- ~~*Maximum Exposure Duration for Worker Receptors.* The analysis contained in the DEIR assumed a cancer risk exposure time period of 40 years for workers as recommended in the "Former OEHHA Guidance." In this revised assessment, the cancer risk impacts are presented for the "Current OEHHA Guidance" which assumes an exposure duration of 25 years for worker receptors, which is based on labor statistics showing 95 percent of workers stay in the same job for 25 years or less.~~
- ~~*Include School Receptors.* The assessment of cancer risks at local school receptors was included in the revised analysis based on the "Current OEHHA Guidance", including the new proposed high school site #5 located north of SR-60.The analysis for the high school #5 is included in the Revised Air Quality Report (Appendix D).~~
- ~~*Buffer Analysis.* The mitigated analysis includes assessment of cancer risks with a buffer of 250 feet (the project design) and 1,000 feet between the project's operational emissions and the centerlines of Redlands Boulevard, Gilman Springs Road, Bay Avenue, and Merwin Street. This assessment is included as a response to comments on the DEIR. The analysis found that a 1,000 foot buffer would result in no substantial reduction in the cancer risk impacts.~~

---

[1] ~~Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015, Section 8.2. http://www.oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf~~

~~The HRA examines the regional nature of the project's potential health risk impacts over a multi-year time period. The HRA methodology applies a risk characterization model to the results from an air dispersion model to estimate potential health risks at each sensitive receptor location. Because of the pervasive nature of diesel particulate matter (diesel PM) in contributing to estimated health risks in California, the focus of this assessment is on estimating the health risks from diesel PM. While the project activities may result in the emission of other TACs (e.g., Total Organic Gases (TOG) from diesel and gasoline-powered vehicles), diesel PM from the project was found to contribute approximately 98 percent of the total cancer risk from project operations (see the revised *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, Appendix D of this EIR). TOG emissions from diesel and gasoline vehicles were, however, included in the assessment of acute non-cancer hazards.~~

~~The HRA process involves four main steps: hazard identification, dose-response assessment, exposure assessment, and risk characterization.~~

- ~~**Hazard Identification**: Hazard identification is the process by which contaminants of concern are selected for investigation in the risk assessment, and includes a review of the chemicals that are potentially released to the atmosphere from the equipment of concern. This assessment is responsive to the emissions of various toxic air contaminants from the construction and operation of the project. The main toxic air contaminants associated with the project include diesel PM from diesel-fueled equipment and total organic gases (TOG) from both gasoline and diesel vehicles.~~
- ~~**Dose-Response Assessment**: The dose-response assessment develops relationships between exposures to a given chemical and the corresponding potential health effects associated with exposure to that chemical. In general, data are limited regarding adverse effects associated with direct exposure to humans to a particular chemical. Therefore, animal experiments have often been performed to assess a chemical's toxicity. These experiments are conducted to determine the organs that are adversely affected by a toxic chemical and the amount of the chemical needed to produce an adverse effect on the organ. Two types of adverse health effects are generally considered in health risk assessments: carcinogenic and non-carcinogenic. Carcinogenic compounds are not considered to have threshold levels (i.e., dose levels below which there are no risks). Any exposure, therefore, will have some associated risk. Chemicals that potentially produce carcinogenic effects have been shown or are suspected to produce tumors in animals or humans. Non-carcinogenic effects, such as liver or kidney damage, may be either reversible or permanent. In these situations, it is assumed that there is a level of exposure at which these chemicals produce no adverse effects in the human body. In other words, exposure to these chemicals in amounts less than a threshold level will result in no adverse health effects. The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure~~
- ~~**Exposure Assessment** identifies potential exposure pathways, estimates chemical concentrations at potential exposure points, and calculates expected doses of emitted substances. An exposure pathway is defined as the means by which an individual or a population is exposed to contaminants that originate from a source. Each pathway represents a different mechanism for exposure. An exposure pathway is defined as the means by which an individual or a population is exposed to contaminants that originate from a source. For this purpose, an air dispersion model (the USEPA AERMOD regulatory model), is used to estimate the toxic air concentrations at locations within and surrounding the project.~~
- ~~**Risk Characterization** is the process of combining dose-response information with the estimates of human exposure in order to derive a quantitative estimate of the likelihood that humans will experience any adverse health effects for the given exposure assumptions. Two general types of health effects are generally considered: potential carcinogenic risks after chronic (long-term)~~

> ~~exposure and potential non-carcinogenic health impacts following chronic (long-term) and acute (short-term) exposure. Each of these health effects was evaluated in this report.~~

~~**Estimation of Cancer Risks.** Excess cancer risks[1] are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a unit-less probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). A risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time.~~

~~The health risk assessment methodology that was included in the DEIR for estimating cancer risks is described below. This methodology, taken from the AB2588 Hot Spot program, estimates cancer risks over a 70-year lifetime of exposure and includes assumptions concerning individual rates of the inhalation of air. This methodology is referred to as the “Former OEHHA Guidance” since it is has been updated by OEHHA since the circulation of the DEIR. The “Former OEHHA Guidance” also provides for an estimate of off-site worker exposures over a 40-year duration.~~

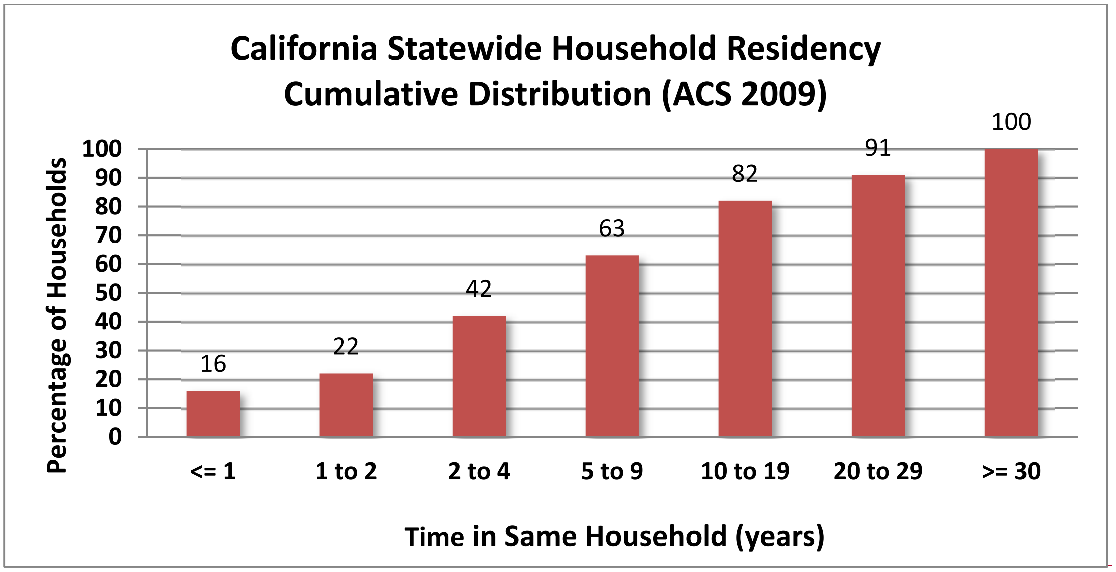
~~On March 6, 2015, the OEHHA released its final version of the document. *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments.*” This Guidance Manual has been developed by OEHHA, in conjunction with CARB, for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). OEHHA is required to develop guidelines for conducting health risk assessments under the Air Toxics Hot Spots Program (Health and Safety Code Section 44360 (b) (2)). OEHHA earlier developed three Technical Support Documents (TSDs) in response to this statutory requirement, which provided the scientific basis for values used in assessing risk from exposure to facility emissions. The three TSDs describe non-cancer risk assessment (derivation of acute, 8-hour and chronic reference exposure levels), derivation of cancer potency factors, and exposure assessment methodology including stochastic risk assessment. The Guidance incorporates the awareness of the sensitivity of early-in-life exposures to toxic air contaminants for sensitive receptors. The methodology is referred to in this document as the “Current OEHHA Guidance.”~~

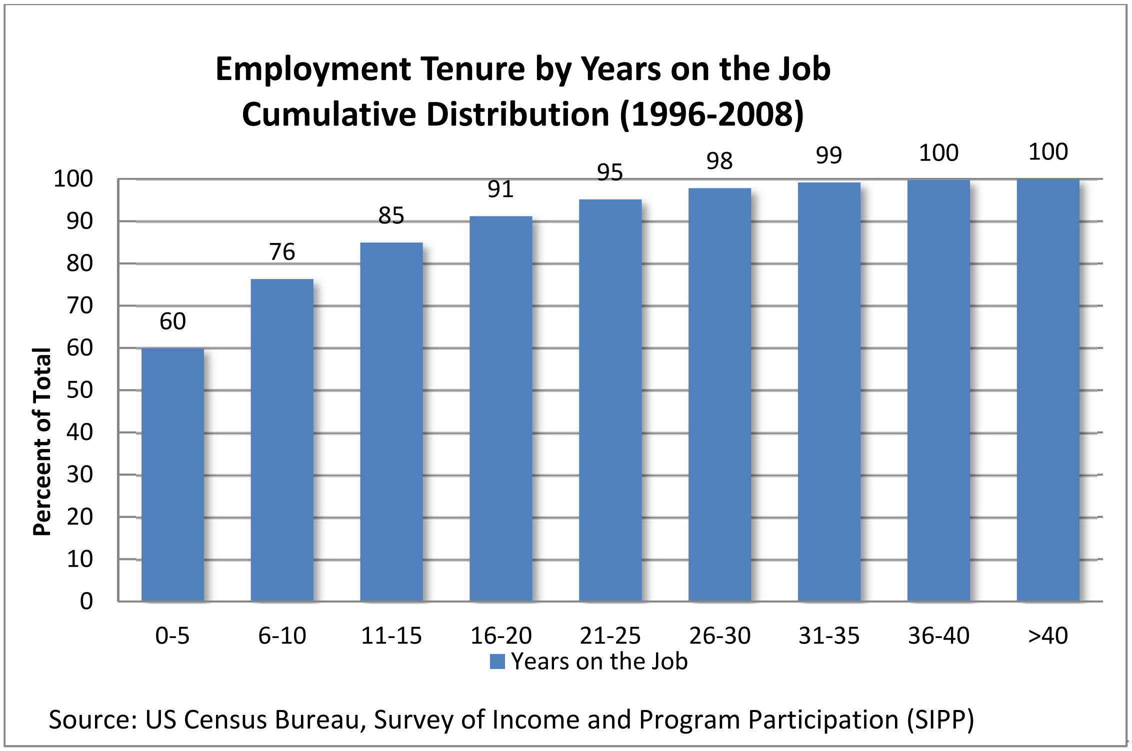
~~The “Current OEHHA Guidance” provides for a 30-year lifetime exposure for sensitive receptors along with assumptions on age-specific sensitivity factors, daily breathing inhalation rates, and time at home estimates. The “Current OEHHA Guidance” also provides for a 25-year exposure duration for off-site worker receptors. To date, the technical support documents relative to the “Current OEHHA Guidance” have been finalized by the OEHHA relative to the AB2588 Hot Spots program; the CARB and SCAQMD have initiated the process to adopt the guidance for AB2588 assessments and application to CEQA air quality impact assessments. This revised assessment estimates the project’s health risk impacts under the “Current OEHHA Guidance”. The changes in the “Current OEHHA Guidance” result in a more conservative estimate of cancer risks resulting from the incorporation of early-in-life exposures compared to the “Former OEHHA Guidance”. This HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study. The estimation of cancer risk involves the specification of several parameters including the concentration level of the toxic air contaminant (for purposes of this assessment diesel PM10 exhaust), the rate of inhalation of the toxic, the exposure frequency (number of days per year), the exposure duration in years, the time period over which the exposure takes place, what is termed a slope factor that represents an upper bound on the increased cancer risk from a lifetime exposure to a toxic by~~

---

[1] ~~Excess cancer risk is the risk from exposure to a source of air toxics that is over and above any cancer risk borne by a person not exposed to these air toxics.~~

~~ingestion or inhalation and early-in-life age sensitivity factors. The values of these parameters depend on the type of receptor, i.e., sensitive/residential, worker, and student as discussed below.~~





Source: US Census Bureau, Survey of Income and Program Participation (SIPP)

~~*Cancer Risk Exposure Assumptions.* The principal focus of this HRA is on the potential health impacts to sensitive/residential receptors located within and surrounding the project site, based on the assumption that diesel exhaust can cause cancer. Sensitive receptors include hospitals, schools, daycare facilities, elderly housing and convalescent facilities. Residences are also considered sensitive receptors. An important parameter necessary to estimate cancer risk requires the specification of the duration of exposure of an individual to toxic air contaminants. An assessment of~~

~~population mobility can assist in determining the length of time a residential receptor is exposed in a particular location. For example, the duration of exposure to a source of toxic air contaminants will be directly related to the period of time residents live near the source of the emissions.~~

~~Table 4.3.G summarizes the primary exposure assumptions used to calculate individual cancer risk by receptor type for the "Current OEHHA Guidance."~~

~~Table 4.3.G: Exposure Assumptions for Cancer Risk for "Current OEHHA Guidance" (new table)~~

~~Type of Guidance~~	~~Receptor Type~~	~~Exposure Frequency~~		~~Exposure Duration (years)~~	~~Age Sensitivity Factors~~	~~Time at Home Factor (%)~~	~~Daily Breathing Rate (L/kg-day)~~
		~~Hours/ day~~	~~Days/ year~~				
~~Current OEHHA Guidance~~	~~Sensitive/Residential:~~						
	~~3rd Trimester~~	~~24~~	~~350~~	~~0.25~~	~~10~~	~~85~~	~~361~~
	~~0-2 years~~	~~24~~	~~350~~	~~2~~	~~10~~	~~85~~	~~1090~~
	~~3-16 years~~	~~24~~	~~350~~	~~14~~	~~3~~	~~72~~	~~745~~
	~~Older than 16 years~~	~~24~~	~~350~~	~~14~~	~~1~~	~~73~~	~~290~~
	~~Student~~	~~8~~	~~180~~	~~9~~	~~3~~	~~NA~~	~~745~~

~~(L/kg-day) = liters per kilogram body weight per day; NA = not applicable~~
~~The daily breathing rates shown are the 95th percentile rate as recommended by the OEHHA.~~
~~Source: OEHHA 2014~~

~~The underlying factors used in the analysis exemplify the conservative nature of utilizing the exposure scenarios and the underlying assumptions:~~

- ~~The residential cancer risk calculation assumes that each resident will be exposed to diesel particulate matter (diesel PM) and organic gases for 24 hours a day for 350 days a year at the location of his or her home throughout the entire 30 year residential exposure period.~~
- ~~The worker cancer risk calculation assumes that workers are exposed to diesel PM for 8 hours a day for 250 days a year, next to, but outside of the buildings in which they work.~~
- ~~The atmospheric dispersion model and traffic model that are used to estimate risks generally provide impact estimates that are over-estimates based on the use of conservative model assumptions.~~

~~Other Factors that Influence Health Risk Estimates: Conservative Trip Estimates.~~ ~~It should also be noted that the traffic analysis used a conservative estimate of the number of truck trips after the project begins operation. This is important because diesel PM emissions are directly related to both the number of trucks and the vehicle miles traveled.~~

~~The traffic analysis in the EIR used the traffic generation rate for high-cube warehouses suggested by the Institute of Traffic Engineers ("ITE") which is based on traffic counts from a number of large warehouses located in California and elsewhere in the United States. This rate was also compared to the trip generation rate actually resulting from the Skechers warehouse immediately adjacent to the project. The Skechers warehouse is representative of the warehouses planned for the project. The ITE trip generation rate is three times greater than the Skechers warehouse traffic counts (see Table 4.15.K in the revised EIR). Because the project analysis used a higher trip generation rate, the vehicle miles traveled are also higher. The combination of the conservative forecasts of traffic and of the miles traveled means that the calculation of the cancer risk in the EIR overstates the extent of that risk regardless of the exposure period used.~~

~~Cancer Burden~~~~. Whereas cancer risk represents the probability of an individual to develop cancer, cancer burden multiplies the cancer risk by the exposed population to estimate the number of~~

~~individuals that would be expected to contract cancer from the project. The exposed population is defined as the number of persons within a facility's zone of impact, which is typically the area exposed to an incremental cancer risk of one in a million from the project. Consistent with this definition, cancer burden was calculated by first identifying all population census tracts[1] located within the project's zone of impact, multiplying the estimated incremental project cancer risk impact in the census tract by the population of the census tract and then summing all of products of population times estimated cancer risk in the zone of impact. Note that each census tract contributes to the cancer burden in proportion to its population and risk. For example, if a census tract has a relatively high estimated cancer risk, but no people living there, it will not contribute to the estimation of the cancer burden. As provided in the "Current OEHHA Guidance", the cancer burden is calculated assuming a 70-year exposure duration along with the appropriate exposure frequency, daily breathing rates, age sensitivity factors, and time at home factors appropriate to each age group[2].~~

~~**Non-cancer Hazards.** Separate from cancer risk impacts, exposures to TACs such as diesel PM can also cause chronic (long-term) and acute (short-term) related non-cancer illnesses such as reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system, birth defects, or other adverse environmental effects. Risk characterization for non-cancer health risks from TACs is expressed as a hazard index (HI). The HI is a ratio of the predicted concentration of a project's emissions to a concentration considered acceptable to public health professionals, termed the Reference Exposure Level (REL). This is a separate and distinct analysis from the analysis conducted for cancer risk. A significant risk is defined by the SCAQMD as an HI of 1 or greater. The California OEHHA has assigned a chronic non-cancer REL of 5 µg/m^3 for diesel PM (OEHHA 2011). Diesel PM has effects on the respiratory system, which accounts for essentially all of its potential chronic non-cancer hazards. Therefore, the only HI calculated was for the respiratory system.~~

~~Exposures to toxics air contaminants can also have short-term or acute non-cancer effects, typically dealing with exposures over an hour or so. The California OEHHA has not defined a reference exposure level for diesel PM appropriate for estimating acute non-cancer hazards from diesel PM. Therefore, to estimate the potential acute non-cancer impacts from the project, it was necessary to examine the various individual chemical components (or chemical species) that comprise the emissions from both diesel vehicles and gasoline vehicles. For this purpose, use was made of emission source profiles that provide estimates of the various chemical components that comprise the exhaust from diesel and gasoline vehicles. From this information, an estimate can be made of the maximum one-hour average concentration levels of the project's various chemical species from which an acute non-cancer hazard index can be determined.~~

~~**Morbidity and Mortality.** Respirable particulate matter is a public health concern as it is known to impact both the respiratory and cardiovascular systems. Respirable particulate matter deposition in the lungs and penetration into the bloodstream (for the smallest particles) triggers a range of inflammation responses and exacerbates health problems such as asthma and chronic bronchitis. Individuals susceptible to higher health risks from exposure to airborne particulate matter (PM_{10} and $PM_{2.5}$) include children, the elderly, smokers, and people of all ages with low pulmonary/cardiovascular function. The CARB reviewed and summarized the toxic health effects (i.e., mortality and morbidity) of PM exposure and presented a health effect model attempting to quantify~~

---

[1] ~~A census tract is a geographic region defined for the purpose of taking a census. Usually these regions coincide with the limits of cities, towns, or other administrative areas. Each tract has a unique numeric code and averages about 4,000 inhabitants. The census tract centroid is the geographic center of the tract based on a weighted distribution of the population within the tract using the census blocks that comprise the tract. A census block is the smallest geographic unit used to tabulate population and each tract can be comprised of several blocks.~~

[2] ~~Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015, Section 8.1. http://www.oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf~~

~~these impacts based on concentration-response functions (C-R functions). This CARB model has been used, for example, to estimate the number of cases of disease and premature deaths linked to PM and ozone exposure from ports and goods movement in California.~~

~~The CARB model has also been used to quantitatively assess project-specific incremental levels of public mortality and morbidity, however, such calculations are subject to significant uncertainty. Sources of uncertainty include emission estimates, population exposure estimates, concentration-response functions, baseline rates of mortality and morbidity that are entered into C-R functions, and occurrence of additional not-quantified adverse health effects. It should be noted that the nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as sulfur dioxide, NO_2, CO, and O_3 that tend to co-occur with PM in ambient air, greatly increase the complexity of deriving accurate PM concentration-response functions. Health risk estimates derived in the presence of significant uncertainty tend to rely on very conservative assumptions that may greatly overestimate the potential adverse health effects. Risk assessment has various uncertainties in the methodology and is therefore deliberately designed so that risks are not under predicted.~~

~~Despite a number of uncertainties in the analysis methodology, the expected increase in mortality and morbidity was calculated for the project's toxic air emissions.~~

~~**Geographic Scope of the Health Risk Assessment.** The HRA is characterized by two important differences from the localized significance threshold assessment for criteria pollutants. According to the SCAQMD localized significance threshold assessment methodology, the assessment of localized impacts addresses only those emissions that are generated "onsite", that is for the purposes of this project, emissions generated from within or along the boundaries of the Specific Plan. However, for the HRA, both the universe of the project's emission sources and air dispersion model receptors were greatly expanded to assess the regional impact of the project's emissions of toxics. For this purpose, the project's toxics emission sources included over 500 individual arterial road and freeway mainline segments in the region that extended from North Palm Springs to Long Beach in the east-west direction and from Rancho Cucamonga to Hemet/San Jacinto in the north-south direction, roughly an area of 3,500 square miles. The study area for the arterial roads covered all intersections in the City of Moreno Valley of a collector or higher classification street with another collector street or higher classification street at which the project would add 50 or more peak hour trips. The study area included the main arterial routes between the project and neighboring communities of Riverside, Perris, Beaumont, San Jacinto, Hemet, and Redlands.~~

~~The study area for freeways was selected to cover the freeway routes radiating from the project site to the north, south, east, and west. The analysis covered major portions of the following freeways from North Palm Springs to the ports of Los Angeles and Long Beach: Interstate 10, State Route 60, State Route 91, Interstate 215, and Interstate 710.~~

~~The generation of emissions from traffic traveling along the various arterial and freeway mainline roadway segments requires information on traffic volumes, length of segment, and emission factors. The emission factors, in turn, depend on vehicle type, speed, calendar year, and fuel type. Estimates of daily and peak hour vehicle volumes and types (passenger cars, light heavy duty trucks, medium heavy duty trucks, and heavy-heavy duty trucks) were provided by the traffic consultant for each roadway segment analyzed. The physical length and width of each roadway segment were estimated using the segment location as provided by the traffic consultant and aerial photographs available from Google Earth. Vehicle speeds for each roadway segment and vehicle type were estimated based on posted speed limits and peak morning and afternoon average speeds taken from the 2012 Regional Transportation Plan for the years 2008 and 2035 (Southern California Association of Governments 2012). Segment speeds were adjusted to account for stop signs and traffic lights and other stoppages by reducing the prevailing vehicle speeds by 5 to 10 mph. The various roadway parameters are provided in Appendix D.~~

~~The expanded geographic scope of the assessment also necessitated an expansion in the locations of the receptors where the project's impacts were calculated. This expanded network included locations of individual schools within the Moreno Valley School District and over 2,300 census tract centroid locations.~~

~~Finally, it is recognized that because of the large geographical extent of the region covered in this HRA, meteorological conditions differ for different portions of the study region. The most frequent wind direction patterns in the Riverside and Moreno Valley areas are from the northwest direction at as represented by the SCAQMD Riverside air monitoring station. In contrast, the most frequent wind directions along the SR-60 and SR-91 west of SR-71 in the La Habra and Anaheim areas are generally from the southwest. Because of these wind differences, it was necessary to separate the air dispersion modeling into two separate pieces as follows. Those emission sources located east of SR-71 were assumed to be influenced by the meteorological conditions represented by the Riverside meteorological data. Those emission sources located west of SR-71 were assumed to be influenced by the meteorological conditions represented by the Anaheim meteorological data. The air dispersion modeling was done separately for the region east of SR-71 and for the region west of SR-71. The air pollutant concentrations at each receptor location were then comprised as the sum of the emission impacts from those sources located east of SR-71 and west of SR-71 as influenced by their respective meteorological conditions.~~

~~The health risk analysis examined the following condition:~~

- ~~Proposed Project Development condition which examines the effect of project-related construction and operational traffic diesel PM emissions as if the project were built out in accordance with its proposed phased construction and operational buildout schedule commencing with the construction of Phase 1 in 2015, build out of Phase 1 in 2022, and the final full build out in 2035. This condition forms the basis for quantifying the incremental impacts from the project.~~

~~Annual average diesel PM emissions and impacts were calculated for each year starting from 2015 based on the assumption that diesel exhaust can cause cancer. Specifically, annual average diesel PM concentrations were estimated from the diesel PM construction emissions for each year of construction from 2015 to 2030 according to the construction schedule and equipment usage projected for each year of construction. Proposed Project Development examines project impacts resulting from the proposed construction and operation of the project from the commencement of construction in 2015 for a 30-year duration for sensitive/residential receptors, 25-year for worker receptors, and 9-year exposure time periods for school-site student receptors. Annual average diesel PM emissions and impacts during operation were estimated for the years 2022 and 2035, years for which detailed traffic information was available from the traffic impact report. The annual average operational diesel PM impacts were then interpolated among three calculation years: 2015 (operational emissions were assumed to be zero in this year), 2022 and 2035 based on the amount of square-footage of buildings brought online during each year. Annual average diesel PM concentrations for the years beyond 2035 were set to the year 2035 levels.~~

~~During years when both construction and operations occur simultaneously (2016 to 2030), the annual diesel PM concentrations at the sensitive receptors from construction were added to the annual diesel PM concentrations from operations to provide a total impact assessment of all diesel PM emissions from the project during each year. The resulting total annual average diesel PM concentrations calculated each year for the exposure time period (individual annual averages) multiplied by the requisite daily breathing rates, age sensitivity factors, and time-at-home factors for each year of exposure assuming the a child of age zero (within the mother's womb) commences its lifetime exposure in year 2015. The HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study. The revised mitigation conditions require that all diesel~~

~~trucks accessing the project during operation be model year 2010 or newer and that all on-site equipment be Tier 4. The results of the HEI Study indicate that the project mitigation requiring the application of Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.~~

~~4.3.4 Thresholds of Significance~~

~~Based on Appendix G of the *CEQA Guidelines*, air quality impacts would occur if the proposed project would:~~

- ~~Conflict with or obstruct implementation of the applicable air quality plan;~~
- ~~Violate any air quality standard or contribute substantially to an existing or projected air quality violation;~~
- ~~Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);~~
- ~~Expose sensitive receptors to substantial pollutant concentrations; and/or~~
- ~~Create objectionable odors affecting a substantial number of people.~~

~~In addition to the Federal and State AAQS, there are daily emissions thresholds for construction and operation of a proposed project in the Basin. The Basin is administered by the SCAQMD, and guidelines and emissions thresholds established by the SCAQMD in its *CEQA Air Quality Handbook*[1] and subsequent additions to the Handbook were used in this analysis. It should be noted that the emissions thresholds were established based on the attainment status of the air basin with regard to air quality standards for specific criteria pollutants. Because the concentration standards were set at a level that protects public health with an adequate margin of safety, these emissions thresholds are regarded as conservative and would overstate an individual project's contribution related to air quality and health risks.~~

~~4.3.4.1 Thresholds for Construction Emissions~~

~~The following CEQA significance thresholds for construction emissions have been established by the SCAQMD for the Basin:~~

- ~~75 pounds per day of VOC, also known as reactive organic compounds (ROC).~~
- ~~100 pounds per day of NO_X.~~
- ~~550 pounds per day of CO.~~
- ~~150 pounds per day of PM_{10}.~~
- ~~150 pounds per day of SO_X.~~
- ~~55 pounds per day of $PM_{2.5}$.~~

~~Projects in the Basin with construction-related emissions that exceed any of the emission thresholds are considered to be significant under CEQA.~~

---

[1] ~~*CEQA Air Quality Handbook*, April 1993.~~

~~4.3.4.2 Thresholds for Operational Emissions~~

~~Projects with operation-related emissions that exceed any of the emission thresholds listed below are considered significant under the SCAQMD guidelines.~~

- ~~55 pounds per day of VOC, also known as ROC.~~
- ~~55 pounds per day of NO_X.~~
- ~~550 pounds per day of CO.~~
- ~~150 pounds per day of PM_{10}.~~
- ~~150 pounds per day of SO_X.~~
- ~~55 pounds per day of $PM_{2.5}$.~~

~~4.3.4.3 Air Pollutant Standards for CO with Localized Effects~~

~~The significance of localized project impacts under CEQA depends on whether ambient CO levels in the vicinity of the project are above or below State and Federal CO standards (previously referenced Table 4.2.A). If ambient levels are below the standards, a project is considered to have a significant impact if project emissions result in an exceedance of one or more of these standards. If ambient levels already exceed a State or Federal standard, project emissions are considered significant if they increase one-hour CO concentrations by 1.0 ppm or more or eight-hour CO concentrations by 0.45 ppm or more. The Basin meets State and Federal attainment standards for CO; therefore, the proposed project would have a significant CO impact if project emissions result in an exceedance of State or Federal one-hour or eight-hour standard. The following emission concentration standards for CO, based on the SCAQMD *CEQA Air Quality Handbook* (1993), apply to the proposed project:~~

- ~~California State one-hour CO standard of 20.0 ppm.~~
- ~~California State eight-hour CO standard of 9.0 ppm.~~

~~4.3.4.4 Localized Significance Thresholds~~

~~The SCAQMD published its *Final Localized Significance Threshold Methodology* in June 2003, revised July 2008) and *Final Methodology to Calculate Particulate Matter (PM) 2.5 and $PM_{2.5}$ Significance Thresholds* (October 2006), recommending that all air quality analyses include a localized assessment of both construction and operational impacts on the air quality of nearby sensitive receptors. LSTs represent the maximum emissions from a project site that are not expected to result in an exceedance of Federal or State AAQS. LSTs are based on the ambient concentrations of that pollutant within the Source Receptor Area (SRA) where a project is located and the distance to the nearest sensitive receptor. The project site is located in the northern portions of SRAs 24 (Moreno Valley) and 28 (San Jacinto).~~

~~In the case of CO and NO_2, if ambient levels are below the air standards for these pollutants, a project is considered to have a significant impact if project emissions result in an exceedance of one or more of these standards. If ambient levels already exceed a State or Federal standard, then project emissions are considered significant if they increase ambient concentrations by a measurable amount. This would apply to PM_{10} and $PM_{2.5}$, both of which are nonattainment pollutants in the Basin. For these latter two pollutants, the significance criteria are the pollutant concentration thresholds presented in SCAQMD Rules 403 and 1301. The Rule 403 threshold of 10.4 $\mu g/m^3$ applies to construction emissions (and may apply to operational emissions at aggregate handling facilities). The Rule 1301 threshold of 2.5 $\mu g/m^3$ applies to non-aggregate handling operational activities.~~

~~Sensitive receptors include residences, schools, hospitals, and similar uses that are sensitive to adverse air quality. There are currently seven occupied single-family homes and associated ranch/ farm buildings in various locations on the proposed project site. These residences are existing on-site sensitive receptors. The nearest off-site existing sensitive receptors in the vicinity of the proposed project site are the residences located along Bay Avenue, Merwin Street, and west of Redlands Boulevard, and scattered residences along Gilman Springs Road.~~

~~Following the SCAQMD LST methodology, for sites larger than 5 acres, air dispersion modeling needs to be conducted. Because the project site greatly exceeds 5 acres, the localized significance for project air pollutant emissions was determined by performing dispersion modeling to determine if the pollutant concentrations would exceed relevant significance thresholds established by the SCAQMD.~~

~~The following LSTs were applied to the construction and operation of the project:~~

- ~~0.18 ppm (State 1-hour); 0.100 ppm (Federal 1-hour); and 0.03 ppm (Annual) of NO$_2$ for construction or operations.~~
- ~~20 ppm (1-hour) and 9.0 ppm (8-hour) of CO for construction or operation.~~
- ~~10.4 µg/m^3 (24-hour) and 1 µg/m^3 of PM$_{10}$ (Annual) for construction.~~
- ~~2.5 µg/m^3 (24-hour) and 1.0 ppm (Annual) of PM$_{10}$ for operations.~~
- ~~10.4 µg/m^3 (24-hour) of PM$_{2.5}$ for construction.~~
- ~~2.5 µg/m^3 (24-hour) of PM$_{2.5}$ for operation.~~

- ~~Note that when construction and operational activities occur at the same time, the SCAQMD recommends application of the significance thresholds for operation apply in determining emission significance~~

~~4.3.4.5 Health Risk Significance Thresholds~~

~~For pollutants without defined significance standards or air contaminants not covered by the standard criteria cited above, the definition of substantial pollutant concentrations varies. For toxic air contaminants (TAC), "substantial" is taken to mean that the individual cancer risk exceeds a threshold considered to be a prudent risk management level.~~
~~The SCAQMD has defined several health risk significance thresholds that it recommends to Lead Agencies in assessing a project's health risk impacts. The City of Moreno Valley has not adopted its own set of thresholds. Therefore, the following SCAQMD thresholds were adopted for the project.~~

- ~~**Maximum Individual Cancer Risk and Cancer Burden (MICR).** MICR is the estimated probability of a potential maximally exposed individual contracting cancer as a result of exposure to TACs over the applicable exposure period.~~

  ~~A significant impact would occur for:~~

  ~~(A) An increased MICR greater than 10 in 1 million at any receptor location; or~~

  ~~(B) A cancer burden greater than 0.5~~

- ~~**Chronic Hazard Index.** This is the ratio of the estimated long-term level of exposure to a TAC for a potential maximally exposed individual to its chronic reference exposure level. A reference exposure level is the exposure level below which an adverse health effect will not occur as determined by health professionals The Chronic Hazard Index calculations include multi-pathway consideration, when applicable.~~

~~A significant impact would occur if the increase in total chronic hazard index for any target organ system due to exposures to total TAC emissions from the project exceeds 1.0 at any receptor location.~~

- ~~**Acute Hazard Index.** This is the ratio of the estimated maximum one-hour concentration of a TAC for a potential maximally exposed individual to its acute reference exposure level, the exposure level below which an adverse health effect will not occur as determined by health professionals.~~

  ~~A significant impact would occur if the increase in total acute Hazard Index for any target organ system due to exposure to total TAC emissions from the project exceeds 1.0 at any receptor location.~~

~~4.3.5 Less than Significant Impacts~~

~~The following impacts were determined to be less than significant. For each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.~~

~~4.3.5.1 Odors~~

~~Threshold~~	~~Would the proposed project create objectionable odors affecting a substantial number of people?~~

~~The SCAQMD recommends that odor impacts be addressed in a qualitative manner. Such an analysis shall determine whether the project would result in excessive nuisance odors, as defined under the California Code of Regulations and Section 41700 of the California Health and Safety Code, and thus would constitute a public nuisance related to air quality.~~

~~Land uses typically considered associated with odors include wastewater treatment facilities, waste-disposal facilities, or agricultural operations. The project does not contain land uses typically associated with emitting objectionable odors.~~

~~SCAQMD Rule 402 dictates that air pollutants discharged from any source shall not cause injury, nuisance, or annoyance to the health, safety, or comfort of the public. With the exception of short-term construction-related odors (e.g., equipment exhaust, paint, and asphalt odors), the proposed uses that would be developed on the proposed site do not include uses that are generally considered to generate offensive odors (e.g., agricultural uses, wastewater treatment plants, or landfills). While the application of architectural coatings and installation of asphalt may generate odors, these odors are temporary and not likely to be noticeable beyond the project boundaries. SCAQMD Rules 1108 and 1113 identify standards regarding the application of asphalt and architectural coatings, respectively.~~

~~SCAQMD Rule 1108 sets limitations on ROG (reactive organic gases), which are similar to and for the purposes of this EIR equivalent to and therefore interchangeable with volatile organic compounds (VOC) content in asphalt. This rule is applicable to any person who supplies, sells, offers for sale, or manufactures any asphalt materials for use in the Basin. Rule 1113 of the SCAQMD deals with the selling and application of architectural coatings. Rule 1113 is applicable to any person who supplies, sells, offers for sale, or manufactures any architectural coating for use in the Basin that is intended to be applied to buildings, pavements, or curbs. This rule is also applicable to any person who applies or solicits the application of any architectural coating within the Basin. Rule 1113 sets limits on the amount of VOC emissions allowed for all types of architectural coatings, along with a time table for tightening the emissions standards in the future. Compliance with Rule 1113 means that architectural~~

~~coatings used during construction would have VOC emissions that comply with these limits. In addition, pursuant to Mitigation Measure 4.3.6.2C, the project would be required to use low VOC paints.~~

~~The SCAQMD indicates that the number of overall complaints has been declining. Between 2003 and 2007, odor complaints made up 50 to 55 percent of the total nuisance complaints. Over the past decade, odor complaints from paint and coating operations have decreased from 27 to 7 percent and odor complaints from refuse collection stations have increased from 9 to 34 percent.~~

~~Diesel exhaust and VOCs would be emitted during construction of the project, which are objectionable to some; however, emissions would disperse rapidly from the project site and therefore should not reach an objectionable level at the nearest sensitive receptors. Diesel exhaust would also be emitted during operation of the project from the long-haul trucks that would visit the project site. However, the concentrations would not be at a level to result in a negative odor response at nearby sensitive or worker receptors. In addition, modern emission control systems on diesel vehicles since 2007 virtually eliminate diesel's characteristic odor.~~

~~During blow-down maintenance activities, natural gas odors will be present around the SDG&E Compressor Plant located on the project site. When this portion of the WLC Specific Plan is developed, these odors will occasionally be detectable from the industrial warehouse properties adjacent to the SDG&E facility. These odors will be infrequent and odorized natural gas will not be present in high concentrations. Therefore, potential odor impacts from on-site natural gas operations are considered to be less than significant and do not require mitigation.~~

~~Adherence to applicable provisions of these rules is standard for all development within the Basin. In addition, conditions for the design of waste storage areas on the proposed site would be established through the permit process to ensure enclosures are appropriately designed and maintained to prevent the proliferation of odors. Solid waste generated by the proposed on-site uses will be collected by a contracted waste hauler, ensuring that any odors resulting from on-site uses would be adequately managed. Therefore, impacts associated with this issue would be less than significant and no mitigation is required.~~

~~4.3.5.2 Long-Term Microscale (CO Hot Spot) Emissions~~

~~Threshold~~	~~Would the proposed project violate any air quality standard or contribute substantially to an existing or projected air quality violation?~~
	~~For CO, the applicable thresholds are:~~
	~~- California State one-hour CO standard of 20.0 ppm; and~~
	~~- California State eight-hour CO standard of 9.0 ppm.~~

~~Vehicular trips associated with the development of the proposed project could contribute to congestion at intersections and along roadway segments in the project vicinity resulting in potential local CO "hot spot" impacts. The primary mobile source pollutant of local concern is CO, which is a direct function of vehicle travel speeds and idling time and, thus, traffic flow conditions. CO transport is extremely limited; it disperses rapidly with distance from the source under normal meteorological conditions. However, under certain extreme meteorological conditions, CO concentrations proximate to a congested roadway or intersection may reach unhealthful levels affecting local sensitive receptors (residents, schoolchildren, etc.). High CO concentrations are typically associated with roadways or intersections operating at unacceptable levels of service or with very high traffic volumes. In areas with high ambient background CO concentrations, modeling is recommended to determine a project's effect on local CO levels.~~

~~Carbon monoxide (CO) "hot spot" thresholds ensure that emissions of CO associated with traffic impacts from a project in combination with CO emissions from existing and forecast regional traffic do not exceed State or Federal standards for CO at any traffic intersection affected by the project. Project concentrations may be considered significant if a CO hot spot intersection analysis determines that project-generated CO concentrations cause a localized violation of the State CO 1-hour standard of 20 ppm, State CO 8-hour standard of 9 ppm, Federal CO 1-hour standard of 35 ppm, or Federal CO 8-hour standard of 9 ppm.~~

~~A CO hot spot is a localized concentration of CO that is above the State or Federal 1-hour or 8-hour CO ambient air standards. Localized high levels of CO are associated with traffic congestion and idling or slow-moving vehicles. To provide a worst-case scenario, CO concentrations are estimated at project-impacted intersections where the concentrations would be the greatest.~~

~~This analysis follows guidelines recommended by the CO Protocol (University of California, Davis 1997) and the SCAQMD. According to the CO Protocol, intersections with Level of Service (LOS) E or F require detailed analysis. In addition, intersections that operate under LOS D conditions in areas that experience meteorological conditions favorable to CO accumulation require a detailed analysis. The LOS for intersections is determined in the project Traffic Impact Analysis (refer to Section 4.15 of this EIR, Traffic and Circulation). The SCAQMD recommends that a local CO hot spot analysis be conducted if the intersection meets one of the following criteria: (1) the intersection is at LOS D or worse and where the project increases the volume to capacity ratio by 2 percent, or (2) the project decreases LOS at an intersection from C to D. A decrease in LOS, i.e., from C to D, means that there is more traffic and more delay at the intersection.~~

~~For this project analysis, the intersections with the highest traffic volumes and the LOS E or F before mitigation were identified for 2022 using information from the table in the traffic study "Intersection LOS under 2022 Plus Phase 1 Conditions." The intersections with the greatest LOS before mitigation were also identified for 2035 using information from the table in the traffic study "Intersection LOS under 2035 Plus Build-out Conditions."~~

~~The CO concentrations were estimated using the CALINE4 model using 2012 emission factors. The emission factors are for "all" vehicle classes and are not adjusted for a project-specific fleet to provide a worst-case scenario. In addition, the emission factors do not take into account the project mitigation reductions from requiring that all diesel trucks are model year 2010 or newer.~~

~~Table 4.3.H shows estimated CO concentrations at year 2022 plus project traffic conditions. The estimated CO concentrations at year 2035 are shown in Table 4.3.I. As shown in the tables, the estimated 1-hour and 8-hour average CO concentrations from project-generated and cumulative traffic plus the background concentrations are below the State and Federal standards. No CO hot spots are anticipated because of traffic-generated emissions by the project in combination with other anticipated development in the area. Therefore, the mobile emissions of CO from the project are not anticipated to contribute substantially to an existing or projected air quality violation of CO. Therefore, according to this criterion, air pollutant emissions during operation would result in a less than significant impact. No mitigation is required.~~

~~Note: The following tables were edited because the revised Traffic Impact Analysis revised traffic volumes and LOS. CO hotspot analyses are dependent of traffic volumes through specific intersections; changes in a traffic analysis may result in changes to the intersections that require analysis in order to determine the location of greatest impact. That occurred in this analysis with changing transportation analysis requiring a modified CO hotspot analysis.~~

~~Table 4.3.H: Carbon Monoxide Concentrations at Intersections, 2022~~

~~Intersection~~	~~Peak Hour~~	~~CO Concentration (ppm)~~		~~Significant Impact?~~
		~~1 Hour~~	~~8 Hour~~	
~~Cactus Avenue at Graham Street~~	~~PM~~	~~5.2~~	~~3.4~~	~~No~~
~~Cactus Avenue at Elsworth Street~~	~~PM~~	~~4.9~~	~~3.2~~	~~No~~

~~4.3.6 Significant Impacts~~

~~The following impacts were determined to be potentially significant. In each of the following issues, mitigation measures have been recommended to reduce the significance of the identified impacts.~~

~~4.3.6.1 Air Quality Plan Management Plan Consistency~~

~~**Impact 4.3.6.1:** *Implementation of the proposed project has the potential to conflict with implementation of the SCAQMD 2012 AQMP.*~~

~~Threshold~~	~~Would the proposed project conflict with or obstruct implementation of the applicable air quality plan?~~

~~According to the 1993 SCAQMD Handbook, there are two key indicators of consistency with the Air Quality Management Plan (AQMP):~~

1. ~~Indicator: Whether the project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.~~
2. ~~Indicator: A project would conflict with the AQMP if it would exceed the assumptions in the AQMP in 2010 or increments based on the year of project buildout and phase. The Handbook indicates that key assumptions to use in this analysis are population number and location and a regional housing needs assessment. The parcel-based land use and growth assumptions and inputs used in the Regional Transportation Model run by the Southern California Association of Governments~~

> ~~that generated the mobile inventory used by the SCAQMD for AQMP are not available and assumed not to include the proposed project; therefore, the SCAQMD's significance thresholds are used to determine if the project exceeds the assumptions in the AQMP.~~

~~Considering the recommended criteria in the SCAQMD's 1993 Handbook, this analysis utilizes the following criteria to address this potential impact:~~

- ~~Project's contribution to air quality violations (SCAQMD's first indicator, 1 as listed above);~~
- ~~Assumptions in AQMP (SCAQMD's second indicator, 2, as listed above); and~~
- ~~Compliance with applicable emission control measures in the AQMPs.~~

~~**Project's Contribution to Air Quality Violations and Assumptions in AQMP.** According to the SCAQMD, the project is consistent with the AQMP if the project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP (SCAQMD 1993, page 12-3). As shown in analyses in Impact 4.3.6.3, the project could violate an air quality standard and therefore could contribute substantially to an existing or projected air quality violation.~~

~~If a project's emissions exceed the SCAQMD regional thresholds for NO_X, VOC, PM_{10}, or $PM_{2.5}$, it follows that the emissions could cumulatively contribute to an exceedance of a pollutant for which the Basin is in nonattainment (ozone, PM_{10}, and $PM_{2.5}$) at a monitoring station in the Basin.~~

~~The thresholds are criteria for determining environmental significance and are discussed in the SCAQMD's 1993 Handbook for Air Quality Analysis and are updated in the SCAQMD's most recent thresholds published online in 2012.[4] An exceedance of a nonattainment pollutant at a monitoring station would not be consistent with the goals of the AQMP to achieve attainment of pollutants.~~

~~As discussed in the analyses below (Impact 4.3.6.2, Construction Emissions, and Impact 4.3.6.4, Long-Term Operational Emissions), the project would exceed the regional emission significance thresholds for VOC, NO_X, CO, PM_{10}, and/or $PM_{2.5}$ prior to the application of mitigation. (Refer specifically to Table 4.3.J for construction emissions and Table 4.3.Y for operational emissions.) This means that project emissions of VOC and NO_X could combine with other sources and could result in an ozone, PM_{10}, or $PM_{2.5}$ exceedance at a nearby monitoring station. The Basin in which the project is located is in nonattainment for these pollutants; therefore, according to this criterion, the project would not be consistent with the AQMP. The regional emissions assume a zero baseline for existing emissions on the project site and therefore assumes that the AQMP had no emissions for the project site. The regional significance thresholds can be interpreted to mean that if project emissions exceed the thresholds, then the project would also not be consistent with the assumptions in the AQMP. The project does not meet this criterion.~~

~~*Note: The project comparison with the Moreno Highlands Specific Plan was removed because it is assumed that there would be a zero baseline for the existing emissions, instead of assuming that the existing conditions are emissions from the Moreno Highlands Specific Plan. Please see the paragraphs above for a discussion. Note that a comparison to the Moreno Highlands Specific Plan is still part of the No Project analysis of the EIR and can be found in the Alternatives Section 6.0.*~~

---

[4] ~~The most recent SCAQMD significance thresholds are located at the following website.http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2~~

~~**Compliance with Emission Control Measures.** The second indicator of whether the project could conflict with or obstruct implementation of the AQMP is by assessing the project's compliance with the control measures in the AQMPs and the State Implementation Plan (SIP).~~

~~**2003 AQMP.** The 2003 AQMP contains a number of land use and transportation control measures including the following: the SCAQMD's Stationary and Mobile Source Control Measures; State Control Measures proposed by the CARB; and SCAG Transportation Control Measures (TCMs). The CARB's strategy for reducing mobile source emissions includes the following approaches: new engine standards; reduction of emissions from in-use fleet; requiring clean fuels; supporting alternative fuels and reduction of petroleum dependency; working with the EPA to reduce emissions from Federal and State sources; and pursuit of long-term advanced technology measures (AQMP 2003, page 4-25). SCAG TCMs include those contained in the Regional Transportation Plans (RTPs), the most current version of which is the 2008 RTP, which has control measures to reduce emissions from on-road sources by incorporating strategies such as high occupancy vehicle interventions, transit, and information-based technology interventions (AQMP 2003, page 4-19). The project would comply with the control measures and regulation set by the CARB and SCAG.~~

~~**2007 AQMP.** The focus of the 2007 AQMP is to demonstrate attainment of the Federal $PM_{2.5}$ ambient air quality standard by 2015 and the Federal 8-hour ozone standard by 2024, while making expeditious progress toward attainment of State standards. This is to be accomplished by building upon improvements from the previous plans and incorporating all feasible control measures while balancing costs and socioeconomic impacts. The 2007 AQMP indicates that $PM_{2.5}$ is formed mainly by secondary reactions of precursor gases. Therefore, instead of reducing fugitive dust (a primary source), the strategy for reducing $PM_{2.5}$ focuses on reducing precursor emissions of SO_X, directly emitted $PM_{2.5}$, NO_X, and VOC.~~

~~The 2007 AQMP control measures consist of four components: The first component is SCAQMD's Stationary and Mobile Source Control Measures. The Final 2007 AQMP includes 30 short-term and mid-term stationary and seven mobile source control measures for SCAQMD implementation. A complete listing of the measures is in the 2007 AQMP and includes measures such as VOC reductions from gasoline transfer and dispensing facilities, further NO_X reductions from space heaters, localized control program for PM emission hot spots, urban heat island, energy efficiency and conservation, etc. Some of the measures will become new rules and some will be amendments to existing rules. When the rules pass, the owner-operator will follow the applicable rules.~~

~~The second component is the CARB's Proposed State Strategy, which includes short- and mid-term control measures aimed at reducing emissions from sources that are primarily under State jurisdiction, including on-road and off-road mobile sources, and consumer products. These measures are required in order to achieve the remaining emission reductions necessary for $PM_{2.5}$ attainment. The CARB's strategy includes measures such as improvements to California's Smog Check Program, expanded passenger vehicle retirement, cleaner in-use heavy-duty trucks, reductions from port-related sources, cleaner off-road equipment, evaporative and exhaust strategies, pesticide strategies, etc. When these measures are implemented by the CARB, the project would be required to follow them.~~

~~The third component is the SCAQMD Staff's Proposed Policy Options to Supplement CARB's Control Strategy. SCAQMD staff believes that a combination of regulatory actions and public funding is the most effective means of achieving emission reductions. As such, the 2007 Final AQMP proposes three policy options for the lead agency to consider in achieving additional reductions. The first option is to incorporate the SCAQMD-proposed additional control measures as a menu of selections further reducing emissions from sources primarily under State and Federal jurisdiction. The second option is to have the State fulfill its NO_X emission reduction obligations under the 2003 AQMP by 2010 for its short-term defined control measures plus additional reductions needed to meet the NO_X emission target between 2010 and 2014. The third option is based on the same rate of progress under Policy Option 1 (the first option discussed above), but it relies heavily on public funding assistance to~~

~~achieve the needed NO_X reductions via accelerated fleet turnover to post-2010 on-road emission standards or the cleanest off-road engine standards in effect today (or after 2010). This third component, the CARB's Control Strategy does not directly apply to the project. However, Mitigation Measure 4.3.6.3B requires that all diesel trucks accessing the project during operation be model year 2010 or newer, which is consistent with the third option under CARB's Strategy.~~

~~The fourth component consists of Regional Transportation Strategy and Control Measures provided by SCAG. Transportation plans within the Basin are statutorily required to conform to air quality plans in the region, as established by the 1990 Federal Clean Air Act and reinforced by other Acts. The region must demonstrate that its transportation plans and programs conform to the mandate to meet the Federal ambient air quality standards in a timely manner. The SCAG RTP is developed every 4 years with a 20-year planning horizon to meet the long-term transportation planning requirements for emission reductions from on-road mobile sources within the Basin. The Regional Transportation Improvement Program (RTIP) requires that SCAG meet the short-term implementation requirements of the Transportation Conformity Rule. The first 2 years of the program are fiscally constrained and demonstrate timely implementation of a special category of transportation projects called Transportation Control Measures (TCMs). In general, TCMs are those projects that provide emission reductions from on-road mobile sources, based on changes in the patterns and modes by which the regional transportation system is used. Strategies are grouped into three categories: high occupancy vehicle strategy, transit and systems management, and information-based technology (traveling during a less congested time of day). SCAG approved the transportation measures in the RTP, which have been included in the region's air quality plans. The TCMs will be implemented by the appropriate agencies and will subsequently reduce emissions in the Basin.~~

~~**2012 AQMP.** The 2012 AQMP was adopted in December 2012. The purpose of the 2012 AQMP for the Basin is to set forth a comprehensive and integrated program that will lead the Basin into compliance with the federal 24-hour $PM_{2.5}$ air quality standard, and to provide an update of the Basin's projections in meeting the Federal 8-hour ozone standards. The 2012 AQMP states, "The remarkable historical improvement in air quality since the 1970's is the direct result of Southern California's comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs."~~

~~Similar to the prior AQMPs, the project would comply with all applicable rules and regulations enacted as part of the AQMP. In addition, the AQMP relies upon the SCAG regional transportation strategy, which is in its adopted 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2011 Federal Transportation Improvement Program. Included in the RTP/SCS are transportation control measures including active transportation (non-motorized transportation, e.g., biking and walking); transportation demand management; transportation system management; transit; passenger and high-speed rail; goods movement; aviation and airport ground access; highways; arterials; and operations and maintenance.~~

~~The project would be involved in goods movement. The heavy-duty trucks would access local highways and arterials.~~

~~**State Implementation Plans.** Geographical areas in the State that exceed the Federal air quality standards are called nonattainment areas. The project area is in nonattainment for ozone, PM_{10}, and $PM_{2.5}$. SIPs show how each area will attain the Federal standards. To do this, the SIPs identify the amount of pollutant emissions that must be reduced in each area to meet the standard and the emission controls needed to reduce the necessary emissions. On September 27, 2007, the CARB adopted its State Strategy for the 2007 SIP. In 2009, the SIP was revised to account for emissions reductions from regulations adopted in 2007 and 2008 and clarifies CARB's legal commitment. Additional recent revisions to the SIP are as follows:~~

- ~~In 2008, the EPA revised the lead[1] national ambient air quality standard by reducing it to 0.15 µg/m^3. On December 31, 2010, the Los Angeles County portion of the Basin was designated as nonattainment for the 2008 lead national standard as a result of exceedances measured near a large lead-acid battery recycling facility. The 2012 Lead SIP for Los Angeles County was prepared by the SCAQMD and addresses the recent revision to the lead national standard, and outlines the strategy and pollution control activities that demonstrate attainment of the lead national standard before December 31, 2015. The 2012 Lead SIP was approved May 4, 2012.~~
- ~~A SIP revision for the federal nitrogen dioxide standard was prepared in 2012, to address the new 1-hour federal ambient air quality standard for nitrogen dioxide.~~
- ~~The proposed California Infrastructure SIP revision was considered by the CARB on January 23, 2014. The proposed Infrastructure SIP revision is administrative in nature and covers the National Ambient Air Quality Standards (federal standards) for ozone (1997 and 2008), fine particulate matter (PM2.5; 1997, 2006, and 2012), lead (2008), nitrogen dioxide (2010), and sulfur dioxide (2010). The proposed revision describes the infrastructure (authorities, resources, and programs) California has in place to implement, maintain, and enforce these federal standards. It does not contain any proposals for emission control measures.~~

~~The SIP takes into account CARB rules and regulations. The project will comply with applicable rules and regulations as identified in the AQMPs and SIPs. Because the project would comply with all applicable rules and regulations, the project complies with this criterion.~~

~~**Summary.** Although the project would be consistent with the policies, rules, and regulations in the AQMPs and SIPs, the project must meet all the criteria listed above to be consistent with the AQMPs. The project could impede AQMP attainment because its construction and operation emissions exceed the SCAQMD regional significance thresholds, so the project is considered to be inconsistent with the AQMP.~~

~~**Mitigation Measures.** To facilitate monitoring and compliance, applicable SCAQMD regulatory requirements are restated in the mitigation identified below in Section 4.3.6.2 and 4.3.6.3. These measures shall be incorporated in all project plans, specifications, and contract documents. Typical mitigation measures identified to reduce the level of emissions of criteria pollutants include those identified below in Section 4.3.6.2 and 4.3.6.3. **Mitigation Measures 4.3.6.2A, 4.3.6.2B, 4.3.6.2C, 4.3.6.2D, 4.3.6.3A, 4.3.6.3B, 4.3.6.3C, 4.3.6.3D,** and **4.3.6.4A** are required.~~

~~**Level of Significance After Mitigation.** As noted above, implementation of the proposed project would exceed applicable thresholds for all criteria pollutants, with the exception of SO_X. Despite the implementation of mitigation measures, emissions associated with the proposed project cannot be reduced below the applicable thresholds. In the absence of feasible mitigation to reduce the proposed project's emission of criteria pollutants to below SCAQMD thresholds, potential air quality impacts resulting from exhaust from construction equipment will remain significant and unavoidable.~~

~~4.3.6.2 Construction Emissions~~

~~**Impact 4.3.6.2:** *Construction of the proposed project has the potential to exceed applicable daily thresholds that may affect sensitive receptors.*~~

~~**Threshold**~~	~~Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants?~~
	~~For construction operations, the applicable daily thresholds are:~~

---

[1] ~~Lead referred to here is a chemical element; a heavy metal.~~

~~- 75 pounds per day of ROC/VOC;~~
~~- 100 pounds per day of NO$_X$;~~
~~- 550 pounds per day of CO;~~
~~- 150 pounds per day of PM$_{10}$;~~
~~- 150 pounds per day of SO$_X$; and~~
~~- 55 pounds per day of PM$_{2.5}$.~~

~~Grading and other construction activities produce combustion emissions from various sources such as site grading, utility engines, on-site heavy-duty construction vehicles, equipment hauling materials to and from the site, asphalt paving, and motor vehicles transporting the construction crew. Exhaust emissions during these construction activities will vary daily as construction activity levels change. The use of construction equipment on site would result in localized exhaust emissions. Activity during peak grading days typically generates a greater amount of air pollutants than other project construction activities.~~

~~While the actual details of the future construction schedule are not known, it is expected that project construction would occur in two phases with seven discrete activities in Phase 1 and eight discrete activities in Phase 2. For Phase 1, the following activities are assumed to occur over the course of seven years in the analysis: 1) rough grading, which includes mass site grading; 2) finish grading; 3) building construction; 4) infrastructure construction which includes utility installation; 5) curb, gutter, sidewalk, subgrade preparation, drop rock, and paving activities; 6) asphalt paving; and 7) landscaping. For Phase 2, the same activities are assumed to occur over the course of nine years in the analysis, Phase 1 includes interchange construction as the eighth activity. Within the "building construction" phase, it is assumed that there would also be subphases of concrete pouring, installation of wet utilities, electrical installation, and landscaping. Appendix D of this EIR includes details of the emission factors and other assumptions.~~

~~Table 4.3.J identifies projected emissions resulting from grading and construction activities for the proposed project and shows the estimated maximum daily construction emissions over the course of project construction prior to the application of mitigation.~~

~~The construction emissions estimates summarized in Table 4.3.J are based on the assumed construction scenario described in Section 3.0, *Project Description*, of this EIR. Using emission factors from the CalEEMod model, Table 4.3.J indicates that construction emissions of criteria pollutants would exceed the SCAQMD daily emission thresholds for all criteria pollutants (VOC, NOx, CO, PM$_{10}$, and PM$_{2.5}$), with the exception of SO$_X$.[1] This is a significant impact requiring mitigation.~~

~~Fugitive dust emissions are generally associated with land clearing and exposure of soils to the air and wind, and cut-and-fill grading operations. Dust generated during construction varies substantially by project, depending on the level of activity, the specific operations and equipment, local soils, and weather conditions at the time of construction. The proposed project will be required to comply with SCAQMD Rules 402 and 403 to control fugitive dust. There are a number of feasible control measures that can be reasonably implemented to significantly reduce PM$_{10}$ emissions from construction.~~

~~As identified in Table 4.3.J, fugitive dust and exhaust emissions during the anticipated peak construction day for the proposed project would exceed SCAQMD daily construction thresholds. The percentage of dust and exhaust varies by year but for PM$_{10}$ is an average of 70 percent dust and 30 percent exhaust. PM$_{2.5}$ has an average of 29 percent dust and 71 percent exhaust.~~

~~[1] The project would emit SO$_X$ from construction equipment exhaust; however, the maximum emissions (6.8 pounds per day) are less than significant as they are far below the threshold of 150 pounds per day.~~

~~Table 4.3.J: Short-Term Regional Construction Emissions–Without Mitigation (Table Revised)~~

~~Year~~	~~Maximum Daily Pollutant Emissions (lbs/day)~~								
	~~VOC~~	~~NO_x~~	~~CO~~	~~PM_{10} dust~~	~~PM_{10} exhaust~~	~~PM_{10} Total~~	~~$PM_{2.5}$ dust~~	~~$PM_{2.5}$ exhaust~~	~~$PM_{2.5}$~~

~~- Sulfur oxide (SOx) emissions are contained in the CalEEMod output; the maximum emissions would be 2.5 pounds per day, substantially under the threshold of 150 pounds per day.~~
~~- The emissions assume all construction activities (mass grading, fine grading, building, utilities, curbing, landscaping, painting, paving, and/or interchange) occur on the same day, depending on the year in which the activity occurs.~~
~~- Emissions assume compliance with SCAQMD Rule 403.~~
~~VOC = volatile organic compounds NO_X = nitrogen oxides CO = carbon monoxide PM_{10} and $PM_{2.5}$ = particulate matter~~
~~NA = not applicable as there is no separate threshold for dust/exhaust~~
~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~The proposed project is required to comply with regional rules that assist in reducing short-term air pollutant emissions. SCAQMD Rule 402 requires implementation of dust-suppression techniques to prevent fugitive dust from creating a nuisance off site. SCAQMD Rule 403 requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off site. Applicable dust suppression techniques from Rule 403 are summarized below. Implementation of these dust suppression techniques can reduce the fugitive dust generation (and thus the PM_{10} component). Compliance with these rules would reduce impacts on nearby sensitive receptors. The applicable Rule 403 measures are as follows:~~

- ~~All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.~~
- ~~The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.~~

- ~~Cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meter (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicular Code Section 23114.~~
- ~~The contractor shall ensure that traffic speeds on unpaved roads and project site areas are 15 miles per hour or less to reduce fugitive dust haul road emissions.~~

~~As previously discussed, SCAQMD Rule 1113 regulates the sale and application of architectural coatings. Rule 1113 is applicable to any person who applies or solicits the application of any architectural coating within the Basin. Rule 1113 sets limits on the amount of ROG or VOC emissions allowed for all types of architectural coatings. Compliance with Rule 1113 means that architectural coatings used during construction would have ROG or VOC emissions that comply with these limits.~~

~~**Mitigation Measures.** The following measures are recommended to reduce the level of emissions of criteria pollutants:~~

~~**4.3.6.2A**~~ ~~Construction equipment maintenance records (including the emission control tier of the equipment) shall be kept on site during construction and shall be available for inspection by the City of Moreno Valley.~~

~~a) Off-road diesel-powered construction equipment greater than 50 horsepower shall meet United States Environmental Protection Agency Tier 4 off-road emissions standards. A copy of each unit's certified tier specification shall be available for inspection by the City at the time of mobilization of each applicable unit of equipment.~~

~~b) During all construction activities, off-road diesel-powered equipment may be in the "on" position not more than 10 hours per day. c) Construction equipment shall be properly maintained according to manufacturer specifications.~~

~~d) All diesel powered construction equipment, delivery vehicles, and delivery trucks shall be turned off when not in use. On-site idling shall be limited to three minutes in any one hour.~~

~~e) Electrical hook ups to the power grid shall be provided for electric construction tools including saws, drills and compressors, where feasible, to reduce the need for diesel-powered electric generators. Where feasible and available, electric tools shall be used~~

~~f) The project shall demonstrate compliance with South Coast Air Quality Management District Rule 403 concerning fugitive dust and provide appropriate documentation to the City of Moreno Valley.~~

~~g) All construction contractors shall be provided information on the South Coast Air Quality Management District Surplus Off-road Opt-In "SOON" funds which provides funds to accelerate cleanup of off-road diesel vehicles.~~

~~h) Construction on-road haul trucks shall be model year 2007 or newer.~~

~~i) Information on ridesharing programs shall be made available to construction employees.~~

~~j) During construction, lunch options shall be provided onsite.~~

~~k) A publicly visible sign shall be posted with the telephone number and person to contact regarding dust complaints per AQMD Standards. l) Only non-diesel material handling equipment may be used in any logistics building in the WLC.~~

~~m) Off-site construction shall be limited to the hours between 6 a.m. to 8 p.m. on weekdays only. Construction during City holidays shall not be permitted.~~

~~**4.3.6.2B** Prior to issuance of any grading permits, a traffic control plan shall be submitted to and approved by the City of Moreno Valley that describes in detail the location of equipment staging areas, stockpiling/storage areas, construction parking areas, safe detours around the project construction site, as well as provide temporary traffic control (e.g., flag person) during construction-related truck hauling activities. Construction trucks shall be rerouted away from sensitive receptor areas. Trucks shall use State Route 60 using Theodore Street, Redlands Boulevard (north of Eucalyptus Avenue), and Gilman Springs Road. In addition to its traffic safety purpose, the traffic control plan can minimize traffic congestion and delays that increase idling emissions. A copy of the approved Traffic Control Plan shall be retained on site in the construction trailer.~~

~~**4.3.6.2C** The following measures shall be applied during construction of the project to reduce volatile organic compounds (VOC):~~

~~a) Non-VOC containing paints, sealants, adhesives, solvents, asphalt primer, and architectural coatings (where used), or pre-fabricated architectural panels shall be used in the construction of the project to the maximum extent practicable. If such products are not commercially available, products with a VOC content of 100 grams per Liter or lower for both interior and exterior surfaces shall be used.~~

~~b) Leftover paint shall be taken to a designated hazardous waste center.~~

~~c) Paint containers shall be closed when not in use~~

~~d) Low VOC cleaning solvents shall be used to clean paint application equipment.~~

~~e) Paint and solvent-laden rags shall be kept in sealed containers.~~

~~**4.3.6.2D** No grading shall occur on days with an Air Quality Index forecast greater than 150 for particulates or ozone as forecasted for the project area (Source Receptor Area 24).~~

~~As shown in Table 4.3.K, construction emissions are still significant after mitigation, with the exception of~~ ~~$PM_{2.5}$~~~~. The reduction in~~ ~~$PM_{2.5}$~~ ~~emissions is by a reduction in exhaust from the application of Tier 4 off-road equipment.~~ ~~PM_{10}~~ ~~emissions are still significant because emissions in 2019 exceed the threshold; however, emissions of~~ ~~PM_{10}~~ ~~during all other years of construction are less than significant. Although mitigation reduces emissions of all pollutants during construction, potential air quality impacts resulting from exhaust from construction equipment and fugitive dust will remain significant and unavoidable.~~

~~Exceeds Threshold?~~	**~~Yes~~**	**~~Yes~~**	**~~Yes~~**	**~~Yes~~**	**~~No~~**

~~* There is an error in the way CalEEMod estimates the effect of a higher tier (such as Tier 3 or 4) on mitigated CO; therefore, the unmitigated values are reported for CO. This was confirmed by the SCAQMD by a personal communication. The SCAQMD is currently preparing a work around for this; however, it was not available as of the date of this analysis.~~

- ~~Sulfur oxide (SOx) emissions are contained in the CalEEMod output in Appendix A of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report; the maximum emissions would be approximately 2 pounds per day after mitigation, substantially under the threshold of 150 pounds/day.~~
- ~~Mitigation Measure 4.3.6.2A(a) was estimated by CalEEMod using its mitigation module by assuming Tier 4 off road equipment.~~
- ~~Mitigation Measure 4.3.6.2A(b) restricts equipment from operating more than 10 hours per day in the on position, which is estimated in CalEEMod in both the unmitigated and mitigated estimates.~~
- ~~Mitigation Measures 4.3.6.2A(c) through (e), 4.3.6.2A(g) through (m), 4.3.6.2B, and 4.3.6.2D are not quantified.~~
- ~~Mitigation Measure 4.3.6.2A(f) is assumed in the unmitigated and mitigated estimates (Rule 403).~~
- ~~Mitigation Measure 4.3.6.2A(i) requires that construction haul trucks be 2007 model year or greater. CalEEMod does not have a mitigation measure embedded in the model to quantify the reduction from this measure. Therefore, this reduction quantification was not provided.~~
- ~~Mitigation Measure 4.3.6.2C reduces VOC emissions during painting and is calculated as demonstrated in the spreadsheets in Appendix A of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report.~~

~~VOC = volatile organic compounds NO$_X$ = nitrogen oxides CO = carbon monoxide PM$_{10}$ and PM$_{2.5}$ = particulate matter~~

~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~Comparing the emissions to those as estimated in the DEIR, average daily emissions of VOC, NOx, CO and PM$_{2.5}$ have decreased by approximately 100, 600, 500 and 25 pounds per day, respectively. This is primarily because 1) the construction period for the project increased from 10 years to 15 years, resulting in decreased construction activity levels (if market conditions further slow project development, impacts would be no greater than those described in this analysis); 2) Tier 4 equipment is applied as mitigation; and 3) a newer version of CalEEMod was used to estimate construction emissions. The average PM$_{10}$ emissions increased slightly by approximately 35 pounds per day, primarily because of the inclusion of unpaved road dust.~~

~~The results of this regional construction analysis indicate that during construction, the South Coast Air Basin may experience the following cumulative health effects from ozone exposure:[1]~~

~~[1] Although carbon monoxide emissions are over the threshold, it is primarily a localized pollutant. The localized analyses demonstrated that concentrations would not exceed the ambient air quality standards for carbon monoxide; therefore, less than significant health effects are anticipated.~~

~~Ozone can cause the following health effects: Irritate respiratory system; reduce lung function; breathing pattern changes; reduction of breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; and/or increased mortality risk.~~

~~4.3.6.3 Localized Construction and Operational Air Quality Impacts~~

~~**Impact 4.3.6.3:** *Construction and operation of the proposed project has the potential to exceed localized daily thresholds that may affect sensitive receptors.*~~

~~**Threshold**~~	~~Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants?~~
	~~The applicable localized thresholds are:~~
	~~- 20 ppm (1 hour) and 9 ppm (8 hours) of CO during construction or operation;~~
	~~- 0.18 ppm (State 1 hour), 0.100 ppm (National 1 hour), and 0.030 ppm (Annual) of NO_X during construction or operation;~~
	~~- 10.4 $\mu g/m^3$ (24 hours) 1.0 $\mu g/m^3$ (Annual) of PM_{10} during construction~~
	~~- 2.5 $\mu g/m^3$ (24 hours) and 1.0 $\mu g/m^3$ (Annual) of PM_{10}; during operation and~~
	~~- 2.5 $\mu g/m^3$ (24 hours) of $PM_{2.5}$ during operation~~
	~~- During time periods when construction and operational activities occur at the same time, the SCAQMD recommends application of the significance thresholds for operations to assess the significance of the activities~~

~~*Note: Section 4.3.6.3 in the original DEIR was replaced in its entirety in this revised DEIR section. The reader is referred to the original DEIR section 4.3.6.3 for the text of that section.*~~

~~The localized analysis focused on three analysis conditions:~~

1. ~~Project Phase 1 (2012), which evaluates what air quality impacts the project-related emissions would have if Phase 1 of the project (approximately 56 percent of the square footage) was built out in full in 2012[1] and no other changes occurred to land uses or the roadway system;~~
2. ~~Project Phase 1 and Phase 2 Full Build Out (2012), which evaluates what air quality impacts the project-related emissions would have if the entire project, both Phase 1 and Phase 2, were build out in full in 2012 and no other changes occurred to land uses or the roadway system; and~~
3. ~~Proposed Project Development Schedule, which evaluates the air quality impacts from the construction and operation of the project as a 2-phase development with the construction commencing in 2015, build out of Phase 1 in 2022 and the final Phase 1 and Phase 2 build out in 2035.~~

~~The Project Phase 1 (2012) and Project Phase 1 and Phase 2 Full Build Out (2012) conditions represents worst-case conditions in that the project physically could not be built-out in 2012 or, in fact, in any single year due to the size of the project. These conditions have been included in this assessment to correspond to the analysis scenarios examined in the project traffic impact report. These conditions also do not account for the fact that vehicle emissions are expected to decline significantly over the next ten years in response to mandated motor vehicle emission controls adopted by the CARB and EPA as~~

~~[1] 2012 is the CEQA Baseline year for this project.~~

~~the project develops in the future. Thus, consideration of these conditions will significantly overestimate the project's potential air quality impacts. The Proposed Project Development condition represents the logical and realistic development of the project over a period of 15 years as represented by the project applicant. The LST analysis is presented for each condition below.~~

~~Pursuant to the SCAQMD's LST methodology, only emissions generated from emission sources located within and along the project boundaries are included in the LST assessment. These emission sources include vehicle travel on the roadway network within and along the borders of the project and emissions from support equipment including forklifts, yard/hostler trucks, and emergency standby electric generators.~~

~~The project's emissions then served as input into the AERMOD air dispersion model to derive estimate of the project's localized air quality impacts for each condition.~~

~~Project Phase 1 (2012) LST Assessment~~

~~The project's on-site emissions were estimated from the traffic-generated by the various project vehicles as provided by the traffic impact report. Vehicle emissions were assumed to be representative of the calendar year 2012 vehicle fleet. Also included were emissions from various support equipment including forklifts, yard trucks, and standby emergency generators. The localized assessment results for the Project Phase 1 (2012) condition are provided in Table 4.3.L for receptors located within the project boundaries and in Table 4.3.M for receptors located outside the project's boundaries along with a comparison to the SCAQMD's localized significance thresholds. The significance thresholds for CO and nitrogen dioxide are derived from the measured ambient air quality data from the SCAQMD Riverside air monitoring station and serve as the measure of existing air quality.~~[1]

~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~As noted from Table 4.3.L, the project would exceed the SCAQMD's localized significance thresholds for nitrogen dioxide and PM_{10} at receptors located within the project boundaries, realizing again however, that this scenario reflects an impossible situation that assumes that Phase 1 of the project is built out in its entirety in 2012 and that the existing receptors located within the project boundaries remain in place. As shown in Table 4.3.M, the significance thresholds would not be exceeded at any sensitive receptor located outside of the project boundaries except for the annual PM_{10} project impact.~~

~~The Project Phase 1 and Phase 2 Full Build Out (2012) LST Assessment~~

~~The localized assessment results for the Project Phase 1 and Phase 2 Full Build Out (2012) condition are provided in Table 4.3.N for receptors located within the project boundaries and in Table 4.3.O for receptors located outside the project's boundaries along with a comparison to the SCAQMD's localized significance thresholds. The significance thresholds for CO and nitrogen dioxide are derived~~

~~from the measured ambient air quality data from the SCAQMD Riverside air monitoring station and serve as the measure of existing air quality.~~

~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~As noted from the above tables, the project would exceed the SCAQMD's significance thresholds for NO_2, PM_{10}, and $PM_{2.5}$ for receptors located within the project's boundaries and NO_2 and PM_{10} at receptors located outside of the project's boundaries.~~

~~It is important to note the Project Phase 1 (2012) and Project Phase 1 and Phase 2 Full Build Out (2012) conditions assume that the project's emissions are at the levels that would occur in 2012. The majority of the project's operational emissions are from on-road mobile sources, more particularly, heavy-duty trucks that contribute a disproportionate amount of emissions compared to passenger vehicles. Emissions from on-road mobile sources are regulated at the State and Federal levels and, therefore, are outside of the control of local agencies such as the City and the SCAQMD. For example, the CARB is working closely with the EPA, engine and vehicle manufacturers, and other interested parties to identify programs that will reduce emissions from heavy-duty diesel vehicles in California. In its "Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles," the CARB presented a blueprint for achieving a 75 percent reduction in diesel particulates by 2010 and an 85 percent reduction by 2020 from the 2000 baseline. The emission reductions would arise from a combination of measures including the use of ultra-low sulfur diesel fuel, new emission standards for large diesel engines, restrictions on diesel engine idling, addition of post-combustion filter and catalyst equipment, and retrofits for business and government diesel truck fleets. The implementation of these emission reductions will also result in reductions of other pollutants such as NO_X, VOC, and CO. As these emission reduction programs are implemented and there is a turnover in the use of older vehicles with newer and cleaner vehicles, the project's operational emissions are expected to decline significantly in the future.~~

~~Emission controls on mobile source vehicles already adopted by the CARB particularly dealing with NO_X and PM_{10} controls on heavy duty trucks will reduce truck emissions significantly over the next 10 years. As an example, in the South Coast Air Basin, the per-mile running exhaust rate of NO_X emissions from the largest category of heavy duty diesel trucks is estimated to decline from an average of 11.4 grams/mile in 2012 to 3.9 grams/mile by 2022, a decline of 66 percent from 2012 levels and to 1.8 grams/mile in 2035, a decrease of 84 percent from 2012 levels. Similarly, the per-mile running exhaust rate of PM_{10} emissions from the largest category of heavy duty diesel trucks is estimated to decline from an average of 0.34 gram/mile in 2012 to 0.02 gram/mile in 2022, a decline of 94 percent from 2012 levels and decline to 0.006 grams/mile in 2035, a decline of 98 percent from 2012 levels. Thus, two Project (2012) conditions represent highly conservative estimates, in terms of overestimating of the project's operational impacts.~~

~~Proposed Project Development Schedule LST Assessment~~

~~The final localized threshold assessment condition examined potential local project impacts considering the proposed construction and build out schedule of the project over a time period of 15 years from the commencement of construction in 2015 to the final build out in 2035. This condition examined three specific time periods:~~

- ~~The year 2021: the year 2021 was selected to determine the potential localized impacts from the project's construction and operational emissions to the existing residences located to the west of the project across Redlands Boulevard. These residences are the closest sensitive receptors outside of the project's boundaries. According to the conceptual construction schedule provided by the applicant, extensive building construction is expected to take place within the project site along and to the east of Redlands Boulevard in 2021. The year 2021 also corresponds to the completion of approximated 88 percent of the Phase 1 operation (50 percent of the entire project) and the attendant operational emissions. The project's onsite maximum daily and annual construction emissions were estimated using the CalEEMod land use emission model and the construction equipment inventory and activities provided by the applicant (see discussion in Appendix D). The project's onsite operational emissions, principally from the project's mobile sources, were derived from detailed traffic volume data provided by the project's traffic impact~~

~~analysis. The traffic impact analysis applied a comprehensive regional transportation model to develop daily and peak hour traffic volumes for 2022 and 2035 from the project's mobile sources. Peak hour and daily project traffic volumes were developed for each year from 2015 to 2035 for roadway segments within and along the boundaries of the project using the following assumptions:~~

  - ~~Project operational traffic volumes were assumed to be zero in 2015, the year that project construction would commence.~~
  - ~~Traffic volumes for the years 2016 to 2022 (the completion year for Phase 1 operations) were interpolated from 2015 to 2022 by applying the annual project occupancy schedule to the 2022 traffic volumes.~~
  - ~~Traffic volumes for the years 2023 to 2035 were interpolated from the provided traffic volumes in 2022 and 2035 by applying the annual project occupancy schedule.~~

- ~~The year 2027, when the project's total daily on-site construction and operational emissions would be the highest for several air pollutants and construction and operations would occur along the eastern portion of the project potentially impacting the existing residences across from the project along Gilman Springs Road; and~~
- ~~The year 2035, which is the long term planning year analyzed in the project traffic impact report and representative of the complete build out of both Phases 1 and 2.~~

~~**Localized Impact Analysis, 2021.** The localized impacts for the short-term construction and operational activities were analyzed using an air dispersion model (EPA AERMOD Model) to simulate the transport and dispersion of project-related emissions through the air. These impacts were then compared to the applicable SCAQMD localized concentration thresholds.~~

~~The estimated maximum localized air quality impacts from the construction and operation of the project in 2021 are summarized in Table 4.3.P for locations within the project's boundaries. These maximum impacts were found at the locations of the existing residences within the project boundaries. Table 4.3.Q summarizes the highest air quality impacts for sensitive receptors located outside of the project boundaries. As noted from these two tables, project impacts would exceed the significance thresholds for nitrogen dioxide, PM_{10} and $PM_{2.5}$ for locations within the project boundaries and nitrogen dioxide and PM_{10} at receptors located outside the project boundaries, and thus represents a significant impact without mitigation.~~

~~[2] Highest impacts at any receptor located outside of the boundaries of the project generally occur in the residential areas to the west of the project across Redlands Boulevard.~~
~~[3] During periods when both construction and operation overlap the SCAQMD recommends the operational significance thresholds for PM$_{10}$ and PM$_{2.5}$ as opposed to the construction thresholds which are 10.4 ug/m^3 for PM$_{10}$ and PM$_{2.5}$. This provides a very conservative threshold for determining the significance of project impacts.~~
~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~**Localized Air Quality Impact Analysis, 2027.** The year 2027 was selected for the LST Analysis for two principal reasons: 1) the year 2027 corresponds to the year with the highest combined total onsite construction and operational emissions of NO$_x$ and CO and the third or fourth highest onsite emissions of PM$_{10}$ and PM$_{2.5}$ during the time period of 2015 to 2035; and 2) the location of the building construction in 2027 places the construction emissions adjacent to the existing residences located on the eastern side of the project across Gilman Springs Road.~~

~~The project's maximum combined impacts from construction and operations during 2027 are shown in Table 4.3.R for the existing sensitive receptors located within the project boundaries along with the SCAQMD-recommended significance thresholds. Table 4.3.S shows the maximum combined impacts for sensitive receptors located outside of the project boundaries. These latter impacts were found within the residential areas located to the east of the project across Gilman Springs Road. As shown~~

~~in these tables, the project would exceed the SCAQMD's significance thresholds for PM_{10} at locations within the project boundary and no thresholds outside of the project boundary.~~

~~**Localized Air Quality Impact Analysis, 2035.** The year 2035 represents a long-term planning year when both phases of the project would be fully in operation. Operational emissions during 2035 were estimated based on the project's trip generation and project-related travel along the local roadway network within and along the project boundaries. Table 4.3.T shows the maximum localized air quality impacts for 2035 relative to the background air quality levels at the existing sensitive receptors located within the project boundaries. Table 4.3.U identifies the highest localized impacts for sensitive receptors located outside of the project boundaries. These latter impacts were found within the residential areas located to the west of the project across Redlands Boulevard. As shown in Table 4.3.T, the concentrations of PM_{10} exceed the SCAQMD's significance thresholds due principally to the inclusion of entrained road dust in the impact assessment and would, therefore, represent a significant impact without mitigation. Table 4.3.U indicates that no receptor located outside of the project boundary would exceed any significance threshold.~~

~~**Summary.** The localized significance analysis demonstrates that without mitigation, the project would exceed the localized significance thresholds for NO$_2$, PM$_{10}$, or PM$_{2.5}$ for one or more of the LST assessment years (2021, 2027, or 2035) analyzed under this revised LST assessment. Therefore, according to this criterion, the air pollutant emissions would result in a significant impact and could exceed or contribute to an exceedance of the ambient air quality standards for NO$_2$, PM$_{10}$, and PM$_{2.5}$.~~

~~**Mitigation Measures.** Mitigation measures identified previously under Impact 4.3.6.2 (**Mitigation Measures 4.3.6.2A**, **4.3.6.2B**, and **4.3.6.2D**) to reduce construction emissions of criteria pollutants are required. The project will also be required to comply with SCAQMD Rules 402 and 403. Additionally, the following mitigation measures are required to reduce emissions of criteria pollutants during project operations.~~

~~**4.3.6.3A**~~ ~~Prior to issuance of occupancy permits for each warehouse building within the WLCSP, the developer shall demonstrate to the City that vehicles can access the building using paved roads and parking lots.~~

~~**4.3.6.3B**~~ ~~The following shall be implemented as indicated:~~

~~**Prior to Issuance of a Certificate of Occupancy**~~

~~a) Signs shall be prominently displayed informing truck drivers about the California Air Resources Board diesel idling regulations, and the prohibition of parking in residential areas.~~

~~b) Signs shall be prominently displayed in all dock and delivery areas advising of the following: engines shall be turned off when not in use; trucks shall not idle for more than three consecutive minutes; telephone numbers of the building facilities manager and the California Air Resources Board to report air quality violations.~~

~~c) Signs shall be installed at each exit driveway providing directional information to the City's truck route. Text on the sign shall read "To Truck Route" with a directional arrow. Truck routes shall be clearly marked per the City Municipal Code.~~

~~**On an Ongoing Basis**~~

~~d) Tenants shall maintain records on fleet equipment and vehicle engine maintenance to ensure that equipment and vehicles are maintained pursuant to manufacturer's specifications. The records shall be maintained on site and be made available for inspection by the City.~~

~~e) Tenant's staff in charge of keeping vehicle records shall be trained/certified in diesel technologies, by attending California Air Resources Board approved courses (such as the free, one-day Course #512). Documentation of said training shall be maintained on-site and be available for inspection by the City.~~

~~f) Tenants shall be encouraged to become a SmartWay Partner.~~

~~g) Tenants shall be encouraged to utilize SmartWay 1.0 or greater carriers.~~

~~h) Tenants' fleets shall be in compliance with all current air quality regulations for on-road trucks including but not limited to California Air Resources Board's Heavy-Duty Greenhouse Gas Regulation and Truck and Bus Regulation.~~

~~i) Information shall be posted in a prominent location available to truck drivers regarding alternative fueling technologies and the availability of such fuels in the immediate area of the World Logistics Center.~~

~~j) Tenants shall be encouraged to apply for incentive funding (such as the Voucher Incentive Program [VIP], Carl Moyer, etc.) to upgrade their fleet.~~

~~k) All yard trucks (yard dogs/yard goats/yard jockeys/yard hostlers) shall be powered by electricity, natural gas, propane, or an equivalent non-diesel fuel. Any off-road engines in the yard trucks shall have emissions standards equal to Tier 4 Interim or greater. Any on-road engines in the yard trucks shall have emissions standards that meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.~~

~~l) All diesel trucks entering logistics sites shall meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025 or be powered by natural gas, electricity, or other diesel alternative. Facility operators shall maintain a log of all trucks entering the facility to document that the truck usage meets these emission standards. This log shall be available for inspection by City staff at any time.~~

~~m) All standby emergency generators shall be fueled by natural gas, propane, or any non-diesel fuel.~~

~~n) Truck and vehicle idling shall be limited to three (3) minutes.~~

~~**4.3.6.3C** Prior to the issuance of building permits for more than 25 million square feet of logistics warehousing within the Specific Plan area, a publically-accessible fueling station shall be operational within the Specific Plan area offering alternative fuels (natural gas, electricity, etc.) for purchase by the motoring public. Any fueling station shall be placed a minimum of 1000 feet from any off-site sensitive receptors or off-site zoned sensitive uses. This facility may be established in connection with the convenience store required in Mitigation Measure 4.3.6.3D.~~

~~**4.3.6.3D** Prior to the issuance of building permits for more than 25 million square feet of logistics warehousing within the Specific Plan area a site shall be operational within the Specific Plan area offering food and convenience items for purchase by the motoring public. This facility may be established in connection with the fueling station required in Mitigation Measure 4.3.6.3C.~~

~~**4.3.6.3E** Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such~~

~~environmental analysis shall be provided with any warehouse plot plan proposing refrigerated space. Any such proposal shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).~~

~~**Level of Significance After Mitigation.** Significant and unavoidable. Table 4.3.V compares the project impacts before and after mitigation for those assessment conditions and pollutants that indicated a significant impact before mitigation. After application of mitigation, the project would continue to exceed the localized significance thresholds at one or more of the existing residences located within the project boundaries for PM_{10} (24-hour and annual) all assessment conditions. Mitigation does reduce impacts from NO_2 emissions. The project's localized impacts would not exceed any significance thresholds for receptors located outside of the project boundaries.~~

~~In summary, those residents inside the project boundaries could be exposed to significant short-term and long-term PM_{10} concentrations on an ongoing basis. The health effects from particulate matter were discussed earlier and could include the following:~~

- ~~Particulate matter can cause the following health effects from short-term (24-hour) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.~~
- ~~Particulate matter can cause the following health effects from long-term exposure (annual): reduced lung function; chronic bronchitis; changes in lung morphology; and/or death.~~

~~4.3.6.4 Long-Term Operational Emissions~~

~~Impact 4.3.6.4:~~ ~~*Implementation of the proposed project may have the potential to exceed applicable daily thresholds for operational activities.*~~

~~Threshold~~ ~~Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants?~~

~~For long-term operations, the applicable daily thresholds are:~~

~~- 55 pounds of VOC;~~
~~- 55 pounds of NO$_X$;~~

~~- 550 pounds of CO;~~
~~- 150 pounds of PM_{10};~~
~~- 55 pounds of $PM_{2.5}$; and~~
~~- 150 pounds of SO_X.~~

~~Long-term air pollutant emission impacts that would result from the proposed project are those associated with stationary sources and mobile sources involving any project-related change (e.g., emissions from the use of motor vehicles by project-generated traffic). This analysis assesses the mobile source emissions generated by vehicles driving to and from the proposed land uses, as well as area source emissions generated by project maintenance operations.~~

~~**Worst-Case Scenario.** Projected emissions resulting from operational activities of the proposed project under the worst-case scenario are identified in Table 4.3.W.~~

~~Emissions from the existing on-site residences and fugitive dust are not included in the worst-case analysis. In addition, there may be minor emissions of VOC from the fueling station, depending on what type of fuel is used. However, details regarding the fueling station are currently unknown so the emission source is not estimated. This is a worst-case analysis because it assumes that the entire project would be built-out in 2012. The motor vehicle and truck emission factors are from 2012, which assumes a "dirtier" fleet than would be the case in later years. In addition, no reductions are taken for mitigation measures.~~

~~As identified in Table 4.3.W, operational emissions for the proposed project would exceed SCAQMD daily operational thresholds for all criteria pollutants with the exception of SO_X for the "worst-case" 2012 scenario.~~

~~**Operational Regional Emissions.** Table 4.3.X shows the detailed operational emission sources generated both on site and off site for Phase 1 (2022) and buildout. The table shows particulate matter (PM_{10} and $PM_{2.5}$) divided into dust and exhaust sources. As shown in the table, emissions of VOC, NOx, CO, PM_{10}, and $PM_{2.5}$ are significant after completion of Phase 1 and after full buildout.~~

~~Table 4.3.Y shows the operational emissions year by year using future year emission factors: year 2022 for Phase 1 (2016 to 2022) and year 2035 for Phase 2 (2023 to buildout). The VOC, NOx, CO, PM10, and PM2.5 emissions would be over the SCAQMD's significance thresholds. The emissions demonstrate that although the number of vehicles and trucks would increase year by year, the emissions do not increase dramatically because the per-vehicle emission factors decrease over time as cleaner vehicles enter the fleet over time.~~

~~**Combined Construction and Operation.** There would be overlapping of construction and operational emissions with project implementation. The maximum daily operational emissions as shown in Table 4.3.Y were added to the maximum daily construction emissions (from Table 4.3.K) and are shown in Table 4.3.Z, which shows all pollutants for all years exceed the SCAQMD thresholds, with the exception of SO_X emissions. SO_X are not shown in the table as they are far below the significance threshold of 150 pounds per day.~~

~~As identified in the preceding tables, project-related air quality impacts for all criteria pollutants, with the exception of SO_X, would be significant and mitigation measures are required.~~

~~**Mitigation Measures.** The mitigation measures previously identified under Impact 4.3.6.3 (**Mitigation Measures 4.3.6.3A** through **4.3.6.3E**) would reduce operational emissions of criteria pollutants associated with the project. Additionally, the following mitigation measure is required:~~

~~Significant?~~	~~Yes~~	~~Yes~~	~~Yes~~	~~No~~	~~Yes~~	~~Yes~~

- ~~Emissions are from local vehicles, trucks, natural gas, emergency generators, forklifts, yard trucks, painting, and consumer products. There is no reduction from existing onsite emissions.~~
- ~~Emissions for Phase 1 are years 2016-2022. Emissions for Phase 2 are year 2023-buildout operational emissions are assumed to be zero in 2015 when project construction commences.~~
- ~~PM$_{10}$ and PM$_{2.5}$ emissions include exhaust and road dust.~~
- ~~Landscaping emissions are negligible.~~

~~*~~ ~~Sulfur dioxide emissions as estimated in the Draft EIR were substantially less than the threshold of 150 pounds per day. Thus, emissions reflecting decreased vehicle miles traveled would also be less than significant.~~

~~VOC = volatile organic compounds; NO$_X$ = nitrogen oxides; SO$_2$ = sulfur dioxide; CO = carbon monoxide; PM$_{10}$ and PM$_{2.5}$ = particulate matter~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~**4.3.6.4A** The following measures shall be incorporated as conditions to any Plot Plan approval within the Specific Plan:~~

~~a) All tenants shall be required to participate in Riverside County's Rideshare Program.~~

~~b) Storage lockers shall be provided in each building for a minimum of three percent of the full-time equivalent employees based on a ratio of 0.50 employees per 1,000 square feet of building area. Lockers shall be located in proximity to required bicycle storage facilities.~~

~~c) Class II bike lanes shall be incorporated into the design for all project streets.~~

~~d) The project shall incorporate pedestrian pathways between on-site uses.~~

~~e) Site design and building placement shall provide pedestrian connections between internal and external facilities.~~

~~f) The project shall provide pedestrian connections to residential uses within 0.25 mile from the project site.~~

~~g) A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building. In addition, parking facilities with 100 parking spaces or more shall be designed and constructed so that at least three percent of the total parking spaces are capable of supporting future electric vehicle supply equipment (EVSE) charging locations. Only sufficient sizing of conduit and service capacity to install Level 2 Electric Vehicle Supply Equipment (EVSE) or greater are required to be installed at the time of construction.~~

~~h) Each building shall provide indoor and/or outdoor - bicycle storage space consistent with the City Municipal Code and the California Green Building Standards Code.- Each building shall provide a minimum of two shower and changing facilities for employees.~~

~~i) Each building shall provide preferred and designated parking for any combination of low-emitting, fuel-efficient, and carpool/vanpool vehicles equivalent to the number identified in California Green Building Standards Code Section 5.106.5.2 or the Moreno Valley Municipal Code whichever requires the higher number of carpool/vanpool stalls.~~

~~j) The following information shall be provided to tenants: onsite electric vehicle charging locations and instructions, bicycle parking, shower facilities, transit availability and the schedules, telecommunicating benefits, alternative work schedule benefits, and energy efficiency.~~

~~It is important to note that, in addition to the operational activity mitigation measures identified previously, future development would need to incorporate physical attributes and operational programs that will act to generally reduce operational-source pollutant emissions including GHG emissions. These project characteristics are identified in Section 4.7, *Climate Change and Greenhouse Gas Emissions*, of this EIR.~~

~~**Level of Significance after Mitigation.** Mitigated operational emissions for full buildout are shown in Table 4.3.AA. Also shown in the table are existing emissions from the onsite agricultural activities. When those emissions are subtracted from the project emissions, emissions are still over the significance thresholds. Note that the emissions are based on conservative assumptions such as truck trips and miles traveled. Even with mitigation, emissions are still significant. Despite implementation of mitigation measures, emissions of criteria pollutants would still exceed SCAQMD significance thresholds resulting in a significant and unavoidable operational air quality impact. Therefore,~~

	~~Significant Impact?~~	~~Yes~~	~~Yes~~	~~Yes~~	~~Yes~~	~~Yes~~

~~- PM$_{10}$ and PM$_{2.5}$ emissions include exhaust and road dust.~~
~~- Landscaping emissions are negligible.~~
~~- Sulfur oxides emissions are under the 150 pounds per day significance threshold and at buildout would be less than 23 pounds per day.~~
~~VOC = volatile organic compounds NO$_X$ = nitrogen oxides CO = carbon monoxide PM$_{10}$ and PM$_{2.5}$ = particulate matter~~
~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~there could be cumulative health effects from ozone, PM$_{10}$, and PM$_{2.5}$ as described earlier in this section and summarized as follows:~~

- ~~Ozone can cause the following health effects: irritate respiratory system; reduce lung function; breathing pattern changes; reduce breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; and/or increase mortality risk.~~
- ~~Particulate matter (PM$_{10}$ and PM$_{2.5}$) can cause the following health effects from short-term (hours/days) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.~~
- ~~Particulate matter can cause the following health effects from long-term exposure: reduced lung function; chronic bronchitis; changes in lung morphology; and/or death.~~

~~Operational emissions (not including construction emissions) at buildout in this revised analysis as compared with the estimates in the DEIR are as follows:~~

- ~~Emissions of VOC have decreased slightly by 140 pounds/day, in accordance with a reduction in square feet for the project and a revision of emission factors.~~
- ~~For the unmitigated emissions, NOx, CO, and PM$_{10}$ in the revised analysis are about 1,800, 2,200, and 600 pounds per day lower than in the DEIR, respectively. For the mitigated emissions, NOx, CO, and PM$_{10}$ in the revised analysis are about 2,000, 2,000, and 600 lower than in the DEIR, respectively. The revised emissions are lower because the emission factors for the mobile trucks and vehicles have been revised and because the vehicle miles traveled (VMT) has decreased. In the DEIR, the VMT at buildout for heavy duty trucks was 730,100 miles per day and in the revised analysis, the diesel vehicles is 420,400 miles per day; therefore, the VMT for diesel vehicles decreased by approximately 309,700 miles per day. The VMT decreased because the analysis in the DEIR assumed a conservative, but arbitrary 50 miles per trip for all heavy duty trucks and in the revised analysis the VMT is based on actual model results for all trips as estimated in the Traffic Impact Analysis for nearly 500 freeway and roadway segments. The VMT for light duty vehicles increased by approximately 64,600 miles: in the DEIR, the VMT for light duty vehicles was 549,700 miles per day and in the revised analysis, the VMT for gasoline vehicles is 614,300 miles per day.~~
- ~~Emissions of PM$_{2.5}$ in the revised analysis have increased by approximately 150 pounds per day because of the use of updated emission factors.~~

~~During overlap of construction and operation, VOC, NO$_X$, CO, PM$_{10}$, and PM$_{2.5}$ would continue to exceed SCAQMD significance thresholds after mitigation, as shown in Table 4.3.AB. Therefore, impacts are significant and unavoidable. The emissions do not take into account the existing onsite agricultural emissions.~~

~~4.3.6.5 Impacts to Sensitive Receptors~~

~~**Impact 4.3.6.5:** *Implementation of the proposed project may have the potential to result in impacts to sensitive receptors.*~~

~~Threshold~~ ~~Would the proposed project expose sensitive receptors to substantial pollutant concentrations?~~

~~For localized air quality impacts, the applicable thresholds are:~~

- ~~20 ppm (1 hour) and 9 ppm (8 hours) of CO during construction and operation;~~
- ~~0.18 ppm (State 1 hour), 0.100 ppm National 1 hour), and 0.030 ppm (Annual) of NO$_X$ during construction and operation;~~
- ~~10.4 µg/m^3 (24-hours) and 1 µg/m^3 (Annual) of PM$_{10}$ during construction~~
- ~~2.5 µg/m^3 (24 hours) and 1.0 µg/m^3 (Annual) of PM$_{10}$ during operations; and~~
- ~~2.5 µg/m^3 (24 hours) of PM$_{2.5}$ during operations.~~
- ~~During time periods when construction and operational activities occur at the same time, the SCAQMD recommends application of the significance threshold for operations.~~

~~For health risk impacts, the applicable thresholds are:~~

- ~~Maximum Individual Cancer Risk: An increased cancer risk greater than 10 in 1 million at any receptor location;~~
- ~~Cancer burden: An increase in cancer burden of 0.5 or~~
- ~~Non-cancer chronic hazard indices (HI): A cumulative increase for any target organ system exceeding 1.0 at any receptor location.~~

~~**Localized Air Quality Impacts.** The construction and operation of the project would result in the emissions of carbon monoxide, oxides of nitrogen, and particulate matter. As noted in the discussion of Impact 4.3.6.3, construction and operation of the proposed project have the potential to exceed localized air quality significance thresholds for oxides of nitrogen (NO_x) and particulate matter (PM_{10} and $PM_{2.5}$) that may expose sensitive receptors to substantial pollutant concentrations. These impacts are shown in Impact 4.3.6.3.~~

~~**Acute and Chronic Health Risk Impacts.** Acute and chronic health risk impact analysis examines the increased risk associated with air pollution for non-cancer health outcomes. Since these are non-cancer health impacts, as described below, the impacts are analyzed separately from increased cancer risk associated with air pollution.~~

~~Past studies have indicated that exposures to diesel PM can have both short-term and long term non-cancer health effects. The construction and operation of the project would not emit any toxic chemicals in any significant quantity other than vehicle exhaust. While there may be other toxic substances in use on site, compliance with State and Federal handling regulations will bring these emissions to below a level of significance.~~

~~Exposure to diesel exhaust can have immediate (acute) health effects, such as irritation of the eyes, nose, throat, and lungs, and can cause coughs, headaches, light headedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. However, according to the rulemaking on *Identifying Particulate Emissions from Diesel-Fueled Engines as a Toxic Air Contaminant* (CARB 1998), the available data from studies of humans exposed to diesel exhaust are not sufficient for deriving an acute non-cancer health risk guidance value.~~

~~The revised analysis, however, does derive an estimate of acute non-cancer risks by examining the acute health effects of the various toxic components that comprise diesel and gasoline emissions. There is specific guidance for estimating the acute non-cancer hazards from these toxic components based on chemical profiles established by the CARB which was used in the revised analysis to determine the project's acute non-cancer hazards.~~

~~To determine the project's *chronic* non-cancer hazard impact, the highest annual diesel PM concentration was determined covering the years 2015 (the commencement of project construction) to 2035 (the full build out of the project). In this regard, the highest annual average diesel PM concentration prior to mitigation determined through air dispersion modeling was 1.02 ug/m^3, at an existing residence located within the project boundaries. This diesel PM concentration was due to the impacts of diesel PM emissions from the off-road construction equipment and operation equipment. This level of diesel PM impact results in a chronic non-hazard index of 0.20. This hazard index is less than the SCAQMD's significance level of 1.0, and is, therefore, less than significant.~~

~~The estimation of the *acute* non-cancer hazard index requires the estimation of the maximum 1-hour impacts of total organic gases (TOG). Estimates of the project's maximum 1-hour TOG emissions were derived from the project's peak hour traffic data along the nearly 500 roadway segments contained within the assessment and then speciated or broken down into the various toxic air contaminant components by fuel type, gasoline and diesel. The acute non-cancer hazard index was determined for a worst-case condition that assumed the project would be completely built out in 2012 with the project's attendant traffic and emission estimates as they would exist in 2012. This condition is the same as the Project Phase 1 and Phase 2 Full Build Out (2012) condition assumed in the Localized Significance Threshold assessment provided earlier. Based on this information, the maximum acute non-cancer hazard index found at any receptor within the model domain was 0.07, which is less than the SCAQMD's non-cancer hazard index of 1.0, and, therefore, is less than significant.~~

~~Therefore, the potential for short-term acute and chronic exposure from diesel exhaust are considered to be less than significant and no mitigation is required.~~

~~**Cancer Risks.** As noted in Section 4.3.3, *Methodology*, the project health risk assessment examined the following condition for impacts to both sensitive/residential and worker receptors:~~

> ~~*Proposed Project Development condition which evaluates the impacts of project-related construction and operational traffic diesel PM emissions as if the project were built out in accordance with its proposed phased construction and operational buildout schedule commencing with the construction of Phase 1 in 2015, build out of Phase 1 in 2022, and the full build out in 2035.*~~

~~This HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study. The revised mitigation conditions require that all diesel trucks accessing the project during operation be model year 2010 or newer and that all on-site equipment be Tier 4. The results of the HEI Study indicate that the project mitigation requiring the application of Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.~~

~~*Cancer Risk for Sensitive/Residential Receptors.* To provide context with the methodology shown in the DEIR, Table 4.3.AC presents the results of the health risk assessment as presented in the DEIR. The cancer risk estimated applied the “Former OEHHA Guidance” and the now out-of-date EMFAC2011 mobile source emission model at several receptor locations inside and outside of the project boundary. For reference, a risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the specific concentration of diesel PM over the duration of the exposure. This risk would be an excess cancer risk that is in addition to any cancer risk borne by a person not exposed to these air toxics.[1]~~

~~Table 4.3.AD presents the estimated cancer risks applying the “Current OEHHA Guidance” and the use of the EMFAC2014 mobile source emission model. The results are provided separately for project construction diesel PM emissions, operational diesel PM emissions, and the total project diesel PM emissions prior to the application of emission mitigation. As noted therein, the estimated cancer risks are far greater than the corresponding risks estimated using the “Former OEHHA Guidance”. This is because of the use of the age-specific factors (e.g., age-sensitivity factors and daily breathing rates) used in the “Current OEHHA Guidance” during the first 16 years, and in particular the first 2 years, of the 30-year exposure duration that greatly influence the risks over the entire 30-year exposure duration. The “Former OEHHA Guidance” used a 70-year exposure but did not make use of any age-specific factors. Because of the use of the age-specific early-in-life factors under the “Current OEHHA Guidance”, the estimated cancer risks would result in an exceedance of the 10 in a million cancer risk significance threshold in the first year of the project construction in 2015 alone. As can be seen from Table 4.3.AD the construction impacts contribute the greatest proportion of the total impact particularly under the “Current OEHHA Guidance”.~~

~~On the basis of the results shown in Table 4.3.AD based on the application of the “Current OEHHA Guidance”, the project would exceed the SCAQMD’s cancer risk significance threshold of 10 in a~~

~~million prior to the application of mitigation and would represent a significant impact. However, this analysis is based on the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study and discussed in more detail below.~~

~~Figures 4.3.18a and 4.3.18b show the incremental cancer risks for the project location as calculated based on the EMFAC2014 emission model and the application of the "Current OEHHA Guidance" cancer risk estimation methodology and based on the assumption that diesel exhaust from old technology engine diesel emissions can cause cancer. The figures show the results prior to the application of mitigation.~~

~~*Estimates of Cancer Risk for School Site Receptors.* Cancer risk at school sites in the area with the application of the "Current OEHHA Guidance" is provided in Appendix D. Prior to the application of the mitigation, the maximum cancer risk is 3.2 in a million at Ridgecrest Elementary School. The cancer risk at the proposed high school at Ironwood Avenue and Quincy Street is 3.4 in a million. Impacts at schools are less than the 10 in one million significance threshold prior to mitigation and are less than significant.~~

~~*Estimates of Cancer Risk for Worker Receptors*. Estimates of worker exposures were prepared based on the assumption of a 25-year exposure duration for 250 days per year and 8 hours per day as described in the methodology section above and in the revised Air Quality, Greenhouse Gas, and Health Risk Assessment Report (Appendix D). Note that the OEHHA early-in-life age factors do not apply to worker receptors. The highest worker cancer risk estimates prior to the application of mitigation are greater than the SCAQMD cancer risk threshold of 10 in a million at 10.1 in a million inside the project boundaries and 4.1 in a million outside the project boundaries.~~

~~However, this analysis is based on the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study and discussed in more detail below.~~

~~*Estimates of Cancer Burden.* In response to comments received on the DEIR, an estimate of cancer burden was developed in this revised analysis. The cancer burden calculation provides an estimate of the increased number of cancer cases as a result of exposures to TAC emissions. The total cancer burden is the product of the number of persons in a population area (such as a census tract) and the estimated individual risk from TACs in that population area and then summed over all population areas. The SCAQMD indicates that the burden calculation include those population units having an incremental cancer risk of 1 in a million or greater.~~

~~Cancer risks were estimated at the geographical center (centroid) of 2,360 census tracts that spanned the Basin from Palm Springs to the City of Los Angeles. For the 70-year exposure duration with the inclusion of the "Current OEHHA Guidance", the cancer burden is estimated to be 1.6 out of a population of about 880,000 individuals that were estimated to have a cancer risk of 1 in a million or more. The SCAQMD has established a threshold for cancer burden of 0.5. Therefore, the project would exceed the SCAQMD's cancer burden significance threshold prior to the application of mitigation.~~

~~*Informational Purposes: Morbidity and Mortality*. There is no established threshold or approved methodology for calculating morbidity and mortality. For purposes of this assessment, morbidity is a term for describing how an external effect such as air pollution would exacerbate an existing illness and other health effect. Mortality is another term for death. The following represents the result of the calculations for long-term mortality and various morbidity health endpoints due to diesel PM for the project prior to the application of mitigation. The locations for the morbidity/mortality estimations were at the location with the highest combined annual diesel PM concentration and census tract population such that the change in diesel PM would affect the greatest number of people. A cumulative total of each mortality/morbidity health endpoint was also calculated that totals the number of added cases of an identified health endpoint at each census tract location within the entire region potentially impacted by the project emissions.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.3.18b: Incremental Project Cancer Risk – “Current OEHHA Guidance” Close-In View~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~The estimates of mortality and morbidity impacts are based on the application of concentration-response functions (C-R functions) that relate the change in the number of adverse health effect incidences in a population to a change in air pollutant concentration experienced by that population. However, such estimations are subject to great uncertainty. Sources of uncertainty include emission estimates, population exposure estimates, form of C-R functions, baseline rates of mortality and morbidity that are entered into the C-R functions, and occurrence of additional not-quantified adverse health effects. It should be noted that the nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as sulfur dioxide, NO_2, CO, and ozone that tend to co-occur with PM in ambient air, greatly increase the complexity of deriving accurate PM concentration-response functions.~~

~~Exposure to the Project's diesel PM emissions prior to mitigation would result in an increase in mortality of approximately 0.002 additional cases per year at the location where the project has its maximum impact from diesel PM emissions or 0.2 additional cases over all of the census tracts contained In the modeling domain.~~

~~Table 4.3.AE summarizes the estimates of the various morbidity health endpoints due to the emissions from the project. As shown in this table, the project would not result in a single new added case of a quantified health endpoint either at either the location where the impact would be greatest or cumulatively over the entire air dispersion modeling domain examined in this assessment (approximately 3,500 square miles, potentially impacted by the project).~~

~~**City of Moreno Valley General Plan.** The project is consistent with the following City of Moreno Valley General Plan (2006) policies to help reduce air quality impacts to sensitive receptors:~~

- ~~Policy 6.7.4 Locate heavy industrial and extraction facilities away from residential areas and sensitive receptors. Project consistency: The project would not contain heavy industrial and extraction facilities (such as a gravel mine). The project would contain warehousing, distribution, and light logistics. Therefore, the project is consistent with this policy. Nonetheless, the proposed plan places this development at the eastern end of the City, reducing the potential residential/development interface.~~
- ~~Policy 6.7.5 Require grading activities to comply with South Coast Air Quality Management District's Rule 403 regarding the control of fugitive dust. Project consistency: The project would~~

~~comply with all applicable rules and regulations. Mitigation Measure 4.3.6.2A requires that the project demonstrate compliance with Rule 403.~~

~~**Mitigation Measures.** The mitigation measures previously identified under other impact sections are required (**Mitigation Measures 4.1.6.1A, 4.3.6.2A**, **4.3.6.2B**, **4.3.6.2D, 4.3.6.3A, 4.3.6.3B, 4.3.6.3C, 4.3.6.3D,** and **4.3.6.3E**) to reduce construction and operational emissions of criteria pollutants would reduce the estimated cancer risks associated with the project.~~

~~**Level of Significance after Mitigation for Worker and School Children Cancer Risk**. Less than Significant. The cancer risk impacts are less than the threshold of 10 in a million for workers 1.3 in one million onsite; 0.5 in one million offsite) and school children (0.7 in one million). More importantly, HRA is being provided to allow decision makers to see the cancer-related impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study.~~

~~**Level of Significance after Mitigation for Localized Particulate Matter Impacts.** Significant and unavoidable. In summary, those residents inside the project boundaries could be exposed to significant short-term and long-term PM10 concentrations on an ongoing basis. The health effects from particulate matter were discussed earlier and could include the following:~~

- ~~Particulate matter can cause the following health effects from short-term (24-hour) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.~~

- ~~Particulate matter (PM_{10}) can cause the following health effects from long-term exposure (annual): reduced lung function; chronic bronchitis; changes in lung morphology; and/or death.~~

~~**Level of Significance after Mitigation for Sensitive Receptor Cancer Risk.** Less than significant.~~

~~**Mitigation Measure 4.3.6.3B** would require that all diesel trucks that access the project site be model year 2010 or later and limits truck and vehicle idling to 3 minutes. **Mitigation Measure 4.3.6.2A** would require that Tier 4 construction equipment be used on the project site. These mitigation measures would reduce the cancer risk from the project.~~

~~**Mitigation Measure 4.3.6.3C** may encourage alternative fueled vehicles and trucks on the project site; however, no reduction is taken. **Mitigation Measure 4.3.6.3D** may reduce vehicle miles traveled to food establishments; however, no direct reduction is taken. **Mitigation Measure 4.3.6.3E** requires that if transportation refrigeration units are to be used, electrical hookups would be required. In addition, refrigerated space is prohibited unless the impacts do not exceed any environmental impacts identified in the EIR. Therefore, it is assumed in the unmitigated and mitigated estimates that there would be no transportation refrigeration units.~~

~~Table 4.3.AF shows the cancer risks estimated with the “Current OEHHA Guidance” after application of mitigation. As noted, the cancer risks are substantially less after mitigation. However, the SCAQMD cancer risk significance threshold would continue to be exceeded at locations within the project boundaries but not at any residential areas outside of the project boundary. The large reduction in cancer risk after mitigation is attributable principally to the reduced diesel PM attributed to mitigation such as the commitment to Tier 4 construction equipment. The impact of this mitigation is largely felt during the first 3 to 5 years of construction when the “Current OEHHA Guidance” assigns large age sensitivity factors to the first few years of the 30-year exposure duration. Figure 4.3.19a and Figure 4.3.19b provided a regional and close-in view of the risks, respectively after the application of mitigation. Even so, this HRA is being provided to allow decision makers to see the cancer-related~~

~~impacts of the proposed project in the assumption that new technology diesel exhaust cause cancer, contrary to what was found by the HEI study, as discussed in more detail below. Through mitigation, new technology diesel engines are required for the WLC project. The revised mitigation conditions require that all diesel trucks accessing the project during operation be model year 2010 or newer and that all on-site equipment be Tier 4. The results of the HEI Study indicate that the project mitigation requiring the application of Model Year 2010 engines as well as the use of Tier 4-compliant off-road construction equipment are not expected to result in emissions that would be associated with the formation of cancer in exposed individuals.~~

~~The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.~~

~~Mitigation measures 4.3.6.2A and 4.3.6.3B require 2010-compliant trucks for operation and Tier 4 equipment for construction, both of which rely on diesel particulate filters similar to those tested in the HEI study. These vehicles reduce emissions by 90% when compared to 2006 vehicles and by 99% when compared to uncontrolled diesel engines. Recent emissions testing by CARB revealed that these diesel engines are cleaner than originally estimated. These findings, which are reflected in the latest CARB emissions factor model EMFAC2014, are 70% cleaner than previously estimated.~~

~~Beginning in 2001, USEPA and CARB began issuing a series of regulations that require new diesel-powered vehicles and equipment to use the latest emissions control technology. This technology relies on two components. The first is a diesel particulate filter, which is capable of reducing particulate matter emissions by over 90% (required for new engines beginning in 2007). The second technology is selective catalytic reduction, which reduces emissions of nitrogen oxides by over 90% (required for new engines beginning in 2010). Diesel emissions from equipment equipped with this technology is referred to as NTDE. As a result of the advances in emission control technology, USEPA, CARB, and other government and industry stakeholders commissioned a series of studies called the Advanced Collaborative Emissions Study (ACES). ACES has been guided by an ACES Steering Committee consisting of representatives of HEI and the Coordinating Research Council (CRC: a nonprofit organization that directs engineering and environmental studies on the interaction between automotive or other mobility equipment and petroleum products), along with the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others. The Health Effects Institute (HEI), funded in part by USEPA, was selected to oversee Phase 3 of ACES.~~

~~Phase 3 of ACES evaluated whether emissions from new technology diesel engines cause cancer or other health effects. Specifically, it evaluated the health impacts of a 2007-compliant engine equipped with a diesel particulate filter. HEI found that lifetime exposure to new technology diesel exhaust (NTDE) did not cause carcinogenic lung tumors. The study also confirmed that the concentrations of particulate matter and toxic air pollutants emitted from NTDE are more than 90% lower than emissions from traditional older diesel engine.~~

~~As a result of the very low emissions from new technology diesel engines and the research conducted by HEI, it is projected that the project would not result in any new cancer risks from the project's diesel emissions. Therefore, the project would have a less than significant health risk impact.~~

~~As discussed above, there are no significant health risk impacts associated with the project. However, under a very conservative application of the "Current OEHHA Guidance" to the proposed project (which was provided for informational purposes), three homes within the Specific Plan area could be identified as having a health risk in excess of the SCAQMD threshold. Although air quality significance thresholds have been established for outdoor environments, a significant portion of human exposure to air pollutants occurs indoors where people spend more than 90 percent of their time (USEPA 2011). One approach to reduce exposure is the installation of high efficiency panel filters inside the HVAC system. Air filters and other air-cleaning devices are designed to remove~~

~~pollutants from indoor air. Some are installed in the ductwork of a home's central heating, ventilating, and air-conditioning (HVAC) system to clean the air in the entire house. In studies of the effectiveness of air filtration systems in classrooms (SCAQMD 2009) and by the EPA in residences (USEPA 2009b), the combination of an HVAC system with a high performance panel filter reduced indoor levels of fine particulate matter, PM2.5 and smaller particles by 70 to 90 percent.~~

~~The use of a filtration system consisting of the application of filters with a rating of ASHRSE Standard 52.2 MERV-13 is sufficient to capture a significant portion of the diesel particulate matter. However, the filtration system would not remove the smallest of particles (less than approximately 0.01 to 0.2 micron in diameter). MERV-13 filters would, however, reduce particles in the range of 0.3 to 1 micron by up to 75 percent and particles larger than 1 micron by 90 percent (see Table 1 of the Addendum to CARB 2012). Based on measurement studies of the size distribution of the collected DPM, approximately 0.1 to 10 percent of the total DPM mass includes particles between 0.01 and 0.2 micrometer in diameter, particles between 0.3 and 1 micrometer in diameter comprise 70 percent of the total DPM mass, and particles above 1 micrometer comprise 5 to 20 percent of the total DPM mass (DieselNet.com 2002).~~

~~Since the cancer risk from DPM is calculated from the mass of DPM emitted, the quantity of DPM reduced by the action of air filters would thus equate to a reduction in cancer risk. The application of MERV-13 air filter filtration system would result in a reduction of DPM exposures by approximately 70 percent.~~

~~DPM Size: 0.01 to 0.2 micrometers   0.3 to 1 micrometers   Greater than 1 micrometer~~

~~(10% total mass × 0% reduction + 70% total mass × 75% reduction + 20% total mass × 90% reduction)~~

~~Attributing an adjustment for time that windows might be open, residents would be outside, or for different compounds that result in the cancer risk would reduce the efficacy of the filters by about 20 percent, bringing the total cancer risk reduction from the filters to 50 percent.~~

~~Absent the results of the HEI study, installation of air filters meeting the requirements discussed above on the three identified homes within the WLCSP area would reduce the OEHHA-calculated risk to below 10 in one million. The use of the filters would bring the OEHHA-calculated risk below the SCAQMD threshold eliminating any possible risk from the project on those three homes within the Specific Plan area. However, based upon the results of the HEI study, health risk impacts are less than significant and no further mitigation is required.~~

~~In summary, the implementation of all the recommended mitigation measures, including the requirement to use 2010 diesel engine emissions standards and Tier 4 construction equipment, will reduce the OEHHA-calculated cancer risk to below 10 in one million on all but three existing residences within the WLCSP boundary. However, the HEI study indicates the use of 2010 diesel engines and TIER 4 equipment will eliminate the project cancer risk, therefore, there will be no impacts to the three homes and no mitigation is required.~~

~~Finally, note further that after application of mitigation, the cancer risk burden is estimated at 0.10 based on the "Current OEHHA Guidance" which is less than the SCAQMD cancer burden significance threshold of 0.5, based on the assumption that diesel exhaust can cause cancer. Therefore, the project would not exceed the SCAQMD's cancer burden significance threshold.~~

~~As requested in comments received during the DEIR comment period, an analysis was conducted to compare cancer risks for a design buffer area of 250 feet from the project boundaries (this is the current project design) to a buffer area of 1,000 feet from the property boundary based on the "Current OEHHA Guidance." As shown in Table 4.3.AG, the results for the maximum incremental~~

~~cancer risk are nearly identical for the 250-foot buffer and the 1,000-foot buffer. The 1,000-foot buffer would not appreciably reduce air quality impacts. More importantly, as result of revised mitigation measures such as 4.3.6.2.A that commits to cleaner construction equipment, there is no significant health impact outside the project boundaries for residents, workers, or other sensitive receptors that would be affected by an increased buffer area. That analysis assumes that traditional diesel equipment would be used as opposed to new technology diesel (which does not contribute to cancer~~

~~Table 4.3.AG: Estimated Cancer Risks, 70-year Exposure Duration for Sensitive/Residential Receptors, With Mitigation~~

~~Receptor Location~~	~~Incremental Cancer Risk[1] (risk/million)~~		~~SCAQMD Cancer Risk Significance Threshold (risk/million)~~	~~Exceeds Threshold?~~
	~~250-Foot Buffer~~	~~1000-Foot Buffer~~		
~~Maximum risk anywhere in the modeling domain~~[2]	~~17.0~~	~~16.5~~	~~10~~	~~Yes~~
~~Maximum risk at existing residences within the project boundaries~~	~~17.0~~	~~16.5~~	~~10~~	~~Yes~~
~~Maximum risk at any existing residential area outside of the project boundaries~~[3]	~~4.3~~	~~3.9~~	~~10~~	~~No~~
~~Maximum risk at any undeveloped residentially zoned property outside of the project boundaries~~[4]	~~4.0~~	~~3.7~~	~~10~~	~~No~~

~~Notes:~~

(1) ~~30-year average exposures from 2015 to 2044 (includes diesel PM emissions from construction and operation)~~

(2) ~~Location is at the existing residences within the boundaries of the project~~

(3) ~~Location is at the southwest corner of the project along Bay Avenue~~

(4) ~~Location is at an undeveloped property zoned for residential at the southwest corner of the project~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~risk), as required by project mitigation measures. As shown in Figure 4.3.20, the locations of the 10 in one million cancer risk contour line for the project design and the 1,000 foot buffer under the “Current OEHHA Guidance” exposure duration are coincident and overlap each other.~~

~~*Risk in Perspective.* To better understand cancer risk, even though new technology diesel exhaust does not cause cancer according to the HEI study, it helps to understand risk in other contexts. For instance, SCAQMD estimates that the risk of developing cancer from all sources of air pollution in Southern California is approximately 367 in one million. According to the National Cancer Institute, Americans face an overall risk of developing cancer from all causes of 408,000 in one million. Figure 4.3.21 presents the project risk in perspective with other lifetime risks in the United States based on mortality statistics. As shown in the figure, the project cancer risk (the risk of developing cancer, not dying of cancer) has a slightly higher risk than dying from a lightning strike and lower risk than accidental drowning.~~

~~4.3.7 Cumulative Impacts~~

~~4.3.7.1 Short-Term Air Quality Impacts~~

~~The cumulative area for air quality impacts is the Basin. It is generally accepted that if a project exceeds the regional threshold for a nonattainment pollutant, then it would result in a cumulatively considerable net increase of that pollutant and result in a significant cumulative impact. The Basin is currently in nonattainment for ozone, PM_{10} and $PM_{2.5}$. The implementation of the project would contribute criteria pollutants to the area during project construction. A number of individual projects in the area may be under construction simultaneously with the proposed project. Depending on construction schedules and actual implementation of projects in the area, generation of fugitive dust and pollutant emissions during construction would result in substantial short-term increases in air pollutants. Each project would be required to comply with the SCAQMD’s standard construction measures; however, despite adherence to SCAQMD’s standard construction measures and **Mitigation Measures 4.3.6.2A** through **4.3.6.2D** identified previously, project-related emissions would still exceed applicable SCAQMD regional thresholds for VOC, NOx, and CO. Therefore, cumulative impacts associated with short-term air quality impacts would be significant and unavoidable.~~

~~4.3.7.2 CO Hot Spot Impacts~~

~~As identified in Section 4.3.5.2, no significant CO hot spot impacts would occur. It is anticipated that CO emissions in the future will decrease with advances in technology. As previously identified, background concentrations in future years are anticipated to continue to decrease as the concerted effort to improve regional air quality progresses. Therefore, CO concentrations in the future years would generally be lower than existing conditions. Based on the analysis, because no CO hot spot impacts would occur, it is reasonable to assume that a less than significant cumulative CO impact would occur.~~

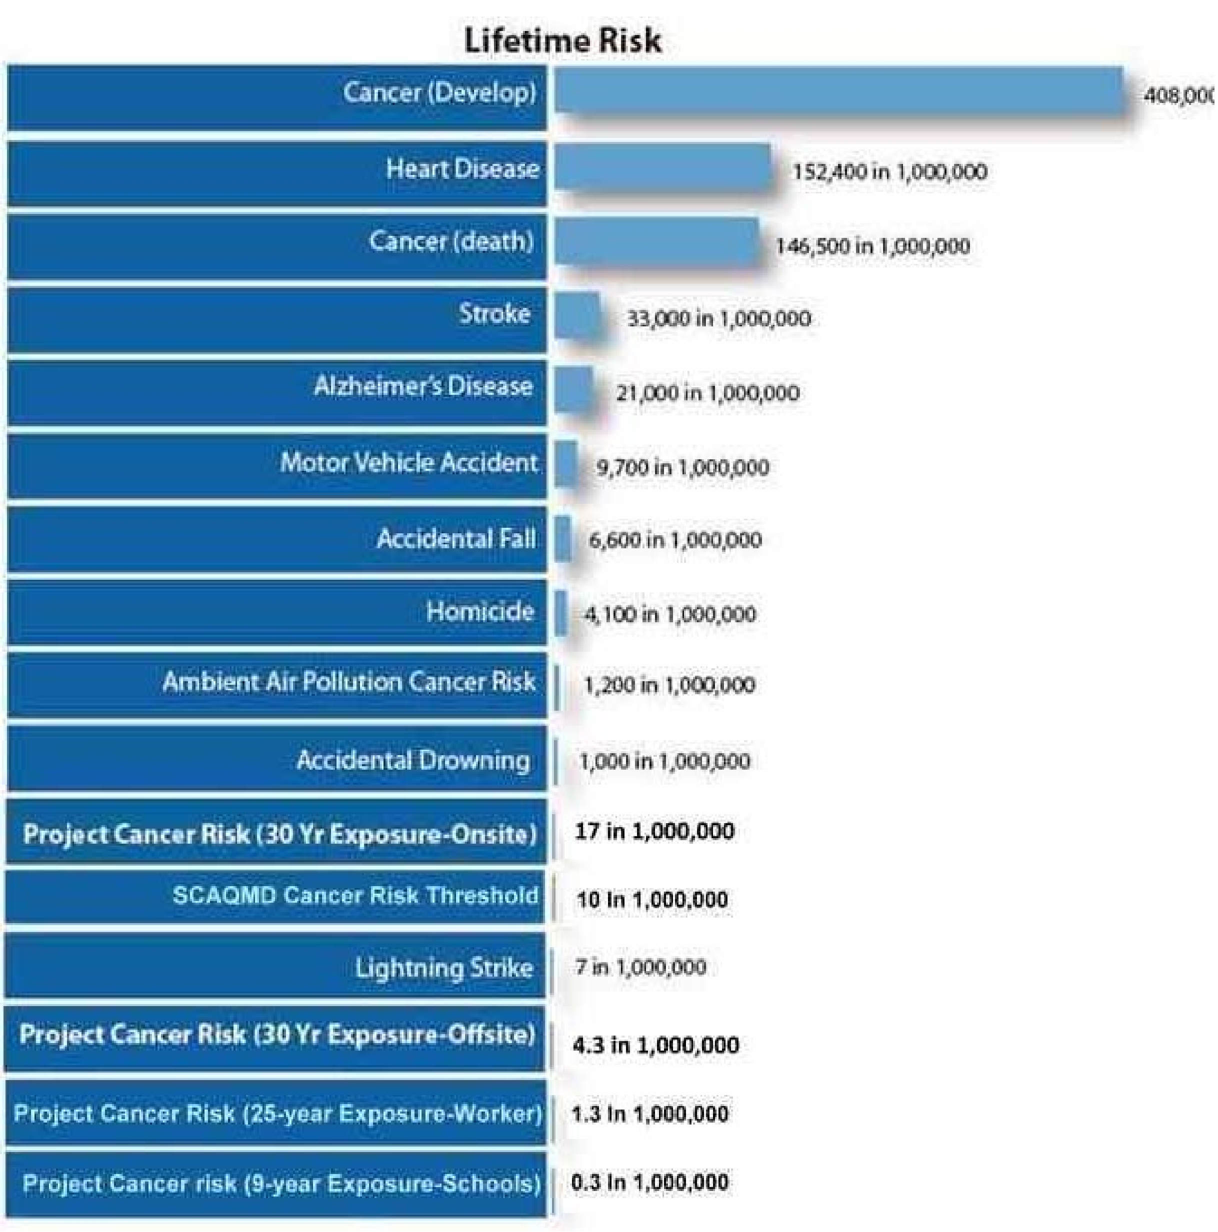
~~4.3.7.3 Long-Term Regional Air Quality Impacts~~

~~As previously identified in Tables , 4.3.AA and 4.3.AB, the long-term operation and the combined construction and operational emissions of the project would contribute to long-term regional air pollutants despite implementation of mitigation measures. The Basin is in nonattainment for ozone, PM_{10} and $PM_{2.5}$ at the present time; therefore, the operation of the proposed project would exacerbate nonattainment of air quality standards within the Basin and contribute to adverse cumulative air quality impacts. Implementation of the proposed project would unavoidably contribute to significant long-term cumulative air quality impacts.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.3.20: Cancer Risk Buffer Analysis – "Current OEHHA Guidance" with Mitigation~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~



~~Figure 4.3.21: Lifetime Risk Comparison~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~4.3.7.4 Cumulative Health Risk Impacts~~

~~**Cancer Risks to Sensitive Receptors and Cancer Burden.** SCAQMD recommends that any given project's potential contribution to cumulative cancer risk impacts should be assessed using the same significance criteria as for project-specific impacts. Therefore, a project that has the potential to exceed any significance threshold on its own would also result in a cumulatively considerable significant impact. As noted from the results shown in previously discussed in Impact 4.3.6.5 in the subsection *Cancer Risks*, since the project would implement mitigation measures resulting in the cleanest on-road and off-road diesel equipment and such equipment has been shown though extensive health effects studies to not result in cancer. Therefore, the project would not result in a cumulatively considerable impact.~~

~~**Non-Cancer Acute and Chronic Hazards Impacts.** As previously identified, the maximum non-cancer chronic hazard index and acute non-cancer hazard index from the operation of the project are estimated to be less than 0.13 and 0.06, respectively. These values are less than the SCAQMD's significance threshold of 1.0. Therefore, the project would also have a less than significant cumulative non-cancer hazard impact.~~

~~Summary of Project-Related Air Quality Impacts~~

~~Based on the preceding analyses in Sections 4.3.5.1 through 4.3.6.5, the WLC project will have the following direct and cumulative air quality impacts:~~

~~Table 4.3.AH: Summary of Project-Related Air Quality Impacts (new table)~~

~~Impact~~	~~Air Quality Topic/Issue~~	~~Impact Conclusion~~
~~Project Impacts~~		
~~4.3.5.1~~	~~Odors~~	~~Less than Significant No Mitigation Required~~
~~4.3.5.2~~	~~Long-Term Micro-Scale CO Hotspot Emissions~~	~~Less than Significant No Mitigation Required~~
~~4.3.6.1~~	~~Air Quality Management Plan Consistency~~	~~Significant (inconsistent) and Unavoidable with Mitigation~~
~~4.3.6.2~~	~~Regional Construction Emissions~~	~~Significant and Unavoidable with Mitigation (VOC, NOx, CO, and PM_{10}; regional health effects from ozone)~~
~~4.3.6.3~~	~~Localized Construction and Operation (LSTs)~~	~~Significant and Unavoidable with Mitigation (onsite)~~ ~~Less than Significant with Mitigation (offsite)~~

~~4.4 BIOLOGICAL RESOURCES: TABLE OF CONTENTS~~

~~FIGURES~~

~~TABLES~~

~~**NOTE TO READERS.** *The following revisions have been made due to changes in the proposed WLC project, responses to comments on the Programmatic DEIR and revisions and updates to the project biological resources assessment.*~~

~~4.4 BIOLOGICAL RESOURCES~~

~~***Changes from December 2012 Biological Resource Analysis***~~

- ~~*At the request of Metropolitan Water District of Southern California (Letter C-2) information about the Inland Feeder was added to the Section 4.4.1.*~~
- ~~*Additional details about existing setting Section 4.4.1 were added in response to the revised survey area and comments made on the DEIR. The format of this section was revised to follow the format and organization that was used in the revised MSHCP report. However, the information is conceptually the same.*~~
- ~~*Table 4.4.A: Summary of Vegetation was updated based on the revised MSHCP report and moved to Section 4.4.1.4.*~~
- ~~*Table 4.4.B was divided into two separate tables based on the updated biological resources report in addition to comments regarding the presence of sensitive plants and wildlife in the area.*~~
- ~~*Additional discussion of burrowing owl was added to Sections 4.4.1.13 and 4.4.1.14 due to a burrowing owl being identified within the project site during the 2013 focus survey.*~~
- ~~*Table 4.4.D Special Interest Species was incorporated into Tables 4.4.B Sensitive Plant Species in the WLC Project Area and 4.4.C Sensitive Wildlife Species in the WLC Project Area.*~~
- ~~*The discussion of riparian habitat and potential wildlife species was expanded in section 4.4.1.14 due to the updated MSHCP report.*~~
- ~~*Detailed information about on-site drainages has been excerpted from the Jurisdictional Delineation Report and added to Section 4.4.1.19. A discussion of on-site drainages was also added to Section 4.4.6.3.*~~
- ~~*The updated MSHCP report determined that Section 4.4.5.1 Jurisdictional Waters/Wetlands required mitigation to be less than significant. This section was added to 4.4.6.3 Jurisdictional Delineation, Riparian Habitat or Other Sensitive natural Communities. The existing mitigation was revised to mitigate potential jurisdictional impacts to less than significant levels.*~~
- ~~*All mitigation measures in Section 4.4.6 were updated based on the revised the MSHCP report.*~~
- ~~*In response to a comment made on the DEIR a nitrogen deposition section of added to section 4.4.6.2.*~~
- ~~*Mitigation Measures 4.4.6.1A through 4.4.6.1C were revised based on comments from the U.S. Fish and Wildlife Service.*~~
- ~~*Additional discussion of burrowing owl impacts was added to Section 4.4.6.4 due to the burrowing owl being identified within the project site during the 2013 focus survey. Burrowing Owl mitigation was also expanded.*~~

NOTE TO READERS: This portion of the Revised Sections of the FEIR entirely replaces Section 4.4 of the FEIR. The cumulative portion of Section 4.4 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.4 of this Revised Sections of the FEIR. The absence of reference to a portion of Section 4.4 means that the corresponding portion of Section 4.4 in the FEIR remains unchanged or has been deleted.

4.4 BIOLOGICAL RESOURCES

The Superior Court ruling requires the following actions with regards to Biological Resources:

> "The FEIR should remove all references to and consideration of the 910 acres of SJWA and MSHCP land as "buffer zone" or "CDFW Conservation Buffer Area" in the Biological Resources and Habitat Impacts analysis, and the potential environmental impacts on Biological Resources should be re-analyzed without and consideration of said buffer". The Biological Resources and Sensitive Species Survey Results Technical Memorandum is included in Appendix B.

The following text and figures from the FEIR has been amended to address the above outlined requirements. In particular, the text has been amended to ensure that the "buffer" concept was eliminated and not considered, and this document does not consider or evaluate any part of the San Jacinto Wildlife Area (SJWA) as a buffer area, and instead, the analyses below evaluate whether or not the WLC Project would have any potential impacts on biological resources.

This section discusses the potential impacts of development of the ~~proposed~~WLC project on biological resources. In 2012, Michael Brandman Associates (MBA) conducted a Habitat Assessment, Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis, Habitat Acquisition and Negotiation Strategy (HANS) Report, and California Environmental Quality Act (CEQA) Biological Resources Assessment to comply with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) requirements. The 2012 MBA report summarized the results of several focused surveys conducted since 2004 on the WLC property. In 2014, the various WLC project studies were updated to reflect the most current information about the ~~project area.~~World Logistics Center (WLC) site. ESA completed updated biological resource assessments in 2018 to document any changes to the results from the previous surveys conducted by MBA. Information to evaluate and analyze the ~~proposed~~ project's impacts to biological resources is derived from the following references and studies included in Appendix E:

- 2018 focused surveys for Los Angeles pocket mouse, burrowing owl and coastal California gnatcatcher conducted by ESA.
- *Habitat Assessment, MSHCP Consistency, and HANS Report*, MBA, original dated December 20, 2012, revised September 2014~~.~~ and May 2018. (This includes the focused surveys included as separate documents in the previous version.)
- *Jurisdictional Delineation of the World Logistics Center,* MBA, original dated October 29, 2012, revised dated December 19, 2013.
- *World Logistics Center – Jurisdictional Delineation Update,* ESA, December 19, 2016 letter to Highland Fairview.
- Determination of Biologically Equivalent or Superior Preservation (DBESP), MBA, December 5, 2013, revised September 2014 and May 2018.

In addition, the analysis contained in this section is based on the following reference documents:

- Western Riverside County Regional Conservation Authority – World Logistics Center Joint Project Review (JPR) Consistency Determination 13-12-12-01, dated October 17, 2014.
- *Conservation Element*, City of Moreno Valley General Plan, adopted in July 2006.
- Western Riverside County MSHCP, adopted October 2003.
- MSHCP Final EIR, certified October 2003.

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

For the reader's reference, this ~~EIR~~portion of the Revised Sections of the FEIR and each of the technical reports and analyses contained herein have been written to address ~~a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are~~the court ruling summarized ~~below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (this project September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included~~ in Section ~~3.4~~1.0 of this Revised Sections of the ~~EIR, *Project Characteristics.*~~ FEIR.

The MBA report included an assessment of the WLC Specific Plan (~~WLCSP)~~WLC site) (2,610 acres), the ~~910-acre CDFW Conservation Buffer Area within~~northern portion of the San Jacinto Wildlife Area (SJWA), the SDG&E Moreno Compressor Plant (194 acres), an "indirect impact zone" surrounding portions of the ~~WLCSP~~WLC site property (502 acres, all off-site within the SJWA and east of Gilman Springs Road), potential offsite infrastructure facilities (~~304~~104 acres) and modified survey areas to match the reduced ~~project area~~WLC site of the specific plan from the original 2005 MBA surveyed areas. In this section, the combined areas described in this paragraph total 5,972 acres and are hereafter referred to in this section as the survey area. This area has been resurveyed by ESA in March/April, 2018, except for the "indirect impact zone."

The information presented in this section is based on surveys of various ~~portions~~areas of the project site conducted by MBA from 2005 to 2013 as referenced above~~.~~ and by ESA in 2018. Development is only proposed on the ~~Specific Plan property~~WLC site; the ~~CDFW~~SJWA and public facilities property are not proposed for development and are expected to remain in their present condition. The habitat assessment information summarized in this section was collected during several site visits to the ~~project area~~WLC site, the ~~CDFW buffer area~~northern portion of the SJWA, the public facilities property, and the off-site improvement area at various times from 2005 to ~~2013~~2018.

4.4.1 Existing Setting

The WLC site is located on the fringe of the urbanized development area of the City of Moreno Valley. The majority of the WLC site has been used for agricultural purposes for decades. Various portions of the area contain structures associated with previous agricultural activities, including residential structures, farm buildings, concrete pads, and fences. There are two small portions of relatively undisturbed vegetation on site, one in the northeastern portion of the site on land owned by Metropolitan Water District, and the second in the southwestern portion of the site in the rocky hills south of Alessandro Road and west of World Logistics Center Parkway. Many of the off-site facilities such as water and sewer lines and access to potential water reservoirs are proposed along existing rights-of-way in the City of Moreno Valley. Debris basins are proposed along the eastern side of Gilman Springs Road to prevent debris and sediment from the Badlands from disrupting traffic on Gilman Springs Road after significant storm events. The northern portion of the SJWA south of the Specific Plan area is similar in history and conditions to the project site. The northernmost portion of the SJWA has been plowed for decades and portions of it were recently farmed. A portion of the northernmost portion of the SJWA contains areas of non-native grasslands, although aerial photographs show that the area has been intermittently tilled over last 80 years.

The entire ~~project area~~WLC site is regulated by the MSHCP, which is a regional conservation plan adopted by Riverside County in 2003. The MSHCP establishes core areas identifying important land that supports listed or sensitive species. The MSHCP also establishes criteria cells for land with important resources that need to be protected as part of the overall plan. The MSHCP identifies these critical lands for preservation or for relatively passive open space and utility uses. The MSHCP serves as a regional habitat conservation plan. The MSHCP was created, studied, and adopted by the County, the U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Wildlife (CDFW~~,~~), and fourteen cities in Riverside County~~ along with the County~~. A more complete discussion of the MSHCP is provided in Section 4.4.1.6.

4.4.1~~ Existing Setting~~

~~The project area is located on the fringe of the urbanized development area of the City of Moreno Valley. The majority of the project area has been used for agricultural purposes for decades. Various portions of the area contain structures associated with previous agricultural activities, including residential structures, farm buildings, concrete pads, and fences. There are two small portions of relatively undisturbed vegetation on site, one in the northeastern portion of the site on land owned by Metropolitan Water District, and the second in the southwestern portion of the site in the rocky hills south of Alessandro Road and west of Theodore Street. Many of the off-site facilities such as water and sewer lines and access to potential water reservoirs are proposed along existing rights-of-way in the City of Moreno Valley. Debris basins are proposed along the eastern side of Gilman Springs Road to prevent debris and sediment from the Badlands from disrupting traffic on Gilman Springs Road after significant storm events. The CDFW Conservation Buffer Area south of the Specific Plan area is similar in history and conditions to the project site. The ~~.1~~,104-acre area has been plowed for decades and portions of it are being actively farmed. The southwestern portion of the Conservation Buffer contains areas of non-native grasslands, although aerial photographs show that the area has been intermittently tilled over last 80 years.~~

~~*Note: The following information was added at the request of the Metropolitan Water District of Southern California (Letter C-2) regarding the Inland Feeder. A figure showing the location of the Inland Feeder can be found at the end of comment Letter C-2 from the Metropolitan Water District of Southern California.*~~

> ~~“Metropolitan owns property and owns and operates facilities on and adjacent to the site of the proposed project. As shown on the attached map, Metropolitan's irregularly shaped fee-owned property (APN 422-040-009 and 422-040-015), Inland Feeder Tunnel, and appurtenant tunnel access structure are located within the proposed specific plan area. In addition, Metropolitan's 145-inch-inside-diameter Inland Feeder pipeline and appurtenant structures extend through the specific plan area in the street rights-of-way for Eucalyptus Avenue, Theodore Street, and Davis Road. Metropolitan also has a 110-foot-wide easement along Davis Road.”~~

~~4.4.1.1 Topography and Soils~~

~~The project area is located in Rancho Belago, in the eastern portion of the City of Moreno Valley, in western Riverside County. The site is generally located south of SR-60, east of Redlands Boulevard, west of Gilman Springs Road, and north of the San Jacinto Wildlife Area (SJWA). The project site gently slopes down from north to south, and contains 15 identifiable drainages, as outlined in the jurisdictional delineation.[1]~~

~~The soils in the project area have been mapped by the *Soil Survey of Western Riverside Area, California* (1971)[2] and include San Emigdio loam (SgA and SgC) and San Emigdio fine sandy loam (SeC2), with smaller inclusions of Arbuckle loam (AkC), Badland (BaG), Gorgonio loamy sand (GhC), Greenfield sandy loam (GyA, GyC2, GyD2), Hanford coarse sandy loam (HcC and HcD2), Metz loamy sand (MdC and MeD), Metz loamy fine sand (MfA), Metz gravelly sandy loam (MlD), Ramona sandy loam (RdD2), Rockland (RtF), San Emigdio fine sandy loam (SeA and SeD2), and San Timoteo loam (SmE2).~~

~~The observed surface soils in the area contain evidence of heavy repeated disturbance from agriculture-related activities. None of the soils present in the project area is considered sensitive pursuant to the MSHCP, which includes all of Moreno Valley (i.e., the City is a signatory to the MSHCP).~~

~~4.4.1.2 Land Uses~~

~~Agricultural fields including dry-land grain farming dominate the project area. Some rural residences are located in the central portion of the area along Theodore Street, and areas of open space are located throughout the southern and northeastern portions of the site. General land uses around the project area include suburban residential development to the west, vacant land and scattered rural residences to the north and east (across SR-60 and Gilman Springs Road, respectively), the SJWA and natural gas distribution facilities to the south, and the Lake Perris State Recreation Area (LPSRA) to the southwest.~~

~~4.4.1.3~~ Vegetation, General

The ~~following~~vegetation data~~ on vegetation~~ in the study area are from the City's *General Plan Final Program EIR*[3] and the *MSHCP Consistency Analysis Report*[4] for the ~~project area~~WLC site. The following describes the vegetation within various WLC ~~project areas~~sites, including the Specific Plan area, Offsite Improvement Area, ~~CDFW Conservation Buffer~~northern portion of the SJWA adjacent to WLC, Indirect Impact Zone, and Additional Survey Areas. Table 4.4~~.A~~-1 provides a numerical summary of the various types of vegetation within the WLC planning area. For this Revised Sections of the FEIR acreages are limited to the Specific Plan area and the Offsite Improvement Area.

~~*Note: Table*~~ 4.4.~~*A: Summary of*~~ 1.2 Vegetation ~~*with the WLC Study Area has been removed in its entirety. To see original table please refer to FEIR Volume IV Section 4.4.1.3, Table 4.4.A.*~~

~~*Note: The following changes are the result of modifications to the WLCSP project area and updates to the various biological technical studies, and in response to a number of comments recommending the biological site surveys be updated. In addition, some paragraphs in this section were moved and only new information is shown in double underline.*~~

~~4.4.1.4 Vegetation (MBA ~~(Project Survey Area)

There are eleven (11) plant communities/vegetation types that occur within the~~ MBA~~ project survey area: extensive agriculture (e.g., dry-land farming), non-native grassland, urban/developed, disturbed, Riversidean sage scrub, mule fat scrub, non-vegetated channel, open water, ornamental, southern willow scrub, and northern mixed chaparral (see Figure 4.4.1). Figure 4.4.2 depicts the location of drainage features and Riparian/Riverine areas. The following acreages are for approximately 5,972 acres including the ~~WLCSP~~WLC site (2,610 acres) plus off-site improvements and the existing Highland Fairview Corporate Park (Skechers) property, which was included in some of the historical vegetation surveys for this area. The vegetation of the ~~CDFW~~SJWA/public facilities lands and the Off-site Analysis Zone are addressed following the information on the ~~Project Area~~WLC site (i.e., areas of proposed or existing development).

Almost all (5,815 acres or 97.4 percent) of the ~~MBA~~project survey area (5,972 acres) is disturbed by human activity,[1] mainly dryland farming, with only 157 acres or 2.6 percent consisting of native plant communities. The nature and extent of the existing plant communities are discussed below in the order of their presence on the property.

a. Extensive Agriculture

This disturbed plant association covers ~~3,434~~2,837.0 acres or ~~57~~47.5 percent of the ~~MBA~~project survey area, and includes areas where vegetative cover comprises less than 10 percent of the surface area and where there is evidence of intense soil surface disturbance associated with agricultural uses. There are approximately 2,200 acres of extensive agriculture found within the WLC site and there is no extensive agriculture in the Offsite Improvement Areas. This community is generally dominated by winter wheat (*Triticum aestivum*), but also has small inclusions of non-native vegetation along the margins of the fields. Non-native vegetation within disturbed land will have a high predominance of invasive or weedy species that are indicators of heavy, soil disturbance, such as horse nettle (*Solanum elaeagnifolium*), bindweed (*Convolvulus arvensis*), and short-pod mustard (*Hirschfeldia incana*). There was no modification to this mapped plant association made after the 2018 update survey.

The extensive agriculture community in the ~~project area~~WLC site also contains various interstitial ditches that are excluded from regular heavy-agricultural equipment disturbances, such as disking. These areas are less frequently disturbed and contain larger, more established, ruderal vegetation, such as tree tobacco (*Nicotiana glauca*) and tree of heaven (*Ailanthus altissima*), in addition to the fast-growing Russian thistle (*Salsola tragus*), telegraph weed (*Heterotheca grandiflora*), lamb's quarters (*Chenopodium album*), sow thistle (*Sonchus oleraceus*), and short-pod mustard. The interstitial ditch areas do not occupy enough area nor are continuous enough to constitute a separate plant community and are therefore considered part of the extensive agricultural plant community. The majority of the ~~project area~~WLC site is occupied by extensive agriculture and recently disked or heavily grazed, such as in the pasturelands in the northwestern portion of the ~~project area~~WLC site. Most of these areas are disked at least once each year and planted with winter wheat.

b. Non-Native Grassland

Non-native grassland is characterized by a dense to sparse cover of non-native annual grasses often associated with numerous weedy species and native annual forbs (wildflowers), especially in years with plentiful rain. Seed germination occurs with the onset of winter rains. Some plant growth occurs in winter, but most growth and flowering occurs in the spring. Plants then die in the summer, and persist as seeds in the uppermost layers of soil until the next rainy season. Dominant plants include brome (*Bromus* spp.), wild oat (*Avena* spp.), Russian thistle, London rocket (*Sisymbrium irio*), cheeseweed (*Malva parviflora*), wild radish (*Raphanus raphanistrum*), short-pod mustard, stinknet (*Oncosiphon piluliferum*), Jimson weed (*Datura stramonium*), and common sunflower~~.~~ (*Helianthus annuus*). Non-native grassland occupies ~~1,729~~2,326.0 acres or ~~29.0~~38.9 percent of the ~~MBA~~project survey area,

---

[1] Includes agriculture, non-native grassland, urban/developed, disturbed, and ornamental categories.

mainly in the Badlands area east of Gilman Springs Road and the ~~southern~~northern portion ~~as part~~ of the ~~CDFW Conservation Buffer land~~SJWA lands to the south of the WLC site. There are 219 acres of non-native grassland found within the WLC site and there are 9 acres of non-native grassland in the Offsite Improvement Areas. There was no modification to this mapped plant association made after the 2018 update survey.

c. Urban/Developed

The urban/developed area includes any form of human disturbance associated with the development of rural residences that has resulted in permanent impacts to natural communities. This land use type comprises ~~approximately492~~approximately 492.0 acres ~~or8~~or 8.2 percent of the ~~MBA~~project survey area. By definition, urban/developed areas include roads, buildings and structures, pavement, concrete, landscape vegetation, and windrow vegetation. There are 92 acres of urban/developed found within the WLC site and there are 4 acres of urban/developed in the Offsite Improvement Areas. The isolated occurrences of the urban/developed community occur throughout the study area. The urban/developed area is not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds and common terrestrial wildlife that have adapted to urban, agricultural, or other disturbed areas associated with human activity. The largest area of Urban/Developed land occurs in the northwestern corner of the survey area and is associated with the existing Skechers building. There was no modification to this mapped land use type made after the 2018 update survey.

d. Disturbed Areas

These areas support sparse ruderal vegetation and an occasional scattering of native plant species. This type of “habitat” is not a plant community and is considered to be of little or no value to wildlife. Disturbed areas include an area in the northern portion of the project site associated with the adjacent rural residences. These areas have been cleared of vegetation. The remaining disturbed areas are associated with dirt access roads and the area surrounding the existing natural gas compressor station. This category occupies 150 acres or ~~25~~2.5 percent of the project survey area. There are 48 acres of disturbed areas found within the WLC site and there are 3 acres of disturbed areas in the Offsite Improvement Areas. There was no modification to this mapped habitat made after the 2018 update survey.

Figure 4.4-2
Drainage Features

ESA

e. Riversidean Sage Scrub

Stands of Riversidean sage scrub (RSS) range from fairly open to dense with dominant species including brittlebush (*Encelia farinosa*), California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), California sagebrush (*Artemisia californica*), and coastal goldenbush (*Isocoma menziesii*). Other species observed include four-winged saltbush (*Atriplex canescens*), scalebroom (*Lepidospartum squamatum*), and California aster (~~*Lessingia*~~*Corethrogyne* *filaginifolia*), in addition to non-native grasses such as ripgut brome (*Bromus diandrus*), slender oat (*Avena barbata*), red brome (*Bromus madritensis* ssp. *rubens*), and non-native weedy species such as short-pod mustard. There ~~are97~~are 97.0 acres (1.6%) of RSS located within the main drainage feature on the eastern side of the ~~WLC~~ project ~~site~~survey area (Drainage Feature 9, see Figure 4.4.2). There are 48 acres of RSS found within the WLC site and there is no RSS in the Offsite Improvement Areas. The quality of the habitat on site can generally be considered moderate based on vegetation characteristics such as plant density, diversity of species, and level of disturbance. The stand within Drainage Feature 9 is of low quality due to high levels of disturbance, low density of native species, and sparse coverage. There are small patches of RSS in the northeastern and southwestern corners of the ~~MBA survey area~~project survey area. There was no modification necessary for this mapped plant association after the 2018 update survey.

f. Mule Fat Scrub

Mule fat scrub is a widespread natural community throughout California and usually occurs below 2,000 feet. Mule fat scrub occupies approximately 41.0 acres or ~~07~~0.7 percent of the ~~MBA~~project survey area within a portion of Drainage Feature 9 in the southeastern portion of the ~~the~~ WLC Specific Plan area and the ~~CDFW Conservation Buffer~~northern portion of the SJWA lands~~.~~ to the south. There are 5 acres of mule fat scrub found within the WLC site and there is no mule fat scrub in the Offsite Improvement Areas. The mule fat scrub in the ~~project area~~WLC site is generally characterized by dense stands of mule fat (*Baccharis salicifolia*) with various shrubs, weeds, and non-native grasses sparsely intermixed. There was no modification necessary for this mapped plant association after the 2018 update survey.

All areas of mule fat scrub within the drainage feature on the site are relatively undisturbed and contain little trash dumping, agricultural activities, or the presence of domesticated animals. The mule fat scrub plant community provides moderate quality habitat for a number of species. The dominant species observed within the mule fat scrub community were mule fat and tree tobacco. Other species observed include cheeseweed~~ (*Malva parviflora*),~~, wild radish~~ (*Raphanus raphanistrum*),~~, Russian thistle, common sunflower~~ (*Helianthus annuus*),~~, and short-pod mustard, in addition to non-native grasses such as ripgut brome, slender oat, and red brome. Drainage Feature 9 also contains scattered occurrences of scalebroom and four-winged saltbush.

g. Southern Willow Scrub

The southern willow scrub community is characterized by dense, broad-leafed, winter deciduous riparian thickets of vegetation, and is dominated by several species of willow tree. Scattered emergent ~~Freemont~~Fremont cottonwood (*Populus fremontii*) and California sycamore (*Platanus racemosa*) are most closely associated with this community. Most stands are too dense for understory development. This plant community is typically found on loose, sandy, or fine gravelly alluvium soils near stream channels during flood flows. It requires repeated flooding to prevent it from converting to a more mature Southern Cottonwood-Sycamore Riparian Forest community. The CDFW lists it as a sensitive plant community. Plant species identified within the community include sandbar willow (*Salix exigua*), black willow (*Salix goodingii*), mule fat, ~~Freemont's~~Fremont cottonwood, Mexican fan palm (*Washingtonia robusta*), olive (*Olea europea*), phacelia (*Phacelia sp.*), and common sunflower. There was no modification necessary for this mapped plant association after the 2018 update survey.

There is a single patch of southern willow scrub ~~hat~~that comprises approximately 0.9 acre within the central portion of the ~~WLCSP~~WLC site. There is no southern willow scrub in the Offsite Improvement Areas. This community is composed of a single isolated stand within a human-made, catch basin that occurs south of Alessandro Boulevard and west of Virginia Street (see Figure 4.4.2). This stand was a direct result of nuisance flow and agricultural runoff from concrete cattle containment areas adjacent to the catch basin. This area no longer receives runoff from the previous cattle facility and habitat quality is progressively getting worse due to a lack of available moisture. Therefore, this patch of habitat is considered of low-habitat value. The remainder of the southern willow scrub habitat is either within additional survey area or within the ~~CDFW Conservation Buffer~~northern portion of the SJWA to the south.

h. Non-Vegetated Channel

The non-vegetated channel community occurs within the northeastern portion of the site (east of Gilman Springs Road) and the southwestern corner of the survey area, west of ~~Theodore Street~~World Logistics Center Parkway and south of Alessandro Road and accounts for 7 acres (0.1%) of habitat within the survey area. There is no non-vegetated channel found within the WLC site and there are 2 acres of non-vegetated channel in the Offsite Improvement Areas. This habitat contains mainly cobbles and boulders along the channel bottom and banks. The substrate contains sparse sandy deposits with limited vegetative cover and therefore provides low quality habitat for sensitive plant and wildlife species. There was no modification necessary for this mapped community after the 2018 update survey.

i. Ornamental

This plant community occupies 6.0 acres or 0.1 percent of the ~~MBA~~project survey area. There are 3 acres of ornamental found within the WLC site and there is no ornamental in the Offsite Improvement Areas. There are two distinct areas within the survey area that contain ornamental vegetation. The first area is located within rural residential development just west of ~~Theodore Street~~World Logistics Center Parkway and south of Eucalyptus Avenue. This portion of the survey area contains a stand of olive trees. The second area occurs within a human-made catch basin in the center of the ~~WLCSP~~WLC site and is likely naturally occurring and likely began growing several decades ago. The area with this vegetation previously contained southern willow scrub, but has naturally converted to a dense stand of salt cedar. Wildlife that uses this area has adapted to urban, agricultural, or other disturbed areas associated with human activity. The other catch basin is discussed relative to the southern willow scrub community above. The ornamental area is not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds. There was no modification to this mapped plant community made after the 2018 update survey.

An ornamental plant community is typically described as a large stand of non-native ornamental trees or shrubs. These areas are often artificially created, but can be naturally occurring. Plant species vary from project site to project site, but are generally non-native and are often associated with landscape plants.

There are two distinct areas within the survey area that contain ornamental vegetation. The first area is located within rural residential development just west of ~~Theodore Street~~World Logistics Center Parkway and south of Eucalyptus Avenue. This portion of the survey area contains a stand of olive trees. The second area occurs within a human-made catch basin in the center of the ~~WLCSP~~WLC site and is likely naturally occurring and likely began growing several decades ago.

The ornamental areas are not associated with any native vegetation and provides only limited habitat value, primarily as cover, nesting, and perching opportunities for birds and common terrestrial wildlife that have adapted to urban, agricultural, or other disturbed areas associated with development. This land use type comprises approximately six acres of the survey area.

j. Open Water

Open water is characterized by ponded or flowing water with little to no vegetative cover. These areas are specifically associated with freshwater drainage features and typically provide habitat for aquatic plant and wildlife species. There is a 1.0-acre area or less than 0.1 percent of open water located in the northern portion of the SJWA. The open water areas within the survey area are artificially created ponded areas and none exists within the WLC site or the Offsite Improvement Areas. There was no modification to this mapped land cover made after the 2018 update survey.

k. Northern Mixed Chaparral

The northern mixed chaparral community is characterized by broad-leaved shrubs forming dense, often nearly impenetrable vegetation dominated by scrub oak (*Quercus dumosa*), chamise (*Adenostoma fasciculatum*), and any one of several species of manzanitas (*Arctostaphylos)* and California lilacs (*Ceanothus*). Plants are typically deep-rooted and little or no understory vegetation is present. This vegetation community is adapted to repeated fires, to which many species respond by stump sprouting. A dense cover of annual herbs may appear during the first growing season after a fire, followed in subsequent years by perennial herbs, short-lived shrubs, and reestablishment of dominance by the original shrub species. There is 1.0 acre or less than 0.1 percent of northern mixed chaparral located on a north-facing slope of the hills at the southwestern corner of the ~~project area~~WLC site. This one (1) acre of northern mixed chaparral occurs within the WLC site. There is no northern mixed chaparral in the Offsite Improvement Areas. There was no modification necessary for this mapped plant association after the 2018 update survey.

4.4.1.~~5~~3 Vegetation in the ~~CDFW Conservation Buffer~~Northern Portion of the San Jacinto Wildlife Area (SJWA)

Six plant communities/land use types occur within the ~~1,104-acre CDFW Conservation Buffer Area~~northern portion of the SJWA to the south: extensive agriculture (e.g., dryland farming), non-native grassland, Riversidean sage scrub, disturbed, southern willow scrub, and urban/developed. The ~~CDFW Conservation Buffer~~northern portion of the SJWA consists of the ~~910 acres of land~~fallow farmland that was placed into conservation in 2001 and surrounding portions of the 194-acre SDG&E facility. ~~The CDFW Conservation Buffer Area~~This northern portion of the SJWA has been used for agricultural pursuits over many years, but ~~there are a few isolated areas that have~~it has been left fallow for several years now and these have ~~begun to return to~~become non-native grassland and Riversidean sage scrub. See Table 4.4~~.A~~-1 for a listing of plant associations in the ~~CDFW Conservation Buffer~~SJWA within the Survey Area.

4.4.1.~~6~~4 Vegetation in the Indirect Impact Zone

Seven plant communities/land use types occur within the 1,636.6-acre off-site analysis zone. This area was evaluated as an additional 1,000-foot zone beyond the boundaries of the ~~project area~~WLC site to consider potential off-site indirect impacts associated with noise, light, water quality, and air quality concerns beyond the boundary of the actual ~~project area. Plan~~WLC site. Plant communities associated with the Indirect Impact Zone include non-native grassland, extensive agriculture, RSS, disturbed, urban/developed, mule fat scrub, and non-vegetated channel (see Figure 4.4.1). This area contains land that has been previously disturbed as a result of development and off-road vehicle trails east of Gilman Springs Road and general open space areas in the southwestern portion of the survey area.

4.4.1.~~7~~5 Wildlife in the Specific Plan Area

Despite the disturbed nature of the WLC planning area (i.e., 97% non-native vegetation), common wildlife species that have adapted to human-modified landscapes are present and were observed on site, including the red-tailed hawk (*Buteo jamaicensis*), house finch (*Carpodacus mexicanus*), mourning dove (*Zenaidia macroura*), common raven (*Corvus corax*), coyote (*Canis latrans*), desert cottontail (*Sylvilagus audubonii*), and California ground squirrel (*Otospermophilus beecheyi*). A complete list of species observed on site is included in Appendix B of the *MSHCP Consistency Analysis* contained ~~in Appendix E~~as an appendix to this ~~EIR~~Revised Sections of the FEIR. Utilization of agricultural areas by wildlife varies greatly depending upon the type of crop and the time of the year. Due to the amount of agricultural activities over the past decades, there is a limited number of species that are present although many species discussed above occur along the margins of the agricultural fields and along the limited drainage areas. In addition to the more common species discussed above, the San Diego gopher snake (*Pituophis cantenifer annectens*), white-tailed kite (*Elanus leucurus*), barn owl (*Tyto alba*), loggerhead shrike (*Lanius ludovicianus*), and Botta's pocket gopher (*Thomomys bottae*) were recorded to occur within the ~~WLCSP~~WLC site and the off-site facility areas. There is a robust passerine bird population at the site during the growing season with a severely limited number of mammals following the harvest, largely due to the extensive disking activities.

4.4.1.~~8~~6 Wildlife in the ~~CDFW Conservation Buffer Area~~Northern Portion of the SJWA

The adjacent ~~San Jacinto Wildlife Area (~~SJWA~~)~~ to the south of the WLC site has a very high diversity and abundance of bird species, and is recognized nationally and internationally for its bird population. The amount and diversity of birds in the SJWA contributes to a large degree to the number of different kinds of birds observed in the agricultural areas on the project site~~ and within the CDFW Conservation Buffer Area.~~. Numerous bird and mammal species occur within these agricultural areas and fallow fields may provide foraging opportunities for raptors. The number of passerine birds is high and includes both year-round species and transitory birds associated with the SJWA. The number of mammals is limited probably due to the extensive agricultural pursuits of the past.

4.4.1.~~9~~7 Wildlife in the ~~Off-site Analysis~~ Indirect Impact Zone

MBA evaluated this area using direct observations, literature reviews, and information from studies performed on adjacent areas. The area adjacent to Gilman Springs Road on the south end of the planning area was examined by MBA biologists in 2007 (unpublished Burrowing Owl Survey Report, MBA). The distribution of wildlife species at this adjacent area was similar to the ~~WLCSP~~WLC site and the ~~CDFW Conservation Buffer Area~~SJWA, with a very limited distribution of mammals (primarily burrowing mammals) and a high incidence of passerine birds.

4.4.1.~~10~~8 Wildlife in the SJWA and Mystic Lake

The SJWA is 20,000 acres of man-made wetlands and open water ponds and is the first state wildlife area to utilize reclaimed water to enhance its wetlands. It is located south of the ~~project area~~WLC site and the ~~CDFW Conservation Buffer~~northern portion of the SJWA adjacent to the WLC site was included in the Survey Area. This northern portion of the SJWA is included in the Survey Area because it is adjacent to the WLC site. The SJWA contains several habitat areas, including wetlands, restored riparian habitat, grasslands, sage scrub, and marshes and provides habitat for the several threatened and endangered wildlife species including Stephens' kangaroo rat, Swainson's hawk, and bald eagle. The SJWA contains an important inland wetland, which provides habitat for many wetland plant species and wildlife species including aquatic birds, amphibians, and fish. According to the CDFW:

> *"The San Jacinto Wildlife Area public lands currently total about 20,000 acres. The Wildlife Area shares a common boundary with the 8,800-acre Lake Perris State Recreation Area. The majority of the Wildlife Area is located in unincorporated Riverside County. The northern portion of the Wildlife Area is included within the city limits of Incorporated City of Moreno Valley. Davis Road, an unimproved dirt road, bisects the Wildlife Area in a north-south direction. This roadway is maintained by DFG on the north and the County of Riverside on the south. Surrounding land users are primarily involved in agriculture principally dry land wheat farming and dairy operations. The private lands immediately north of the Wildlife Area are currently farmed and are included within the City of Moreno Valley jurisdiction. The 150~~-~~-acre Double Bar "S" Horse Ranch represents the only substantial in-holding within the current Wildlife Area boundary. To the east lies Mystic Lake bed, the most northern portion of which has recently been Incorporated into the Wildlife Area. The south eastern parts of the lake bed remain in private ownership and are used for agriculture when not inundated with*

> *flood waters from the San Jacinto River. Numerous privately owned hunt clubs (waterfowl and game bird hunting clubs) are also located on the current eastern boundary of the Wildlife Area. The unincorporated rural communities of Lakeview and Nuevo are located to the south. Much of the land on the immediate southern boundary of the Wildlife Area is currently farmed by the Amway Corporation Nutrilite Division."*

The SJWA is a significant resource for avian species and other wildlife. In 1981–82, the State Wildlife Conservation Board initially purchased 15,000 acres of the Mystic Lake area as mitigation for habitat impacts associated with the construction of the State Water Project (SWP). ~~This area was designated as the SJWA. In 1995, the Board acquired an additional 921 acres of upland farmland within the southern portion of the Moreno Highlands Specific Plan property to incorporate into the SJWA. In 2001, the Board acquired an additional 274 acres in this same area. This land was purchased to provide a buffer between the land surrounding Mystic Lake and the planned urban development within Moreno Valley. The Board action on this purchase indicated the land was to "facilitate restoration of historic water flows back into the lakebed and allow for reversion back to wetlands during wet years, and areas of low vegetation cover during dry years, all providing significant habitat for species using the SJWA, including a number of state and federally listed species."[1]~~

~~**CDFW Conservation Buffer Area.** The entirety of the State-owned land south of the project area is referred to as the SJWA. However, the land purchased out of the Moreno Highlands Specific Plan is referred to in this EIR as the CDFW Conservation Buffer Area to denote the reason for its original purchase. The 1,195 acres acquired by the Wildlife Board during the past twenty years was intended to serve as an effective buffer between the SJWA and the development expected to occur north of the SJWA area (the present mixed-use Moreno Highlands Specific Plan). Currently, this acreage provides not only a buffer area, but also provides open space for raptor and bird foraging habitat, and is actively farmed under CDFW contract. Approximately 909 acres of the land within the project area are identified as Conservation Area (total 1,085 acres) and are owned by the CDFW and support vegetation identified as "Extensive Agriculture" in Section 4.4.1.3, *Vegetation*. The proposed project will permanently designate this CDFW Conservation Buffer Area as Open Space under the City General Plan. It is anticipated the State would maintain its function as a buffer and also as foraging habitat for raptors as long as it is regularly tilled. There are no plans to alter the current agricultural activities on this property.~~

Mystic Lake. This is a large crescent-shaped, intermittent water body within the SJWA, which serves as a significant wetland habitat for numerous birds including migratory waterfowl such as ducks, grebes, and occasional geese. Seasonal upland game hunting is allowed within the SJWA and Lake Perris State Recreation Area. Other uses of the SJWA include wildlife observation, nature study, fishing, hiking, photography, field trials, hunting dog training classes, and conservation of wildlife and wildlife habitat. Bird species commonly found at various times of the year in the SJWA include a wide variety of ducks, shore birds and gulls, upland game species, and a variety of passerine birds including those found in the ~~project area and the CDFW Conservation Buffer area~~WLC site.

4.4.1.~~11~~ ~~**Sensitive Biological Resources**~~

~~Special status species are plant and animal species or subspecies for which there is concern for population sustainability or that are otherwise considered worthy of consideration for protection by the CDFW, USFWS, local agencies, or special interest groups, such as the California Native Plant Society (CNPS). In addition to species federally or State listed as endangered or threatened, these include species that are Candidates or Proposed for listing as endangered or threatened, plant species that are State listed as Rare, animal species designated as Fully Protected or Species of Special Concern by the State of California, and plant species designated as California Rare Plant Rank (RPR) 1A, 1B, or 2. California Rare Plant Ranks are assigned by a committee of government agency and non-governmental botanical experts, including experts from CNPS, and are not official State designations~~

~~[1] Wildlife Conservation Board minutes from May 18, 2001.~~

~~of rarity status. Legal protection for sensitive species varies widely, from the comprehensive protection extended to federally listed threatened and/or endangered species to species without legal protection at the current time.~~

~~4.4.1.12~~9 Western Riverside County Multiple Species Habitat Conservation Plan

The MSHCP for western Riverside County is an element of the Riverside County Integrated Project (RCIP), which is an integration of land use, transportation, and conservation planning and implementation to develop a consensus for the future development of Riverside County. The MSHCP is designed to protect over 150 species and conserve over 500,000 acres of land in western Riverside County. The MSHCP was conceived, developed, and is being implemented specifically to address the direct, indirect, cumulative, and growth-related effects on covered species resulting from build out of planned land use and infrastructure, including the ~~proposed~~ project.

The MSHCP involves efforts by the County, State, and Federal governments, the fourteen cities in western Riverside County, and private and public entities engaged in construction activities that potentially affect the species covered under the MSHCP. The plan specifies an obligation of local projects, both public and private, to mitigate their impacts on species. The MSHCP includes incentives for conservation or the purchase of properties from willing sellers and will eventually result in a Conservation Area in excess of 500,000 acres, focusing on conservation of 146 species. The MSHCP Conservation Area includes approximately 347,000 acres of existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land.

The MSHCP Conservation Area~~[1]~~ is made up of existing and proposed “Core” areas, or large assemblages of public land that contain important habitat and listed or sensitive species populations. The core areas are connected by a series of “linkages” or “corridors” identified across public and private lands to allow wildlife movement and genetic connectivity and diversity among the core areas. The MSHCP identifies conservation areas through a series of “criteria cells” within which certain biological resources (i.e., vegetation and/or physical features) should be preserved over the long term. The MSHCP also establishes various processes to evaluate land development proposals in light of its goals and requirements. The MSHCP also identifies when studies need to be performed within certain criteria cells to determine the presence or absence of listed or otherwise sensitive species of plants or animals.

The project site is located within the Reche Canyon/Badlands Area Plan of the MSHCP. Portions of the ~~project area~~WLC site occur in ~~14 criteria~~3criteria cells of the MSHCP. Therefore, the project applicant, the City, and the County[2] are required to use the Habitat Acquisition Negotiation Strategy (HANS) process established in the MSHCP to identify and acquire habitat as part of the development review process. The HANS process involves negotiations between a landowner and the Western Riverside County Regional Conservation Authority (RCA) so the County can acquire land with important habitat or other biological resources while providing fair compensation and/or reasonable development opportunities on the remaining land for the landowner.

~~The southern portion of the project area (910 acres owned by the CDFW) is the northern portion of the SJWA, which is classified as “Public Conserved Land” under the MSHCP.~~ MSHCP Proposed Core 3 is located to the north and east of the ~~project area~~WLC site, and Existing Core H is located to the south. Small portions of the ~~project area~~WLC site fall within both Core Areas (see Figure 4.4.3). No existing or proposed linkage or constrained linkage areas are within or adjacent to the ~~project area~~WLC site.

The 2013 ~~MBA report~~habitat assessment and DBESP focused on sensitive resources that could potentially occur in the overall planning area, including nine Criteria Area plant species, burrowing owl (*Athene cunicularia*), and Los Angeles pocket mouse (*Perognathus longimembris brevinasus*).

~~[1] Not to be confused with the Conservation Area within the WLC planning area~~

[2] Western Riverside County Regional Conservation Authority (RCA)

4.4.1.~~13~~10 Endangered, Threatened, and Special Status Species

It is typical to base the presence or likelihood of presence of sensitive species within a specific area on the following criteria:

- Direct observation of the species or its sign in the ~~project area~~WLC site or immediate vicinity during site-specific surveys or reported in previous biological studies;
- Sighting by other qualified observers;
- Record reported by the Natural Diversity Data Base (NDDB) published by the CDFW; and/or
- Presence or location of specific species lists provided by private groups (e.g., California Native Plant Society - CNPS).

Threatened and Endangered Species. The USFWS and the CDFW list species as threatened or endangered under the Federal and California Endangered Species Acts (FESA and CESA, respectively). An endangered species is one that is in danger of extinction throughout all or a significant portion of its range. A threatened species is one that is likely to become endangered in the foreseeable future.

The USFWS may designate “critical habitat” that identifies specific areas, both occupied and unoccupied, that are often necessary to the conservation of a listed species. To make a determination of Critical Habitat, biologists consider physical and biological habitat features needed for life and successful reproduction of the species which include:

- Space for individual and population growth and for normal behavior;
- Cover or shelter;
- Food, water, air, light, minerals, or other nutritional or physiological requirements;
- Sites for breeding and rearing offspring; and
- Habitats that are protected from disturbances or are representative of the historic geographical and ecological distributions of a species.

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.4.3: MSHCP Areas~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

Critical Habitat areas may require special management considerations or protections.

The project site is not located within any USFWS designated Critical Habitat area, and no threatened or endangered species were observed within the project site during the ~~field~~previous field surveys. However, the threatened coastal California gnatcatcher was observed in the northeastern portion of the project survey area during the 2018 focused surveys.

Table 4.4~~.B~~-2 identifies special status plant species identified in the City's *General Plan Final EIR,* and in searches of the CDFW's *California Natural Diversity Data Base* (CNDDB) and the CNPS's *Electronic Inventory of Rare and Endangered Vascular Plants of California* that may potentially occur in the project survey area, and a statement as to whether they were identified onsite.

~~*Note: Table 4.4.B was divided into two separate tables based on the updated biological resources report and various comments regarding the presence of sensitive plants and wildlife in the area. For the original Table 4.4.B please refer to Final EIR Volume IV, Section 4.4, Table 4.4.B.*~~

~~*Note: The following sections were reorganized from the original DEIR to be more consistent with the updated biological resource reports, but the data has not substantially changed.*~~

World Logistics Center Project

Figure 4.4-3
MSHCP Areas

Federally Endangered Plant Species. As shown in Table 4.4~~.B-~~2, two federally endangered plant species, San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*) and slender-horned spineflower (*Dodecahema leptoceras*), were analyzed for their potential to occur in the ~~project area~~WLC site and the off-site facilities. No evidence of these plant species was found during reconnaissance-level surveys. In addition, no suitable habitat for this species occurs on site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native, low-quality vegetation. No additional federally endangered plant species were analyzed for potential to occur in the ~~project area~~WLC site and off-site facilities because no additional federally endangered plant species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the ~~project area~~WLC site or off-site facilities to support other federally endangered plant species. Therefore, federally endangered plant species are not likely to occur in the ~~project area~~WLC site or off-site facilities.

Federally Threatened Plant Species. As shown in Table 4.4~~.B-~~2, one federally threatened plant species, thread-leaved brodiaea (*Brodiaea filifolia*), was analyzed for its potential to occur in the ~~project area~~WLC site. No evidence of this federally threatened plant species was found and no suitable habitat for this federally threatened plant species occurs on site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional federally threatened plant species were analyzed for their potential to occur in the ~~project area~~WLC site because no additional federally threatened plant species are known to occur on, or in the vicinity of, the site. No suitable habitat was found during the site surveys to support other federally threatened plant species. Therefore, federally threatened plant species are not likely to occur in the ~~project area~~WLC site.

Federally Proposed Endangered, Proposed Threatened, Federal Candidate, and Federal Plant Species of Concern. The USFWS has developed several categories for sensitive species not yet determined to have reached endangered or threatened status. Generally, federally proposed endangered or threatened species are species considered unofficially endangered or threatened (i.e., final regulatory action formally listing such species has not yet occurred). Federal candidate species are species who are candidates for becoming listed as endangered or threatened, and Federal species of concern are species whose numbers are considered low enough to have approached Federal candidate status.

~~**California Native Plant Society**~~
~~1A Plants presumed extinct in California.~~
~~1B Plants rare, threatened, or endangered in California and elsewhere.~~
~~2 Plants rare, threatened, or endangered in California, but more common elsewhere.~~
~~3 Plants about which we need more information.~~
~~4 Plants of limited distribution.~~

~~**Not Likely to Occur** - There are no present or historical records of the species occurring on or in the immediate vicinity (within 3 miles) of the WLCSP and the diagnostic habitats strongly associated with the species do not occur on or in the immediate vicinity of the site.~~
~~**Low Potential to Occur** - There is a historical record of the species in the vicinity of the WLCSP and potentially suitable habitat onsite, but existing conditions (e.g., density of cover, prevalence of non-native species, evidence of disturbance, limited habitat area, isolation) substantially reduce the possibility that the species may occur. The site is above or below the recognized elevation limits for this species.~~
~~**Moderate Potential to Occur** - The diagnostic habitats associated with the species occur on or in the immediate vicinity of the WLCSP, but there is not a recorded occurrence of the species within the immediate vicinity (within three miles). Some species that contain extremely limited distributions may be considered moderate, even if there is a recorded occurrence in the immediate vicinity.~~
~~**High Potential to Occur** - There is both suitable habitat associated with the species and a historical record of the species on or in the immediate vicinity of the WLCSP (within 3 miles).~~
~~**Species Present** - The species was observed in the WLCSP at the time of the survey or during a previous biological survey.~~

~~Source: Habitat Assessment, MSHCP Consistency Analysis, and HANS report, Michael Brandman Associates, September 2014.~~

Federally Protected Plant Species. As shown in Table 4.4~~.B-~~2, no Federal plant species of concern were analyzed for their potential to occur in the ~~WLCSP~~WLC site and off-site facilities because no evidence of any Federal plant species of concern was found in the ~~project area~~WLC site, nor was any suitable habitat found due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation.

Federally Endangered Wildlife Species. As shown in Table 4.4~~.C-~~3, four federally endangered wildlife species were analyzed for potential to occur in the ~~project area~~WLC site or off-site facilities: Riverside fairy shrimp (*Streptocephalus woottoni*), southwestern willow flycatcher (*Empidonax traillii extimus*), least Bell's vireo (*Vireo bellii pusillus*), and Stephens' kangaroo rat (*Dipodomys stephensi*). No evidence of any federally endangered wildlife species was found in the ~~project area~~WLC site or off-site facilities. Stephens' kangaroo rat is the only federally listed wildlife species potentially occurring on site. Although no sign of Stephens' kangaroo rat was identified during the site surveys, it was determined that this species may range through the general area. This species is commonly found in ruderal and minimally disturbed areas. Low quality habitat was observed along existing roadsides.

Some species that contain extremely limited distributions may be considered moderate, even if there is a recorded occurrence in the immediate vicinity.
High Potential to Occur - There is both suitable habitat associated with the species and a historical record of the species on or in the immediate vicinity of the WLC site (within 3 miles).
Species Present - The species was observed in the WLC site at the time of the survey or during a previous biological survey.

Source: Habitat Assessment, MSHCP Consistency Analysis, and HANS report, Michael Brandman Associates, September 2014 and ESA, May 2018.

Since the ~~project area~~WLC site is within the known range of this species and low quality habitat was identified on site, there is a moderate potential for Stephens' kangaroo rat to occupy some portion of the WLC ~~project area~~site or off-site facilities.

No suitable habitat for Riverside fairy shrimp, southwestern willow flycatcher, and least Bell's vireo, occurs on site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional federally endangered wildlife species were analyzed in Table 4.4C for their potential to occur in the ~~project area~~WLC site because no additional federally endangered wildlife species are known to occur on, or in the vicinity of, the site.

Federally Threatened Wildlife Species. As shown in Table 4.4~~.C~~-3, Coastal California gnatcatcher (*Polioptila californica californica*) is known to occur within moderate to high quality coastal sage scrub in the general area and some suitable habitat occurs on site for coastal California gnatcatcher. There is marginal Riversidean sage scrub in the ~~north~~northern portion of the project site near SR-60 and Gilman Springs Road and in the proposed Open Space Area adjacent to the Lake Perris State Recreation Area (LPSRA) south of Brodiaea Avenue, west of ~~Theodore Street~~World Logistics Center Parkway and east of Redlands Boulevard. Coastal California gnatcatcher was observed by ESA on the WLC site in coastal sage scrub habitat south of SR-60 near Gilman Springs Road in 2018. No additional federally threatened wildlife species were analyzed for their potential to occur in the WLC ~~project area~~site.

Federally Proposed Endangered, Proposed Threatened, Federal Candidate, and Federal Species of Concern. The USFWS has developed several categories for sensitive species not yet determined to have reached endangered or threatened status. Generally, federally proposed endangered or threatened species are species considered unofficially endangered or threatened (i.e., final regulatory action formally listing such species has not yet occurred). Federal candidate species are species who are candidates for becoming listed as endangered or threatened, and Federal species of concern are species whose numbers are considered low enough to have approached Federal candidate status. The western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) is the only Federal Candidate Species with a potential to occur in this area, but this species is not likely to occur in the ~~WLCSP~~WLC site and off-site facilities. In addition, it is a covered species under the MSHCP.

Federally Protected Wildlife Species. There was only one Federal wildlife species of concern analyzed for its potential to occur in the ~~WLCSP~~WLC site and off-site facilities (see the western yellow-billed cuckoo discussed above). No evidence of any other Federal wildlife species of concern was found in the ~~project area~~WLC site nor does any suitable habitat occur due to historic agricultural activities, regular
disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional Federal wildlife species of concern were analyzed for potential to occur in the WLC site because no additional Federal wildlife species of concern are known to occur on, or in the vicinity of, the site.

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

California State Endangered Plant Species. As shown in Table 4.4-2, two California State endangered plant species were analyzed for their potential to occur in the WLC site and off-site facilities: slender-horned spine-flower and thread-leaved brodiaea. No evidence of these State-listed plant species was found in the WLC site nor is there any suitable habitat for these State-listed plant species due to regular disking of the site and dominance of sparse, non-native low-quality vegetation. No additional State-listed plant species were analyzed for potential to occur in the WLC site because no additional State-listed plant species are known to occur on, or in the vicinity of, the site, nor was any suitable habitat found to support other State-listed plant species. Therefore, State-listed plant species are not likely to occur in the WLC site and there is no potential impact to State endangered plant species.

Scientific Name	**Common Name**	**Federal**	**State**	**Other**			
Branchiopods							
Streptocephalus woottoni	Riverside fairy shrimp	FE	—	CDFW: CSC	Occurs in tectonic swales and earth slump basins in grassland and coastal sage scrub. Inhabits seasonally astatic pools filled by winter/spring rains. Hatches in warm water later in the season.	Covered	**Not Likely to Occur.** No vernal pools occur in the ~~WLCSP~~WLC site. Observed farther than 5 miles south of the ~~WLCSP~~WLC site.
Reptiles and Amphibians							
Aspidoscelis hyperythra	Orange-throated whiptail	—	—	CDFW: CSC	Inhabits low-elevation coastal scrub, chaparral, and valley-foothill hardwood habitats. Prefers washes and other sandy areas with patches of brush and rocks. Also near perennial plants where termites, its major food, can be found.	Covered	**Low Potential to Occur.** Limited coastal scrub is present in the ~~WLCSP~~WLC site. Woody vegetation onsite is very sparse and is not considered sufficient to support the species. The nearest occurrence of the species was recorded approximately 0.3 mile north of the ~~WLCSP~~WLC site; however, in the eighteen years since the observation, the previous site conditions have changed to become unsuitable habitat (CNDDB 2012).
Crotalus ruber ruber	Northern red-diamond rattlesnake	—	—	CDFW: CSC	Inhabits chaparral, woodland, grassland, and desert habitats. Occurs in rocky areas and dense vegetation. Needs rodent burrows, cracks in rocks, or surface cover objects.	Covered	**Not Likely to Occur.** No rocky areas and dense native plant communities occur in the ~~WLCSP~~WLC site and the site is regularly disturbed. Recorded approximately 1 mile south of the ~~WLCSP~~WLC SITE; however, the observation occurred over 80 years ago (CNDDB 2012). The BMP has recently found the species in the same area as the CNDDB sighting (RCA 2013)
Phrynosoma ~~coronatum~~ blainvillei	Coast horned lizard	—	—	CDFW: CSC	Inhabits coastal sage scrub and chaparral in arid and semi-arid climates. Prefers friable, rocky, or shallow sandy soils.	Covered	**Low Potential to Occur.** The portion of the ~~WLCSP~~WLC site that contains sandy soils or rocky soils and chaparral/RSS along the western border of the project in an area slated as open space. Recorded approximately 4 miles northwest of the ~~WLCSP~~WLC site (CNDDB 2012)

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		Status					
Scientific Name	**Common Name**	**Federal**	**State**	**Other**	**Required Habitat**	**MSHCP Coverage**	**Potential to Occur/Known Occurrence/Suitable Habitat**
Spea hammondii	Western spadefoot	—	—	CDFW: CSC	Occurs primarily in grassland habitats, but also found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.	Covered	**Not Likely to Occur.** No vernal pools or native woodlands occur in the ~~WLCSP~~WLC site. Recorded approximately 2 miles south and west of the ~~WLCSP~~WLC site (CNDDB 2012). The BMP studies have occurrences approximately 0.7 mile south of the study area boundary (RCA 2013)
Birds							
Agelaius tricolor	Tricolored blackbird	—	—	CDFW: CSC	Highly colonial species. Requires open water, protected nesting substrate, and foraging areas with insect prey within a few miles of the colony.	Covered	**Low Potential to Occur.** No open water or protected nesting habitat is located in the ~~WLCSP~~WLC site. Numerous nesting pairs were recorded within the wheat fields on the southeastern portion of the ~~WLCSP~~WLC site in 1995. The wheat has since been removed and no suitable nesting vegetation remains (CNDDB 2012).
Aimophila ruficeps canescens	Southern California rufous-crowned sparrow	—	—	CDFW: CSC	Resident in coastal sage scrub and sparse mixed chaparral. Frequents relatively steep, often rocky hillsides with grass and forb patches.	Covered	**Low Potential to Occur.** While sparse RSS and chaparral are present within the ~~WLCSP~~WLC site, no steep slopes are present in the ~~WLCSP~~WLC site. Recorded approximately 4 miles west of the ~~WLCSP~~WLC site (CNDDB 2012). The BMP database has the species less than 1.0 mile from the ~~WLCSP~~WLC SITE study area boundary (RCA 2013).
Amphispiza belli belli	Bell's sage sparrow	—	—	CDFW: CSC	Nests in chaparral dominated by fairly dense stands of chamise. Found in coastal sage scrub in southern portion of range. Nests typically located on the ground beneath shrub or in shrub 6 to 18 inches above ground.	Covered	**Not Likely to Occur.** No dense stands chaparral or coastal sage scrub vegetation occurs in the ~~WLCSP~~WLC site. Recorded approximately 4 miles northwest of the ~~WLCSP~~WLC site (CNDDB 2012) and according to the BMP 4 miles south of the ~~WLCSP~~WLC site study area (RCA 2013).

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		**Status**					
Scientific Name	**Common Name**	**Federal**	**State**	**Other**	**Required Habitat**	**MSHCP Coverage**	**Potential to Occur/Known Occurrence/Suitable Habitat**
~~*Athene cunicularia*~~site	Burrowing owl	—	—	CDFW: CSC	Occupies burrows in open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	Covered	**Present.** Despite the heavy disturbance the ~~WLCSP~~WLC site contains flat topography with sparse, low-lying vegetation and various California ground squirrel burrows. Observed within the ~~WLCSP~~WLC site in 2005; however, focused surveys conducted in 2010 and 2012 found the ~~WLCSP~~WLC site and surroundings to be unoccupied. The 2013 survey of the ~~WLCSP~~WLC site again found a pair of owls (MBA 2013b~~)~~); however, the 2018 ESA survey found only a single owl.
Aquila chrysaetos	Golden eagle	—	—	CDFW: FP	Open mountains, foothills, plains.	Covered	**Low Potential to Occur.** The ~~WLCSP~~WLC site contains open flat area that is considered marginally suitable foraging habitat, but not suitable nesting habitat. Recorded approximately 1 mile south of the ~~WLCSP~~WLC site (RCA 2013)
Buteo swainsonii	Swainson's hawk	—	ST	—	Grasslands and riparian areas	Covered	**Low Potential to Occur.** The ~~WLCSP~~WLC site contains open flat area that is considered marginally suitable foraging habitat, but not suitable nesting habitat. Recorded approximately 1 mile south of the ~~WLCSP~~WLC site (RCA 2013)
Buteo regalis	Ferruginous hawk	—	—	CDFW: CSC	Winters in open grasslands, sagebrush flats, desert scrub, low foothills, and fringes of pinyon-juniper habitats.	Covered	**Low Potential to Occur.** The ~~WLCSP~~WLC site contains open flat area that is considered marginally suitable foraging habitat, but ~~not~~no suitable nesting habitat. Recorded approximately 1 mile northeast of the ~~WLCSP~~WLC site (CNDDB 2012) and 2 miles south of the ~~WLCSP~~WLC site according to BMP records (RCA 2013).

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
Scientific Name	**Common Name**	**Federal**	**State**	**Other**			
Coccyzus americanus occidentalis	Western yellow-billed cuckoo	FC	SE	—	Riparian forest nester, along the broad, lower flood-bottoms of larger river systems. Specifically nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles, or wild grape.	Covered	**Not Likely to Occur.** No riparian plant communities occur in the ~~WLCSP~~WLC site. Recorded approximately 5.5 miles northwest of the ~~WLCSP (CNDDB~~WLC site (CNIDDB 2012).
Elanus leucurus	White-tailed kite	—	—	CDFW: FP	Nests in rolling foothills/valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodlands. Prefers open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	Covered	**Present.** The ~~WLCSP~~WLC site contains suitable foraging habitat, but few dense-topped trees occur in the vicinity of the site. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDB 2012). The BMP indicates that the species is found 1.0 mile from the ~~WLCSP~~WLC site study area boundary (2013). Species was observed foraging within the southern portion of the survey area adjacent to the SJWA~~.~~ and was observed in the western portion of the survey area in 2018.
Empidonax traillii extimus	Southwestern willow flycatcher	FE	SE	—	Nests in riparian woodlands in southern California.	Covered	**Not Likely to Occur.** No riparian plant communities occur in the ~~WLCSP~~WLC site. Recorded approximately 6.5 miles east of the ~~WLCSP~~WLC site (CNDDB 2012).
Eremophila alpestris actia	California horned lark	—	—	CDFW: CSC	Inhabits short-grass prairie, bald hills, mountain meadows, open coastal plains, fallow grain fields, and alkali flats.	Covered	**Present.** The ~~WLCSP~~WLC SITE contains flat, fallow grain fields that constitute suitable nesting habitat. Observed in the ~~WLCSP~~WLC site during the reconnaissance-level surveys (MBA 2012~~).~~) but not seen in 2018.

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		Status					
Scientific Name	**Common Name**	**Federal**	**State**	**Other**	**Required Habitat**	**MSHCP Coverage**	**Potential to Occur/Known Occurrence/Suitable Habitat**
Falco columbarius	Merlin	—	—	CDFW: CSC	Winters in seacoast, tidal estuaries, open woodlands, savannahs, edges of grasslands and deserts, farms and ranches. Clumps of trees or windbreaks are required for roosting in open country.	Covered	**Low Potential to Occur.** Portions of the ~~WLCSP~~WLC site contain windbreak trees and open farmland. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDB 2012). The BMP database has the species less than a mile south of the ~~WLCSP~~WLC site study area (RCA 2013).
Falco mexicanus	Prairie falcon	—	—	CDFW: CSC	Inhabits dry, open terrain, either flat or hilly. Breeding sites located on cliffs.	Covered	**Low Potential to Occur.** The ~~WLCSP~~WLC site contains marginally suitable foraging habitat but no suitable nesting habitat. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDB 2012).
Falco peregrinus anatum	Peregrine falcon	FD	SE	CDFW: FP	Nests near wetlands, lakes, rivers, or other water; on cliffs, banks, dunes, mounds, and human-made structures. Nest consists of a scrape on a depression or ledge in an open site.	Covered	**Low Potential to Occur.** The ~~WLCSP~~WLC site contains marginal nesting habitat. Known to occur in the San Jacinto Valley but not recorded within 7 miles of the site (CNDDB 2012). The BMP indicates the species is within 1.0 mile of the southern boundary of the study area (RCA 2013).
Icteria virens	Yellow-breasted chat	—	—	CDFW: CSC	Summer resident; inhabits riparian thickets of willow and other brushy tangles near watercourses. Specifically nests in low, dense riparian vegetation, consisting of willow, blackberry, wild grape. Forages and nests within 10 feet of ground.	Covered	**Not Likely to Occur.** No riparian plant communities occur in the ~~WLCSP~~WLC site. Recorded approximately 5.5 miles northwest of the ~~WLCSP~~WLC site (CNDDB 2012).

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		Status					
Scientific Name	**Common Name**	**Federal**	**State**	**Other**	**Required Habitat**	**MSHCP Coverage**	**Potential to Occur/Known Occurrence/Suitable Habitat**
Lanius ludovicianus	Loggerhead shrike	—	—	CDFW: CSC	Inhabits broken woodlands, savannah, pinyon-juniper, Joshua tree and riparian woodlands, desert oases, scrub and washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.	Covered	**Present.** The ~~WLCSP~~WLC site contains flat, open area that is suitable foraging habitat but not suitable nesting habitat. Observed by MBA during previous surveys, approximately within the ~~WLCSP~~WLC site (MBA 2012~~).~~) but not observed by ESA in 2018.
Plegadis chihi	White-faced ibis	—	—	CDFW: CSC	Rookery sites include shallow freshwater marshes. Nests in dense tule thickets interspersed with areas of shallow water for foraging.	Covered	**Not Likely to Occur.** No marshes or bodies of water occur in the ~~WLCSP~~WLC site. Recorded approximately 3 miles southeast of the ~~WLCSP~~WLC site (CNDDB 2012).
Polioptila californica californica	Coastal California gnatcatcher	FT	—	CDFW: CSC	Obligate, permanent resident of coastal sage scrub below 2,500 feet in southern California. Prefers low coastal sage scrub in arid washes and on mesas and slopes.	Covered	~~**Low Potential to Occur.**~~**Present.** There is limited and sparse coastal sage scrub vegetation ~~occurs~~occurring in the ~~WLCSP. Recorded~~WLC site. Previously recorded approximately 4 miles northwest of the ~~WLCSP~~WLC site (CNDDB 2012) and less ~~that~~than 0.5 mile of the ~~WLCSP~~WLC site study area according to BMP (RCA 2013). Observed within the WLC site by ESA during 2018 update surveys.
Vireo bellii pusillus	Least Bell's vireo	FE	SE	—	Summer resident in low riparian vegetation in the vicinity of water or in dry river bottoms; below 2,000 feet. Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, baccharis, and mesquite.	Covered	**Not Likely to Occur.** No riparian plant communities or significant riparian vegetation occur in the ~~WLCSP~~WLC site. Recorded approximately 3 miles northeast of the ~~WLCSP~~WLC site (CNDDB 2012) and was recorded by the BMP at 2 miles from the closest ~~WLCSP~~WLC site border (RCA 2013).

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
Scientific Name	**Common Name**	**Federal**	**State**	**Other**			
Mammals							
Chaetodipus fallax fallax	Northwestern San Diego pocket mouse	—	—	CDFW: CSC	Inhabits coastal scrub, chaparral, and grasslands. Prefers sandy, herbaceous areas, usually in association with rocks or coarse gravel.	Covered	**Present.** Sandy to loamy soils occur in the ~~WLCSP~~WLC site. There are limited areas of RSS and chaparral and herbaceous areas are severely limited due to agricultural activities. Species was ~~caught~~trapped within Drainage 9 (MBA 2013).
Dipodomys stephensi	Stephens' kangaroo rat	FE	ST	—	Primarily found in annual and perennial grasslands, but also occurs in coastal scrub and sagebrush with sparse canopy cover. Prefers buckwheat, chamise, brome grass, and filaree. Will burrow into firm soil.	Covered under SKRHCP	**Moderate Potential to Occur.** The ~~WLCSP~~WLC site contains areas similar to grasslands with very sparse canopy, but is heavily disturbed. Recorded approximately adjacent to the general ~~WLCSP~~WLC site on the west and south (CNDDB 2012).
Lasiurus xanthinus	Western yellow bat	—	—	CDFW: CSC	Occurs in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats below 1,800 feet. Roosts in trees.	Not Covered	**Not Likely to Occur.** No riparian or native plant communities occur in the ~~WLCSP~~WLC site. Recorded approximately 3.5 miles southwest of the ~~WLCSP~~WLC site (CNDDB 2012).
Lepus californicus bennettii	San Diego black-tailed jackrabbit	—	—	CDFW: CSC	Inhabits coastal sage scrub habitats. Specifically, intermediate canopy stages of shrub, open shrub, herbaceous and tree, and herbaceous edge habitats.	Covered	**Present** Recorded within the MWD lands in the northern portion of the ~~WLCSP~~WLC site during burrowing owl surveys (MBA 2013~~).~~) but not observed in 2018.
Onychomys torridus ramona	Southern grasshopper mouse	—	—	CDFW: CSC	Inhabits desert areas, especially scrub habitats with friable soils. Prefers low to moderate shrub cover. Feeds almost exclusively on arthropods, especially scorpions and orthopteran insects.	Not Covered	**Not Likely to Occur.** No shrub or scrub habitat occurs in the ~~WLCSP~~WLC site. Additionally, the site is regularly disturbed by disking. Recorded approximately 4 miles southeast of the ~~WLCSP~~WLC site (CNDDB 2012).

Table 4.4~~.C~~-3: Sensitive Wildlife Species in the WLC ~~Project Area~~Site

Species		Status			Required Habitat	MSHCP Coverage	Potential to Occur/Known Occurrence/Suitable Habitat
Scientific Name	Common Name	Federal	State	Other			
Perognathus longimembris brevinasus	Los Angeles pocket mouse	—	—	CDFW: CSC	Inhabits lower elevation grasslands and coastal sage communities. Prefers open ground with fine sandy soils.	Covered	**Low Potential to Occur.** The sandy soils that occur in the ~~WLCSP~~WLC site are limited to existing drainages with the proper coastal sage communities. Three years of trapping did not produce any Los Angeles pocket mice. Recorded approximately 3 miles south of the ~~WLCSP~~WLC site (CNDDB 2012). It was observed in BMP trapping within 2 miles of the study area (RCA 2013).
Taxidea taxus	American badger	—	—	CDFW: CSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats. Needs sufficient food, friable soils, and open, uncultivated ground. Preys on burrowing rodents.	Not covered	**Low potential to occur.** The ~~WLCSP~~WLC site contains limited amounts of vegetation and the ground is cultivated. Recorded approximately 8.5 miles northwest of the ~~WLCSP~~WLC site (CNDDB 2012). RCA data lists the closest recorded occurrence~~, just outside the 1,000-foot buffer area. Most likely limited to~~ within the badlands area north and east of the project site.

Federal		**State**		**Other**	
FE	Federal Endangered	SE	State Endangered	CDFW: CSC	California Species of Special Concern
FT	Federal Threatened	ST	State Threatened	CDFW: FP	Fully Protected Species
FSC	Federal Species of Concern			CDFW: P	Protected Species
PFT	Proposed Federal Threatened				
FC	Candidate for Federal Listing				
FD	Delisted				

Not Likely to Occur - There are no present or historical records of the species occurring on or in the immediate vicinity (within 3 miles) of the ~~WLCSP~~WLC site and the diagnostic habitats strongly associated with the species do not occur on or in the immediate vicinity of the site.

Low Potential to Occur - There is a historical record of the species in the vicinity of the ~~WLCSP~~WLC site and potentially suitable habitat onsite, but existing conditions (e.g., density of cover, prevalence of non-native species, evidence of disturbance, limited habitat area, isolation) substantially reduce the possibility that the species may occur. The site is above or below the recognized elevation limits for this species.

Moderate Potential to Occur - The diagnostic habitats associated with the species occur on or in the immediate vicinity of the ~~WLCSP~~WLC site, but there is not a recorded occurrence of the species within the immediate vicinity (within three miles). Some species that contain extremely limited distributions may be considered moderate, even if there is a recorded occurrence in the immediate vicinity.

High Potential to Occur - There is both suitable habitat associated with the species and a historical record of the species on or in the immediate vicinity of the ~~WLCSP~~WLC site (within 3 miles).

Species Present - The species was observed in the ~~WLCSP~~WLC site at the time of the survey or during a previous biological survey.

Source: Habitat Assessment, MSHCP Consistency Analysis, and HANS report, Michael Brandman Associates, September 2014~~.~~

~~disking of the site,~~ and ~~dominance of sparse, non-native low-quality vegetation. No additional Federal wildlife species of concern were analyzed for potential to occur in the project area because no additional Federal wildlife species of concern are known to occur on, or in the vicinity of, the site~~ESA, May 2018.

~~**California State Endangered Plant Species.** As shown in Table 4.4.B, two California State endangered plant species were analyzed for their potential to occur in the WLCSP and off-site facilities: slender-horned spine-flower and thread-leaved brodiaea. No evidence of these State-listed plant species was found in the project area nor is there any suitable habitat for these State-listed plant species due to regular disking of the site and dominance of sparse, non-native low-quality vegetation. No additional State-listed plant species were analyzed for potential to occur in the project area because no additional State-listed plant species are known to occur on, or in the vicinity of, the site, nor was any suitable habitat found to support other State-listed plant species. Therefore, State-listed plant species are not likely to occur in the project area and there is no potential impact to State endangered plant species.~~

California State Threatened Plant Species. As shown in Table 4.4~~.B~~-2, no California State threatened plant species are known to occur on, or in the vicinity of, the project site and no suitable habitat occurs within the project are for any California State threatened plant species. Therefore, California State threatened plant species are not likely to occur in the ~~project area~~WLC site and there is no potential impact to State threatened plant species.

California State Endangered Wildlife Species. As shown in Table 4.4~~.B~~.-3, four California State endangered wildlife species were analyzed for their potential to occur in the ~~WLCSP~~WLC site and off-site facilities: western yellow-billed cuckoo, southwestern willow flycatcher, least Bell's vireo, and peregrine falcon (*Falco peregrinus anatum*). No evidence of these California State endangered wildlife species was found in the ~~project area~~WLC site. In addition, no suitable habitat for these species occurs within the ~~project area~~WLC site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. No additional California State endangered wildlife species were analyzed for potential to occur in the ~~project area~~WLC site because no additional California State endangered wildlife species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the ~~project area~~WLC site to support other California State endangered wildlife species. Therefore, California State endangered wildlife species are not likely to occur in the ~~project area~~WLC site and there is no potential impact to State endangered wildlife species.

California State Threatened Wildlife Species. As shown in Table 4.4~~.C~~-3, two California State threatened wildlife species was analyzed for its potential to occur in the ~~project area~~WLC site: Swainson's hawk (*Buteo swainsonii*) and Stephens' kangaroo rat. There is little to no nesting habitat within the ~~WLCSP~~WLC SITE for Swainson's hawk and ~~marginally~~marginal quality foraging habitat. This species is known to occur ~~with~~within the adjacent SJWA and has a low potential to occur within the ~~WLCSP~~WLC site project site. Although no sign of Stephens' kangaroo rat was identified in the ~~project area, MBA~~WLC site, it is concluded that this species may range through the general area. This species is known to occur in ruderal and minimally disturbed areas. Marginal habitat for Stephens' kangaroo rat was observed along existing roadsides and within active pasture areas. Since the ~~project area~~WLC site is within the known range of this species, and marginal habitat was identified on site, there is a moderate potential for Stephens' kangaroo rat to occupy some portion of the area.

No ~~additional~~other California State threatened wildlife species are known to occur on, or in the vicinity of, the WLC site. No suitable habitat was found in the ~~project area~~WLC site to support other California State threatened wildlife species. Therefore, except for the Stephens' kangaroo rat, California State threatened wildlife species are not likely to occur in the ~~project area~~WLC site and there is no potential impact to California State threatened wildlife species.

California State Fully Protected Species. The classification of Fully Protected was California's initial effort in the 1960s to identify and provide additional protection to those animals that were rare or faced possible extinction. The list of fully protected species included fish, mammals, amphibians, reptiles, birds, and mammals. Most fully protected species are currently listed as threatened or endangered species under the more recent endangered species laws and regulations.

Fully protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.

~~**California State Fully Protected Species.**~~ As shown in Table 4.4~~.C~~-3, three California State Fully Protected species were analyzed for their potential to occur in the ~~project area~~WLC site: golden eagle (*Aquila chrysaetos*), white-tailed kite (*Elanus leucurus*) and peregrine falcon. No suitable nesting habitat for golden eagle, white-tailed kite or peregrine falcon occurs within the area due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. However, agricultural land does represent marginal quality foraging habitat within the ~~WLCSP~~WLC site project site and adjacent ~~CDFW Conservation Areas~~SJWA. No additional California State fully protected wildlife species were analyzed for their potential to occur in the ~~project area~~WLC site because no additional California State fully protected wildlife species are known to occur on, or in the vicinity of, the site. No suitable habitat was found in the ~~WLCSP~~WLC site and off-site facilities to support other California State fully protected wildlife species. Therefore, California State fully protected wildlife species are not likely to occur in the ~~project area~~WLC site and there is no impact to California State fully protected wildlife species.

California Rare Plants Species and California Species of Concern. California Species of Concern (CSC) applies to animals not listed under the FESA or CESA, but are declining at a rate that could result in Federal or State listing or historically occur in low numbers and known threats to their persistence currently exist.

California Rare Plant Species. No California rare plant species are known to occur on, or in the vicinity of, the ~~project area~~WLC site nor is any suitable habitat known to occur within the area. Therefore, no California rare plant species were analyzed for their potential to occur in the ~~project area~~WLC site. Eleven special status plant species, as determine by the California Native Plant Society, were identified as potentially occurring within the ~~project area~~WLC site. Three of the species (Plummer's mariposa lily [*Calochortus plummerae*], Robinson's pepper-grass [*Lepidium virginicum* var. *robinsonii*], and San Bernardino aster [*Symphyotrichum defoliatum*]) are not covered by the MSHCP. Plummer's mariposa lily and Robinson' pepper-grass have a moderate to low potential to occur based on habitat type and soils requirements. These species were not identified during sensitive plant surveys (MBA 2010; ESA 2018).

The 2010 sensitive plant survey was conducted based on the 2010 site boundary and the then-current existing conditions. Several areas within the current ~~WLCSP~~WLC site were not surveyed because they were either not included in the proposed development footprint (such as the Off-site Improvement Areas) or were not within areas of suitable habitat. Therefore, areas that contained suitable habitat, but are outside of the proposed development footprint, or areas that were not accessible during the survey, were not included. Since all areas of the ~~WLCSP~~WLC site were not surveyed, additional plant surveys are recommended on a project-by-project basis. There has been below-average rainfall in the area since the 2010 plant surveys were conducted. Project-level surveys will be required prior to submittal of the CEQA documents as part of the project-specific environmental review process.

The Sensitive Plant Focused Survey Report only discusses the plant communities in which focused plant surveys were conducted. Many of the areas within the Extensive Agricultural Areas and the Urban/Developed areas contain elements of Riversidean sage scrub, non-native grasslands, and riparian habitat, but not in a sufficient amount to be considered a separate plant community. The remaining nine plant communities found within the ~~WLCSP~~WLC site, either do not provide suitable habitat or are not within the ~~proposed~~ project impact area; these plant communities will not be directly or indirectly impacted by project development.

Updated focused plant surveys will likely be warranted on a project-level basis, especially if existing site conditions change over time. However, updated focused plant surveys in 2018 did not observe any special-status plant species. If the agricultural fields are left fallow, suitable habitat for a number of sensitive plant species may develop. Therefore, additional focused plant surveys will be required on a project-by-project basis as specific developments are proposed and subsequent or supplemental CEQA documentation is prepared.

The potential habitat for these species is confined to RSS and sandy-rocky soils, which are confined to the proposed open space area in the southwestern portion of the Specific Plan area.

California Species of Concern. Twenty-one California Wildlife Species of Concern were analyzed for their potential to occur in the ~~WLCSP~~WLC site and off-site facilities:

- Orange-throated whiptail (*Aspidoscelis hyperythra*)
- Coast horned lizard (*Phrynosoma coronatum*)
- Tricolored blackbird (*Agelaius tricolor*)
- Bell's sage sparrow (*Amphispiza belli belli*)
- Ferruginous hawk (*Buteo regalis*)
- Merlin (*Falco columbarius*)
- Yellow-breasted chat (*Icteria virens*)
- White-faced ibis (*Plegadis chihi*)
- Western yellow bat (*Lasiurus xanthinus*)
- Southern grasshopper mouse (*Onychomys torridus ramona*)
- American badger (*Taxidea taxus*)
- Northern red-diamond rattlesnake (*Crotalus ruber ruber*)
- Western spadefoot (*Spea hammondii*)
- Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)
- Burrowing owl (*Athene cunicularia hypugaea*)
- California horned lark (*Eremophila alpestris actia*)
- Prairie falcon (*Falco mexicanus*)
- Loggerhead shrike (*Lanius ludovicianus*)
- Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*)
- San Diego black-tailed jackrabbit (*Lepus californicus bennettii*)
- Los Angeles pocket mouse (*Perognathus longimembris brevinasus*)

The ~~project area~~WLC site contains suitable foraging habitat for loggerhead shrike, ferruginous hawk, merlin, prairie falcon, California horned lark, and burrowing owl but no suitable nesting habitat for ferruginous hawk, merlin, or prairie falcon. Suitable ground-nesting habitat occurs for burrowing owl and California horned lark. No sign of burrowing owl was identified during focused surveys conducted in 2012. However, burrowing owl was identified within the southern portion of in the ~~WLCSP~~WLC project site and offsite facilities during focused surveys conducted in 2013 and in 2018, and, it was determined that this species may range through the general area. Several California horned larks and loggerhead shrikes were observed foraging within the area. No suitable habitat for western spadefoot, Bell's sage sparrow, yellow-breasted chat, white-faced ibis, western yellow bat, southern grasshopper mouse, and American badger occurs within the ~~project area~~WLC site due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation. The western yellow bat, southern grasshopper mouse and American badger are not covered under the MSHCP. However, since there is no suitable habitat for these species, no impact is expected to occur. The remaining species are covered under the MSHCP.

There is limited suitable habitat for orange-throated whiptail, northern red-diamond rattlesnake, coast horned lizard, southern rufous-crowned sparrow, northwestern San Diego pocket mouse, San Diego jackrabbit, and Los Angeles pocket mouse in the ~~project area~~WLC site. These species are generally associated with RSS, which is limited to the north near SR-60 and Gilman Springs Road and in the proposed Open Space Area adjacent to the LPSRA between ~~Theodore Street~~World Logistics Center Parkway and Redlands Boulevard, just south of Brodiaea Avenue. Focused surveys for Los Angeles pocket mouse in 2005, 2010, 2012, and 2013 were negative. The orange-throated whiptail is not covered under the MSHCP. There is limited habitat for the orange-throated whiptail in an area that is currently proposed for open space in the southwestern corner of the Specific Plan area. The other species mentioned are covered under the MSHCP. There is a low potential for these species to occur.

No additional California wildlife species of concern were analyzed for potential to occur in the ~~project area~~WLC site because none is known to occur on, or in the vicinity of, the site. No suitable habitat was found in the ~~project area~~WLC site to support other California Wildlife Species of Concern. Therefore, except for the burrowing owl, loggerhead shrike, and California horned lark, California Wildlife Species of Concern are not likely to occur in the ~~WLCSP~~WLC site and off-site facilities.

California Native Plant Society (CNPS). The CNPS is a non-profit organization whose collaborative efforts in research helps maintain an inventory of rare and endangered plants that occur throughout California. The CNPS has developed its own classification system in defining the degree of endangerment for sensitive plant species that models that of the FESA and CESA. Plants considered to be rare, threatened, or endangered in California are designated as ~~List~~CRPR 1B or List ~~2~~2B plant species. Plants for which more information is needed to determine their status are designated ~~List~~CRPR 3 species. Plants with limited distribution are designated as ~~List~~CRPR 4 species.

CNPS ~~Listed~~Ranked Plant Species. Eight CNPS ~~List~~CRPR 1B plant species were analyzed for potential to occur in the ~~project area~~WLC site: San Jacinto Valley crownscale, thread-leaved brodiaea, Plummer's mariposa lily, smooth tarplant (*Centromadia pungens* ssp. *laevis*), slender-horned spineflower, Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*), Robinson's peppergrass, and San Bernardino aster.

Two CNPS ~~List 2~~CRPR 2B plant species, mud nama (*Nama stenocarpum*) and Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*), were analyzed for potential to occur in the ~~project area~~WLC site.

One CNPS ~~List~~CRPR 3 plant species, Parry's spineflower (*Chorizanthe parryi* var. *parryi*), was also analyzed for potential to occur in the ~~project area~~WLC site.

No evidence of any CNPS ~~List~~CRPR 1B, List ~~2~~2B, or List 3 plant species were observed in the ~~project area~~WLC site. In addition, no suitable habitat for any of these species occurs due to historic agricultural activities, regular disking of the site, and dominance of sparse, low quality non-native vegetation.

No additional CNPS ~~List~~CRPR plant species were analyzed for potential to occur in the ~~WLCSP~~WLC site and off-site facilities because none is known to occur on, or in the vicinity of, the site. No suitable habitat was found in the ~~project area~~WLC site to support other CNPS ~~List~~CRPR plant species. Therefore, CNPS ~~List~~CRPR plant species are not likely to occur in the ~~project area~~WLC site.

Migratory Bird Treaty Act and Section 3503 of the State Fish and Game Code. The ~~project area~~WLC site contains suitable nesting habitat for ground-nesting birds such as burrowing owl and horned lark. The few large trees on the site provide suitable habitat for other migratory birds.

Raptor Foraging Habitat. The ~~project area~~WLC site contains flat, open areas with sparse vegetation, which provides marginal foraging habitat for some raptors species. Due to the regular, heavy disturbance associated with the various agricultural activities in the area, and the limited size of the site in relation to the expansive foraging habitat in the vicinity including the ~~CDFW Conservation Buffer Area and the~~ SJWA, LPSRA, and the Badlands to the east, the foraging habitat on site is considered marginally suitable and of poor quality (MBA 2013, pages 94-95).

4.4.1.~~14~~11 MSHCP Consistency Analysis

a. Burrowing Owl

The burrowing owl is an avian species of special concern that is protected by the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code Section 3503. This species typically occurs in grassland and scrub habitats characterized by low-growing vegetation with an abundance of small mammal burrows, including the California ground squirrel. It often prefers areas with moderate disturbance and/or berms or drainage features. Reasons for burrowing owl population decline include habitat destruction, insecticide poisoning, rodenticide (particularly squirrel eradication), and shooting.

The ~~project area~~WLC site contains potentially suitable habitat for burrowing owl, such as flat, open, valley floor plains occupied by non-native grasslands, fallow fields, and agricultural lands. Details of the methodologies for the focused surveys are discussed in Appendix D, Burrowing Owl Focused Surveys. Details for these focused surveys for burrowing owl may not match exactly with the ~~project area~~WLC site as the boundaries of the various studies have evolved over time. The 2012 studies for burrowing owl encompassed ~~the~~ 3,300 acres ~~of the project area~~.

Burrowing owl was identified within the southern portion of the ~~WLCSP project~~WLC site during focused surveys conducted in 2013~~,~~ by MBA and in 2018 by ESA, and the species may continue to range through the general area. Focused surveys for burrowing owl conducted in June–July 2012 did not locate any owls (MBA 2012b). However, burrowing owl was observed on the WLC site in 2018. During focused surveys conducted by MBA in 2005 (covering approximately 1,778 acres of the ~~project area~~WLC site), a single breeding pair of burrowing owls was observed within an ephemeral drainage feature (Drainage 4) that longitudinally traverses the western portion of the survey area. The owls were observed perching and in flight along the western bank of the drainage feature, immediately south of its intersection with Dracaea Avenue. Conditions in this area have changed over the 6-year period and ~~this~~there was no longer suitable habitat due to changes in land use.

In addition, focused burrow and burrowing owl surveys conducted by MBA in 2006 (750 acres), 2007 (2,904 acres), 2010 (3,714 acres), and 2012 (3,300 acres) did not determine the presence of any burrowing owls. (Appendix D, Burrowing Owl Focused Surveys). Burrowing owls were recorded in 2008 (246 acres) just south of the Skecher's Logistic Center (Fierro, personal communication). A single burrowing owl was observed within the temporary detention basin located south of the Skecher's building during the March 2012 site visit. Burrowing owl was observed in the southeastern portion of the WLC site in 2018, just north of the SJWA.

The disked and fallow fields within the ~~project area~~WLC site continue to provide suitable foraging habitat for burrowing owl. The area contains numerous California ground squirrel and desert cottontail burrows, which are potentially suitable for burrowing and nesting by the owls. Therefore, this species appears to be present within portions of the ~~project area~~WLC site and the ~~CDFW Conservation Buffer Area~~SJWA to the south, although it may not be a permanent resident.

b. Los Angeles Pocket Mouse

Los Angeles pocket mouse (LAPM) is a California species of special concern that inhabits lower elevation grasslands and scrub communities within Los Angeles, San Bernardino, and Riverside Counties. Los Angeles pocket mouse is the smallest of the pocket mice subspecies and is adapted for arid or semi-arid environments and nocturnal activity. The primary habitat requirement for the subspecies is a suitable burrowing substrate of fine sandy soils. LAPM is commonly found in low elevation open grasslands, coastal sage scrub, and alluvial fan sage scrub. The subspecies is recorded to have been observed approximately 2 miles southeast of the study area (CDFW 2012).

The majority of the ~~project area~~WLC site does not contain suitable habitat for LAPM due to regular disturbance associated with agriculture, and the absence of fine sand soils. Drainage Feature 9, however, is not subject to regular agricultural disturbance and contains Riversidean sage scrub appropriate soils; therefore, this drainage feature contains marginally suitable habitat for LAPM.

MBA conducted surveys for LAPM in 2005, 2010, 2012, and 2013. ESA conducted LAPM surveys in 2018. In 2005, MBA conducted focused trapping surveys for LAPM in the south-central and southeastern portions of the ~~project area~~WLC site. A total of 121 traps were set throughout the drainage features. In 2010, MBA conducted focused trapping surveys in the same location as in 2005 and in two additional drainage features. A total of 122 traps were set among the three drainage features in 2010. Only Drainage Feature 9 has suitable RSS and soils, and the other two drainage features only contained suitable soils. The 2012 trapping effort was conducted in the same area as in 2010. No LAPM were trapped. No LAPM were trapped during the focused surveys in any of the ~~three~~MBA trapping sessions (2005, 2010, 2012, and 2013); therefore, ~~MBA has~~it was determined that this species is absent from the ~~project area~~WLC site and no additional trapping ~~is~~were required. However, ESA conducted trapping in 2018 but found no LAPM.

c. Criteria Area Species

The following ten Criteria Area Species were assessed for their potential to occur in the ~~project area~~WLC site:

- Mud nama (*Nama stenocarpum*);
- Little mousetail (*Myosurus minimus* ssp. *apus*);
- Coulter's goldfields (*Lasthenia glabrata* ~~sub~~ssp. *coulteri*);
- Thread-leafed brodiaea (*Brodiaea filifolia*);
- Davidson's saltscale (*Atriplex serenana* var. *davidsonii*);
- Parish's brittlescale (*Atriplex parishii*);
- San Jacinto valley crownscale (*Atriplex coronata* var. *notatior*);
- Round-leafed filaree (~~*Erodium*~~*California macrophyllum*);
- Smooth tarplant (~~*Hemizonia*~~*Centromadia pungens* ssp. *laevis*) and
- Nevin's Barberry (~~*Mahonia*~~*Berberis nevinii*).

The thread-leafed brodiaea typically occurs on gentle hillsides, valleys, and floodplains in semi-alkaline mudflats; therefore, it is not likely to occur within the WLC ~~planning area~~site.

Most of these species are associated with in highly alkaline, silty-clay soils in association with the Traver-Domino-Willows soil association. In Riverside County, vernal pool plant species are most closely associated with the Willows soil series.

According to the biological assessment, San Jacinto valley crownscale, Parish's brittlescale, Davidson's saltscale, smooth tarplant, Coulter's goldfields, and little mousetail are not likely to occur on the project site due to the absence of vernal pools or vernal pool-like conditions, or alkaline conditions (e.g., alkali annual grassland components of alkali vernal plains or areas that have semi-regular inundation).

The ~~project~~WLC site does not contain friable clay soils, so round-leafed filaree is not expected to occur. Although small areas of the site contain sage scrub and chaparral vegetation, no alluvial scrub or rocky chaparral slopes occur; therefore, Nevin's barberry is not likely to occur on the project site.

Mud nama is associated with ponds, lakes, or regularly muddy embankments. Since these conditions are not present, it is unlikely this species occurs on the ~~project~~WLC site.

d. Narrow Endemic Plant Species

The following six Narrow Endemic Plant Species were assessed for their potential to occur on the ~~project area~~WLC site:

- San Diego ambrosia (*Ambrosia pumila*);
- Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*);
- California Orcutt grass (*Orcuttia californica*);
- spreading navarretia (*Navarretia fossalis*);
- many-stemmed dudleya (*Dudleya multicaulis*); and
- Munz's onion (*Allium munzii*).

As with the Criteria Area species, San Diego ambrosia, Wright's trichocoronis, California Orcutt grass, and spreading navarretia are not likely to occur on the WLC site due to the absence of vernal pools, vernal pool-like conditions, or alkaline conditions (e.g., alkali annual grassland components of alkali vernal plains or areas that have semi-regular inundation). In addition, no clay soils occur within the ~~project area~~WLC site; therefore, many-stemmed dudleya and Munz's onion are not likely to occur. Rare plant surveys conducted by ESA in 2018 did not result in observations of any Criteria Area nor Narrow Endemic Plant Species.

e. Riparian/Riverine Habitat and Vernal Pools

The ~~project area~~WLC site contains two types of riparian vegetation: mule fat scrub and southern willow scrub. Both plant communities are isolated, disturbed, low in vegetative cover, and generally of poor habitat quality. Three drainage features and one catch basin contain riparian/riverine areas (see previously referenced Figure 4.4.2). One of these drainage features is outside of the ~~project area~~WLC site on the east side of Gilman Springs Road, within one of the proposed debris basins.

The mule fat scrub community on site occurs intermittently within Drainage Feature 9; a small patch within Drainage Feature 7; and within the debris basin associated with Drainage Feature 8. Drainage Feature 9 and the catch basin are both narrow and bordered on each side by disked agricultural fields. Drainage Feature 9 also contains a narrow band of mule fat scrub, but is bordered by relatively undisturbed Riversidean sage scrub. Over time, the drainage feature has fragmented and currently contains isolated patches of riparian vegetation. Within the mule fat scrub community, tree tobacco and other non-native plant species, have established in approximately equal quantity as mule fat.

Drainage Feature 8 has a proposed debris basin across Gilman Springs Road. This small drainage has an area of mule fat scrub that is probably surviving based on the blockage of the drainage at the road. The mule fat scrub portions of the ~~project area~~WLC site are poor in habitat quality due to the small size of the stands, the sparse vegetative cover within the communities, the isolation of the individual stands, and the disturbance from the adjacent agricultural uses. Given the above characteristics, riparian wildlife species have a low potential to occur. Despite the absence of suitable habitat for federally and State listed threatened or endangered species such as least Bell's vireo, southwestern willow flycatcher, or western yellow-billed cuckoo that commonly occur in riparian habitat, this drainage feature is considered riparian/riverine areas under the MSHCP because of the presence of mule fat and the subsurface connectivity to off-site riparian areas downstream.

Southern willow scrub occurs in a single isolated catch basin in the ~~project area~~WLC site (Figure 4.4.2, Drainage Feature 14). The catch basin contains marginal vegetative characteristics and no hydrological characteristics that fit the MSHCP description for riverine/riparian areas. It exists as isolated, human-made, catch basin that receives nuisance flows and agricultural runoff from concrete cattle containment areas adjacent to the basin, which have subsequently been removed. It is located south of Alessandro Road and does not contain any upstream or downstream connection to any other drainage features. There is no evidence of prolonged ponding within this basin. Due to the high percolation rate, this area does not hold water long enough to provide the necessary hydrology associated with the creation and maintenance of a vernal pool. There are no drainage features that convey natural flows into these basins. Therefore, the basins only source of hydrology is from natural rainfall within the limits of the basin. Vegetation in the catch basin consists of southern willow scrub and includes plant species such as Freemont's cottonwood, black willow, sandbar willow, and mule fat. The plant community primarily consists of a moderate density of trees with a few understory plants.

Southern willow scrub is typically considered suitable habitat for a number of wildlife species that commonly occur in riverine/riparian habitats throughout southern California. These wildlife species include sensitive avian species such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. The southern willow scrub associated with Drainage 14 does not contain hydric soils or wetland hydrology indicators. This basin is considered low in habitat quality because it is isolated, small in size, and lacks significant vegetation density. The vegetation within the basin is sparse, with a 30- to 40- percent canopy cover of native willows. The small patch of riparian habitat also contains about 50 percent native willows and 50 percent non-native ornamental trees such as Peruvian pepper tree (*Schinus molle*). The southern willow scrub habitat is 0.86 acre in size (rounded up to 1 acre in the document). There is no suitable habitat for any riparian/riverine avian species, such as least Bell's vireo (*Vireo bellii pusillus),* southwestern willow flycatcher (*Empidonax traillii extimus*), and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*), due to the limited size of the basin. There is also no suitable habitat within the immediate vicinity (approximately 2 miles) and there is no direct habitat connection to any suitable offsite habitat. Based on these factors, there is no suitable nesting habitat and limited resting habitat for the listed riparian species covered under the MSHCP. Given these characteristics, riparian wildlife species have a low potential to occur.

The term "functioning riparian habitat" describes a patch or area of riparian habitat that functions as a riparian habitat. It provides suitable habitat for plant and wildlife species that are commonly found in riparian habitats. Even low-quality riparian habitat may provide functional riparian habitat if it supports a population of riparian species. The riparian habitat onsite is extremely small and completely isolated from riparian habitat in the eastern portion of the City of Moreno Valley.

The riparian vegetation onsite does not support wildlife species commonly found within riparian habitat such as common yellow-throat (*Geothlypis trichas sinuosa*), yellow warbler (*Dendroica petechia brewsteri*), yellow-breasted chat (*Icteria virens*), and summer tanager (*Piranga rubra*), as described in the Birds as Indicators of Riparian Vegetation (no date) condition in the western U.S. Bureau of Land Management, Partners in Flight, Boise, Idaho. Therefore, even though the ~~WLCSP~~WLC site contains small patches of riparian vegetation, it does not function as a riparian habitat for common riparian bird species. A few plants in an isolated area do not create a functional habitat.

MBA also conducted a vernal pool habitat assessment within the ~~WLCSP~~WLC site and off-site facilities. As defined by the MSHCP, vernal pools are "seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season." No vernal pools or ephemeral ponds were observed in the ~~WLCSP~~WLC site or any of the off-site areas during the habitat assessment survey. In addition, no suitable habitat for any fairy shrimp species was identified within any of the ~~project area~~WLC site.

f. Urban/Wildlands Interface Analysis

This section addresses the indirect effects associated with locating development in proximity to MSHCP Conservation Areas. The ~~project area~~WLC site is bordered to the east by Proposed Core 3 (MSHCP Section 6.1.1) and to the south by the SJWA and Existing Core H. Moreover, portions of the ~~project area~~WLC site fall within the boundaries of these Conservation Areas.

The portion of the ~~project~~study area within the SJWA ~~(i.e., Conservation Area) is currently~~was previously used for agricultural land, but is owned by the ~~CDFW~~State of California and operated as ~~conservation land as~~ part of the SJWA. No development will occur in this area. The remaining portions of the ~~project area~~WLC site that are ~~on~~within or adjacent to conservation areas will incorporate the design features and measures related to drainage features, toxics, lighting, noise, invasive plants, barriers, and grading/land development discussed below. These measures will make the~~ proposed~~ project consistent with the MSHCP, Section 6.1.4, Guidelines Pertaining to the Urban/Wildlands Interface. A detailed description of recommendations pertaining to an urban/wildlands interface is provided below for adjacency issues identified in the MSHCP. Additional discussion of indirect impacts of the project on the SJWA and Conservation Areas is included in Section 4.4.1.12, *Other Issues*, later in this section. This information is from Section 6.1.4 of the MSHCP, *Guidelines Pertaining to the Urban/Wildland Interface.*

Drainage Features. Development of the ~~project area~~WLC site will include a comprehensive system of storm drains to handle runoff from the ~~proposed~~ project. The project drainage plan shows that drainage from the ~~project area~~WLC site will be directed to the regional storm drain system and away from the adjacent open space, or treated by water quality and retention basins to maintain historical runoff rates and patterns onto downstream land, such as the Mystic Lake area.

The conceptual drainage plan for the ~~WLCSP~~WLC site development consists of a series of collection basins throughout the development that will treat the first flush storm events and convey storm flows to a series of detention basins along the southern boundary of the ~~WLCSP~~WLC site. The basins will be designed to provide a water quality treatment as well as provide an area for creation of riparian habitat. Based on the size of the proposed detention basins, only the inlet and outlet structures will require routine maintenance. This allows the majority of the detention basins to remain undisturbed, which allows for long-term conservation of the riparian habitat. The design, operation, and maintenance of the drainage system for the ~~proposed~~ project will be designed to regulate the discharge of water into any MSHCP Conservation Area under either of these design scenarios. No water quality impact to downstream properties will result with implementation of the project.

~~All development within the project area will be required to obtain a statewide general National Pollutant Discharge Elimination System (NPDES) construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program. The NPDES requirements are discussed in greater detail in Section 4.9, *Hydrology and Water Quality*.~~

Proposed Developments in proximity to the MSHCP Conservation Area will be required to incorporate measures, including measures required through the National Pollutant Discharge Elimination System (NPDES) requirements, to ensure that the quantity and quality of runoff discharged to the MSHCP Conservation Area is not altered in an adverse way when compared with existing conditions. In particular, measures will be required to be put in place to avoid discharge of untreated surface runoff from developed and paved areas into the MSHCP Conservation Area. Stormwater systems will be required to be designed to prevent the release of toxins, chemicals, petroleum products, exotic plant materials or other elements that might degrade or harm biological resources or ecosystem processes within the MSHCP Conservation Area. This can be accomplished using a variety of methods including natural detention basins, grass swales or mechanical trapping devices. Regular maintenance shall occur to ensure effective operations of runoff control systems.

Barriers. The ~~WLCSP~~WLC project will incorporate special edge treatments designed to separate development areas from MSHCP open space areas both to the south and across Gilman Springs Road (i.e., fencing). The Specific Plan ~~indicates~~requires that native landscaping and fencing~~ will~~ be installed to minimize unauthorized public access to the south and across Gilman Springs Road, which will also help minimize impacts related to domestic animal predation and illegal trespass and dumping. Impacts to adjacent native areas across Gilman Springs Road will therefore be minimized. In addition, the landscaping palette for the Specific Plan uses native species and precludes invasive plants as shown in the MSHCP invasive species list (MSHCP Table 6-2). The Specific Plan shows a 250-foot setback along the SJWA boundary to the south, as well as walls/fencing and controls on lighting that will comply with the City's new Municipal Code section 9.08.100 to preclude light spillage off site greater than 0.25 foot-candles per square meter. Warehousing will have a minimum 11-foot solid wall along the SJWA boundary with landscaping to soften the appearance and which may eventually provide roosting or nesting opportunities for native birds. There will be no public pedestrian or vehicular access from the development onto the SJWA land to the south, and private access to MSHCP areas to the east across Gilman Springs Road will be limited by fencing along private property lines within the project site.

Access. The project will prohibit public access into all MSHCP conservation areas including those contained within SJWA and Existing Core H to the south of the ~~project area~~WLC site. Private access to Proposed Core 3 (Section 6.1.1, Proposed Core 3) ~~to~~in the ~~east~~eastern portion of the WLC ~~project area~~site will be limited by fencing of private property limits, but the public may still be able to access these areas from public roads, including Gilman Springs Road.

Grading/Land Development. Project grading will not encroach into conservation land that will be designated as open space located within Existing Core H to the south or Proposed Core 3 (Section 6.1.1, *Proposed Core 3*) to the east of the WLC ~~project area~~site.

Fuels Management. Fuels management focuses on hazard reduction for humans and their property (MSHCP, p. 6-72). According to the Fuels Management Guidelines, for new development planned adjacent to all MSHCP conservation areas or other undeveloped areas, brush management shall be incorporated in the development boundaries and shall not encroach into the MSHCP conservation areas (MSHCP, p. 6-72). Any areas planted with fire-resistant, non-invasive plants must not encroach into the MSHCP conservation area. Accordingly, with implementation of these measures, the ~~WLCSP~~WLC SITE project will be consistent with the MSHCP Fuels Management Guidelines.

g. Migratory Corridors/Linkages

The ~~project area~~WLC site is adjacent to an existing migratory corridor across Gilman Springs Road (i.e., Criteria Cells 1290, 1389, and 1390) as designated by the MSHCP. While the open agricultural fields that presently occupy much of the ~~project area~~WLC site are not designated as corridors or linkages in the MSHCP, the ~~project~~WLC site, ~~including~~and the ~~CDFW property~~SJWA, supports extensive agricultural fields, which do not constitute native vegetation, but do provide some foraging value and may allow for migration or movement of wildlife through the general area even considering the level of repeated disturbance by agricultural activities. Wildlife movement through this area is generally planned to take place across the Mystic Lake property to the south. The northern (upland) portion of the SJWA~~ (i.e., the CDFW Conservation Buffer Area)~~ and the southern portion of the Specific Plan area do not provide suitable habitat or resources to support wildlife migration or regular wildlife movement.

4.4.1.~~15~~12 MSHCP Conservation Criteria Areas

Figure 4.4.4 shows the location and relationship of the MSHCP conservation areas described in this section, as well as their relationship to the ~~project area~~WLC site.

a. Core 3

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

The MSHCP establishes a number of “core” areas that contain or support important biological habitat or species. Some of the core areas are existing reserves, while others are proposed for preservation. This section analyzes the ~~proposed ~~project in relation to the nearby MSHCP core areas. The ~~project area~~WLC site is located within the Reche Canyon/Badlands Area Plan and falls within both the Badlands North Area Plan Subunit and the SJWA/Mystic Lake Area Plan Subunit. No existing or proposed linkage, or constrained linkage areas are in the vicinity of the project. Proposed Core 3 (MSHCP Section 6.1.1) is located to the north and east of the ~~project area~~WLC site and Existing Core H is located to the south (see previously referenced Figure 4.4.~~3~~4). As shown in Table 4.4~~.D~~-4, portions of the ~~project area~~WLC site fall within ~~12~~3 Criteria Cells ~~that are all ~~associated with existing or proposed core areas. ~~However, the following analysis ~~No development will ~~show that almost all criteria cells are~~take place within ~~the CDFW-owned Conservation Buffer Area and thus~~any of the three Criteria Cells nor will ~~not~~there be ~~directly affected by the development within the Specific Plan. The project also proposes no~~any development within the 74.3-acre Open Space area in the southwestern corner of the ~~Specific Plan~~WLC site.

Table 4.4~~.D-~~4: MSHCP Criteria Cells within the ~~Project~~WLC Site Study Area

Area Plan Subunit within MSHCP	Cell Group	Criteria Cells
Badlands North Area Plan Subunit 3	Cell Group E	1390
	Cell Group X	1297
		1204
San Jacinto Wildlife Area/Mystic Lake Area Plan Subunit 4	Cell Group D	1364
		1370
		1377
		1386
		1389
		1482
		1483
		1477
		1577

~~The~~

No portions of the ~~project area~~WLC site occur within Cell Group D~~ are~~, which is within the SJWA/Mystic Lake Area Plan Subunit 4. This Cell Group supports Existing Core H. Approximately 929 acres of the ~~project area~~SJWA site are within Cell Group D. This ~~portion within Cell Group D is located within the SJWA. This area is currently~~area is owned by the State of California through a purchase in 2001 and is ~~now~~ designated as Public/Quasi-Public Conserved Land under the MSHCP (see Figure 4.4.~~3). Although this~~ 4). This land ~~is not considered to be mitigation for the proposed development, it does provide~~ consists of more than 900 acres of ~~buffer between the project and the high quality habitat areas of the SJWA~~non-native grassland.

~~As shown in Figure 4.4.4, the CDFW-owned portion of the project area overlaps Cell Groups E and X, which are within the Badlands North Area Plan Subunit 3. These Cell Groups support Proposed Core 3. Approximately 52 acres of the CDFW area overlap Cell Group E, and approximately 114 acres of the CDFW Area occurs within Cell Group X. The project will not conflict with MSHCP Conservation Criteria because no development is planned within the CDFW area of the project (which is part of the SJWA). However, any development adjacent to the SJWA will need to address edge effects.~~

Minimizing edge effects is considered a significant goal of Proposed Core 3.~~ Approximately 56 acres of the project area occur within the western extent of Proposed Core 3.~~ The portions of the Core along Gilman Springs Road are currently subject to edge effects associated with existing traffic, and the development of the project may incrementally increase these edge effects. All development in the southern portion of the project will need to implement measures that minimize edge effects associated with urban development in wildlands. The minimization efforts are addressed in Section 4.4.1.8g, *Urban/Wildlands Interface Analysis*, of this report.

The ~~CDFW-owned~~SJWA land~~ within the project area~~ is located adjacent to the junction of Proposed Core 3 and Existing Core H. Development of the WLC project will not impede the movement of wildlife or reduce the continuous area of the two cores, which are both goals of Proposed Core 3. Additionally, the portion of the ~~project area~~WLC site located adjacent to the Core 3/Core H junction will remain undeveloped, facilitating connectivity between the two Cores.

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.4.4: MSHCP Conservation Areas~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

The ~~project area~~WLC site occupies less than 0.1 percent of Proposed Core 3 and the goals of the Proposed Core 3 will be maintained.

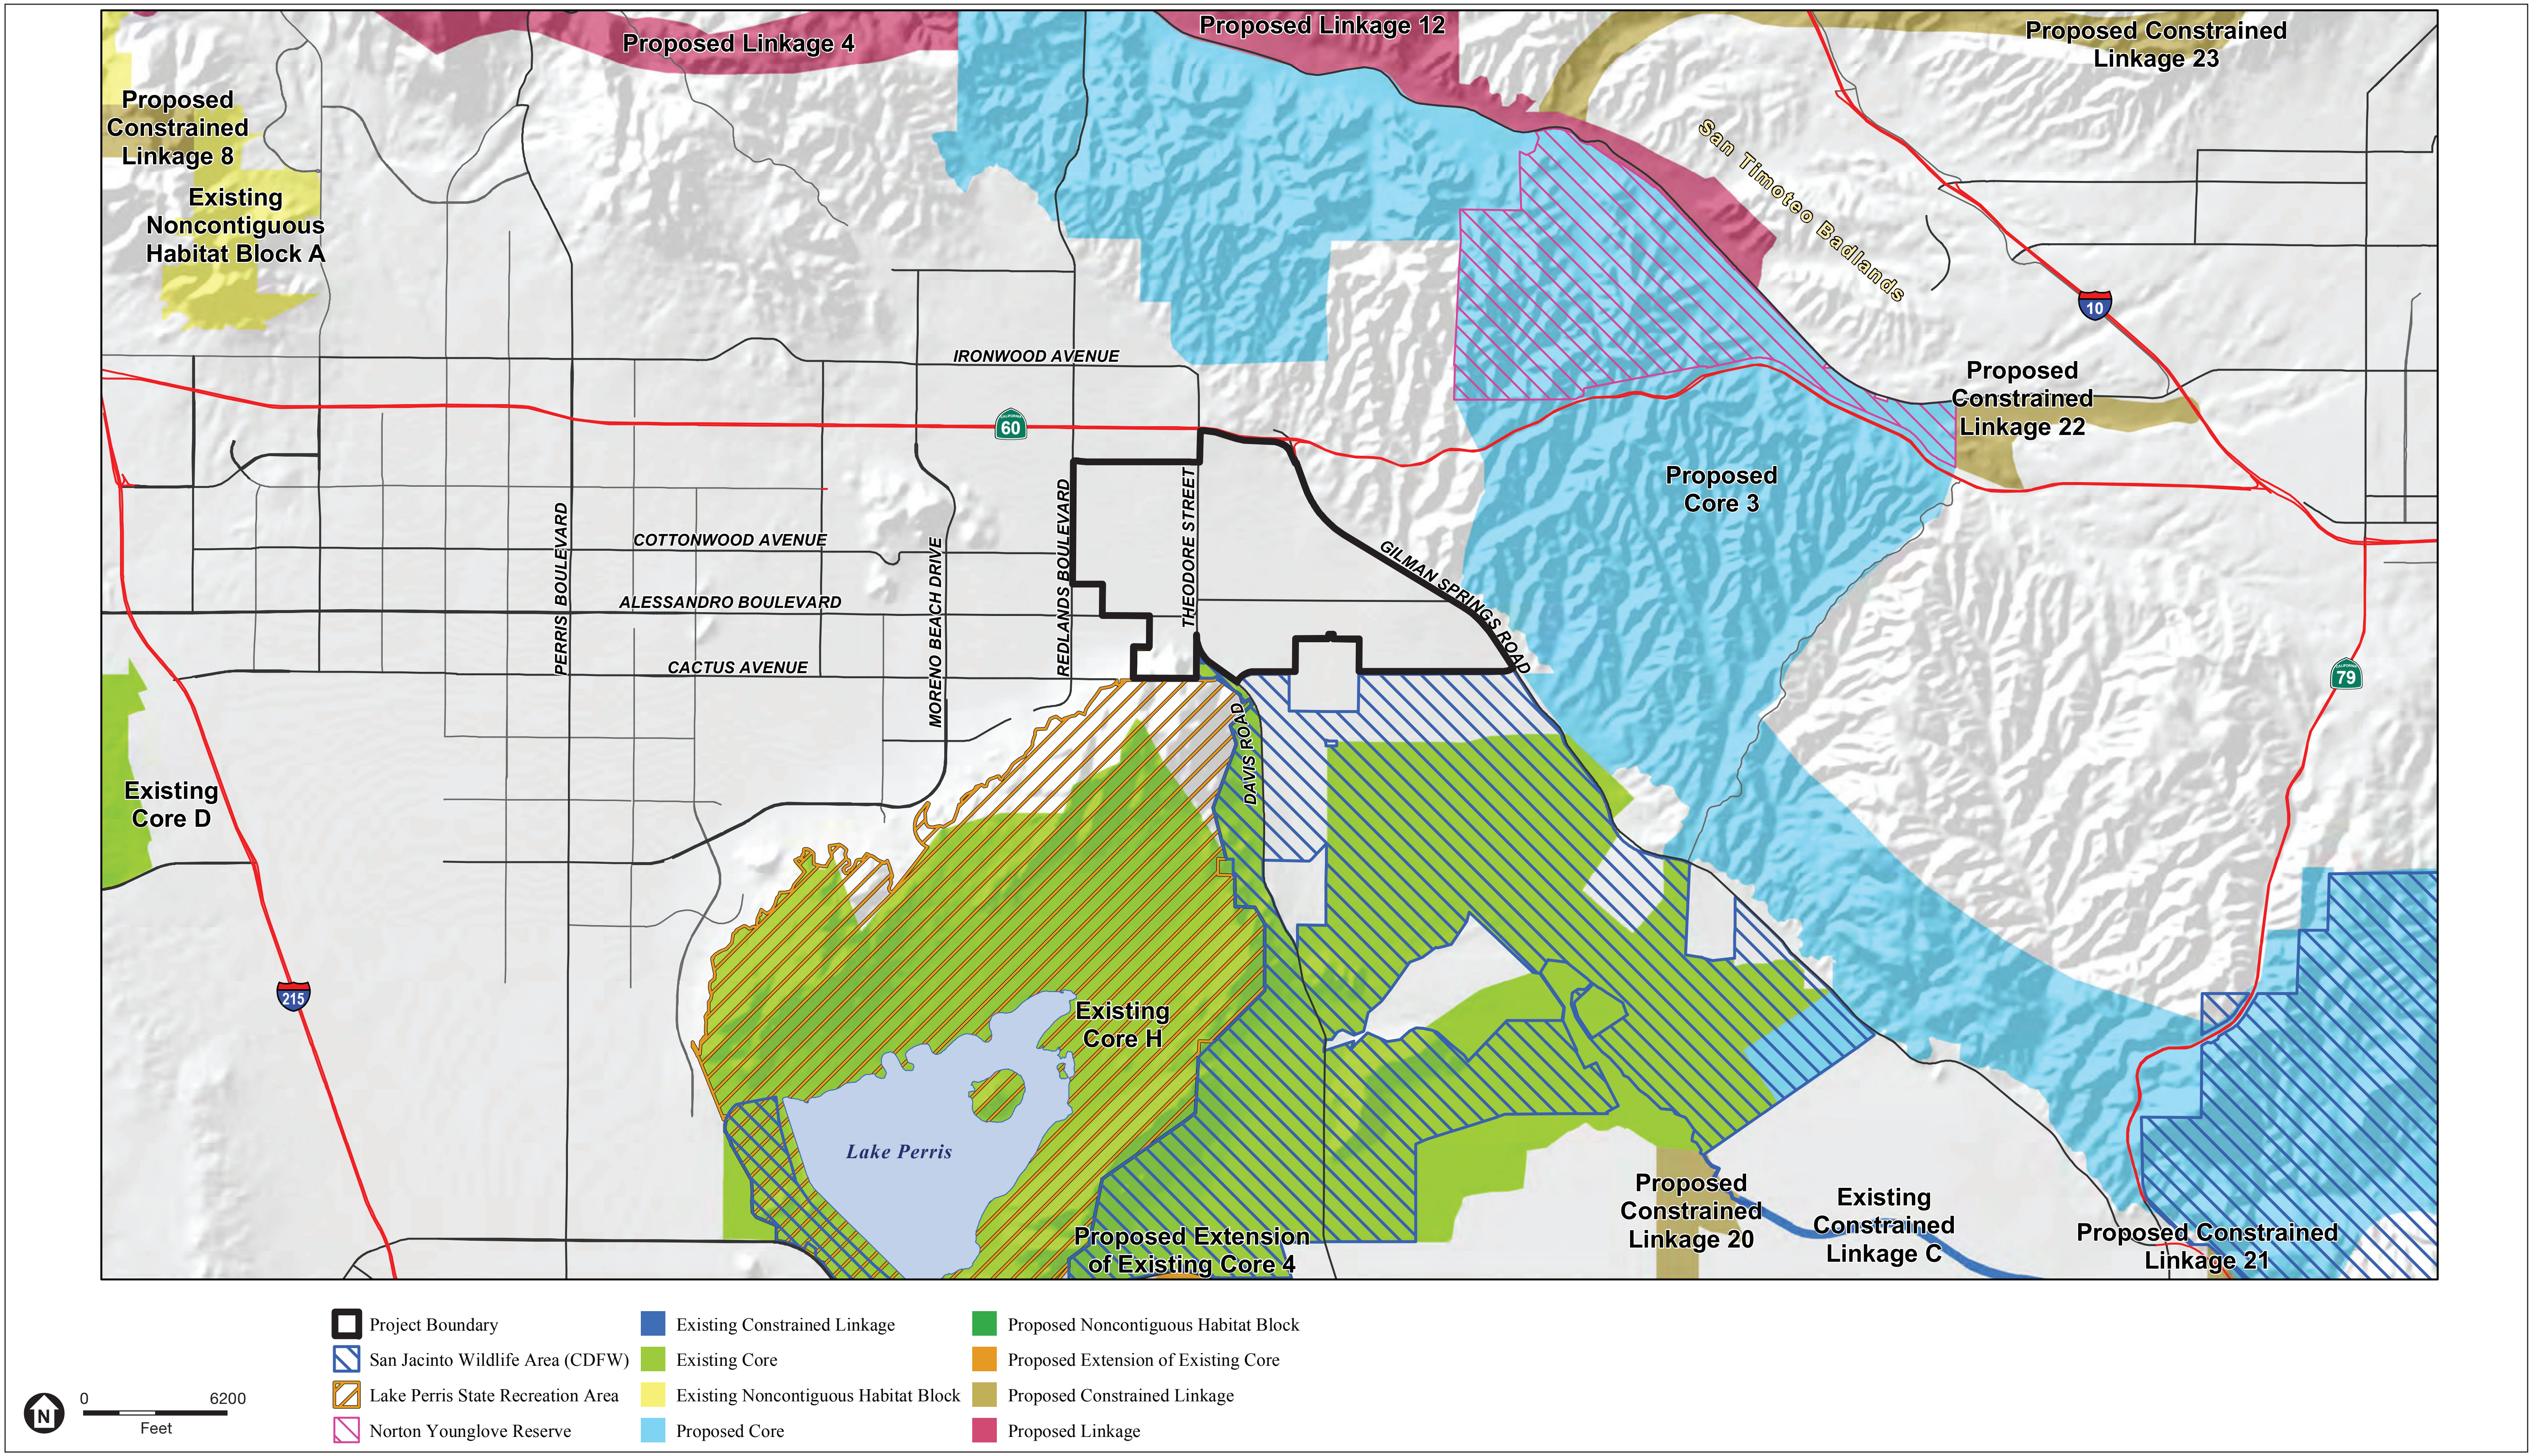
b. Existing Core H

Existing Core H consists of the Lake Perris State Recreation Area (LPSRA), SJWA, private lands, and lands with pre-existing conservation agreements (see Figure 4.4.4). It provides resident habitat for several species, contains soils suitable for some Narrow Endemic plant species, supports vernal pool complexes and may provide a connection to Core Areas in the Badlands and the middle reach of the San Jacinto River. Maintenance of habitat quality, floodplain processes along the San Jacinto River, and conservation of vernal pool complexes are important for species covered by the MSHCP. The Core Area provides potentially suitable live-in habitat for small rodents and common mammals.

~~Approximately 113.1 acres of the project area are located within the northern extent of Existing Core H. The CDFW-owned Area~~The SJWA in Existing Core H contains potentially suitable habitat for small rodents, common mammals, and burrowing owl. No vernal pool complexes or floodplain conditions occur on the project site and there is no suitable habitat for any narrow endemic plant species. ~~The portion of the project area within Existing Core H will not be developed (i.e., the Conservation Buffer Area) because it is part of the SJWA. The WLC planning area occupies less than 0.2 percent of~~The WLC site is not located within Existing Core H and the goals of this core area will be maintained.

c. Reche Canyon/Badlands Area Plan

The Reche Canyon/Badlands Area Plan of the MSHCP is in the northern portion of western Riverside County, south of the City of San Bernardino, west of The Pass Area Plan and the San Jacinto Valley Area Plan, north of the Mead Valley Area Plan and the Lakeview/Nuevo Area Plan, and east of the Highgrove Area Plan, the Cities of Norco and Riverside Area Plan, and the March Area Plan. The City of Moreno Valley sits entirely within the Reche Canyon/Badlands Area Plan. The Area Plan incorporates lands within the LPSRA and SJWA, and is separated into 4 Area Plan Subunits. The ~~project area~~WLC site is located within portions of Area Plan Subunit 3: Badlands North and Area Plan Subunit 4: San Jacinto Wildlife Area/Mystic Lake (see Figure 4.4.4).



SOURCE: County of Riverside, 2003 & 2011; California Dept. of Fish and Game, 2011

World Logistics Center Project

Figure 4.4-4
MSHCP Conservation Areas

The target conservation acreage range for the Reche Canyon/Badlands Area Plan is 30,815 to 35,905 acres; it is composed of approximately 20,295 acres of existing Public/Quasi-Public Lands and 10,520 to 15,610 acres of Additional Reserve Lands. The target acreage range within the City of Moreno Valley is 80 to 130 acres. The City of Moreno Valley target acreage is included within the 10,520 to 15,610~~-~~-acre target conservation range on Additional Reserve Lands for the entire Area Plan.

The ~~Conservation Buffer Area portion~~SJWA immediately south of the WLC ~~planning area includes approximately 910 acres of the SJWA, which~~site, is designated as Additional Reserve Land. All of this area is within the City of Moreno Valley, and ~~preservation of~~will not be impacted by the ~~Conservation Area of the~~WLC project~~ will~~, which would fulfill the MSHCP's target acreage range for the City.

d. Area Plan Subunit 3: Badlands, North

Area Plan Subunit 3 of the Reche Canyon/Badlands Area Plan includes lands within the northeastern and eastern portions of the Area Plan within the Badlands (see Figure 4.4.4). Area Plan Subunit 3 contains a total of 88 Criteria Cells organized into 16 Cell Groups and 4 independent cells. The MSHCP conservation objectives for Area Plan Subunit 3 include conserving land within the Badlands area, north to the vicinity of SR-60, south to southeastern extent of the SJWA, west to the eastern boundary of the SJWA, and east to the Laborde Canyon vicinity. Target acreage range required for Additional Reserve Lands within Area Plan Subunit 3 is 8,270 to 10,895 acres. Plant and Wildlife Planning Species within Area Plan Subunit 3 include:

- Nevin's barberry;
- Bell's sage sparrow;
- Cactus wren;
- Loggerhead shrike;
- Southern California rufous-crowned sparrow;
- Los Angeles pocket mouse;
- San Bernardino kangaroo rat;
- Stephens' kangaroo rat;
- Bobcat; and
- Mountain lion.

Under the MSHCP, additional biological issues and considerations are proposed for conservation for each Area Plan Subunit. The biological issues and considerations emphasized in Area Plan Subunit 3 include:

- Conserving large habitat blocks in the Badlands.
- Maintain Core Area for bobcat.
- Maintaining Core and Linkage Areas for mountain lion.
- Determining potential for populations of San Bernardino kangaroo rat along San Timoteo Creek.
- Maintain Linkage Area to SJWA for Stephens' kangaroo rat.
- Determine presence of potential Core Area for Los Angeles pocket mouse in San Timoteo Creek and tributaries to the Badlands.
- Maintain Core Area for Nevin's barberry.

The eastern boundary of the ~~project area~~WLC site (i.e., Gilman Springs Road) is within Area Plan Subunit 3, the main focus of which is protection of bobcat and mountain lion habitat. The portions of the ~~project area~~WLC site within Area Plan Subunit 3 are along the southwestern edge of the Subunit and collectively comprise approximately one percent of the target acreage range proposed for conservation. Since the ~~project area~~WLC site encroaches on a limited portion of the boundary of the Area Plan Subunit, and since these portions of the ~~project area~~WLC site are already subject to existing edge effects, impacts from development under the ~~WLCSP~~WLC site does not conflict with the long-term conservation goals for bobcat or mountain lion habitat. It should be noted that the ~~project~~WLC site is across a major roadway (Gilman Springs Road) from the Badlands and the sensitive habitat contained in this Area Plan Subunit.

e. Cell Group E and Criteria Cell 1390

Conservation within Cell Group E will contribute to assembly of Proposed Core 3 and will focus on chaparral, coastal sage scrub, grassland, and Riversidean alluvial fan sage scrub habitat. Areas conserved within this Cell Group will be connected to habitat proposed for conservation in Cell Group X to the north, habitat proposed for conservation in Cell Group C also to the north, and to habitat proposed for conservation in Cell Group F to the south. Conservation within Cell Group E will range from 45 percent to 55 percent of the Cell Group focusing in the western portion (see Figure 4.4.4).

~~Within the westernmost portion of Cell Group E, and specifically within Criteria Cell 1390, the project area encroaches on 51.9 acres. This portion of the project area is already in public ownership, is within the northeastern portion of the SJWA which is Public/Quasi-Public Conserved Land and is designated to be conserved by the CDFW. The project proposes no development on this land, so it would be consistent with the MSHCP (see Figure 4.4.3). It should be noted that this area is already part of the SJWA and is not proposed for any development under the proposed project.~~

f. Cell Group X: Criteria Cells 1204 and 1297

Conservation within Cell Group X will contribute to assembly of Proposed Core 3 and will focus on chaparral, coastal sage scrub, and grassland habitat. Areas conserved within Cell Group X will be connected to habitat proposed for conservation in Cell Groups C to the east, V to the northeast, and to chaparral and grassland habitat proposed for conservation in Cell Group E to the south. Conservation within Cell Group X will range from 65 percent to 75 percent of the Cell Group focusing in the northeastern portion of the Cell Group (see Figure 4.4.4).

Within the southwestern portion of Cell Group X, and specifically within Criteria Cells 1204 and 1297, the ~~project area~~WLC site encroaches on 114.2 acres. Under the MSHCP, conservation for Cell Group X is proposed for the northeastern portions of the Cell Group. The ~~project area~~WLC site is not within the targeted conservation areas and, therefore, will not adversely affect the County's ability to achieve the goals of the MSHCP (see Figure 4.4.4). In addition, no development is proposed within Criteria Cells 1204 and 1297.

g. Area Plan Subunit 4: San Jacinto Wildlife Area/Mystic Lake

Area Plan Subunit 4 of the Reche Canyon/Badlands Area Plan includes lands within the southeastern portions of the Area Plan within the SJWA. Area Plan Subunit 4 contains 26 Criteria Cells organized into 3 Cell Groups and 12 independent cells. The MSHCP conservation objectives for Area Plan Subunit 4 include conserving land within the SJWA and Mystic Lake (see Figure 4.4.4). The target acreage range required for Additional Reserve Lands within Area Plan Subunit 4 is 860 to 1,750 acres.

Plant and Wildlife Planning Species within Area Plan Subunit 4 include:

- California Orcutt grass
- Coulter's goldfields

- Los Angeles pocket mouse
- Smooth tarplant~~ (*Hemizonia pungens*)~~
- Thread-leaved brodiaea
- Wright’s trichocoronis
- Stephens’ kangaroo rat
- Loggerhead shrike
- Northern harrier (*Circus cyaneus*)
- Peregrine falcon~~ (*Falco peregrinus*)~~
- Tricolored blackbird~~ (*Agelaius tricolor*)~~
- White-tailed kite~~ (*Elanus leucurus*)~~
- Black-crowned night heron (*Nycticorax nycticorax*)
- California horned-lark~~ (*Eremophila alpestris actia*)~~
- San Jacinto Valley crownscale
- Spreading navarretia
- Vernal barley (*Hordeum intercedens*)
- American bittern (*Botaurus lentiginosus*)
- Burrowing owl
- Bobcat
- Mountain plover (*Charadrius montanus*)
- Osprey (*Pandion haliaetus*)
- Prairie falcon~~ (*Falco mexicanus*)~~
- White-faced ibis~~ (*Plegadis chihi*)~~
- Davidson’s saltscale~~ (*Atriplex serenana var. davidsonii*)~~
- Double-crested cormorant (*Phalacrocorax auritus*)

The biological issues and considerations emphasized in Area Plan Subunit 4 include:

- Conservation of alkali playa and other habitat to augment existing conservation in the SJWA and Mystic Lake.
- Conservation of existing vernal pool complexes associated with the San Jacinto River floodplain in the SJWA and Mystic Lake area. Conservation should focus on vernal pool surface area and supporting watersheds.
- Provide for a connection of intact habitat between the SJWA and the adjacent Badlands to the north.
- Conservation of Willow-Domino-Travers soils supporting sensitive plants such as San Jacinto Valley crownscale, Davidson saltscale, Coulter’s goldfields, spreading navarretia, vernal barley and Wright’s trichocoronis.
- Provide for and maintain a continuous linkage along the San Jacinto River from the southern to the southeastern boundary of the Reche Canyon/Badlands Area Plan.
- Maintain Linkage Area for bobcat.
- Maintain a Linkage Area for Stephens’ kangaroo rat to SJWA.
- Determine the potential presence of potential Core Area for Los Angeles pocket mouse in connection between the Badlands and the SJWA.

The ~~southern portion~~SJWA south of the ~~project area (i.e., the CDFW-owned Conservation Buffer Area)~~WLC site includes grasslands and agricultural lands~~ that will be conserved as part of the northern portion of the SJWA.~~. The ~~project area~~WLC site is not within or along the San Jacinto River floodplain, and does not contain any alkali playa habitat or vernal pool complexes under the definition provided by the MSHCP.

There is no Willow-Domino-Travers soil within the ~~project area~~WLC site; therefore, San Jacinto Valley crownscale, Davidson saltscale, Coulter's goldfields, spreading navarretia, vernal barley and/or Wright's trichocoronis are not likely to occur in the ~~project area~~WLC site.

The ~~project area~~WLC site is located immediately north of the Stephens' kangaroo rat preserve within the SJWA. ~~The CDFW-owned~~Only a small portion of the ~~project area adjacent to~~northern portion of the SJWA ~~is~~(about 135 acres along the northern boundary) has been subject to regular disking and other disturbances associated with agricultural uses, while the remainder has converted to non-native grassland. The regular disturbances have resulted in an absence of suitable habitat for Stephens' kangaroo rat within the ~~project area.~~northern portion of the SJWA. The presence of a habitat linkage for this species within the ~~project area~~WLC site is unlikely and population fragmentation is not anticipated.

Small portions of the ~~project area~~WLC site contain suitable habitat for Los Angeles pocket mouse and burrowing owl; however, ~~MBA's~~ focused surveys by MBA and ESA concluded that the ~~project area~~WLC site does not support the Los Angeles pocket mouse. The population of burrowing owl on site fluctuates from year to year, but they have been observed on site in the past and ~~this EIR concludes this species may be present, especially in areas with suitable habitat or where agricultural fields become fallow for~~in the recent 2018 survey, and extended periods of time.

h. Cell Group D: Criteria Cells 1364, 1370, 1377, 1386, 1389, 1477, 1482, 1483, and 1577

Conservation within Cell Group D will contribute to assembly of areas proposed for conservation for Existing Core H (see Figures 4.4.4 and 4.4.3). Conservation within Cell Group D will focus on agricultural land. Conservation within this Cell Group will be approximately five percent of Cell Group D focused on the southern and western portion of the Cell Group. This cell group is already part of the SJWA and is being maintained ~~as~~for possible agricultural ~~land by the CDFW (i.e., it constitutes the CDFW-owned Conservation Buffer Area).~~use.

~~Within Cell Group E, and specifically within Criteria Cells 1364, 1370, 1377, 1386, 1389, 1477, 1482, 1483, and 1577, the project area encroaches on 928.5 acres. Under the MSHCP, conservation for Cell Group D is proposed for the southern and western portions of the Cell Group. The project area includes approximately 60 percent of the northern portion of the Cell Group; therefore, future development of the project area is consistent with the conservation goals for this cell group. The majority of Cell Group D is within the northern extent of SJWA, a Public/Quasi-Public Conserved Land. This area is part of the SJWA and designated as conserved by the CDFW. It is designated as the Conservation Area and is not proposed for development under the project. Any development within land adjacent to Cell Group D (and the SJWA) must incorporate urban edge design features to minimize any potential impacts to the SJWA.~~

Cell Group D, which includes Criteria Cells 1364, 1370, 1377, 1386, 1477, 1482, 1483 and 1577, is proposed for conservation under the MSHCP. All of the Criteria Cells are within the SJWA except for approximately 5 acres of the WLC site within Criteria Cell 1364 on which no development will be allowed.

4.4.1.~~16~~13 Federal Migratory Bird Act and California Department of Fish and Wildlife Protection

a. Nesting Birds

The extensive agriculture plant communities in the ~~project area~~WLC site provide suitable nesting habitat for ground-nesting avian species such as western meadowlark (*Sturnella neglecta*) and burrowing owl. Suitable habitat for shrub and tree nesting species such as red-tailed hawk, black phoebe (*Sayornis nigricans*), and house finch occur along the edges of existing development surrounding the ~~project area~~WLC site as well as isolated, remnant patches of vegetation in undisturbed portions of the ~~project area~~WLC site. Therefore, portions of the ~~project area~~WLC site provide suitable nesting habitat for migratory birds protected under the MBTA and California Fish and Game Code.

b. Stephens' Kangaroo Rat

The ~~project area~~WLC site is located just north of the Core Reserve Area for the Stephen's Kangaroo Rat Habitat Conservation Plan (HCP), but is not located within a core area. However, the ~~project~~entire study area is located within the fee area of the HCP. The project would have to comply with the HCP's Implementing Agreement (IA) and pay the County's per-acre mitigation fee.

~~The CDFW-owned portion of the project area is located immediately north of Core Reserve Area for Stephens' kangaroo rat and is not proposed for development as it is owned by the State and is already part of the SJWA. Therefore, incorporating this area into the Core Reserve Area for Stephen's kangaroo rat will provide a setback from the areas proposed for development within the project.~~

c. USFWS Designated Critical Habitat

No USFWS designated Critical Habitat for any species is present within the ~~project area~~WLC site.

d. Other Special Status Species

Based on the CDFW and CNPS database searches mentioned above, 26 special status species that are not listed as Threatened or Endangered have the potential to occur in the project vicinity (previously referenced Tables 4.4~~.B~~-2 and 4.4~~.C~~-3). Species that are not covered under the MSHCP or are not adequately conserved by the MSHCP at this time are also included in those tables.

4.4.1.~~17~~14 Special-Status Species Not Covered by the MSHCP

The vast majority of special-status species considered in this analysis are "covered" species under the MSHCP. However, 18 special-status species have the potential to occur in the general project vicinity and are not covered under the MSHCP or are not adequately conserved by the MSHCP at this time. Details regarding the potential occurrence of these non-covered species are included in the General Biological Resources and MSHCP Compliance Report prepared by MBA and included as Appendix E-1. Due to unsuitable habitat and conditions within the project limits, none of these 18 non-covered species is expected to occur in the ~~project area~~WLC site (see previously referenced Tables 4.4~~.B~~-2 and 4.4~~.C~~-3). Neither additional surveys nor additional conservation measures will be required for the project to address these species.

~~*Note: Table 4.4.D has been deleted in its entirety. Please refer to Volume IV of the Final EIR to see original Table 4.4.D in section 4.4.1.17.*~~

a. Special-Status Wildlife

~~*Note: The following changes have been made in response to the revised Habitat Assessment MSHCP Consistency Analysis and in response to Comment F-7A-34 in Letter F-7A from Lozeau Drury LLP.*~~

The revised MBA report (2013) states that no special-status wildlife species were observed during field surveys. However, raptors are numerous in the agricultural fields on the ~~project~~WLC site and off site in the SJWA. None of the other special-status wildlife species was determined to be present within the WLC planning area because their habitat requirements are not present on the site; therefore, no further survey or study is required to determine likely presence, absence, or to assess project-related effects to these species.

While none of the bat species identified in the MSHCP Compliance Report (Appendix E-1) is expected to roost in the ~~project area~~WLC site, the site does contain suitable foraging habitat for bat species that may roost in the surrounding region. The incremental loss of bat foraging habitat on the site would be compensated by participation in the MSHCP because the MSHCP mitigation fees are meant to purchase conservation lands to support species throughout western Riverside County.

b. Raptors and Other Avian Species

California Fish and Game Code, Sections 3503, 3503.5, 3505, and 3513, and the California Code of Regulations (Title 14, Sections 251.1, 652 and 783-786.6) have specific provisions for the protection of raptors (birds of prey). Furthermore, the MBTA protects the nests of migratory birds and raptors. There are a limited number of tall trees within the project site that would provide roosting or nesting habitat for raptors, such as hawks and owls, among other resident and migratory bird species. Two raptor species, red-shouldered hawk and American kestrel, have been observed in the area on a regular basis, suggesting at least these raptors may be roosting on site or nearby. The extensive open land within the ~~project area~~WLC site provides foraging habitat for raptors and other avian species.

~~*NOTE: The following changes have been made in response to the revised Habitat Assessment MSHCP Consistency Analysis and in response to Comment F-7A-34 in Letter F-7A from Lozeau Drury LLP.*~~

Thirteen species have a low-to-moderate potential to occur on the site based on existing habitat quality. Burrowing owl is assumed to be present on site, especially in areas of suitable habitat and in agricultural fields that are left fallow for extended periods of time. Burrowing owl was observed on-site in 2018.

As previously indicated, the project site is within the MSHCP burrowing owl survey area, and habitat assessments and focused surveys were conducted. During the focused survey in 2005, one location within the ~~project~~WLC site contained burrowing owl sign (i.e., whitewash and bone fragments) and a pair was observed in this same area. Field surveys also identified suitable burrows in the ~~project area~~WLC site that may provide habitat for the western burrowing owl. Therefore, the species is considered to be present due to the presence of suitable habitat on site.

To confirm presence or absence of the burrowing owl in specific development areas of the ~~project area~~WLC site, an MSHCP 30-day pre-construction protocol survey for burrowing owl will need to be conducted prior to any ground-disturbing activities. Figure 4.4.5 shows the location of burrowing owl habitat on the ~~project~~WLC site.

Of the species with potential to occur on the site, none is listed as threatened or endangered under State or Federal law, all are relatively widespread, and the ~~project area~~WLC site does not contain high quality habitat for any of these species.

4.4.1.~~18~~15 Other Issues

a. Setbacks

The MSHCP's urban/wildlands interface analysis encourages ~~buffers or~~ setbacks between proposed development areas and areas with sensitive biological resources. The WLC project has been designed to incorporate setbacks from sensitive biological resources pursuant to MSHCP requirements. The SJWA is considered an important resource due to the large number and diversity of birds that utilize it. Available research and MSHCP guidelines recommend a setback ~~or buffer~~ between the north boundary of the SJWA and the south boundary of development within the ~~proposed~~WLC project. Existing scientific and academic literature can provide guidance on the appropriate width of such a ~~buffer~~setback under these types of conditions. Typical setbacks to protect wildlife from human presence (though not warehousing) ranges from 50 to 500 feet, but 200–250 feet appears adequate for the most sensitive ~~or~~

~~valuable wetlands.[1] As an example, Placer County has setback guidelines in its General Plan of a setback range of 100–400 feet between field crops and natural areas, and a setback range of 50–200 feet between rangeland/pastures and natural areas[2].~~species.[3] In addition, the MSHCP and adopted guidelines of the USFWS and CDFW include a setback of 200 feet or more from nesting birds during construction activities. For example, typical burrowing owl mitigation says, “To adequately avoid active nests, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season.”

~~In evaluating the potential impacts of project development on the SJWA and Mystic Lake, it will be important to consider that the CDFW Conservation Buffer Area was originally purchased by the State to provide a buffer between SJWA/Mystic Lake and future development within the Moreno Highlands Specific Plan (now the proposed project area).~~

Note: The following information has been excerpted from the Jurisdictional Delineation Report prepared by MBA which was updated in 2014 to respond to comments from the resource agencies. ESA prepared an update in 2016. The reports are available for review at the City of Moreno Valley

4.4.1.~~19~~16 On-site Drainages

A formal jurisdictional delineation (JD) was conducted within the ~~WLCSP~~WLC site and offsite facilities by MBA in September 2007 and again in March 2012. ESA conducted an updated JD in 2016 that corroborated the MBA JD. A total of 15 primary drainage features were identified during these combined surveys. A number of sub-drainages or tributaries were also identified. Jurisdiction for each drainage and/or sub-drainage or tributary was evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board (RWQCB~~,~~), respectively; the Porter Cologne Act as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by CDFW.

World Logistics Center

Figure 4.4-5
Burrowing Owl Habitat Suitability

ESA

THIS PAGE INTENTIONALLY LEFT BLANK

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

Based on comments received from the resource agencies, the 2013 JD report concludes that two drainage features (Drainage 12 and 15) have been determined to be jurisdictional waters of the U.S. under Section 404 and 401 of the Clean Water Act (CWA~~.~~). Drainage 15 is included in this discussion because it may occur within two offsite utility improvements. Approximately 500 linear feet of the drainage feature was included in the survey area. Approximately 5,430 linear feet of Drainage 12 is included in the survey area (0.5 acres). This includes approximately 1,300 linear feet within the ~~WLCSP~~WLC site, and the remaining 4,130 linear feet will be part of the offsite improvements. The remaining 13 drainage features are considered isolated features with no direct connectivity to downstream traditional navigable waters or have no significant nexus. Drainage features 1, 5, and 6 are roadside ditches that are also isolated features. Drainage features 3, 4, 10, 11, and 13 are upland swales with evidence of periodic erosion but no evidence of annual flows and no clearly defined bed and bank feature. No jurisdictional wetlands were identified within the entire ~~WLCSP~~WLC site. However, the regulatory agencies make all final jurisdictional determinations.

Drainage features 3, 4, 10, 11, and 13 do not have a clearly defined bed and bank feature and do not have any riparian habitat or evidence of flows. These features are better described as upland swales with occasional eroded areas. Under the Porter Cologne Act, the RWQCB takes jurisdiction of drainage features that would normally be under USACE jurisdiction, but are considered isolated. Drainages 7, 8, 9, 12, and 15 were determined to be waters of the state and subject to the jurisdiction of both the CDFW and RWQCB. The jurisdictional limits of waters of the state are not required to have downstream connectivity. There are approximately 3.0 acres of waters of the state, which includes areas with a clearly defined bed and bank feature within the ~~WLCSP~~WLC site and offsite facilities. However, the CDFW makes all final Section 1600 jurisdictional determinations.

Drainage 1: This feature is a roadside ditch that conveys nuisance flows on the east side of Redlands Boulevard. Currently the ditch is contained within a concreted-lined swale and has intermittent areas with an earthen bed and bank. This ditch has no vegetation and leaves the site in an underground storm drain facility. This roadside ditch typically conveys flows during any storm event because most of the drainage is currently paved. This feature does not contribute to the function or value of any downstream drainage features and is not considered a riparian/riverine feature~~ (see Photos 9 and 10).~~.

Drainage 2: This feature is an upland swale that conveys nuisance flows within an actively disked agricultural field and only receives flows every 5 to 7 years. This swale contains periodic sign of erosion, but is mostly an unvegetated swale with minimal evidence of flows. This drainage begins to sheet flow just north of Bay Avenue and has no hydrologic connection to any downstream drainage feature. This feature does not contribute to the function or value of any downstream drainage and is not considered a riparian/riverine feature~~ (see Photos 11 and 12).~~.

Drainage 3: This feature is a temporary detention basin used to treat nuisance flow from the adjacent Skechers logistic facility. The flows within this feature are completely contained within the facility and there is no downstream connection to any other drainage features. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature ~~(see Photo 13).~~.

Drainage 4: The drainage feature previously originated from an underground storm drain beneath SR-60. The previous flows from this feature have been redirected into the detention basin associated with Drainage 3. Drainage 4 currently conveys flows from local runoff within the ~~WLCSP~~WLC site footprint and only receives flows every 5 to 7 years. This feature has evidence of a historic channel near the intersection of Dracaea Avenue and Sinclair Street. However, this feature sheet flows just south of Cottonwood Avenue and has no hydrologic connection to any downstream drainage features. This drainage does not contribute to the function or value of any downstream drainage features and is not considered a riparian/riverine feature~~ (see Photos 14 and 15).~~.

Drainage 5: This drainage is a roadside ditch located along the western side of ~~Theodore Street.~~World Logistics Center Parkway. This drainage originates at the eastbound ~~Theodore Street~~World Logistics

Center Parkway off-ramp from SR- 60. This feature conveys nuisance flows from Theodore Street and immediate vicinity during large storm events and may only receive flows every 5 to 7 years. This feature contains an intermittent bed and bank feature, but terminates just north of Alessandro Boulevard. This feature has no hydrologic connection to any downstream drainage. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature ~~(see Photos 16 and 17).~~.

Drainage 6: This feature is also a roadside ditch located along the eastern side of ~~Theodore Street~~World Logistics Center Parkway. This drainage originates from an underground storm drainage beneath SR- 60. It conveys nuisance flow from ~~Theodore Street~~World Logistics Center Parkway and immediate vicinity and may only receive flows every 5 to 7 years. This feature contains an intermittent bed and bank feature, but terminates southeast of Alessandro Boulevard within an active agricultural field. This feature has no hydrologic connection to any downstream drainage. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature~~ (see Photos 18 and 19).~~.

Drainage 10: This drainage is an isolated feature that contains some evidence of erosion and is caused by a change in slope within highly erosive soils. This feature terminates as the topography levels resulting in sheet flows. This feature contains a few scattered tree tobacco, but otherwise has no change in soils or vegetation. This feature has no hydrologic connection to any downstream drainage and may only receive flows every 5 to 7 years. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature~~ (see Photo 20).~~.

Drainage 11: This drainage is an isolated feature and similar to Drainage 10. This feature contains some evidence of erosion and is likely caused by runoff associated with Gilman Springs Road. This feature terminates as the topography levels resulting in sheet flows. This feature has no hydrologic connection to any downstream drainage and may only receive flows every 5 to 7 years. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature~~ (see Photo 21).~~.

Drainage 13: This drainage is an isolated feature and similar to Drainage 10. This feature contains some evidence of erosion and is likely caused by runoff associated with the steep hillsides to the south. This feature terminates as the topography levels resulting in sheet flows. This feature has no hydrologic connection to any downstream drainage and may only receive flows every 5 to 7 years. This feature does not contribute to function or value to any downstream drainage features and is not considered a riparian/riverine feature~~ (see Photo 22).~~.

Drainages 1, 2, 3, 4, 5, 6, 10, 11, and 13 do not provide any function or value as drainage features and do not meet the minimum criteria to be designated as Riparian/Riverine areas. All of the above-mentioned drainage features, with the exception of Drainage 13, flow in a north-to-south direction and in a straight-line channel. Drainage 13 flows in a south-to-north orientation. All of these channels terminate as sheet-flow within the ~~WLCSP~~WLC site or immediately offsite and do not reappear further downstream. These features have a parallel flow pattern and are artificially created to minimize flooding impacts to the surrounding agricultural lands within the ~~WLCSP~~WLC site. None of these features has any downstream hydrologic connectivity to any downstream drainage features.

Project components affecting streambed and bank subject to CDFW jurisdiction, including riparian habitat, would require a Streambed Alteration Agreement (SAA) from CDFW.

When impacts are identified during project-specific applications, the proponent will apply for appropriate permits. Mitigation ratios will be determined following standard guidelines and mitigation will include a mixture of onsite habitat creation, offsite habitat creation, or the purchase of offsite mitigation credits at an established mitigation bank. Compensatory mitigation will be no less than a 1:1 replacement ratio to guarantee a no net loss of riparian habitat, but this mitigation ratio is negotiated during the permit ~~the~~ acquisition process on a project-by-project basis.

The ~~WLCSP~~WLC site also incorporates a number of potential offsite improvements. All offsite improvements east of Redlands Boulevard may potentially impact drainage features likely considered jurisdictional by USACE, RWQCB, and CDFW. Once these offsite improvements have been finalized, a project specific jurisdictional delineation will be required in order to document the existing conditions, potential impacts, and recommended mitigation measures.

The previous jurisdictional delineation report[1] conducted in 2012 concluded that the ~~project area~~WLC site contained 14 drainage features including four roadside ditches, seven isolated drainage features, and three isolated features. All 14 drainage features lack direct connectivity to any downstream Traditional Navigable Waters (TNWs) or any other Relatively Permanent Waters (RPW). The four roadside ditches lack riparian vegetation and only convey nuisance flows from localized runoff from the adjacent road. These flows eventually revert to sheet flow within the survey area and have no direct connectivity.

According to the ~~previous~~ 2012 report, the three isolated features include an abandoned water quality detention basin and two abandoned basins associated with previous cattle activities. The water quality basin is a temporary facility that was constructed to treat drainage flows resulting from the construction of the Skechers facility. The two isolated basins were previously used to collect polluted runoff from the associated cattle facility. The facility included concrete-lined areas to contain cattle in a dairy operation. Animal waste would be collected in the basins to protect downstream water quality. The livestock facilities have been removed and the basins are no longer functioning.

The 2012 report determined that the on-site features did not meet the minimum requirements to be considered jurisdictional by regulatory agencies due to the following:

- Lack of connectivity to any downstream waters of the US or waters of the State.
- Absence of a consistent bed and bank and/or ordinary high water mark (OHWM).
- Low biological resource value.
- The roadside ditches and agricultural drainages drain only upland areas and do not carry relatively permanent water flows.
- No jurisdictional wetlands occur within the ~~project area~~WLC site.

Important Note. Although the ~~previous~~ JD report from 2012 concluded the onsite drainages were not jurisdictional, the 2013 JD report has amended that conclusion based on comments by the state and Federal resource agencies. The 2013 JD report concludes there are two (2) drainage channels on the WLC site (Drainages 12 and 15) that are considered jurisdictional by both Federal and state agencies, while drainages 7, 8, and 9 are considered jurisdictional by the CDFW and the RWQCB. The location and extent of these on-site drainages in relation to the project site are illustrated in previously referenced Figure 4.4.2.

~~4.4.1.20 NOP/Scoping Comments~~

~~Local residents and representatives of several conservation groups related the biological resources of the San Jacinto Wildlife Preserve expressed concern about impacts of the project on the Preserve, including diesel particulates and other air pollutants, noise, night lighting, etc. At least one conservation group representative felt that project impacts should be identified~~

---

[1] *Jurisdictional Delineation Report*, Michael Brandman Associates, April 23, 2012.

~~for every species present in the area (see Section 2.6.1, *Notice of Preparation*). Copies of NOP comment correspondence is included in Appendix A.~~

~~The discussion of potential environmental impacts of the project on biological resources and the MSHCP that was requested by conservation groups has been addressed in previous sections, including indirect effects of diesel air pollutant emissions, lighting, noise, etc.~~

4.4.2 Existing Policies and Regulations

4.4.2.1 Federal Regulations

Federal Endangered Species Act (FESA). The FESA was enacted to protect any species of plant or animal that is endangered or threatened with extinction. Section 9 of the FESA prohibits “take” of federally threatened or endangered wildlife. Take, as defined under the FESA, means to harass, harm, pursue, hunt, wound, kill, trap, capture, collect, or attempt to engage in any such conduct (16 USC 1532[19]). Section 9 also prohibits the removal and reduction of endangered plants from lands under Federal jurisdiction, and the removal, cutting, digging, damage, or destruction of endangered plants on any other area in “knowing violation of State law or regulation.”

Section 9 of the FESA (16 USC 1538) prohibits take of a federally listed endangered species of fish or wildlife except pursuant to a permit and HCP approved under Section 10(a) of the FESA (16 USC 1539). The FESA prohibitions and requirements are different, however, for endangered species of plants. Section 9 prohibits the take of endangered plants only from areas under Federal jurisdiction, or if such take would violate state law.

Development ~~proposed by~~of the WLC ~~project~~ site is located on private land. For listed plants located on private land, formal consultation with the USFWS is required when a project has a Federal “nexus” (i.e., a Federal permit is required or Federal funding is involved). In the absence of a Federal nexus, a project does not require a permit under the FESA for impacts to listed plants on private lands.

Clean Water Act. The USACE regulates discharges of dredged or fill material into waters of the United States. These waters include wetlands and non-wetland bodies of water that meet specific criteria, including a direct or indirect connection to interstate commerce. The USACE regulatory jurisdiction pursuant to Section 404 of the Federal Clean Water Act (CWA) is founded on a connection, or nexus, between the water body in question and interstate commerce. This connection may be direct (through a tributary system linking a stream channel with traditional navigable waters used in interstate or foreign commerce) or may be indirect (through a nexus identified in the USACE regulations). The USACE typically regulates as non-wetland waters of the U.S. any body of water displaying an ordinary high water mark (OHWM). In order to be considered a jurisdictional wetland under Section 404, an area must possess three wetland characteristics: hydrophytic vegetation, hydric soils, and wetland hydrology. Each characteristic has a specific set of mandatory wetland criteria that must be satisfied in order for that particular wetland characteristic to be met.

In 2006, the United States Supreme Court in ~~the consolidated cases~~ *Rapanos v. United States* ~~and *Caravell v. United States*, Nos. 04-1034 and 04-1384 (*Rapanos*: June 19,~~ 574 U.S. 715 (2006) addressed CWA jurisdiction over wetlands adjacent or abutting navigable, non-navigable and ephemeral tributaries and jurisdiction over permanent and relatively permanent non-navigable tributaries. According to the United Sates Supreme Court, the CWA does not assert jurisdiction over upland erosional features, gullies, and roadside ditches that have infrequent, low volume, and short duration of water flow. The USACE uses a significant nexus analysis. A water body is considered to have a “significant nexus” with a traditional navigable water (TNW)[1] if its flow characteristics and

---

[1] A “traditional navigable water” includes all of the “navigable waters of the United States,” defined in 33 C.F.R. § 329 and by numerous decisions of the Federal courts, plus all other waters that are navigable-in-fact.

functions in combination with the ecologic and hydrologic functions performed by all wetlands adjacent to such a tributary, affect the chemical, physical, and biological integrity of a downstream traditional navigable water. Additional information is provided in the Environmental Protection Agency (EPA) memorandum titled "Clean Water Act Jurisdiction Following the U.S. Supreme Court's Decision in *Rapanos v. United States* & *~~Caravell~~Carabell v. United States*," dated June 5, 2007 (USACE 2007), and also the *U.S. Army Corps of Engineers Jurisdictional Determination Form Instructional Guidebook* (USACE and EPA 2007).

The Regional Water Quality Control Board (RWQCB) is responsible for the administration of Section 401 of the CWA, through water quality certification of any activity that may result in a discharge to jurisdictional waters of the U.S. The RWQCB may also regulate discharges to "waters of the State," including wetlands, under the California Porter-Cologne Water Quality Control Act.

4.4.2.2 State Regulations

California Endangered Species Act (CESA). The CESA is similar to the FESA in that its intent is to protect species of fish, wildlife, and plants that are in danger of, or threatened with, extinction because their habitats are threatened with destruction, adverse modification, or severe curtailment, or because of overexploitation, disease, predation, or other factors.

"Take" as defined under CESA means hunt, pursue, capture, or kill, or attempt to hunt, pursue, capture, or kill. Under certain conditions, CESA has provisions for take through a 2081 Permit or a Section 2081 Memorandum of Understanding. The impacts of the authorized take must be minimized and fully mitigated. No permit may be issued if the issuance of the permit would jeopardize the continued existence of the species.

California Environmental Quality Act. Section 15380(b) of the *CEQA Guidelines* provides that a species not listed on the Federal or State lists of protected species may be considered rare or endangered if the species can be shown to meet specified criteria. These criteria have been modeled after the definitions in FESA and CESA and § 2780–2781 of Article 1 of the California Fish and Game Code dealing with the California Wildlife Protection Act of 1990. This section was included in the guidelines primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on a species that has not yet been listed by either the USFWS or CDFW.

California Fish and Game Code Section 3503 and the Migratory Bird Treaty Act. Section 3503 of the California Fish and Game Code prohibits the destruction of bird nests except as otherwise provided for in the Fish and Game Code. The MBTA similarly protects the nests of migratory birds. These regulations apply to the individual nests of these species, but do not regulate impacts to the species' habitats.

Raptor Protection. The California Fish and Game Code (Fish and Game Code, Sections 3503, 3503.5, 3505 and 3513), and California Code of Regulations (Title 14, Sections 251.1, 652 and 783-786.6) have specific provisions for the protection of raptors (birds of prey).

Streambed Alteration Agreements. Sections 1600 et seq. of the California Fish and Game Code define the responsibilities of the CDFW and require public and private applicants to obtain an agreement for projects that would "divert, obstruct, or change the natural flow or bed, channel, or bank of any river, stream, or lake designated by the CDFW in which there is at any time an existing fish or wildlife resource or from which those resources derive benefit, or would use material from the streambed designated by the department." CDFW wardens and/or unit biologists typically have the responsibility for formulating and issuing Streambed Alteration Agreements. The CDFW, through provisions of the Code (Sections 1601–1603), is empowered to issue agreements for any alteration of a river, stream, or lake where fish or wildlife resources may be adversely affected. Streams (and rivers) are defined by the presence of a channel bed and banks, and at least an intermittent flow of water. The

CDFW regulates wetland areas only to the extent that those wetlands are part of a river, stream, or lake as defined by the CDFW.

Native Plant Protection Act (NPPA). Sections 1900–1913 of the California Fish and Game Code (Native Plant Protection Act) direct the CDFW to carry out the Legislature's intent to "… preserve, protect and enhance endangered or rare native plants of this state." The NPPA gives the California Fish and Game Commission the power to designate native plants as "endangered" or "rare" and protect endangered and rare plants from take.

4.4.2.3 Regional Regulations

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The continued loss of habitat to new development and the cumbersome process of environmental review and habitat mitigation on a project-by-project basis led to preparation of the MSHCP. The MSHCP is a multi-jurisdictional effort that provides a regional conservation solution to species and habitat issues. The underlying goal of the MSHCP is to protect multiple species by preserving a variety of habitat and providing linkages between different habitat areas and other undeveloped lands. The MSHCP allows Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of CESA and FESA. The overall goal of the MSHCP is to enhance and maintain biological diversity and ecosystem processes while allowing future economic growth.

The MSHCP was adopted on June 17, 2003. The MSHCP is a comprehensive, multi-jurisdictional Habitat Conservation Plan (HCP) focusing on the long-term conservation of species and their habitats in western Riverside County. The MSHCP serves as an HCP pursuant to Section 10(a)(1)(B) of FESA as well as the Natural Communities Conservation Plan (NCCP) under the State of California. ~~The USWFS issued a Biological Opinion for the MSHCP on June 22, 2004.~~ The CDFW also issued the NCCP Approval and Take Authorization for the MSHCP. As long as adherence to the policies and requirements of the MSHCP is maintained, participants in the MSHCP, which include the County of Riverside and fourteen cities (including the City of Moreno Valley), are allowed to authorize "incidental take" of plant and wildlife species of concern.

The MSHCP will eventually result in an MSHCP Conservation Area in excess of 500,000 acres and focuses on conservation of 146 species including amphibians, reptiles, birds, mammals, invertebrates, and plants. The MSHCP Conservation Area includes approximately 347,000 acres on existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. The MSHCP Plan Area encompasses approximately 1.26 million acres (1,966 square miles); it includes all unincorporated Riverside County land west of the crest of the San Jacinto Mountains to the Orange County line, as well as the jurisdictional areas of the Cities of Temecula, Murrieta, Lake Elsinore, Canyon Lake, Norco, Corona, Riverside, Moreno Valley, Banning, Beaumont, Calimesa, Perris, Hemet, and San Jacinto. It provides a coordinated MSHCP Conservation Area and implementation program to preserve biological diversity and maintain the region's quality of life.

The MSHCP serves as a HCP pursuant to Section 10(a)(1)(B) of FESA, as well as an NCCP under the NCCP Act of 2001. The MSHCP allows the City of Moreno Valley as well as other signatories of the Plan to authorize "Take" of plant and wildlife species identified within the Plan Area. The USFWS and CDFW have authority to regulate the Take of Threatened, Endangered, and rare Species. Under the MSHCP, the USFWS and CDFW can grant "Take Authorization" for otherwise lawful actions—such as public and private development that may incidentally Take or harm individual species or their habitat outside of the MSHCP Conservation Area—in exchange for the assembly and management of a coordinated MSHCP Conservation Area.

Of the 1.26 million acres covered by the MSHCP, 500,000 acres have been designated for preservation: 347,000 acres are already conserved as public or quasi-public land and another 45,270 acres have been acquired as habitat by the Regional Conservation Authority (RCA). According to the most recent

RCA-MSHCP Annual Report, the City of Moreno Valley has a high-end goal of conserving 130 acres within its sphere of influence of the MSHCP; the City has already conserved 943 acres (RCA Annual Report 2010, Table 3). Altogether, Riverside County has reached 77 percent of the goal in the MSHCP.

Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP). The USFWS issued a permit to the Riverside County Habitat Conservation Agency on May 3, 1996, for incidental take of Stephens' kangaroo rat (*Dipodomys stephensi*). The 30-year plan is designed to acquire and permanently conserve, maintain, and fund the conservation, preservation, restoration, and enhancement of Stephens' kangaroo rat occupied habitat. The SKR HCP covers approximately 534,000 acres within the member jurisdictions (including the City of Moreno Valley), and includes an estimated 30,000 acres of occupied Stephens' kangaroo rat habitat. The SKR HCP requires members to preserve and manage 15,000 acres of occupied Stephens' kangaroo rat habitat in 7 Core Reserves encompassing over 41,000 acres. Currently 12,460 acres of occupied habitat exists within the Core Reserves.

4.4.2.4 City of Moreno Valley General Plan Policies

The specific policies outlined in the City's General Plan Conservation Element related to biological resources include:

Conservation Element

Policy 7.4.1 Require all development, including roads, proposed adjacent to riparian and other biologically sensitive habitats to provide adequate ~~buffers~~setbacks to mitigate impacts to such areas.

Policy 7.4.3 Preserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels.

Policy 7.4.5 The City shall fulfill its obligations set forth within any agreement(s) and permit(s) that the City may enter into for the purpose of implementing the Western Riverside County Multiple Species Habitat Conservation Plan.

4.4.3 Methodologies

The ~~project area~~WLC site was assessed to determine consistency with the MSHCP focusing on conservation of species and their associated habitats in western Riverside County. The Riverside County Integrated Project (RCIP) Conservation Summary Report was first reviewed to determine habitat assessment and potential survey requirements for the study area. Geographic Information Systems (GIS) software was used to map the site in relation to MSHCP areas including Criteria Cells; conservation areas and linkages; Criteria Area Species Survey Areas for plant, bird, mammal, and amphibian species; Narrow Endemic Plants Survey Area; and survey requirements for inadequately covered species.

4.4.3.1 Literature Search

Prior to each field visit, a literature review to determine environmental conditions occurring on the study area and the surrounding area was conducted. The primary objective of the review is to evaluate the potential for suitable habitat for sensitive plant and wildlife species, as well as to determine the applicability of other MSHCP and CEQA requirements as they pertain to the ~~proposed~~ project. A compilation of sensitive plant and wildlife species recorded in the vicinity of the study area was derived from the CDFW's California Natural Diversity Data Base (CDFW 2012), a sensitive species and plant community account database. Additional recorded occurrences of plant species found on or near the planning area were derived from the California Native Plant Society's (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants of California database. The CNDDB and CNPS search was based on the *Lakeview, Sunnymead*, and *El Casco, California* USGS 7.5-minute topographic quadrangles, encompassing 126 square miles. Additional recorded occurrences of these species found on or near the study area were derived from biota studies conducted for the MSHCP as well as studies conducted by MBA biologists for other projects over the years.

The MSHCP and CEQA also require an assessment to determine the potentially significant effects of the project on riparian/riverine areas and vernal pools. According to the MSHCP, the documentation for the assessment shall include mapping and a description of the functions and values of the mapped areas with respect to the species listed in the MSHCP's Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools. This assessment is independent from considerations given to waters of the U.S. and waters of the State under the Clean Water Act (CWA) and California Fish and Game Code. This assessment has been completed for all of the study area but not in the zone of potentially indirect effects.

As part of the MSHCP requirements, an Urban/Wildlands Interface Analysis is required to address the indirect effects associated with locating proposed development in proximity to MSHCP conservation areas. The development may result in edge effects, which could potentially affect biological resources within the MSHCP Conservation Area. According to the MSHCP, the analysis should include an assessment of the potential indirect project impacts that may result from drainage features, toxics, noise, invasive species, barriers, access, and grading/development, as listed and described in the MSHCP's Section 6.1.4, *Guidelines Pertaining to Urban/Wildlands Interface*. For this study, the Urban/ Wildlands Interface Analysis was extended eastward to include indirect effects adjacent to Gilman Springs Road.

4.4.3.2 Habitat Assessment Survey

MBA originally assessed the planning area in 2005 and has conducted numerous additional surveys since then. Details of the survey dates and specific survey areas are provided in the 2012 MBA report (DEIR Appendix E). The ~~planning area, including the~~WLC site, off-site facilities and the ~~CDFW Conservation land, was~~adjacent SJWA, were surveyed to determine the plant communities present, the suitability for Narrow Endemic and Criteria Area plant species, the presence of riparian areas, and the presence of suitable habitat for burrowing owl and Los Angeles pocket mouse. Parameters assessed included soil conditions, presence of indicator species, slope, aspect, and hydrology. ESA conducted update surveys in 2018 for Narrow Endemic plant species, burrowing owl, coastal California gnatcatcher, and Los Angeles pocket mouse.

4.4.3.3 Plants

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photographs. The plant communities within the planning area were classified according to the CDFW's List of Terrestrial Natural Communities (2003) and cross-referenced to descriptions provided in Holland's Preliminary Descriptions of the Terrestrial Natural Communities of California (1986) and Oberbauer's Terrestrial Vegetation Communities in San Diego County Based on Holland's Descriptions (1996). Common plant species observed during reconnaissance-level surveys in the planning area were identified by visual characteristics and morphology in the field and recorded in a field notebook. Uncommon and less familiar plants were identified off site using taxonomical guides. A list of all species observed on the study area was compiled from the survey data, shown in Appendix A of the MBA 2012 report (DEIR Appendix E).

ESA conducted a rare plant survey in 2018 focusing on three plant species having a moderate to high potential to occur based on the existing habitats within the Plan Area and known occurrences within the Project vicinity. These three species include thread-leaf brodiaea, smooth tarplant, and Coulter's goldfields. No special-status plant species were observed during the 2018 focused survey effort.

4.4.3.4 Wildlife

Wildlife species detected during field surveys in the planning area by sight, calls, tracks, scat, or other sign recorded during surveys in a field notebook by all biologists working on the project. Field guides were used to assist with identification of species during surveys. Although common names of wildlife species are fairly well standardized, scientific names are used in this report and are provided in Appendix A of the 2013 MBA report (DEIR Appendix E).

4.4.3.5 Riparian/Riverine and Vernal Pool Habitat

Aerial photography was reviewed prior to conducting general surveys to identify any potential natural drainage features and water bodies that may qualify as riparian/riverine. In general, the surface drainage features indicated as blue-line streams on USGS topographic quadrangle maps that were observed or expected to exhibit evidence of flow, can potentially support riparian/riverine areas. The ~~planning area~~WLC site was evaluated for any riparian/riverine and vernal pool habitat in 2005, 2007, 2012, 2013, and ~~2013~~2016.

4.4.3.6 Burrowing Owl

The ~~project~~WLC site is within the MSHCP burrowing owl survey area, and habitat assessments for burrowing owl (*Athene cunicularia hypugea*) were conducted 2005, 2006, 2010, 2012, 2013, and ~~2013~~2018 on various portions of the ~~project~~WLC site. Areas of suitable habitat, if present, were mapped onto an aerial photograph. Potential owl burrows, such as abandoned small mammal burrows, as well as manmade structures including earthen berms, cement culverts, cement, asphalt, rock, or wood debris piles, or openings beneath cement or asphalt pavement are generally mapped onto an aerial photograph. The site was determined to have suitable habitat in a number of widespread locations, and owls were observed in various locations during the MSHCP fieldwork, so a focused survey was recently conducted in ~~2013~~2018.

A focused western burrowing owl survey was conducted for the proposed ~~project~~WLC site on seven separate days in 2013 and on four days in 2018. Under the MSHCP, the focused survey protocol was divided into two parts: 1) a Focused Burrow Survey; and 2) a Focused Burrowing Owl Survey. The focused survey was conducted during the breeding season (March 1–August 31) as defined under the MSHCP,[1] and also in accordance with the California Burrowing Owl Consortium's (CBOC) *Burrowing Owl Survey Protocol and Mitigation Guidelines*.[2] ~~Although the~~The species was ~~not~~ observed during the most recent survey~~, it~~ in 2018 conducted by ESA, and the species has been observed at other times in the past, and is assumed to be present due to the presence of suitable habitat and the fact they can occupy fallow agricultural fields relatively quickly. The MSHCP requires that pre-construction surveys be completed in areas of suitable habitat.

4.4.3.7 Los Angeles Pocket Mouse

Focused surveys for the Los Angeles pocket mouse (LAPM) (*Perognathus longimembris brevinasus*) were conducted in August 2005, June 2010, June 2012, ~~and~~ July 2013, and May 2018 (see DEIR Appendix E). The surveys were conducted according to the established USFWS protocols for Pacific pocket mouse (*Perognathus longimembris longimembris*), a similar species. The current protocol requires trapping for 5 consecutive nights: conducted when the animal is active aboveground at night, during a new moon phase, if possible. No LAPM were observed in the ~~project area~~WLC site during the focused surveys, ~~but~~although there is marginal habitat located in Drainages 7 and 9. MBA and ESA concluded that the ~~project area~~WLC site was not occupied by LAPM. However, future surveys may be needed for development in areas of the site that contain suitable habitat for the project to be consistent with the long-term conservation goals of the MSHCP.

[2] Burrowing Owl Survey Protocol and Mitigation Guidelines, California Burrowing Owl Consortium, 1993.

4.4.3.8 Jurisdictional Determination Report

Prior to beginning the field delineation, a color aerial photograph, a topographic base map of the ~~project area~~WLC site and the previously cited USGS topographic maps were examined to determine the locations of potential areas of USACE/CDFW/RWQCB jurisdiction. Potential jurisdictional areas were field-checked for the presence of definable channels[1] and/or wetland vegetation, soils and hydrology. Suspected wetland habitats on the site were evaluated using the methodology set forth in the *U.S. Army Corps of Engineers 1987 Wetland Delineation Manual*[2] (Wetland Manual) and the *2008 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0).[3] The limits of USACE/CDFW/RWQCB jurisdiction were recorded using sub-meter GPS technology while in the field.

4.4.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, biological resource impacts would occur if the ~~proposed~~ project would:

- Have a substantial adverse effect, either directly or indirectly or through habitat modification, on any species identified as endangered or threatened in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect, either directly or indirectly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or the USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native or resident migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or
- Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

4.4.5 Less than Significant Impacts

4.4.5.1 Adopted Policies and/or Ordinances

~~Threshold~~	~~Would the proposed project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?~~

---

[1] U.S. Army Corps of Engineers. 2008. A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) ion the Arid West Region of the United States: A Delineation Manual. Threshold Would the proposed project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Table 4.4~~.E~~-5 summarizes the City's General Plan and Municipal Code policies regarding biological resources and their consistency with the ~~WLCSP~~WLC site.

Table 4.4~~.E~~-5: General Plan and Municipal Code Biological Resources Policies

Goals, Objectives, Policies, Ordinances		**Project Consistency**
City of Moreno Valley General Plan		
Objective 7.4	Maintain, protect, and preserve biologically significant habitats where practical, including the San Jacinto Wildlife Area, riparian areas, habitats of rare and endangered species, and other areas of natural significance.	No significant riparian or other biologically sensitive habitat is on or adjacent to the ~~study area~~WLC site. The project is consistent with this objective.
Policy 7.4.1	Require all development, including roads, proposed adjacent to riparian and other biologically sensitive habitats to provide adequate buffers to mitigate impacts to such areas.	No significant riparian or other biologically sensitive habitat is on or adjacent to the ~~study area~~WLC site. The project is consistent with this policy.
Policy 7.4.2	Limit the removal of natural vegetation in hillside areas when retaining natural habitat does not pose threats to public safety.	Limited stands of natural plant communities or stands of native vegetation occur in the ~~study area~~WLC site within hillside areas. These areas are proposed as open space under the proposed action. The project is consistent with this policy.
Policy 7.4.3	Preserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels.	The study area contains 14 drainages and/or basins. As specific projects are designed within the ~~WLCSP~~WLC site, consistency with the policy will have to be determined.
Policy 7.4.4	Incorporate significant rock formations into the design of hillside developments.	The ~~study area~~WLC site is generally not a hillside area. Limited natural rock formations occur in a proposed open space area. The project is consistent with this policy,
Policy 7.4.5	The City shall fulfill its obligations set forth within any agreement(s) and permit(s) that the City may enter into for the purpose of implementing the Western Riverside County Multiple Species Habitat Conservation Plan.	See Consistency with Chapter 3.48 of the City of Moreno Valley Municipal Code below.
City of Moreno Valley Municipal Code		
Title 3 Revenue and Finance		
Chapter 3.48 MSHCP Fee Program (Ordinance 742 Section 1.1, 2007)	Establish a local development mitigation fee to assist in the maintenance of biological diversity and the natural ecosystem processes that support this diversity; the protection of vegetation communities and natural areas within the city and western Riverside County which are known to support threatened, endangered or key sensitive populations of plant and wildlife species; the maintenance of economic development within the city by providing a streamlined regulatory process from which development can proceed in an orderly process; and the protection of the existing character of the city and	MBA conducted an MSHCP Consistency Analysis for the ~~proposed~~ project in 2012 and found that the ~~study~~WLC site area is within the MSHCP fee area. Impacts are potentially ~~significant and~~consistent; however, mitigation is provided.

Table 4.4~~.E~~-5: General Plan and Municipal Code Biological Resources Policies

Goals, Objectives, Policies, Ordinances		Project Consistency
	the region through the implementation of a system of reserves which will provide for permanent open space, community edges, and habitat conservation for species covered by the MSHCP.	
Title 8 Buildings and Construction		
Chapter 8.60 Threatened and Endangered Species (Ordinance 502 Section 2.1, 1996)	Adopt and require certain implementation measures as required by the Stephens' Kangaroo Rat Habitat Conservation Plan (SKRHCP), the Section 10(a) Permit and the Management Authorization; and to adopt and impose an impact and mitigation fee to provide funds to the Riverside County Habitat Conservation Authority to implement the terms of the SKRHCP.	The ~~study area~~WLC site is located within the known range of SKR. The study area is also located within the SKRHCP fee area and not in the SKRHCP Core Reserve Area. Impacts are potentially not consistent; however mitigation is provided.

Sources: City of Moreno Valley General Plan, 2006; City of Moreno Valley Municipal Code.

This analysis indicates the ~~proposed~~ project is consistent with local policies and ordinances protecting biological resources that apply to the ~~project area~~WLC site. Compliance with State and Federal regulations to ensure protection and preservation of significant biological resources, and the implementation of the MSHCP are the applicable policies/programs that the project must implement. As there are no other local policies or ordinances regarding the protection of biological resources identified by the City or other local jurisdiction applicable to the ~~project~~WLC site, no impact would occur and no mitigation is required.

4.4.5.2 Adopted Habitat Conservation Plans

Threshold	Would the proposed project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The project site is subject to the provisions of two HCPs: the SKR HCP and the MSHCP. Impacts related to these HCPs are discussed in this section.

a. Stephens' Kangaroo Rat Habitat Conservation Plan

TheWLC site is within the SKR HCP Fee Area. The SKR is relatively widespread throughout the SKR HCP Fee Area, but the main blocks of occupied habitat are concentrated in several Core Areas that must be conserved. The WLC site is not within an SKR Core Area. The SKR also requires species-specific monitoring and management to ensure its long-term viability in the SKR HCP, including tracking population densities and maintaining sparse, open grassland habitats. The recently released Draft Land Management Plan for the San Jacinto Wildlife Area proposes an SKR resource area in the northeast portion of the SJWA, adjacent to Gilman Springs Road and the WLC site.[1]

The long-term SKR HCP provides Take Authorization for the SKR within its boundaries. The core reserves established by the SKR HCP will be managed as part of the MSHCP Conservation Area consistent with the provisions of the SKR HCP. Focused surveys for Stephens' kangaroo rat will not be required for this project because the project lies within the SKR Fee Area; therefore, no requirements under the SKR HCP other than payment of a local fair share mitigation fee to acquire additional SKR conservation lands are required.

---

[1] "Draft Land Management Plan for the San Jacinto Wildlife Area." Department of Fish and Wildlife, 2017.

b. Summary of Western Riverside County Multiple Species Habitat Conservation Plan Impacts

The WLC site is located within the Reche Canyon/Badlands Area of the MSHCP. Development of the WLC site would not conflict with the conservation goals established by the MSHCP for Cell Group X or Cell Group E. In addition, no conflict from development would occur in relation to the Reche Canyon/Badlands Area Plan, the Area Plan Subunit 4, the Area Plan Subunit 3, Proposed Core 3, or Existing Core H.

The WLC site and the proposed offsite facilities occur immediately adjacent to the vicinity of Core H and proposed Core 3. RCA staff commented that they believed any increase in truck traffic associated with the ed project along Gilman Springs Road could significantly affect wildlife movement between Core H and proposed Core 3 and requested mitigation to offset those impacts. However, the appropriate mitigation for increased traffic on Gilman Springs Road is payment of the project's fair share of the improvements to Gilman Springs Road, including provisions for wildlife movement or crossings. The design and improvement of Gilman Springs Road is a County project that is not under the control of the project applicant or the city. In addition, the WLC project site supports limited habitat suitable to promote wildlife movement because of the lack of vegetative cover.

No development will be allowed within 250 feet of the SJWA. However, development that will be near the SJWA may cause significant indirect impacts to species within the SJWA, which will require mitigation that may include a fair share contribution toward safety improvements along Gilman Springs Road.

The WLC site is adjacent to Cell Group D and Proposed Core 3, it is not near any Linkages identified in the MSHCP. However, it is adjacent to the SJWA and is subject to the project guidelines provided in MSHCP Section 6.1.4 (Guidelines Pertaining to the Urban/Wildlands Interface). The project is also required to adhere to the Best Management Practices (BMPs) found in Appendix C of the MSHCP.

The WLC project does not propose to alter land use in any way that would adversely affect Cores, Linkages, or Reserve Assembly within the Reche Canyon/Badlands Area Plan.

The WLC project is not located within any Amphibian, Mammalian, or Special Linkage Areas identified by the MSHCP. The project is in an area requiring burrowing owl surveys, is within the MSHCP Criteria Area Species Survey Area (CASSA), and is within the Narrow Endemic Plant Species Survey Area (NEPSSA).

The MSHCP and its Implementation Agreement contain a fee mitigation program pursuant to which local agencies collect development impact fees and remit such fees to the Riverside Conservation Authority (RCA). These fees are in turn used to acquire lands that are suitable for habitat preservation for species covered by the MSHCP. Payment of the local MSHCP mitigation fee will be required of the project prior to the issuance of building permits. The MSHCP provides that payment of the fee completely mitigates a project's environmental impacts.

From available information, potential indirect impacts to avian and other biological resources within the SJWA will be reduced to less than significant levels by the creation of a 250-foot on-site setback in **Mitigation Measure 4.4.6.1A**. Project design features and associated setbacks previously described will reduce project impacts to adjacent biological resources to less than significant levels. As required by the October 17, 2014 JPR, the WLC Project must implement the guidelines contained in MSHCP Section 6.1.4 related to controlling adverse effects for development adjacent to the MSHCP Conservation Area, of which there are seven specific conditions. Therefore, the WLC project would have a less than significant impact in regard to the MSHCP.

Participation in the MSHCP and contribution of MSHCP provides compensation for the loss of raptor foraging habitat due to approved projects. A project proponent is required to participate as outlined in the MSHCP, so that loss of raptor foraging habitat is considered to be less than significant and no mitigation is required.

Narrow Endemic Plant Species. No Narrow Endemic plant species are anticipated to occur in the WLC site, but compliance with **Mitigation Measure 4.4.5.2A** will assure there will be no significant impacts to these plant species.

Criteria Area Plant Species. No Criteria Area plant species are anticipated to occur on the WLC site, but compliance with **Mitigation Measure 4.4.5.2A** will assure there will be no significant impacts to these plant species.

Riparian/Riverine Areas and Vernal Pools. Drainage Features 7, 8, 9, 12, and 15 contain riparian/riverine areas, as designated by the MSHCP. The WLC site does not contain habitat suitable for covered riparian species, such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. No vernal pools or ephemeral ponds were observed on the WLC site and no suitable habitat for any fairy shrimp species was identified on site. No additional mitigation regarding vernal pools or vernal pool species is required. A programmatic-level DBESP was prepared by MBA in 2013 to outline specific requirements for project related impacts to these features in the future. A project-specific DBESP will be required for each development project within the WLC.

c. Nitrogen Deposition

Nitrogen deposition is the term used to describe nitrogen-based pollutants that are deposited as a result of emissions from future project related activities. The pollutants are typically in the form of nitrogen oxide (NO_x) and ammonia (NH_3)-derived pollutants, primarily nitric acid (HNO_3). Although there are many types of nitrogen-based pollutants resulting from project-related emissions, HNO3 is typically the easiest to measure and is used in determining nitrogen deposition rates. Mechanisms by which nitrogen deposition can lead to impacts on sensitive species include (1) direct toxicity, (2) changes in species composition among native plants, and (3) enhancement of invasive species (Fenn et al. 2003; Weiss 2006a). Direct toxicity refers to impacts associated with direct contact with the nitrogen pollutants. There is no scientific documentation that links direct toxicity to impacts associated with sensitive plant and wildlife species. Therefore, direct toxicity is not considered a significant impact.

An increase in available nitrogen promotes the growth of non-native weedy species, which alone is not considered a significant impact. The increased dominance and growth of invasive annual grasses is especially prevalent in low-biomass vegetation communities that are naturally nitrogen-limited, such vegetation communities that occur in the project vicinity include coastal sage scrub and vernal pools (Weiss 2006a). An increase in nitrogen deposition does not inhibit the growth of native plants, but promotes the rapid growth of non-native invasive species that could out-compete native plants for available water and nutrients. If the increase of non-native plant species is detrimental to the growth of native plants, the result may be a conversion from a native plant community to a non-native plant community. This change in habitat is only considered a significant impact if that change occurs in suitable habitat for a federally threatened or endangered species within USFWS-designated critical habitat.

In addition, vernal pools were identified by Weiss (2006a) as a California ecosystem that may be sensitive to nitrogen deposition. Nitrogen deposition in vernal pools stimulates plant growth (including non-native species in adjacent uplands) and the nitrogen is rapidly assimilated by plants and invertebrates within the pools (biomass and dissolved organic nitrogen) (Hobson and Dahlgren 1998). Because of the isolated nature of vernal pools, the nitrogen pollutants accumulate over time and provide a more concentrated level of nitrogen for non-native plants. Since vernal pools are known to provide suitable habitat for a number of federally threatened or endangered species, impacts to vernal pools caused by nitrogen deposition may be considered a significant impact. There are no vernal pools within the WLC site.

Although non-native plant invasions have affected the vernal pools in the region (the closest recorded occurrence of vernal pool habitat is approximately 3.5 miles to the south), these invasions generally occur in years when precipitation is sparse. In wetter years, the number of non-native plants is reduced since the non-native upland species are intolerant of inundation and the invasion cycle may be reset in some cases. This means that the established non-native plants are not adaptable to an aquatic habitat and die-off during prolonged periods of inundation. Even though the non-native plant species will have an abundance of available nitrogen and optimum growing conditions, the prolonged inundation periods prohibit non-native invasive species growth.

The WLC will consist of mobile, non-point pollution sources (diesel trucks), which will result in a highly random dispersion of emissions that will occur in a broad, regional fashion. Because of the way in which nitrogen is generated by the WLC project, its overall patterns for dispersion, and the multi-variant parameters that would need to be taken into consideration for such an analysis, there is no established scientific basis or standards to study the effects of nitrogen dispersion for non-point pollution sources; hence, project-specific conclusions or mitigation would be overly speculative for the purposes of this Revised Sections of the FEIR.

Specific Plan Design Features. The project is consistent with the MSHCP requirements relative to core areas, criteria cells, threatened and endangered species. In addition, the WLC project complies with the MSHCP guidelines for urban/wildland interface, riparian/riverine areas, or related buffers (with implementation of **Mitigation Measure 4.4.6.1A**). In addition, future development will be required to demonstrate that it is also consistent with all MSHCP requirements, including indirect impacts such as lighting, noise, and air pollution effects.

Regulatory Compliance. Stephens' kangaroo rats have a low potential to occur within the study area. While the study area is not within the SKR Core Reserve Area, the SKR HCP Implementing Agreement requires payment for loss of habitat within defined areas. The entire WLC site lies within the fee area. An assessment of individual actions for development within the WLC site would be required prior to any implementation. The number of acres of disturbance associated with the development and any off-site improvements will require payment to comply with the SKR HCP. In addition, prior to issuance of a grading permit on each project, applicants will be required to pay the mandatory mitigation fee for the MSHCP. The mitigation fee is a per acre fee for commercial or industrial development. Payment of the fee is considered complete mitigation of a project's environmental impacts.

Mitigation Measures. In addition to payment of SKR and MSHCP impact fees, the following measures are recommended to ensure that potential impacts to sensitive species are reduced to less than significant levels:

4.4.5.2A Each Plot Plan application shall include a focused plant survey of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, Plummer's mariposa lily, or thread-leaved brodiaea) are present. If any of the listed plants are found, they may be relocated to the 250-foot setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, at the applicant's discretion, an impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species. This measure shall be implemented to the satisfaction of the Planning Official.

4.4.5.2B Prior to the approval of any tentative maps for development including or adjacent to any Criteria Cells identified in the Western Riverside County Multiple Species Habitat Conservation Plan, the applicant shall prepare and process a Joint Project Review (JPR) with the Riverside County Resource Conservation Agency (RCA). All criteria cells shall be identified on all such tentative maps. This measure shall be implemented to the satisfaction of the City Planning Division and Riverside County Resource Conservation Agency ("RCA").

In addition, the **Mitigation Measures 4.4.6.1A and 4.4.6.1B** described below will also help reduce potential direct and indirect impacts to biological resources covered by the MSHCP.

Potential impacts related to MSHCP consistency will be less than significant. With implementation of **Mitigation Measures 4.4.6.1A, 4.4.6.1B, 4.4.6.2B, 4.4.5.2A,** and **4.4.5.2B**, the less than significant impacts related to MSHCP consistency will be further reduced.

4.4.5.3 Habitat Fragmentation/Wildlife Movement

~~Threshold~~	~~Would the proposed project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?~~

Threshold	Would the proposed project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Habitat fragmentation occurs when a single, contiguous habitat area is divided into two or more areas, or where an action isolates the two or more new areas from each other. Isolation of habitat occurs when wildlife cannot move freely from one portion of the habitat to another or to/from one habitat type to another. Habitat fragmentation may occur when a portion of one or more habitats is converted into another habitat, as when scrub habitats are converted into annual grassland habitat because of frequent burning. Wildlife movement includes seasonal migration along corridors, as well as daily movements for foraging. Examples of migration corridors may include areas of unobstructed movement for deer, riparian corridors providing cover for migrating birds, routes between breeding waters and upland habitat for amphibians, and between roosting and feeding areas for birds.

The ~~project area~~WLC site contains no significant cover of native plant communities and currently experiences heavy disturbance associated with agricultural activities. Additionally, the ~~project area~~WLC site is adjacent to SR-60 and Gilman Springs Road on the north and east and is bordered by urban development on the west. The nearest linkage area as identified under the MSHCP is Proposed Linkage 5 and is located approximately 3 miles north of the project and approximately 3.6 miles south of the project is Proposed Constrained Link 20. The development of the ~~project area~~WLC site will not impede the movement of any wildlife; therefore, the~~ proposed~~ project will not affect any wildlife movement corridor.

The ~~Conservation Buffer Area located in the southern portion of the project area is owned by the CDFW and currently regularly disked as part of the SJWA's agricultural operations. It~~SJWA currently provides foraging habitat for various resident and migratory wildlife species. The southern portion of the ~~project area~~WLC site adjacent to the SJWA lands has been actively farmed for decades and is regularly disked. The ~~Conservation Buffer Area~~northern portion of the SJWA is designated as open space ~~in the proposed project~~ and no development is proposed for this area.

Although the ~~project area~~WLC site does not contain any designated wildlife movement corridors or MSHCP linkages (i.e., MSHCP, City General Plan, etc.), it is likely that wildlife moves through adjacent properties such as the SJWA and the Mystic Lake area to the south, the Badlands area to the east and the Lake Perris State Recreation Area to the southwest. The MBA project biological report concluded, which was confirmed in the 2018 surveys by ESA, that development of the project as ~~proposed~~WLC site would not directly have any significant impact on wildlife movement in the area, and would not fragment habitat or adversely affect wildlife movement through the surrounding areas~~.~~ because the WLC site contains limited vegetation cover and minimal resource value for wildlife moving between habitat blocks. The biological report also determined that the ~~proposed project~~WLC site would not impede or minimize any significant wildlife corridor for the target species associated within the Reche Canyon/Badlands Area plan, which include Bell's sage sparrow (*Amphispiza belli belli*), cactus wren (*Campylorhynchus brunneicapillus sandiegensis*), loggerhead shrike (*Lanius ludovicianus*), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), bobcat (*Lynx rufus*), Los Angeles pocket mouse (*Perognathus longimembris brevinasus*), mountain lion (*Puma concolor*), San Bernardino kangaroo rat (*Dipodomys merriami parvus*), Stephens' kangaroo rat (*Dipodomys stephensi*), and Nevin's barberry (*Berberis nevinii*). In addition, although not required, Drainage 9, comprising the most suitable habitat in the eastern portion of the WLC site, is being ~~designed~~retained to allow for wildlife movement between the Badlands and the SJWA (e.g., relatively natural channel conditions with 50-foot setbacks on either side of the channel through the ~~WLCSP~~WLC site property. These project design features will maintain a wildlife travel path along Drainage 9. Therefore, impacts related to wildlife movement are less than significant, and no mitigation is needed.

4.4.6 Significant Impacts

4.4.6.1 Endangered and Threatened Species

Impact 4.4.6.1: *The project may have significant impacts on listed species.*

~~Threshold~~	~~Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as endangered or threatened in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?~~

Threshold	Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as endangered or threatened in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Of the special-status plant and animal species that have the potential to occur within the general vicinity of the ~~project area~~WLC site, 17 plant and animal species are designated as endangered or threatened by State and/or Federal authorities (Table 4.4~~.F). None~~-6). One of these species, coastal California gnatcatcher, was observed ~~or is~~but none of the other species are believed to be present on the ~~project~~WLC site; it is possible the listed birds may utilize the SJWA on a seasonal basis.

~~Table 4.4.F: Endangered/Threatened Species Within the Project Area~~

The potential for occurrence determination was based on the results of focused biological resource surveys, and/or the lack of suitable habitat in the project limits for the referenced species. One Federal or State endangered/threatened species, coastal California gnatcatcher, was detected on the WLC site during the focused biological resource surveys, for which mitigation is included. It is also reasonable to conclude that, at a minimum, indirect impacts to listed species may be significant, and mitigation is required.

Coastal California gnatcatcher is a Covered Species in the MSHCP and is considered Adequately Conserved. Consistent with the MSHCP requirements, Mitigation Measure **4.4.6.3A** prevents suitable habitat from disturbance during the breeding season. Active bird nests are protected by both the Migratory Bird Treaty Act and sections of the California Fish and Game Code.

Table 4.4-6: Endangered/Threatened Species Within the WLC site

Species	Status Designation	Potential for Occurrence
Munz's onion *Allium munzii*	Federal: Endangered State: Threatened	Not Expected
San Diego ambrosia *Ambrosia pumila*	Federal: Endangered State: None	Not Expected
Marsh sandwort *Arenaria paludicola*	Federal: Endangered State: Endangered	Low
Nevin's barberry *Berberis nevinii*	Federal: Endangered State: Endangered	Not Expected
Thread-leaved brodiaea *Brodiaea filfolia*	Federal: Endangered State: Threatened	Not Expected
Slender-horned spineflower *Dodecahema leptoceras*	Federal: Endangered State: Endangered	Not Expected
Spreading navarretia *Navarretia fossalis*	Federal: Threatened State: None	Not Expected
California Orcutt grass *Orcuttia californica*	Federal: Endangered State: Endangered	Not Expected
Vernal pool fairy shrimp *Brachinecta lynchi*	Federal: Threatened State: Special Animal	Not Expected
Riverside fairy shrimp *Streptocephalus woottoni*	Federal: Endangered State: Special Animal	Not Expected
Quino checkerspot butterfly *Euphydryas editha quino*	Federal: Endangered State: Special Animal	Not Expected
California tiger salamander *Ambystoma californiense*	Federal: Threatened State: Species of Special Concern	Not Expected
Southwestern willow flycatcher *Empidonax traillii extimus*	Federal: Endangered State: Special of Special Concern	Not Expected
Coastal California gnatcatcher *Polioptila californica californica*	Federal: Threatened State: Special of Special Concern	~~Not Expected~~Present
Least Bell's vireo *Vireo belli pusillus*	Federal: Threatened State: Special of Special Concern	Not Expected
San Bernardino kangaroo rat *Dipodomys merriami parvus*	Federal: Threatened State: Special of Special Concern	Not Expected
Stephens' kangaroo rat *Dipodomys stephensi*	Federal: Endangered State: Threatened	Not Expected

Source: *MSHCP Compliance Report,* Michael Brandman Associates. April 23, 2012 Appendix E-1.

~~The potential for occurrence determination was based on the results of focused biological resource surveys, and/or the lack of suitable habitat in the project limits for the referenced species. No Federal or State endangered/threatened species were detected on the project site during the focused biological resource surveys. However, to err on the side of caution, it is reasonable to conclude that, at a minimum, indirect impacts to listed species may be significant, and mitigation is required.~~

Project or Specific Plan Design Features. The ~~proposed~~ World Logistics Center Specific Plan provides for a number of project design features to address the interface between the ~~project~~WLC site and the SJWA. These features include enhanced landscaping along the southern boundary, restrictions on site lighting, restrictions on native/drought-tolerant landscape materials, the installation of special drainage facilities, restrictions on public access, special architectural standards for building elevations facing the SJWA, restrictions on the orientation of adjacent buildings, signage restrictions, and other development guidelines intended to create an interface area that is sensitive to the unique relationship between the project and the SJWA.

The Specific Plan establishes a 250-foot wide development setback from the southernmost property line along the SJWA boundary, and an additional 150-foot building setback ~~(i.e., in addition to~~from the development setback~~ provided by the CDFW Conservation Area)~~ to help minimize potential impacts on biological resources of the SJWA.

~~It is important to note that the 910-acre area immediately south of the project was purchased by the State of California largely to serve as a buffer between the habitat area and future development to the north (at that time, the Moreno Highlands Specific Plan). The acquisition of this buffer area created a State-owned 3,000-foot wide separation between the project and the SJWA at that time.~~

The Specific Plan includes development restrictions that may affect off-site areas such as the SJWA, including architecture and building design, landscaping, and off-site lighting:

- *Architecture and Building Restrictions (Specific Plan Section 4.1).* Sections 4.1.2 and 4.1.3 require ground- and roof-mounted equipment to be screened from off-site view.

- *Landscaping Restrictions (Specific Plan Section 4.2).* Section 4.2.4 provides “Special Edge Treatment Areas” in terms of adjacent land uses, including the SJWA (Section 4.2.4.3) and Gilman Springs Road (Section 4.2.4.4).

- *Off-site Lighting (Specific Plan Section 4.3).* Section 4.3.1 indicates one of the main objectives of the project lighting is “… all lighting in the vicinity of the San Jacinto Wildlife Area shall be designed to confine all direct light rays to the project site and preclude the visibility of direct light rays from the wildlife area” (page 4-42). The project will also have to comply with the City’s new Dark Sky Lighting Ordinance, which reduces spillover light to 0.25 foot-candles at five feet from the adjacent property lines.

- *Setbacks -* The Specific Plan provides for a 250-foot development setback and an additional 150-foot building setback adjacent to the ~~CDFW Conservation Buffer Area~~SJWA. The development setback area would include landscape areas, drainage facilities, site fencing and walls, etc. According to available research previously presented in Section 4.4.1.18a, a 250-foot development setback is adequate for a project-SJWA ~~buffer~~separation and is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and also the distance established in nesting bird surveys for setbacks from human activity. In addition, the Specific Plan requires solid walls along the property line, which will help provide an additional a buffer from building lighting and noise and effectively mitigate potential direct and indirect impacts on the SJWA.

Roadkill. As development occurs within the ~~WLCSP~~WLC site, some local wildlife will be injured or killed by the additional vehicles and trucks on SR-60, Gilman Springs Road, Redlands Boulevard north of Eucalyptus Avenue, and all internal ~~WLCSP~~WLC site roads. There is no accurate way to quantify this impact, since there are no data on existing roadkill on these roadways. However, it is reasonable to assume this impact will increase linearly (from current levels) as project-related traffic increases. It should be noted that development within the ~~Specific Plan~~WLC site along the west side of Gilman Springs Road will be separated from the roadway by fencing or walls as appropriate; this will help restrict human access to Gilman Springs Road and native areas along the east side of the roadway, and may incrementally reduce roadkill along Gilman Springs Road. Native wildlife will still experience incremental adverse impacts from roadkill along Gilman Springs Road as the WLC project develops in the future, but these impacts would be less than significant as long as the County coordinates with the RCA and takes wildlife movement between Core H and proposed Core 3 into account when designing and improving Gilman Springs Road.

Operational Noise. The northern portion of the SJWA will experience increased, fluctuating sound levels during construction and operation (e.g., vehicle traffic and truck loading and unloading), but truck traffic and human activity will result in an incremental increase in overall ambient sound over the long term. In addition, it is possible construction activities on the ~~project~~WLC site, including areas adjacent to the SJWA, may be subject to construction activity on a 24-hour-per-day, 7-day-per-week schedule. The calculations in Table 4.4~~.G-~~7 were provided by the project noise consultant (Mestre Greve Associates) specifically for the southern boundary area of the project.

The portion of the SJWA immediately south of the ~~Specific Plan~~WLC site ~~(i.e., the Conservation Buffer Area)~~ is vacant and the northern 135 acres immediately adjacent to the WLC site has been regularly disked for dry farming. This area is quiet, with L_{eq} levels during the day of ~~35~~40.8 dB and nighttime levels of ~~40~~35.8 dB. ~~Noise~~Existing noise levels in ~~this north~~the northern SJWA area are affected by road noise from Gilman Springs Road to the east and from noise generated at the existing natural gas facilities.

Table 4.4~~.G-~~7: Noise Levels along the ~~Project~~WLC Site Southern Boundary

Noise Conditions	Daytime (dB)			Nighttime (dB)		
	L_{min}	L_{eq}	L_{max}	L_{min}	L_{eq}	L_{max}
Ambient Noise	35.9	40.8	50.3	30.0	35.8	51.1
Warehousing Noise						
50 feet	38.3	48.6	63.1	38.3	48.6	63.1
100 feet	37.5	47.8	62.3	37.5	47.8	62.3
250 feet	34.4	44.7	59.2	34.4	44.7	59.2
500 feet	30.6	40.9	55.4	30.6	40.9	55.4
Warehousing Noise Plus Ambient[1]						
50 feet	38.3	49.3	63.1	38.3	48.8	63.1
100 feet	37.5	48.6	62.3	37.5	48.1	62.3
250 feet	35.9	46.2	59.2	34.4	45.2	59.2
500 feet	35.9	43.9	55.4	30.6	42.1	55.4
Change in Ambient Noise Levels[2]						
50 feet	2.4	8.5	12.8	8.3	13.0	12.0
100 feet	1.6	7.8	12.0	7.5	12.3	11.2
250 feet	0.0	5.4	8.9	4.4	9.4	8.1
500 feet	0.0	3.1	5.1	0.6	6.3	4.3

1 Distances are in feet, noise levels are in dBA.
2 L_{eq} noise added logarithmically, L_{max} and L_{min} will not add in this situation.
Highest L_{max} and highest L_{min} were used.
3 ~~Source: Project noise report and tabular noise data email, Mestre Greve Associates, May 2012.~~Ambient Noise levels reported by ESA in March 2018.
Please refer to Section 4.12 for a description of noise measurement terms. .

The noise data in Table 4.4~~.G-~~7 indicate that warehousing activity would raise ambient noise levels (measured at 50 feet) by 8.5 dB during the day and 13 dB at night. ~~If a~~The physical setback ~~or buffer were implemented in this area to reduce impacts such as noise,~~of the project ~~noise consultant has~~design would separate the warehouse structures from the SWJA reducing noise impacts, with the estimated ~~the~~ noise levels ~~for distances from 50 to 500 feet~~ shown in Table 4.4~~.G.~~-7. The project design separation of warehouse structures from the SWJA would be 400 feet at the SWJA boundary (the combined 250-foot wide development setback from the southernmost property line with the additional 150-foot building setback).

These calculations show that the increase in noise levels from development would be close to 3 dB at a distance of 500 feet, resulting in overall noise levels (ambient plus development) of 43.9 dB measured at a distance of 500 feet (L_{eq}) during the day and ~~45.2 dB at 500 feet at night~~42.1 dB at 500 feet at night. Recent noise modeling by ESA (2018) concludes that nighttime operational noise levels would not exceed 55 dB at the WLC site boundary and the highest noise level expected at the SJWA boundary during construction would be 52 dB.

In addition to regular background noise contributions from traffic on Gilman Springs Road and the compressors at the SDG&E plant that run 24 hours per day, the SDG&E compressor plant has regular “blow-down” events, which is an automatic pipeline pressure relief process. When these occur, noise levels in the ~~CDFW Conservation Buffer Area~~SJWA adjacent to the compressor plant property lines may reach 130 dB or higher, which is equivalent to a jet plane landing or a train horn at 100 feet. For more information on “blow-down” effects to humans, see Section 4.12, *Noise*, and 4.8, *Hazards and Hazardous Materials*. It should be noted that the pump noise and the blow-down events have been occurring regularly for many years, along with their potential impacts on SJWA wildlife; however, these utility facilities already exist and are not part of any development proposed within the WLC ~~project~~site.

Based on available information, it is reasonable to conclude that increased noise from human activity (project construction, traffic on local roads, loading and unloading of trucks, etc.) related to the ~~proposed~~ project will not have significant impacts on local wildlife in the SJWA area. Available research indicates that increased noise levels near wildlife areas can contribute to behavioral changes such as increased startling in birds, which can be especially harmful during nesting periods, hunting pattern changes or avoidance which decrease habitat value and use, sleep pattern disruption, and decreased overall health from noise stress. These impacts can affect mammals, birds, and other species present within the SJWA. For these reasons, human activity should be set back from the SJWA to help minimize these impacts. The WLCSP ~~indicates~~requires there ~~will~~ be a 250-foot minimum development setback and an additional 150-foot building setback along the southern boundary of the ~~Specific Plan area~~WLC site to act as a buffer between the ~~WLCSP~~WLC SITE and the SJWA. With implementation of the two setback areas (total 400 feet) and proposed solid walls along the SJWA boundary, the anticipated increase in noise from the ~~proposed~~ project will not have a significant impact on wildlife and would not require mitigation.

Construction Noise. Development within the ~~WLCSP~~WLC site and off-site facilities must incorporate landscape elements including trees, shrubs, and groundcover, which would assist in off-site noise reduction. A noise analysis has been prepared for the project to quantify potential short-term and long-term noise impacts that could occur as a result of development of the parcel adjacent to open space areas. Based on ~~recent~~past studies (Landrum and Brown 2012), noise contours would exceed 60 dBA (L_{eq}) roughly 1,000 feet into the ~~CDFW Conservation Buffer Area~~SJWA during construction of the southernmost areas of Phase 2. ~~There is no projected change in noise contours associated with the operation of the facility over those of the no project condition. Therefore, any~~ Any noise-related impacts would be temporary in nature and generally limited to construction of Phase 2 facilities along the southern boundary of the WLC site. Recent noise studies by ESA (2018) conclude that construction noise levels would not exceed 60 dB within the SJWA, with the highest construction noise level projected to be 52 dB at the SJWA boundary with the incorporation of the Specific Plan 250-foot setback.

Invasive Species. The WLCSP landscaping palette does not include any of the invasive plant species listed in Section 6.1.4 of the MSHCP (Table 6-2), but there should be mitigation to ensure that no on-site landscaping along the southern boundary of the site conflicts with MSHCP invasive plant guidelines.

Lighting. Lighting associated with planned warehouse development of the eastern and southern portions of the ~~WLCSP~~WLC site would have various direct and indirect impacts on local wildlife, depending on the species and the nature of light exposure. There is some scientific and academic research on the effects of night lighting on various species, even though the subject species and lighting conditions vary widely. This section generally compares the results of this research to the relationship of the project and the SJWA.

Some available research[1] states that night lighting can have a wide range of adverse effects on wildlife, including mammals, birds, bats, amphibians, insects, fish, even plants. Effects range from reduced health by upsetting diurnal rhythms, reduced clutch size, egg size, or survival success of nesting birds, to actual mortality from increased predation under higher ambient light levels. Bats and certain insects are also attracted to outdoor night lighting, which may adversely affect their survival or cause them to become dependent on the lighting. Small mammals would also be attracted to these areas and might suffer increased predation or roadkill crossing streets.

Future development within the ~~Specific Plan~~WLC site will have to comply with the off-site lighting restrictions outlined in Section 4.3 of the Specific Plan, including the requirement that direct light rays from all lighting fixtures be directed downward, illuminate only the building or space intended, and do not spill onto adjacent properties (Section 9.08.100 Lighting 5.5.2.1). This will also apply to project-related development in Planning Areas 10 and 12, which will help minimize lighting impacts on biological species in the adjacent SJWA land.

All on-site lighting will also have to comply with the new night lighting guidelines in Section 9.08.100 of the City's Municipal Code, which limits off-site impacts to 0.25 foot-candles per square meter. As development occurs within the Specific Plan, adherence to these design guidelines and restrictions will help ensure that night lighting increases will not result in significant indirect lighting impacts on native wildlife within the SJWA.

For example, the Specific Plan requires that streetlights, parking lot lighting, and other project-related illumination sources be positioned, directed, and shielded to avoid "direct light spill" into MSHCP conservation areas including those contained within Existing Core H to the south of the ~~project area~~WLC site, and Proposed Core 3 (Section 6.1.1, Proposed Core 3) to the east of the ~~project area~~WLC site. Lighting installed according to the WLC Specific Plan will be consistent with MSHCP guidelines. The project will also have to comply with the City's new Dark Sky Lighting Ordinance, which reduces spillover light to 0.25 foot-candles at five feet from the adjacent property lines. However, due to the size of the WLC project and its proximity to the SJWA, additional mitigation may be necessary for cumulative lighting impacts on the SJWA.

In addition to night lighting issues associated with construction and operation, the proposed facilities are to include roof-mounted photovoltaic panels to provide electricity for the facilities and aid in the sustainability of the project and reduce additional GHG emissions. There is a potential for glare from these panels to confuse migratory birds into attempting to land in the area of the panels. However, the project design calls for the use of low glare and high solar transmission films to increase solar capacity and prevent unnecessary glare, so this impact would be less than significant.

Toxics~~,~~ Water~~.~~ Quality Development plans for the WLC project will include Water Quality Best Management Practices (BMPs) such as vegetated earthen channels, storm drain stenciling, street sweeping, and education. The BMPs recommended for the proposed ~~WLCSP~~WLC site are described in more detail in Section 4.9.6.1, *Construction-Related Water Quality Impacts,* and Section 4.9.6.2*, Operational Water Quality Impacts*. (Detention basins will be designed to filter potential toxics from storm water. Section 4.9.6.2, *Operational Water Quality Impacts*, also requires the regular removal of any contaminated materials from the detention basins to protect downstream water quality.) These BMPs will be implemented as part of the storm water pollution prevention measures for the project, in accordance with all appropriate NPDES requirements.

Development of the WLC project will result in the additional use of hazardous materials in limited quantities associated with normal logistics use such as janitorial and cleaning products, solvents,

---

[1] *Ecological Consequences of Artificial Night Lighting.* C. Rich and T. Longcore (ed), 2006.

herbicides, and insecticides. However, compliance with regulations, standards, and guidelines established by the Environmental Protection Agency (EPA), State, County, and local agencies relating to the storage, use, and disposal of hazardous waste will reduce the potential risk of hazardous materials exposure.

Development plans for the WLC project will include Water Quality BMPs such as vegetated earthen channels, storm drain stenciling, street sweeping, and education. Detention basins will be designed to filter potential toxics from storm water. These BMPs will be implemented as part of the storm water pollution prevention measures for the project, in accordance with all appropriate NPDES requirements.

~~Toxics, Air Pollution and Diesel Exhaust.~~Emissions Local wildlife (i.e., within the SJWA) may be exposed to vehicular exhaust and diesel particulates and toxic air contaminants from truck exhaust as the WLC project builds out. New development will produce significant amounts of diesel-related air pollutants that will be released into the atmosphere, including gases and particles of various sizes.

Most of the available (and most applicable) research is on diesel pollutant impacts on humans. Although the physiology of many animals is very different than humans, data on health effects from diesel pollution may nonetheless be somewhat instructive when attempting to assess diesel impacts on wildlife. Potential health effects on wildlife obviously depend on the species involved,[1] but in general health effects from air pollution/diesel exhaust include impaired cardiac and lung or respiratory function,[2] reduced heart function or longevity, decreased clutch size or hatching success, increased incidence of cancer and other mutagenic or teratogenic effects, ingestion of air deposited particulates, reduction in overall biodiversity, reproductive failure, etc. In general, impacts on higher animals are most commonly attributed to food loss and reproductive effects, rather than to direct toxic effects on adults. There are relatively few examples of higher animals suffering direct toxic effects from either atmospheric acidity or gaseous air pollution. However, a number of mammals are known to build up high levels of heavy metals and other pollutants in their systems from air pollution.[3]

A recent study of the health effects on rats from diesel particulates concludes that exposure to new technology diesel exhaust would not cause an increase in tumor formation or substantial toxic health effects in rats, although some biological effects might occur. The overall conclusion was that chronic exposure of rats to new technology diesel exhaust did not produce tumors in the lung; these observations are in marked contrast to the effects of chronic exposure to traditional technology diesel exhaust observed in multiple previous rat studies, in which lung tumors, as well as inflammation and the deposition of soot in the lung, were observed.[4]

Diesel emissions[5] contain thousands of pollutant species, and the composition depends on the fuel, vehicle, and driving conditions. The main public health concerns are from fine and ultrafine particulate matter, black or elemental carbon, polyaromatic hydrocarbons (PAHs) like phenanthrene, metallic ashes, gases like nitrogen dioxide, aldehydes like acetaldehyde, acrolein, and crotonaldehyde, volatile organic compounds like benzene and 1,3-butadiene, etc. One of the research limitations is that some health effects from these pollutants take a long time, in some cases even a lifetime, to exhibit themselves. These pollutant species can also be emitted from other sources, so in complex urban environments, it can be difficult to trace individual sources of air pollution. In this case, air quality is relatively good and the only major activity is agriculture, so the increase in most of these pollutant species would predominantly be the result of new warehouse uses within the project. Research[6] suggests that wildlife may be more susceptible to air pollutant impacts than humans, due to their smaller

size, higher respiration rates, smaller lung capacities, ingestion of local plant materials that have also been exposed, higher metabolic rates, etc., although some factors like shorter lifespans would reduce the length of exposure over time. For these reasons and for the purposes of this analysis, it is assumed that animals within the SJWA would be at least as susceptible to health effects from air pollution, including diesel exhaust ~~compared to~~, as humans.

In 2002, the EPA compiled a wide range of scientific studies on the health effects of diesel exhaust, including non-carcinogenic effects[1] of diesel exhaust on laboratory animals. Studies found that diesel particulate matter (diesel PM) had a limited effect on the survival and growth of rats and mice when exposed to diesel PM for short periods of time. However, rats, mice and hamsters all experienced increased lung to body-weight ratios when exposed to 1.5 mg/m^3 diesel PM concentrations for extended periods of time. Several studies looked at behavior effects in animals, and found that juvenile rats exposed to diesel emissions (DE) exhibited a decreased ability to move around on their own, and negatively affected their learning in adulthood.

Extended exposure to diesel emissions caused negative effects on the pulmonary functions of rats, hamsters, cats and monkeys. Depending on the species, DE levels of 1.5–11.7 mg/m^3 affected lung mechanical properties, diffusing capacity, lung volumes, and ventilator performance of the subject animal. The ability of rats to clear their airways was also severely impaired by diesel PM concentrations of 1 mg/m^{3}or greater. Data on the effect of diesel PM on airway clearance in other animals were limited, but the pathological effects of diesel PM seemed to be dependent on the relative rates of pulmonary deposition and clearance (rate of breathing) of the subject animal. The studies also showed that diesel PM can reduce an animal's resistance to respiratory infections. Diesel PM can begin to impair an animal's immune system in as little as 2–6 hours with exposures of 5–8 mg/m^3 of diesel PM. The testing data also suggested that diesel PM may be a factor in increased allergic reactions in animals.

When comparing filtered versus non-filtered DE, studies found that diesel particulates are the main cause of noncancerous health effects. However, they could not determine if diesel PM acts additively with the gas, or whether it combines with the gases to create different effects. The studies also found that other airborne contaminants (e.g., criteria pollutants) can be altered by diesel PM when absorbed by the diesel particles and increase the physical health effects caused by the diesel PM and other contaminants. These increased health risks were only found in laboratory settings. There was no evidence for DE interacting with other contaminants in normal urban atmospheric settings except for the impaired ability of animals to resist respiratory tract infections. No other noncancerous effects were found in any of the studies.

Chapter 7 of the EPA document includes studies that concluded diesel emissions also have carcinogenic effects on animals. Studies indicated that DE and/or diesel PM did result in increased cases of cancer in laboratory animals as well as humans. Rats experienced a trend of increased tumor growth when exposed to concentrations of DE exceeding 1×10^4 mg × hr/m^3. Because tumors were induced at high concentrations it is believed that they are caused by the lungs experiencing particle overload. The studies also examined the effect of filtered exhaust and discovered that it did not cause tumors. They concluded that filtered exhaust either was not a carcinogenic or had low cancer potency.

In addition to pollutants associated with diesel trucks, passenger vehicles produce additional air pollutants including carbon monoxide, nitrogen oxides, particulates,[2] etc. These pollutants will also have indirect impacts on wildlife resources of the SJWA. Two impacts of most concern would be ozone degradation (e.g., plants having an unusual dry or "burned" look) and the deposition of additional nitrogen, both of which can disrupt plant growth cycles.

---

[2] "Pulmonary and cardiovascular of traffic-related particulate matter from roadside and diesel engine exhaust particles." M. Gerlofs-Nijland et al. Inhalation Toxicology, 2010.

Direct air pollutant impacts on wildlife within the northern end of the SJWA will be reduced somewhat because prevailing winds are mainly to the southeast with the remainder mostly to the east (i.e., very little to the south), based on data from the project air quality study (MBA 2012). However, some diesel and other project-related air pollutants will still be expected to disperse toward the SJWA, including gases and particulates, from trucks and passenger vehicles, when prevailing winds are absent.

There appears to be little academic or scientific research on the specific impacts of diesel air pollutant emissions on wildlife (i.e., not laboratory animals) in natural settings, or specific setbacks for wildlife protection areas from warehouse distribution centers or other sources of diesel pollution. Most available research is too limited or specific regarding the type of pollutant and/or the species considered to be affected (e.g., impacts of one pollutant on one species). The portion of the SJWA adjacent to the ~~WLCSP~~WLC site property ~~is~~has been upland agricultural fields which may be used by foraging birds. ~~Indeed, the~~The northern portion of the SJWA land ~~serves as an existing buffer and it was acquired by the CDFW in 1994 for that purpose. Additional buffer areas imposed as mitigation are discussed below.~~is currently non-native grassland with predominantly non-native or invasive species.

Based on available scientific data, it is reasonable to conclude that the ~~proposed~~ project, due to its size and expected amount of truck traffic, will have potentially significant impacts on wildlife within the SJWA and east across Gilman Springs Road from project air pollution, including diesel truck exhaust.

Research by the California Air Resources Board (CARB)[1] indicates that 80 percent of the particulates generally settle out of the atmosphere within 1,000 feet of emission sources. Therefore, diesel particulate deposition may occur within approximately 1,000 feet of truck activities within the project, which would extend part way into the ~~CDFW Conservation Buffer Area. This demonstrates one benefit of the State acquiring this Conservation Buffer Area (i.e., to reduce potential impacts of future development to the north from the SJWA and Mystic Lake to the south). In addition, the Specific Plan establishes an additional 250-foot setback along the SJWA boundary, which provides additional buffering from potential air pollutant impacts.~~northern portion of the SJWA.

Toxics, Health Risk Assessment. A Health Risk Assessment (HRA) (ESA 2018/MBA 2012) was completed for the project primarily prepared for human health risks associated with airborne hazards. An HRA is a guide that helps to determine if current or future exposure to a chemical or substance could affect the health of a population. The State of California Office of Environmental Health Hazard Assessment (OEHHA) develops methods for conducting health risk assessments. As defined under the Air Toxics "Hotspots" Information and Assessment Act of 1987 ["AB 2588" (Chapter 1252, Statutes of 1987), California Health and Safety Code Section 44306], "A health risk assessment means a detailed comprehensive analysis prepared pursuant to Section 44361 to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure" (Office of Environmental Health Hazard Assessment 1987).

The HRA of toxic air contaminants builds upon the assessment methodology described above but requires one additional step beyond that for *assessment* of the local pollutants. This step involves applying a risk characterization model to the results from the air dispersion model to estimate potential health risks at each sensitive receptor location.

Table 4 in the HRA (ESA 2018/MBA 2012) provides a discussion on the air pollutants that could potentially be present as a result of the construction and/or operation of the proposed facilities and the most relevant effects from pollutant exposure to humans. No standards for impacts to wildlife have been established. Since air is not stationary, there is a potential that air quality concerns associated with the project will not be confined to the ~~project~~WLC site itself and thus would disperse into "wildland" areas. The primary wind direction near the ~~project~~WLC site is to the southeast, as shown in ~~Exhibit 5~~

---

[1] *Air Quality and Land Use Handbook.* CARB and EPA. 2005.

~~in~~ the HRA (ESA 2018/MBA 2012). The wind direction would send any air hazards toward the Badlands MSHCP Criteria Cells and points to the east across Gilman Springs Road.

Health risks within the context of this analysis are represented as the increase in cancer risk associated with exposure to diesel particulate matter emissions from project operations. These diesel particulate matter emissions arise from both exhaust and idling of diesel trucks while operating on and near the project site. The methodology applied in calculating cancer risk from diesel particulate matter has been published by the SCAQMD and the California OEHHA.

~~The methodology basically assumes that a person is exposed continuously to a project's emissions for a period of 350 days per year, 24 hours per day over a 70-year lifetime period.~~The Current OEHHA Guidance incorporates the importance of early-in-life sensitivities of young children to exposures to toxics air contaminants and recommends a lifetime exposure duration of 30-years. In this regard, cancer risk is expressed as the probability of an individual developing cancer due to exposure to diesel particulate matter emissions at the above-referenced durations from the project, out of a population of 1 million individuals. Thus, a receptor calculated to have a cancer risk of 1 in one million means that this receptor has a probability of 1 in 1 million of developing cancer from the continuous exposure to diesel particulate matter. The SCAQMD has established a significance threshold of 10 in 1 million for cancer risk attributable to exposure to a project's emissions. No such threshold exists for wildlife and a number of factors vary from the criteria established for human populations. The average life of migratory waterfowl ranges from 10 to 20 years. This might represent the most long-lived of the species in the vicinity of the project site. These species are also not present year round and may spend as little at 100 days in the ~~project area on the SJWA.~~WLC site on the SJWA. Based upon the available information, the effect of emissions on wildlife is less than significant.

Specific Plan Design Features. The Specific Plan requires a 250-foot development setback and an additional 150-foot building setback along the southern boundary of ~~project development~~The WLC site and the ~~CDFW Conservation Buffer Area~~SJWA. In addition, the Specific Plan calls for native landscaping in the setback area and a wall along the north side of the 250-foot setback zone. The separation between planned development along the east side of Gilman Springs Road will be set back from the roadway. This setback, plus the width of the roadway and related shoulder areas, will be sufficient to separate the ~~proposed~~ project from the MSHCP criteria cell areas east of Gilman Springs Road, so no additional setback is needed in that area.

Mitigation Measures. The following measures are proposed to mitigate potential direct and indirect impacts to listed species due to the ~~project's~~WLC site's proximity to the SJWA~~ site,~~, even with the presence of the ~~CDFW Conservation Buffer Area~~proposed approximately 400-foot setback along the WLC site boundary along the SJWA:

4.4.6.1A All Plot Plan applications within Planning Areas 10 and 12 (i.e. adjacent to the San Jacinto Wildlife Area as shown in Final EIR Volume 2 Figure 4.1.6B) shall provide a 250-foot setback from the southerly property line. Permitted uses within this setback area include landscaping, drainage and water quality facilities, fences and walls, utilities and utility structures, maintenance access drives, and similar related uses. No logistics buildings or truck access/parking/maneuvering facilities are permitted in this setback area.

In addition, logistics buildings within Planning Areas 10 and 12 may not be located within 400 feet of the southerly property line. All development proposals in Planning Areas 10 and 12 shall include a minimum six-foot tall chain link fence or similar barrier to separate warehouse activity from the setback area. This fence/barrier shall have metal mesh installed below and above ground level to prevent animals from moving between the development area and the setback area.

Within Planning Areas 10 and 12, all truck activity areas adjacent to the 250-foot buffer area along the southern property line shall be enclosed by minimum 11-foot tall solid walls to reduce noise and lighting impacts on the adjacent property. This measure shall be implemented to the satisfaction of the Planning Official.

A preliminary landscape plan for the 250-foot setback area shall be submitted with all Plot Plan applications for lots adjacent to the ~~California Department of Fish and Wildlife property.~~SJWA. Precise landscape plans shall be submitted with any grading permit for said lots and must be approved prior to the issuance of any building permit on said lots. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the World Logistics Center Specific Plan. No plant species listed in Section 6.1.4 of the Western Riverside County Multiple Species Habitat Conservation Plan shall be installed within the setback area. Cottonwood trees shall be planted within the setback area consistent with the World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development Division Manager.

4.4.6.1B Each Plot Plan application in Planning Areas 10 and 12 shall provide runoff management and water quality facilities adequate to minimize downstream erosion, maintain water quality standards and retain pre-development flows in a manner meeting the approval of the City ~~Engineer.~~of Moreno Valley and RWQCB requirements. All drainage improvements shall be designed to minimize runoff and erosional impacts on adjacent property. This measure shall be implemented to the satisfaction of the Land Development Division Manager of Public Works.

~~The~~Based upon the previously described information, the 250-foot setback identified in **Mitigation Measure 4.4.6.1A**~~, and the presence of the CDFW Conservation Buffer Area~~, will effectively mitigate potential indirect impacts of air pollutants, including diesel particulate matter, on wildlife within the SJWA. Compliance with the off-site lighting guidelines of the Specific Plan, compliance with the night lighting standards in Section 9.08.100 of the City Municipal Code, and implementation of Aesthetics **Mitigation Measure 4.1.6.4A** will help reduce lighting impacts on the SJWA to less than significant levels.

In addition, **Mitigation Measure 4.4.~~6~~5.2A** will help assure that potential impacts to listed or sensitive plant species remain at less than significant levels.

Level of Impact After Mitigation. Compliance with the Specific Plan, Municipal Code, and implementation of the recommended **Mitigation Measures 4.4.6.1A** and **4.4.61B** will help reduce project impacts to listed species to less than significant levels.

4.4.6.2 ~~Adopted Habitat Conservation Plans~~

~~**Impact 4.4.6.2:** *Implementation of the project may conflict with portions of the MSHCP for Western Riverside County.*~~

~~Threshold~~	~~Would the proposed project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?~~

~~The project site is subject to the provisions of two HCPs: the SKR HCP and the MSHCP. Impacts related to these HCPs are discussed in this section.~~

~~a. Stephens' Kangaroo Rat Habitat Conservation Plan~~

~~The project site is within the SKR HCP Fee Area. The SKR is relatively widespread throughout the SKR HCP Fee Area, but the main blocks of occupied habitat are concentrated in several Core Areas that must be conserved. The proposed project site is not within an SKR Core Area. The SKR also requires~~

~~species-specific monitoring and management to ensure its long-term viability in the SKR HCP, including tracking population densities and maintaining sparse, open grassland habitats.~~

~~The long-term SKR HCP provides Take Authorization for the SKR within its boundaries. The core reserves established by the SKR HCP will be managed as part of the MSHCP Conservation Area consistent with the provisions of the SKR HCP. Focused surveys for Stephens' kangaroo rat will not be required for this project because the project lies within the SKR Fee Area; therefore, no requirements under the SKR HCP other than payment of a local mitigation fee are required.~~

~~b. Summary of Western Riverside County Multiple Species Habitat Conservation Plan Impacts~~

~~The project area is located within the Reche Canyon/Badlands Area of the MSHCP. Development of the project area would not conflict with the conservation goals established by the MSHCP for Cell Group X or Cell Group E. In addition, no conflict from development would occur in relation to the Reche Canyon/Badlands Area Plan, the Area Plan Subunit 4, the Area Plan Subunit 3, Proposed Core 3, or Existing Core H.~~

~~The WLCSP and the proposed offsite facilities occur immediately adjacent and within the vicinity of Core H and proposed Core 3. RCA staff commented that they believed any increase in truck traffic associated with the proposed project along Gilman Springs Road could significantly affect wildlife movement between Core H and proposed Core 3 and requested mitigation to offset those impacts. However, the appropriate mitigation for increased traffic on Gilman Springs Road is payment of the project's fair share of the improvements to Gilman Springs Road, including provisions for wildlife movement or crossings. The design and improvement of Gilman Springs Road is a County project that is not under the control of the project applicant.~~

~~No development is proposed within the portion of the project area that lies within Cell Group D and the SJWA. This area is already owned by the State and managed by the CFDW. However, development that will be adjacent to the SJWA property may cause significant indirect impacts to species within the SJWA, which will require mitigation (i.e., designing an appropriate buffer along this "urban edge" will help minimize potential impacts on the SJWA).~~

~~The project area is not adjacent to any Cores or Linkages identified in the MSHCP. However, it is adjacent to the SJWA and is subject to the project guidelines provided in MSHCP Section 6.1.4 (Guidelines Pertaining to the Urban/Wildlands Interface). The project is also required to adhere to the Best Management Practices (BMPs) found in Appendix C of the MSHCP.~~

~~The project does not propose to alter land use in any way that would adversely affect Cores, Linkages, or Reserve Assembly within the Reche Canyon/Badlands Area Plan.~~

~~The project is not located within any Amphibian, Mammalian, or Special Linkage Areas identified by the MSHCP. The project is in an area requiring burrowing owl surveys, is within the MSHCP Criteria Area Species Survey Area (CASSA), and is within the Narrow Endemic Plant Species Survey Area (NEPSSA).~~

~~The MSHCP and its Implementation Agreement contain a fee mitigation program pursuant to which local agencies collect development impact fees and remit such fees to the Riverside Conservation Authority (RCA). These fees are in turn used to acquire lands that are suitable for habitat preservation for species covered by the MSHCP. Payment of the local MSHCP mitigation fee will be required of the project prior to the issuance of building permits.~~

~~From available information, potential indirect impacts to avian and other biological resources within Mystic Lake and the SJWA will be reduced to less than significant levels by the creation of a 250-foot~~

~~on-site setback or buffer area in **Mitigation Measure 4.4.6.1A**, which will be in addition to the existing setback provided by the CDFW Conservation Buffer Area just south of the proposed development area.~~

~~Participation in the MSHCP and contribution of MSHCP provides compensation for the loss of raptor foraging habitat due to approved projects. Typically, a project proponent would participate as outlined in the MSHCP, so that loss of raptor foraging habitat is typically considered to be less than significant and no mitigation is required.~~

~~**Narrow Endemic Plant Species.** No Narrow Endemic plant species are anticipated to occur in the project area, but compliance with **Mitigation Measure 4.4.6.2A** will assure there will be no significant impacts to these plant species.~~

~~**Criteria Area Plant Species.** No Criteria Area plant species are anticipated to occur on the project area, but compliance with **Mitigation Measure 4.4.6.2A** will assure there will be no significant impacts to these plant species.~~

~~**Riparian/Riverine Areas and Vernal Pools.** Drainage Features 7, 8, 9, 12, and 15 contain riparian/riverine areas, as designated by the MSHCP. The project area does not contain habitat suitable for covered riparian species, such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. No vernal pools or ephemeral ponds were observed on the project area and no suitable habitat for any fairy shrimp species was identified on site. No additional mitigation regarding vernal pools or vernal pool species is required. A programmatic-level DBESP was prepared by MBA in 2013 to outline specific requirements for project related impacts to these features in the future. A project-specific DBESP will be required during each development project.~~

~~c. Nitrogen Deposition~~

~~Nitrogen deposition is the term used to describe nitrogen-based pollutants that are deposited as a result of emissions from future project related activities. The pollutants are typically in the form of nitrogen oxide (NO_x) and ammonia (NH_3)-derived pollutants, primarily nitric acid (HNO_3). Although there are many types of nitrogen-based pollutants resulting from project-related emissions, HNO3 is typically the easiest to measure and is used in determining nitrogen deposition rates. Mechanisms by which nitrogen deposition can lead to impacts on sensitive species include (1) direct toxicity, (2) changes in species composition among native plants, and (3) enhancement of invasive species (Fenn et al. 2003; Weiss 2006a). Direct toxicity refers to impacts associated with direct contact with the nitrogen pollutants. There is no scientific documentation that links direct toxicity to impacts associated with sensitive plant and wildlife species. Therefore, direct toxicity is not considered a significant impact.~~

~~An increase in available nitrogen promotes the growth of non-native weedy species, which alone is not considered a significant impact. The increased dominance and growth of invasive annual grasses is especially prevalent in low-biomass vegetation communities that are naturally nitrogen-limited, such vegetation communities that occur in the project vicinity include coastal sage scrub and vernal pools (Weiss 2006a). An increase in nitrogen deposition does not inhibit the growth of native plants, but promotes the rapid growth of non-native invasive species that could out-compete native plants for available water and nutrients. If the increase of non-native plant species is detrimental to the growth of native plants, the result may be a conversion from a native plant community to a non-native plant community. This change in habitat is only considered a significant impact if that change occurs in suitable habitat for a federally threatened or endangered species within USFWS-designated critical habitat.~~

~~In addition, vernal pools were identified by Weiss (2006a) as a California ecosystem that may be sensitive to nitrogen deposition. Nitrogen deposition in vernal pools stimulates plant growth (including non-native species in adjacent uplands) and the nitrogen is rapidly assimilated by plants and invertebrates within the pools (biomass and dissolved organic nitrogen) (Hobson and Dahlgren 1998). Because of the isolated nature of vernal pools, the nitrogen pollutants accumulate over time and provide a more concentrated level of nitrogen for non-native plants. Since vernal pools are known to provide suitable habitat for a number of federally threatened or endangered species, impacts to vernal pools caused by nitrogen deposition may be considered a significant impact. There are no vernal pools within the project site.~~

~~Although non-native plant invasions have affected the vernal pools in the region (the closest recorded occurrence of vernal pool habitat is approximately 3.5 miles to the south), these invasions generally occur in years when precipitation is sparse. In wetter years, the number of non-native plants is reduced since the non-native upland species are intolerant of inundation and the invasion cycle may be reset in some cases. This means that the established non-native plants are not adaptable to an aquatic habitat and die-off during prolonged periods of inundation. Even though the non-native plant species will have an abundance of available nitrogen and optimum growing conditions, the prolonged inundation periods prohibit non-native invasive species growth.~~

~~The WLC will consist of mobile, non-point pollution sources (diesel trucks), which will result in a highly random dispersion of emissions that will occur in a broad, regional fashion. Because of the way in which nitrogen is generated by the WLC project, its overall patterns for dispersion, and the multi-variant parameters that would need to be taken into consideration for such an analysis, there is no established scientific basis or standards to study the effects of nitrogen dispersion for non-point pollution sources; hence, project-specific conclusions or mitigation would be overly speculative for the purposes of this EIR.~~

~~**Specific Plan Design Features.** The project is consistent with the major MSHCP requirements relative to core areas, criteria cells, threatened and endangered species. In addition, the project complies with the MSHCP guidelines for urban/wildland interface, riparian/riverine areas, or related buffers (with implementation of **Mitigation Measure 4.4.6.1A**). In addition, future development will be required to demonstrate that it is also consistent with all MSHCP requirements, including indirect impacts such as lighting, noise, and air pollution effects.~~

~~**Regulatory Compliance.** Stephens' kangaroo rats have a low potential to occur within the study area. While the study area is not within the SKR Core Reserve Area, the SKR HCP Implementing Agreement requires payment for loss of habitat within defined areas. The entire study area lies within the fee area. An assessment of individual actions for development within the WLCSP would be required prior to any implementation. The number of acres of disturbance associated with the development and any off-site improvements shall require payment to comply with the SKR HCP. In addition, prior to issuance of a grading permit on each project, applicants will be required to pay the mandatory mitigation fee for the MSHCP. The mitigation fee is a per acre fee for commercial or industrial development.~~

~~**Mitigation Measures.** In addition to payment of SKR and MSHCP impact fees, the following measures will help ensure that potential impacts to sensitive species are reduced to less than significant levels:~~

~~**4.4.6.2A** Each Plot Plan application shall include a focused plant survey of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, Plummer's mariposa lily, or thread-leaved brodiaea) are present. If any of the listed plants are found, they may be relocated to the 250-foot setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, at the applicant's discretion, an impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate~~

~~conservation organizations to offset for the loss of these species. This measure shall be implemented to the satisfaction of the Planning Official.~~

~~**4.4.6.2B** Prior to the approval of any tentative maps for development including or adjacent to any Criteria Cells identified in the Western Riverside County Multiple Species Habitat Conservation Plan, the applicant shall prepare and process a Joint Project Review (JPR) with the Riverside County Resource Conservation Agency (RCA). All criteria cells shall be identified on all such tentative maps. This measure shall be implemented to the satisfaction of the City Planning Division and Riverside County Resource Conservation Agency ("RCA").~~

~~In addition, the previously outlined **Mitigation Measures 4.4.6.1A and 4.4.6.1B** will also help reduce potential direct and indirect impacts to biological resources covered by the MSHCP.~~

~~**Level of Impact After Mitigation.** With implementation of **Mitigation Measures 4.4.6.1A, 4.4.6.1B, 4.4.6.2A,** and **4.4.6.2B**, potential impacts related to MSHCP consistency will be reduced to less than significant levels.~~

~~4.4.6.3~~ Jurisdictional Delineation, Riparian Habitat or Other Sensitive Natural Communities

Impact 4.4.6.~~3~~2: The project has the potential to result in significant impacts to jurisdictional land, riparian habitat and sensitive natural communities and may require subsequent permits from various resource agencies.

~~Threshold~~	~~Would the proposed project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?~~
	~~Would the proposed project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?~~

Threshold	Would the proposed project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?
	Would the proposed project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Drainages in the ~~project area~~WLC site were investigated and delineated by MBA in March 2012 and updated in 2013. A total of 15 primary drainage features were identified during this survey and a number of sub-drainages or tributaries were also identified. Jurisdiction for each drainage and/or sub-drainage or tributary was evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by USACE and RWQCB, respectively; Porter Cologne as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by the CDFW.

All 15 drainage features identified in the 2013 document were assessed to determine the jurisdictional limits. Based on current conditions, two of the 15 features are subject to the jurisdiction of the USACE and/or RWQCB. In addition, no jurisdictional wetlands or isolated wetlands were identified. Drainage

Features 1, 2, 4, 12, and 13 flow to the south and then southwest of the ~~project area~~WLC site. These drainage features are contained in roadside ditches or otherwise sheet flow prior to leaving the ~~project area~~WLC site.

Drainage Feature 12 and 15 are likely subject to USACE jurisdiction. However, if any portion of Drainage Features 12 and 15 are affected by WLC project construction activities or flood control improvements in the future, then regulatory permitting may be required.

There are two drainage features that are completely isolated, Drainage Features 3 and 14. Drainage Feature 3 is an isolated temporary water quality facility serving the new Skechers building. This feature was created in an existing upland area and will eventually be converted into an underground storm drainage system. The second feature (consisting of two small basins) was created in an upland area to contain polluted runoff from a now-abandoned cattle operation. The eastern feature (Feature 14) is dominated by non-native tree species and contains no native riparian habitat. The western feature contains a mix of non-native trees and native riparian habitat. There is no evidence of ponding and the basin is no longer in use. These basins no longer serve any water quality function and are therefore not considered to be isolated waters of the State under the Porter Cologne Act.

The remaining seven features flow to the south and eventually revert to sheet flow conditions before reaching the San Jacinto Wildlife Area. Each drainage feature was walked until neither an ordinary high water mark (OHWM) nor a clearly defined bed and bank feature was present and the drainage course reverted to sheet flow onto open land. There was no evidence of flows downstream of the drainage where the OHWM was no longer present. Therefore, these features are hydrologically and physically isolated from any downstream RPW or TNW. Surface flows from the ~~project area~~WLC site will eventually be conveyed into the SJWA. The SJWA's system of ponded areas was surveyed to document any downstream connectivity to any RPW or TNW. Based on current site conditions, the water within the SJWA is completely contained within the ponded area system with a large overflow area that conveys flows over a spillway in the southwest corner of the facility. There is no evidence of active flows within the spillway channel and all upstream flows are likely maintained within the SJWA exclusive of major flood events (50- to 100-year floods).

The MBA 2013 report concludes that two of the drainages on the project site are under the jurisdiction of the USACE (Drainages 12 and 15), and several additional drainages are under the jurisdiction of the CDFW and RWQCB (Drainages 7, 8, 9, 12, and 15).

Riparian or riverine areas are lands that contain habitat dominated by trees, shrubs, and persistent emergents, which occur close to or depend upon soil moisture from a nearby water source; or areas with fresh water flowing during all or a portion of the year. Unvegetated drainages (ephemeral streams) may be included if alterations to that drainage have the potential to affect Covered Species and Conservation Areas.

Drainage Feature 7, 8, 9, 12, and 15 within the WLC project are considered riparian/riverine areas, as defined by MSHCP. If impacts to any of these areas cannot be avoided, a DBESP report and relevant mitigation will be required by the RCA.

The ~~project area~~WLC site does not contain habitat suitable for sensitive riparian species, such as least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. Additionally, no vernal pools or ephemeral ponds were observed on the ~~project area~~WLC site and no suitable habitat for any fairy shrimp species was identified ~~on site~~onsite.

Raptor Foraging Habitat. The ~~WLCSP~~WLC site and off-site facilities contain flat, open areas with sparse vegetation, which could be considered foraging habitat for some raptor species. Due to the regular, heavy disturbance associated with the various agricultural activities in the ~~WLCSP~~WLC site and off-site facilities resulting in a rather limited prey base, and the limited size of the site in relation to the expansive foraging habitat in the near vicinity including ~~both the CDFW Conservation Buffer Area~~

~~and~~ the SJWA, LPSRA and the extensive Badlands to the east, the foraging habitat on site is considered marginally suitable and an adverse but not significant impact to raptor foraging habitat is anticipated. No mitigation is necessary or proposed.

Project or Specific Plan Design Features. The ~~WLCSP~~WLC site does not contain any design features related to riparian habitat or other sensitive natural communities.

~~*NOTE: The following changes have been made in responses to Comments A-1-1 in Letter A-1 from the U.S. Army Corps of Engineers, and A-6-12 in Letter A-6 from the U.S. Fish and Wildlife Service and et al.*~~

Mitigation Measures. The JD prepared for the project in 2013 is programmatic in nature because no specific development activity or building plans are proposed at this time. The 2012 JD determined the on-site drainages were not under the jurisdiction of the USACE, but one or more may be under the jurisdiction of the CDFW. Therefore, **Mitigation Measure 4.4.6.~~3A~~2A** will help ensure there will be no significant impacts to riparian areas associated with Waters of the U.S. or Waters of the State as a result of future development within the project.

In addition to the previously identified **Mitigation Measures 4.4.6.1A** through **4.4.6.1C**, the following measures have been identified to reduce the significance of potential impacts to riparian/riverine habitat:

4.4.6.~~3A~~2A Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant ~~will~~shall secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation ~~will~~shall be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins ~~will~~shall be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins ~~will~~shall be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation ~~will~~shall be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan ~~will~~shall be prepared for all unavoidable impacts and ~~will~~shall be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.

The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.

Mitigation ~~will~~shall consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat ~~will~~shall be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat ~~will~~shall be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation ~~will~~shall include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of Moreno Valley (MM BIO-2b and MM DBESP 1 through 3).

4.4.6.~~3B~~2B As required by the Resource Conservation Agency (RCA), a program-level Determination of a Biological Equivalent or Superior Preservation (DBESP) for impacts to Riverine/Riparian habitat has been prepared and shall be approved by the Resource Conservation Agency prior to project grading permit approval. The Determination of a Biological Equivalent or Superior Preservation includes a general discussion of mitigation options for impacts to riverine/riparian areas as well as general location and size of the mitigation area and includes a monitoring program.

If impacts to riparian habitat within the ~~World Logistics Center Specific Plan (WLCSP)~~WLC site cannot be avoided at the time of specific development, then a separate project-level Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared to identify project-specific impacts to riparian habitat and incorporate mitigation options identified in Mitigation Measure 4.4.6.~~3A~~2A.

A project-level Determination of a Biological Equivalent or Superior Preservation for each specific development shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the Western Riverside County Multiple species Habitat Conservation Plan (MSHCP). The project-level Determination of a Biological Equivalent or Superior Preservation shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of onsite preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at offsite or onsite locations. ~~Therefore, mitigation~~Mitigation required for compensation for impacts to riparian/ riverine areas ~~will~~shall require a minimum of 1:1 mitigation ratio of riparian/riverine mitigation land.

As outlined in the WLC programmatic DBESP, erosion control improvements ~~will~~shall be installed within Drainage 9 to reduce sediment transport, and additional riparian habitat ~~will~~shall be enhanced within this drainage following the installation of the erosion control improvements (MM DBESP 4 and 5).

~~*Note: The following Mitigation Measure has been added in response to Comment F-1-6 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society.*~~

4.4.6.~~3C~~2C Prior to issuance of any grading permit for any offsite improvements that support development within the ~~World Logistics Center Specific Plan~~WLC site, the developer shall retain a qualified biologist to prepare a jurisdictional delineation (JD) for any drainage channels affected by construction of the offsite improvements. This jurisdictional delineation shall be submitted to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the offsite improvements will not affect any identified jurisdictional areas, no United States Army Corps of Engineers permitting is required. However, permitting through the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (i.e., Streambed Alternation Agreement) may still be required for these improvements. The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife and Regional Water Quality Control Board to establish the need for permits based on the results of the ~~2012~~2013 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with any altered offsite drainages shall be in agreement with the permit conditions~~.~~ with a minimum1:1 mitigation ratio. Any landscaping associated with these offsite improvements shall use only native species to help protect biological resources residing within or traveling through these drainages per Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Table 6.1.2. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, and the California Department of Fish and Wildlife.

Level of Significance after Mitigation. With implementation of **Mitigation Measures 4.4.6.1A, 4.4.6.1B, ~~4.4.6.3A,~~ and 4.4.6.~~3A~~2A** through **4.4.6.~~3C~~2C**, potential impacts to riparian habitat or other sensitive natural communities, including on-site drainages, will be reduced to less than significant levels.

4.4.6.~~4~~3 Candidate, Non-listed Sensitive, or Special-Status Species

Impact 4.4.6.~~4:~~ 3: *The ~~proposed~~ project has the potential to affect the burrowing owl, designated "species of special concern" by the California Department of Fish and Wildlife.*

~~Threshold~~	~~Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?~~

Threshold	Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Critical Habitat. No USFWS designated Critical Habitat for any species is located within the ~~project area~~WLC site; therefore, no further action with regard to Critical Habitat is necessary.

Los Angeles Pocket Mouse. Focused surveys for the LAPM were conducted in August 2005, June 2010, June 2012, ~~and~~ July 2013, and May 2018. Suitable habitat was found within Drainage Feature 9, one of the main drainage features located in the eastern end of the ~~project area~~WLC site. In its MSHCP Consistency Report, MBA concluded that LAPM is absent from the ~~project area.~~WLC site, which is substantiated by the ESA May 2018 surveys. However, the WLC Specific Plan indicates this drainage will remain in its present natural condition, except for the southern end as it becomes the Street H channel and outlets to the SJWA land to the south. Extensive surveys were completed in 2005, 2010, 2012, 2013, and ~~2013~~2018, which concluded that Los Angeles pocket mouse was not present. In addition, there is no suitable habitat between the known occurrence of Los Angeles pocket mouse and the ~~WLCSP~~WLC SITE. The known populations of Los Angeles pocket mouse are located within the southern portion of the SJWA, which is more than 2 miles from the southern ~~WLCSP~~WLC site boundary. The area between the known recorded occurrences of Los Angeles pocket mouse and the ~~WLCSP is~~WLC site have been actively disked farmland in the past and a 500-foot wide area along the southern WLC site boundary continues to be actively disked. Therefore, there is no habitat connectivity between the known occurrences of Los Angeles pocket mouse and the ~~WLCSP~~WLC site. However, to ensure that no impacts occur**, Mitigation Measure 4.4.6.~~4E~~3E** has been added below.

Migratory or Nesting Birds. The 2013 MBA report found the extensive agriculture plant communities in the ~~WLCSP~~WLC site and offsite facilities provide suitable nesting habitat for ground-nesting avian species such as western meadowlark (*Sturnella neglecta*) and burrowing owl. Suitable habitat for shrub and tree nesting species such as red-tailed hawk, black phoebe (*Sayornis nigricans*), and house finch occur along the edges of existing development surrounding the ~~WLCSP~~WLC site and offsite facilities as well as isolated, remnant patches of vegetation in undisturbed portions of the ~~WLCSP~~WLC site and ~~offsite~~off-site facilities. Therefore, portions of the ~~WLCSP~~WLC site and offsite facilities and immediately adjacent to the ~~WLCSP~~WLC site and off-site facilities provide suitable nesting habitat for migratory birds protected under the MBTA and California Fish and Game Code.

The ~~project area~~WLC site contains suitable nesting habitat for several tree-, shrub-, and ground-nesting avian species. Therefore, MBA recommends construction activities avoid the avian nesting season, from February to August, if possible. If construction activity must take place during the nesting season, a pre-construction nesting bird survey should be conducted prior to any ground disturbance activities. The survey can be conducted in conjunction with the pre-construction survey for burrowing owl.

If passerine birds are found to be nesting or if there is evidence of nesting behavior within 250 feet of the impact area, a 250-foot setback will be required around the nest where no vegetation disturbance will be permitted. For raptor species such as hawks and owls, this buffer should be expanded to 500 feet. A qualified biologist will be required to closely monitor nests until it is determined that they are no longer active, at which time construction activity in the vicinity of nests could continue. Construction activity may proceed within the buffer area at the discretion of the biological monitor.

Burrowing Owl. For those species that are not covered by the take and incidental take provisions of the MSHCP (e.g., burrowing owl), the MSHCP requirements dictate that further protective action be taken. While no burrowing owls were identified within the project's proposed area of disturbance, because suitable habitat is present within the ~~project area~~WLC site for the burrowing owl and because the species is highly mobile, a potential exists that, at some future date prior to project development, this species may occupy the development sites. The species was documented in 2018 within the proposed 250-foot setback area along the southern WLC site boundary. This is a potentially significant impact requiring mitigation.

All burrowing owl observations within the project site prior to 2018 are associated with artificially created berms. The recorded sightings have been within a bank of an existing drainage feature, a berm within the recently constructed detention basin associated with the Skechers Building (Drainage 3), and a roadside berm just south of Alessandro Boulevard. Burrowing owl was observed in 2018 in the eastern drainage within the proposed 250-foot setback area.

The proposed detention basins will be constructed with similar manufactured berms. Based on historic observations of burrowing owl within the ~~project~~WLC site, it is reasonable to assume that construction of similar berms will continue to provide optimum burrow habitat for resident burrowing owls.

In addition, since there have been no recorded occurrences of burrowing owl in the northern portion of the SJWA there is no concern for competition with other burrowing owls. It is reasonable to assume that the created detention basins will provide more than a sufficient amount of foraging habitat to support a single pair of burrowing owl. Since the southern 250~~-~~-feet of the ~~WLCSP~~WLC site will not contain any building development and construction activities will be restricted to detention basins and associated access roads, it would be more appropriate to include the ~~buffer~~setback area in a deed restriction rather than a conservation easement.

Plant Survey Areas. The project limits are within MSHCP Survey Area 10 of the NEPSSA and MSHCP Survey Area 9 of the CASSA for plant species. The MSHCP requires that a habitat site assessment (HSA) be conducted for all proposed developments within Narrow Endemic Plant Species' (NEPSSAs) and Criteria Area Sensitive Plant Species' (CASSAs). The HSA for most NEPSSA and CASSA plants must be done during a normal rainfall year and/rainy season. If it is determined during the HSA that suitable soils and/or growing conditions are present on site to support identified NEPSSA species, a focused plant survey is required during the plant species blooming period.

Habitat suitability of the site for NEPSSA and CASSA species is detailed in the General Biological Resources and MSHCP Compliance Report (~~EIR~~ Appendix E). None of the species analyzed in the NEPSSA or CASSAs is anticipated to occur on the WLC ~~project site.~~site and none were observed during 2018 rare plant surveys. The implementation of the WLC project would not affect the habitat or result in a direct impact for any special status plant species.

~~Project~~WLC or Specific Plan Design Features. The ~~WLCSP~~WLC Specific Plan does not contain any design features relative to sensitive species or birds, other than the landscape palette that contains all native and/or drought-tolerant plants that may be utilized by birds tolerant of human activity.

~~*The following mitigation measures have been changed in response to Comments A-6-17 in Letter A-6 from the U.S. Fish and Wildlife Service, and Comment B-3-33 in Letter B-3 from the California Department of Fish and Wildlife.*~~

Mitigation Measures. The following measures have been identified to reduce the significance of potential impacts to special status bird species:

Listed or Sensitive Species:

The previously identified **Mitigation Measures 4.4.6.1A** through **4.4.6.~~1D~~1B** will reduce potential impacts on listed or otherwise sensitive plant or animal species or critical habitat to less than significant levels, other than the following which are addressed with additional measures:

Migratory/Nesting Birds

4.4.6.~~4A~~3A Pursuant to the Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code (CFGC), site preparation activities (removal of trees and vegetation) shall be avoided during the nesting season of potentially occurring native and migratory bird species (generally February 1 to August 31). If site preparation activities must occur during the nesting season, a pre-activity field survey shall be conducted by a qualified biologist prior to issuance of grading permits for such development. The survey shall determine if active nests of species protected by the Migratory Bird Treaty Act or California Fish and Game Code are present in the construction zone. If active nests of these species are found, the ~~developer~~applicant shall establish an appropriate buffer zone with no grading or heavy equipment activity within of 500 feet from an active listed species or raptor nest, 300 feet from other sensitive or protected bird nests (non-listed), 250 feet from passerine birds, or 100 feet for sensitive or protected songbird nests. All construction activity within the vicinity of active nests must be conducted in the presence of a qualified biological monitor. Construction activity may encroach into the ~~buffer~~setback area at the discretion of the biological monitor in consultation with CDFW. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, mitigation measure 4.4.6.~~4B~~3B shall also apply. This measure shall be implemented to the satisfaction of the City Planning Division.

4.4.6.~~4B~~3B If it is determined that project-related grading or construction will affect nesting migratory bird species, no grading or heavy equipment activity shall take place within the limits established in Mitigation Measure 4.4.6.~~4A~~3A until it has been determined by a qualified biologist that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. This measure shall be implemented to the satisfaction of the City Planning Division.

4.4.6.~~4C~~3C The loss of foraging habitat for golden eagle and white-tailed kite will be mitigated by payment of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) fee and the creation of a landscaped ~~buffer~~setback area adjacent to the ~~San Jacinto Wildlife Area~~SJWA property~~ (SJWA).~~. First, the payment of the Western Riverside County Multiple ~~species~~Species Habitat Conservation Plan fee ~~will~~shall be required on a project-by-project basis. Second, a 250-foot setback as described in Mitigation Measure 4.4.6.1A ~~will~~shall be established within the ~~World Logistics Center Specific Plan area~~WLC site. This area will reduce impacts to raptor species foraging in the adjacent San Jacinto Wildlife Area open space areas.

Burrowing Owl

4.4.6.~~4D~~3D A pre-construction clearance survey for burrowing owl shall be conducted by a qualified biologist no more than thirty (30) days prior to any grading or ground disturbing activities within the ~~project area~~WLC site.

In the event no burrowing owls are observed within the limits of ground disturbance, no further mitigation is required.

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the disturbance area during the 30-day pre-construction survey, construction activity shall maintain a 500~~-~~-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the California Department of Fish and Wildlife (CDFW) shall take place and an appropriate avoidance distance established. No disturbance to active burrows shall occur without appropriate permitting through the Migratory Bird Treaty Act and/or California Department of Fish and Wildlife.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the California Department of Fish and Wildlife. A relocation plan may be required by California Department of Fish and Wildlife if active and/or passive relocation is necessary. The relocation plan ~~will~~shall outline the basic process and provides options for avoidance ~~and mitigation. Artificial burrows -may be constructed within the buffer area south of the World Logistics Center Specific Plan~~. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor in consultation with CDFW.

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot ~~buffer~~setback area or other suitable on-site or off-site areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor.

Los Angeles Pocket Mouse

4.4.6.~~4E~~3E Prior to the approval of any Plot Plans proposing the development of land including or adjacent to Drainage 9, a protocol survey for the Los Angeles Pocket Mouse (LAPM), including 100 feet upstream and downstream of the affected reach shall be prepared by a qualified biologist and submitted to the City. If the affected drainage is not occupied, the area is considered not to be occupied and development can continue without further action. If the species is found within the specific survey area, no development shall occur until an appropriate mitigation fee is paid or appropriate amount of land set aside on the ~~project~~WLC site or off site to compensate for any loss of occupied Los Angeles Pocket Mouse habitat. Alternatively, individuals may be relocated to the 250-foot setback zone along the southern boundary of the property identified in Mitigation Measure 4.4.6.1A, or other appropriate areas as determined by the United States Fish and Wildlife Service. If necessary, this measure shall also be coordinated with Mitigation Measure 4.4.6.2B regarding preparation and processing of a Determination of a Biological Equivalent or Superior Preservation report. This measure shall be implemented to the satisfaction of the City Planning Division.

Resource Management

4.4.6.~~4F~~3F Prior to approval of any discretionary permits for development within Planning Areas 10 and 12, a Biological Resource Management Plan (BRMP) shall be prepared to prescribe how the 250-foot setback area outlined in Mitigation Measure 4.4.6.1A will be developed and maintained This plan ~~will~~shall identify frequent and infrequent vegetation management requirements (i.e., removal of invasive plants) and the planting and maintaining trees to provide roosting and nesting opportunities for raptors and other birds. The Biological Resource Management Plan ~~will~~shall also describe how relocation of listed or sensitive species will occur from other locations as outlined in Mitigation Measures 4.4.~~6~~5.2A, 4.4.6.~~4D~~3D, and 4.4.6.~~4E~~3E.

The Biological Resource Management Plan shall be reviewed and approved by the Planning Official in consultation with the San Jacinto Wildlife Area Manager. The Biological Resource Management Plan shall cover all the land within the 250-foot setback zone within Planning Areas 10 and 12 Implementation of the plan shall be supervised by a qualified biologist, to the satisfaction of the City Planning Division.

4.4.6.~~4G~~3G Mitigation Measure 4.4.6.1A specifies that a landscape plan shall be submitted with any development proposal for lots adjacent to the ~~California Department of Fish and Wildlife (CDFW)~~ San Jacinto Wildlife Area (SJWA) property prior to issuance of a precise grading permit. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the Specific Plan. No plant species listed in Section 6.1.4 or Table 6.2 of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) shall be installed within the setback area. In conjunction with development adjacent to the San Jacinto Wildlife Area (SJWA), cottonwood trees shall be planted within the 250-foot setback area, consistent with the World Logistics Center Specific Plan plant palette (per DBESP MM 8).

During construction, the runoff leaving construction areas ~~will~~shall be directed to onsite detention basins and away from downstream drainage features located offsite. All projects within the ~~WLCSP will~~WLC site shall be required to prepare a Storm Water Pollution Prevention Plan (as outlined in MM 4.9.6.2B). Regarding the 250-foot setback area, pedestrian and vehicular access to areas of riparian/riverine habitat ~~will~~shall be prohibited except for controlled maintenance access. Finally, no grading shall be permitted within conserved riparian/riverine habitat areas except for grading necessary to established or enhance habitat areas (DBESP MM 6, 7, 9, and 10).

4.4.6.~~4H~~3H As outlined in Mitigation Measure 4.4.6.1A, development adjacent to the 250-foot open space setback shall have a six-foot chain link fence or similar barrier to help separate human activity and the ~~buffer~~setback area. Any chain link fencing installed on any properties adjacent to the 250-foot buffer area shall have metal mesh installed below and above ground level to prevent animals from accessing new development areas.

4.4.6.~~4I~~3I The individual property owner and/or Property Owners Association (POA) as appropriate shall be responsible for maintaining the various onsite landscaped areas, open improved or natural drainage channels, and detention or flood control basins in a manner that provide for fuel management and vector control pursuant to standards maintained by the City Fire Marshall and County Department of Environmental Health- Vector Control Group. This measure requires the individual owner or Property Owners Association (POA) to manage vegetation in and around these areas or improvements so as to not represent a fire hazard as defined by the City Fire Department through the substantial buildup of combustible materials. This measure also requires the individual owner or Property Owners Association to manage vegetation and standing water in drainage channels and basins such that they do not encourage or allow vectors to occur (primarily rats and mosquitoes). Runoff shall not be allowed to stand in channels or basins for more than 72 hours without treatment or maintenance to prevent establishment of mosquitoes per published County vector control guidelines and "Best Management Practices for Mosquito Control on California State Properties" which is available from the California West Nile Virus website at http://www.westnile.ca.gov/resources. This measure shall be implemented by the Property Owners Association in consultation with the City Fire Department and Riverside County Department of Environmental Health – Vector Control Group.

4.4.6.~~4J~~3J A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the ~~World Logistics Center Specific Plan~~WLC site adjacent to Western Riverside County Multiple Species Habitat Conservation Plan Conservation Areas. The Fuel Management Plan shall be prepared by the project ~~proponent~~applicant and submitted for approval to the prior to plot plan approval for those projects on the southern and eastern Western Riverside County Multiple Species Habitat Conservation Plan boundary. Per the Western Riverside County Multiple Species Habitat Conservation Plan guidelines, the Fuel Management Plan shall include the following:

- A plant palette of adequate plant species that may be planted within the Fuel Management Area, which will be approved by a biologist familiar with the plant requirements of the area.
- A list of non-native invasive plants that are prohibited from installation.
- Maintenance activities and a maintenance schedule.

Fuel modification zones shall be mapped and include an impact assessment as required under California Environmental Quality Act guidelines for a project-level analysis. The plan shall demonstrate that the adjacent Western Riverside County Multiple Species Habitat Conservation Plan Areas are adequately protected from expected fire risks.

4.4.6.~~4K~~3K Prior to approval of any plot plans for development adjacent to the SJWA, the applicant shall demonstrate that direct light rays have been contained within the development area, per requirements of the MSHCP Section 6.0 which states, "Night lighting shall be directed away from the MSHCP Conservation Area to protect species within the MSHCP Conservation Area from direct night lighting." This measure shall be implemented to the satisfaction of the City Planning Division.

Level of Significance after Mitigation. Implementation of the above-listed mitigation measures would reduce impacts to burrowing owl, migratory bird species, and Los Angeles pocket mouse to less than significant levels.

~~4.4.7~~ **Note to reader:** Cumulative Impacts

~~The cumulative area for biological resources is the Western Riverside County MSHCP area. The MSHCP establishes a comprehensive, multi-jurisdictional program focused on the conservation of 146 species and their habitats in western Riverside County. As stated in its Conservation Element, the City reviews all public and private development and construction projects and other land use plans/activities within the MSHCP area to ensure compliance with the conservation criteria procedures and mitigation requirements set forth in the MSHCP. As a signatory~~ to ~~the MSHCP Implementing Agreement, the City has been issued "Take Authorization," which allows the implementation of land use decisions consistent with the MSHCP without individual authorization by State or Federal authorities. As required by the MSHCP, focused biological resource studies have been conducted to assess potential impacts associated with development of the proposed uses. Where impacts to special status bird species and jurisdictional areas have been identified, mitigation has been identified to reduce the project specific impacts to a less than significant level. Additionally, the MSHCP and its Implementation Agreement contain a fee mitigation program pursuant to which local agencies collect development impact fees and remit such fees to the RCA. These fees~~Biological Resources are ~~in turn used to acquire lands which are suitable for habitat preservation for species covered by the MSHCP. In fact, habitat lands created by the MSHCP also have biological benefits for species technically not covered by the MSHCP, such~~

~~as the burrowing owl. Habitat acquired by the MSHCP may be suitable as owl habitat. The latest adjustment of the MSHCP fee mitigation (July 1, 2009) allows the collection of fees of $~~discussed in Section 6~~,597 per acre of industrial development. The payment of required MSHCP is a standard requirement for all development occurring within the MSHCP area.~~

~~This EIR determined that indirect impacts of the project on the SJWA would be less than significant with mitigation, and the regional (cumulative) implications of the project can be addressed through the fee payment program of the MSHCP because it provides a regional and comprehensive approach to conservation planning. For example, future development that impacts Drainage 9 would be required to prepare a DBESP report consistent with MSHCP requirements. Through the implementation of the stated mitigation for project-specific impacts, and the payment of required MSHCP mitigation fees, no significant cumulative effect on biological resources would result from the development of the proposed uses with implementation of the identified program mitigation measures.~~

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~.4 Biological Resources.

~~4.5 CULTURAL AND PALEONTOLOGICAL RESOURCES: TABLE OF CONTENTS~~

~~FIGURE~~

~~TABLE~~

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

NOTE TO READERS. *The cumulative portion of Section 4.5 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.5 of this Revised Sections of the FEIR. All other portions of Section 4.5 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.5 means that the corresponding portion of Section 4.5 in the FEIR remains unchanged or has been deleted.*~~*This section has been revised in response to public comments received on the Programmatic DEIR which have resulted in project changes, updates to technical studies, and revisions to DEIR sections and proposed Mitigation Measures.*~~

4.5 CULTURAL AND PALEONTOLOGICAL RESOURCES

This section identifies and evaluates the potential of the project to have adverse effects on archaeological, historical, and paleontological resources. The resources of concern include, but are not limited to, prehistoric and historic artifacts, burials, sites of religious or cultural significance to Native American groups, and historic structures. This section provides a detailed discussion of impacts potentially attributable to the project, and criteria used to determine impact significance to cultural resources.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR has been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development. ~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The analysis contained in this section is based on the following technical study prepared for the project:

- Cultural Resources Assessment, Michael Brandman Associates, original dated April 12, 2012, updated September 2014 (Appendix F).
- Copies of City correspondence illustrating City compliance with SB 18 tribal consultation requirements (Appendix A).

In addition to this technical study, the analysis contained in this section is also based on the following reference documents:

- Moreno Valley General Plan Conservation Element, adopted October, 2006.
- Moreno Valley General Plan Environmental Impact Report, certified July, 2006.

4.5.1 Existing Setting

4.5.1.1 Archaeological Resources

Archaeological resources are those associated with prehistoric cultural sites, prehistoric isolates, and the remnants of historic cultural sites that lack substantive building remnants (termed "historic archaeological sites") such as roads and trails. Prehistoric cultural resources consist of those physical properties that predate the advent of written records in a particular region that are considered important to a culture, subculture, or community for scientific or humanistic reasons. These include geographic districts, structures, sites, objects, and other physical evidence of past human activity. Similar to prehistoric cultural resources, historic cultural resources in a particular geographic region are considered important to a culture, subculture, or community, and postdate the advent of written records. An archaeological records search was conducted through the Eastern Information Center (EIC) at the University of California, Riverside by the project archaeologist, Michael Brandman Associates (MBA).

The results of this records search indicated that the project site and surrounding area contain a number of Native American (NA) sites, mainly milling features and slicks associated with the uplands of the nearby Mount Russell Range. The area also contains several historic sites mainly remnant artifacts and foundations of historic homestead/farmstead buildings and/or ranch complexes.

4.5.1.2 Historic Resources

The following is excerpted and summarized from Viola Hamner's "In the Beginning," a history of life in Moreno Valley (Hamner 2003):

> *Our valley was once called San Jacinto Plains. It was so named because the land was considered a part of the huge Rancho San Jacinto, dating back to mission times. It has been described as part of the tableland that stretches between Box Springs and the San Jacinto Mountains, and between the Badlands and Temecula.*
>
> *Great bands of sheep and herds of cattle from the rancho roamed our valley and munched the grasses and weeds. Indian made trails and camped near the hills. Just as new, the hills turned brown during the summer months and into the spring, the undisturbed land became a billowy lake of blossoms…*

> *When the huge Alessandro Tract on the western part of our valley was recorded in August 1887, and the town of Alessandro was established, our valley became known as Alessandro Valley or Alessandro Plains. After 1890 when the town of Moreno was established, it became known as Moreno Valley as well as Alessandro Valley.*
>
> *Then in 1890 appeared Frank E. Brown and his Bear Valley and Alessandro Development Company, coming in like a great wind, and in one big swoop, changed our valley forever… Brown and his partner Edward Judson, devised a plan to build a dam and transport water to their land from Big Bear Mountain. They then founded the successful colony of Redlands. They concluded that if they built the Bear Valley Dam higher, there would be enough water in the big reservoir to establish another colony in what is now Moreno Valley.*
>
> *Brown and his investors bought and subdivided thousands of acres of land throughout the valley.*
>
> *In April 1891, the precious Bear Valley water finally arrived. It traveled down the mountain and through pipelines, tunnels, and ditches for a distance of forty miles… With only a promise of water, the excited settlers started to improve their parcels.*
>
> *For several years, there was great hope and planting activity in the valley. Then, in 1894, a series of misfortunes befell the valley, including several years of drought and a lack of irrigation water as a result of losing a water rights decision with Redlands. It turned out the Big Bear Dam had not been built large enough to handle drought conditions.*
>
> *The drought continued and by 1898, Big Bear Lake was virtually dry. Depopulation of Moreno Valley began, and some settlers moved to nearby towns, taking their houses with them. An English writer described it as a “Valley on Wheels.” Even the three-story Hotel de Moreno (at the corner of Alessandro Avenue and Redlands Boulevard). “Some businesses continued to operate in the town of Moreno. The General Store and Post Office continued on for over 100 years. The town may have withered, but it never died.*
>
> *Over the years, other settlers who could afford it, dug their own wells and continued to raise citrus. In the spring, the sweet smell of orange blossoms gave delightful encouragement. Olives and other crops were planted, but most of the acreage in Moreno Valley was filled with “amber fields of grain.” The dry-land farming had only the winter rains to sustain them.*

The author then refers to the “second coming or the second spurt of development. This began with the subdivision of the Sunnymead Orchard Tract in 1912, the establishment of Alessandro Flying Field (March Field) in 1918, and the subdivision of the Edgemont Tract in 1923.”

Finally, the author refers to the “third coming when huge parcels of open land were turned into housing tracts, starting in the 1960’s, resulting in an explosion of population. The city of Moreno Valley was founded in November 1984. It encompassed the Moreno, Sunnymead, and Edgemont areas. It became the 20th City in Riverside County and the second largest in population at that time.”

4.5.1.3 Paleontological Resources

The project site is located at the northern end of the Peninsular Range Geomorphic Province California Geologic Survey (2002), a 900-mile long northwest-southeast trending structural block that extends from the tip of Baja California to the Transverse Ranges and includes the Los Angeles Basin. This region is characterized by a series of mountain ranges separated by northwest-trending valleys sub-parallel to faults branching from the San Andreas Fault. The trend of topography is similar to that of the Coast Ranges Geomorphic Province located to the north, but the geology is more like that of the Sierra Nevada, with granitic rock intruding on the older metamorphic rocks. It contains extensive pre-Cretaceous (greater than 65 million years ago) igneous and metamorphic rocks covered by limited exposures of post-Cretaceous sedimentary deposits.

Specifically, the project site is located on the Perris Block, which extends from the southern foot of the San Gabriel and San Bernardino Mountains southeast to the vicinity of Bachelor Mountain and Poly Butte. It is bounded on the southwest by the Elsinore Fault Zone and on the northeast by the San Jacinto Fault. The surface of the Perris Block consists of granitic exposures that have been tectonically tilted eastward, leaving granitic outcrops elevated and exposed on the west side of the Perris Block (Jurupa Hills) and allowing Pleistocene sediments to cover the east side, filling the eastern San Bernardino, Lakeview, Perris, and San Jacinto Valleys.

The project site lies between the plutonic batholith of Mt. Russell, the San Jacinto fault zone and the Pliocene-era non-marine sedimentary rocks of The Badlands.[1] Within the project limits, Holocene alluvial sediments and isolated Pleistocene alluvial sediments have been mapped across much of the site, with a small outcrop of Cretaceous granitic bedrock on the surface in the southwestern portion of the site. It is possible that deposits of middle to late Pleistocene (300,000 to 10,000 years ago) alluvium are present just below the surface in isolated locations of the site, but there are no surface expressions of this older formation on the surface within the project site.

Artificial Fill. Artificial fill consists of sediments that have been removed from one location and transported to another by human activity. Artificial fill will sometimes contain modern debris such as asphalt, wood, bricks, concrete, metal, glass, plastic, and plant material. Artificial fill can contain fossils, but since these fossils have been removed from their original location, it is unlikely to contain in-situ fossils. Artificial fill can be found in isolated areas on the project site, mainly associated with former ranch/farm sites or existing residences and farms.

Holocene Alluvial Fan Deposits. Holocene Alluvial Fan Deposits are also known as Recent to Young Alluvial Fan Deposits. They are found at the mouths of canyons or along the sides of hills that flank river and stream valleys (e.g., the Badlands to the east and northeast). They represent deposition by small streams that flow out of mountains and hills. They were deposited during the early to late Holocene and range in age from the recent to 10,000 years before the present. Although Holocene alluvium can contain remains of plants and animals, generally not enough time has passed for the remains to become fossilized. In addition, the remains are contemporaneous with modern species, and these remains are usually not considered to be significant. These deposits are too young to contain in-situ fossils and have low paleontological sensitivity; however, it should be noted that although an area may be mapped with younger alluvium on the surface, deposits of older alluvium are often encountered at shallow depths below the surface, and these older sediments can and do contain fossils.

Pleistocene Alluvial Fan Deposits. Pleistocene Alluvial Fan Deposits are also known as Old Alluvial Fan Deposits and Very Old Alluvial Fan Deposits. Like the Holocene Alluvial Fan Deposits described above, they are found at the mouths of canyons and along the sides of hills that flank river and stream valleys, they are older than the Holocene deposits. The Old Alluvial Fan Deposits were deposited during the late to middle Pleistocene (10,000–300,000 years ago) and the Very Old Alluvial Fan Deposits were deposited during the middle to Early Pleistocene (300,000–1.8 million years ago). Within the subsurface of the project area, sediments from the middle to late Pleistocene likely exist at depths (i.e., possibly as shallow as 5 feet). In addition, as early to middle Pleistocene alluvial sediments are mapped as occurring just to the east and west of the project area, it is also likely that these older sediments may be encountered as well. Fossils are known in similar Pleistocene deposits from excavations for roads, housing developments, and quarries within the Southern California area. These sediments have the potential to contain in-situ fossils and have a high paleontological sensitivity.

---

[1] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

Heterogeneous Granitic Rocks. Heterogeneous mixtures of granitic rocks contain some metamorphic rocks such as schist and gneiss. Granitic rocks range in composition from hornblende-rich quartz diorite to leucocratic tonalite and from potassium feldspar-free rocks to granodiorite and quartz diorite. Because of its igneous origin, granitic rocks do not contain paleontological resources. Surface bedrock deposits are found in the upland areas near the southwest portion of the project site, associated with the Mount Russell Range surrounding Lake Perris.

Summary. A paleontological locality search indicated that there was a low potential for significant paleontological resources to be encountered by construction excavation on the project site at the depths planned for the project, although it is possible that Pleistocene alluvial deposits, which have a higher potential to contain fossils, may be found in some locations during project grading.

4.5.1.4 Ethnographic Context

The Moreno Valley General Plan EIR states that the Luiseño and Cahuilla peoples occupied the region during the Late Prehistoric period. Unfortunately, there is a lack of definitive archaeological evidence linking the prehistoric site complexes located within the City limits of Moreno Valley to any single modern tribal group. It is likely that northern Luiseño and western Cahuilla peoples accessed this area during the late prehistoric period for resource gathering. Areas located at the base of Mt. Russell would have been a logical place for a trade route, as it would link prehistoric site complexes at the north end of the City with the marshy areas at the north end of the San Jacinto Valley. Serrano peoples may have also used the San Jacinto Valley to link with their more southern groups.

a. Cahuilla

The Cahuilla Indians occupied the San Timoteo valley prior to contact with Spanish Mission padres and military personnel, which places the project area near their traditional use areas. Of all the southern California Indians, the Cahuilla existed within the most geographically diverse region, constrained only by water supplies and topography. Currently, it is thought that a migration of Shoshonean peoples from the Great Basin occurred approximately 1,000 to 600 years ago, with populations moving into much of desert and coastal Southern California. Included among these migrants were the forbearers to the modern Cahuilla. The prehistoric Cahuilla were characterized by the occupation of sedentary villages in subsistence territories that permitted them to reach the majority of their resources within a day’s walk. Villages were commonly located near reliable sources of water. During October to November, much of the village population moved to temporary camps in the mountains to harvest acorns and hunt game.

Inland groups also had fishing and gathering spots on the coast that they visited annually. In comparison with the Gabrielino and Luiseño, the Cahuilla appear to have had a lower population density and a less rigid social structure. The Cahuilla patterns may have been relatively stable until mission secularization in 1834, due to the policy of the Catholic Mission fathers or padres to maintain imported European traditional style settlement and economic patterns.

b. Luiseño

The Luiseño, belong to the Shoshonean linguistic family, which is also shared by Cahuilla, Gabrielino, and Serrano among others.[1] Luiseño villages could be found from the Pacific Ocean inland to the western base of the San Jacinto River and near Fallbrook. The villages were typically established near defined water and food sources and in good defensive locations, so these villages were commonly located along valley bottoms, streams, or coastal strands. The Luiseño characteristically lived in

---

[1] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

sedentary villages, therefore one clan or family occupied several food-gathering locations and aggressively guarded these areas against other clans.

c. Serrano

The project area is considered to be in an area historically used by the Serrano. All indigenous groups adjacent to the eastern San Bernardino Mountains were decimated by the Spanish, but some Serrano survived for many years thereafter in the far eastern San Bernardino Mountains due to the ruggedness of the terrain and the dispersed population. It is believed Serrano families inhabited the *Guachama Ranchería* or *Politana* in the early 1800s. This village apparently housed the Rancho San Bernardino *estancia* after about 1819. Their range is generally thought to have been located in and east of the Cajon Pass area of the San Bernardino Mountains, north of Yucaipa, west of Twentynine Palms and south of Victorville. Like all prehistoric Californians, the range of this group was determined by reliable water sources. A Serrano village typically consisted of a collection of families centered about a ceremonial house, with individual families inhabiting willow-framed huts with tule thatching. Considered hunter-gatherers, the Serrano exhibited a sophisticated technology devoted to hunting small animals and gathering roots, tubers, and seeds of various kinds. Today, Serrano descendants are found mostly on the Morongo and San Manuel reservations.

4.5.1.5 Local History

a. Spanish Period (A.D. 1769 to 1821)

The earliest record of exploration of the Moreno Valley area is from the journal of Juan Bautista de Anza, a Spanish explorer who traveled from Mexico City through the San Jacinto Valley, passing by Mystic Lake and through the Moreno Valley area, on his way to Monterrey and San Francisco in 1774.

Father Junipero Serra was sent to Alta California to create a chain of Missions and Mission outposts to bring Christianity to the indigenous population, and create a foundation for colonization of the region. Located between the previously established presidios in Monterey and San Diego, Serra had military assistance in his quest and the San Bernardino area came under the early control of Spanish soldier Pedro Fages and Father Francisco Garces. In 1819, Rancho San Bernardino was established. This followed a decision by the heads of the mission system to expand their agricultural holdings into the interior and later establish a chain of additional Missions in the desert interior. A decision was made to create an *estancia*, or a ranch headquarters with a chapel that was occasionally visited by padres at the *Guachama Ranchería*. Work on the San Bernardino *Asistencia* was started about 1830, and it was not yet finished when the project was abandoned in 1834. The rancho traditions were kept once Mexico established control over the area, but without the original authority of the Mission padres.

b. Mexican Period (A.D. 1821 to 1848)

After years of internal fighting, Mexico achieved its independence from Spain in 1821 and Alta California became the northern frontier of the State of Mexico. The Mission padres were then forced to swear allegiance to Mexico in 1822. Secularization of the missions took place over the next decade and the former mission lands were transferred to the large Mexican families that had settled in the area. Affiliated with Mission San Luis Rey, the Rancho San Jacinto was formed on December 21, 1842 and granted to Jose Antonio Estudillo. This rancho provided Estudillo with twice as much land, 8 square leagues, or 46,080 acres, as he had petitioned for the previous August. Lands north of the modern Alessandro Boulevard were not claimed by any family, probably because little reliable water existed in the area, except for the Mystic Lake cienega, and because it was a two-day ride from the closest Missions, San Gabriel, and San Luis Rey. The property was petitioned for division by Estudillo's brother-in-law Miguel de Pedrorena, soon after and a small portion of The Badlands north of Hemet was added to form the Rancho San Jacinto Nuevo y Potrero.

There is historical evidence a road led from the Rancho San Jacinto headquarters northwest along the base of The Badlands to the springs in the Box Springs Mountains east of what is now Riverside, then over to roads near the Santa Ana River. The route, which likely followed the current alignment of Gilman Springs Road, has been used for travel for over 160 years. The primary purpose of the interior ranchos was to raise cattle and sheep; however, beyond the Mystic Lake *cienega* west of Eden Hot Springs, little reliable water was found north of San Jacinto. The trail likely brought travelers along the base of Mt. Russell as this would shorten the trip to Box Springs. The upper San Jacinto Valley proved marginal in terms of food production for Native Americans, a factor that limited agricultural growth expansion well into the 1950s.

c. Moreno Valley Before 1893

Theodore Street was the eastern border of the old Bear Valley and Alessandro Development Company (BV&A) development. BV&A conceptualized the town of Moreno and the community of Alessandro in 1889. Frank Elwood Brown, an engineer who moved to California in 1876, was the co-founder with Edward Judson of the town of Redlands. In 1890, Brown and other investors formed the BV&A to “plat out new towns, bring Bear Valley water to the [Moreno] Valley, and open another large area to agricultural and town site development.”[1] Brown and Judson began growing citrus in Redlands between 1878 and 1882 using meager local water supplies. Brown formed the Bear Valley Land and Water Company (BVLWC) in the early 1880s and constructed the Big Bear Dam in 1883. After successfully creating Big Bear Lake, at that time the largest man-made reservoir in the world, water began flowing from the dam through a series of flumes and canals to Redlands orchards in 1885. This demonstration led locals to believe that the area could be successfully irrigated using water brought in from the mountains to the north.

The potential for Big Bear Lake seemed enormous because the winters between 1875 and 1885 were some of the wettest winters on record. Brown assumed that the abundance of water stored in the reservoir in those years was typical and would continue as such. With little knowledge of precipitation fluctuations in southern California, water supplies appeared unlimited and Brown and others fostered grandiose schemes for attracting moneyed investors. Between 1889 and 1890, Brown began trading stocks from his own companies to develop land south of Redlands and consolidate his water rights. After organizing the BV&A in 1889, Brown and his associates bought all of the BVLWC stock individually. They then incorporated the Bear Valley Irrigation Company (BVIC), which bought all of the original BVLWC stock, including the dam, from the BV&A.[2]

Frank Brown hoped to duplicate the success of the City of Redlands, which by 1890 was a thriving commercial citrus center located along an established railroad right-of-way. Turning his attention to the valley south of Redlands, a 280-acre town site was named the Town of Moreno. Initially, the town was to have been named New Haven, after New Haven, Connecticut where many of the investors, including Brown, were from. However, to honor Brown, the name Moreno, which is the Spanish word for “brown,” was chosen. North-south streets in the BV&A development in Moreno and Alessandro were named for the corporation leaders, while east-west streets were named for plant and tree species common in California at the time. Hopes were high that Moreno would prosper and local newspapers in 1891 declared that “Moreno will be a rail road town in the future [which has] every advantage of the most favored locality in Southern California and the disadvantages of none.”

In April 1891, it was estimated that between 1,500 and 2,000 people went to the new town site of Moreno to purchase town lots being sold at public auction. In the following eight months, a Congregational Church, four brick commercial buildings, a lumberyard, two brickyards, a cement pipe works, and a school were constructed with as many as “thirty houses being built at one time.”

---

[1] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., September 2014.
[2] Ibid.

By 1893, the Hotel de Moreno, three stories high and encompassing an entire city block, was operational and doing a brisk business with people needing a place to stay while developing their land. Investors interested in Moreno Valley land were from nearby locations, Los Angeles, San Diego, San Bernardino, and from as far away as Wisconsin, Pennsylvania, and New York. A map was created to show potential buyers what types of irrigation systems would be built and where the land was located.[1]

d. Moreno Valley After 1893

Moreno had become a small boomtown with new businesses developing, and orchards and crops being planted on nearby fields. The success for both local businesses and the farmers depended on the availability and consistency of water. Although Brown had studied the feasibility of bringing water into the Valley and had initially been successful piping water from Bear Valley, by 1893 Brown and others realized that without a higher dam, the reservoir could not hold enough water to meet the irrigation needs of Redlands and Moreno. To worsen the situation for Moreno, Redlands was the town for whom the reservoir was initially built and therefore had first rights to the water. A legal suit won by Redlands in 1894, in effect permanently shut off the water to Moreno, although a local judge ordered that domestic water to Moreno homes must be reinstated.[2]

In addition to the lack of water, it is likely that the Recession (Panic) of 1893 forced many potential farmers in southern California to reconsider their options, and new farmers went out of business. The Panic was caused by railroad overbuilding and speculation, much of which was driven by westward expansion into California. According to several sources, over 15,000 businesses and 500 banks failed during this period, many of them in California. The Northern Pacific Railway, the Union Pacific Railroad, and the Atchison, Topeka & Santa Fe Railroad all failed. The resultant depression lasted for three years and farmers went bankrupt nationwide; good economic times did not resurface until about 1899. By that time, the speculative land boom in this part of Southern California was over.

The City remained a rural agricultural community for many decades, until after World War II. The expansion of the Federal freeway system and housing boom following the war led to the start of suburbanization in the Moreno Valley area that slowly converted agricultural land to new homes, shopping centers, etc. In the 1990s at one time, Moreno Valley was one of the fastest-growing communities in the nation. The older agriculture-oriented towns of Alessandro and Moreno gave way to suburban residential neighborhoods. By 2010, “Moreno” had suburban development to the west and agricultural fields to the east.

Alessandro Boulevard. In connection with the development of the Town of Moreno in the 1890s as part of the Bear Valley and Alessandro Development Company’s real estate venture, Alessandro Boulevard was constructed across much of the project site. The roadway has been in continuous use in largely its same location since that time. In 1988, the City adopted Resolution CPAB 88-2 recognizing the landmark status of this roadway and providing for the preservation of its 120-foot right-of-way through the City.

4.5.1.6 NOP/Scoping Comments

The Sierra Club expressed concern about how the project would affect Native American sites in this area, as well as the agricultural history of this area. In addition, Susan Nash provided information about the route that Juan Bautista de Anza took through the San Jacinto Valley and the project site on his travels from San Diego to points north. These comments are addressed in this section of the EIR.

4.5.2 Existing Policies and Regulations

4.5.2.1 Federal Regulations

National Historic Preservation Act (NHPA) of 1966 (as amended), Section 106. The NHPA declares a national policy of historic preservation to protect, rehabilitate, restore, and reuse districts, sites, buildings, structures, and objects significant in American architecture, history, archaeology, and culture. The NHPA established the National Register of Historic Places (National Register), State Historic Preservation Offices (SHPOs) and programs, and the Advisory Council on Historic Preservation. This Act applies to all properties on or eligible for inclusion in the National Register. The Section 106 review process requires consultation to mitigate damage to “historic properties” (defined per 36 CFR 800.16[1] as places that qualify for the National Register), including Native American traditional cultural places (TCPs). Evaluation of cultural resources consists of determining whether it is significant (i.e., whether it meets one or more of the criteria for listing in the National Register). These eligibility criteria are defined in 36 CFR 60.4 as follows:

> The quality of significance in America history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association:
>
> A. That is associated with events that have made a significant contribution to the broad patterns of our history;
>
> B. That is associated with the lives of persons significant in our past;
>
> C. That embodies the distinctive characteristics of a type, period or method of construction, or that represents the work of a master, or possesses high artistic values, or that represents a significant and distinguishable entity whose components may lack individual distinction; and/or
>
> D. That has yielded, or may be likely to yield, information important to prehistory or history.

4.5.2.2 State Regulations

California Environmental Quality Act. An “historic resource” includes, but is not limited to, any object, building, site, area, place, record, or manuscript that is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California.[1] CEQA mandates that lead agencies consider a resource “historically significant” if it meets the criteria for listing in the California Register of Historic Resources (California Register). Such resources meet this requirement if they (1) are associated with events that have made a significant contribution to the broad patterns of California history, (2) are associated with the lives of important persons in the past, (3) embody distinctive characteristics of a type, period, region, or method of construction, and/or (4) represent the work of an important creative individual or possesses high artistic value.[2] These criteria mimic the criteria utilized to determine eligibility for the National Register.

In addition, Public Resources Code Section 21083.2 and *CEQA Guidelines* Section 15064.5(f) recognize that historical or unique archaeological resources other than potential Native American burials may be accidentally discovered during project construction. This guideline recommends that immediate evaluation defined by qualified archaeologists be included in mitigation measures. This guideline also recommends that if the find is determined to be a historical or unique archaeological

---

[1] Public Resources Code, Section 5020.1(j).

[2] Public Resources Code, Section 5024.1(c).

resource, that contingency funding and time allotments sufficient to allow for implementation and avoidance measures be available.

Senate Bill 18. Signed into law in September 2004, and effective March 1, 2005, SB 18 permits California Native American tribes recognized by the Native American Heritage Commission (NAHC) to hold conservation easements on terms mutually satisfactory to the tribe and the landowner. The term “California Native American tribe” is defined as “a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC.”

The bill also requires that, prior to the adoption or amendment of a city or county’s general plan, the city or county consult with California Native American tribes for the purpose of preserving specified places, features, and objects located within the city or county’s jurisdiction. SB 18 also applies to the adoption or amendment of specific plans. This bill requires the planning agency to refer to the California Native American tribes specified by the NAHC and to provide them with opportunities for involvement.

California Health and Safety Code. The California Health and Safety Code Section 7050.5 states that if human remains are discovered on site, no further disturbance shall occur until the County Coroner has made a determination of origin and disposition. If the Coroner determines that the remains are not subject to his or her authority and if the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the NAHC. This regulation is applicable to any project where ground disturbance would occur.

4.5.2.3 City of Moreno Valley General Plan Policies

The General Plan defines goals and policies related to cultural resources within the City of Moreno Valley. The Chapter 9 Goals and Policies section provides the following guidelines to City staff:

Objective 7.6: Identify and preserve Moreno Valley’s unique historical and archaeological resources for future generations.

Policies in Response to Objective 7.6:

7.6.1) Historical, cultural and archaeological resources shall be located and preserved, or mitigated consistent with their intrinsic value.

7.6.2) Implement appropriate mitigation measures to conserve cultural resources that are uncovered during excavation and construction activities.

7.6.3) Minimize damage to the integrity of historic structures when they are altered.

7.6.4) Encourage restoration and adaptive reuse of historical buildings worthy of preservation.

7.6.5) Encourage documentation of historic buildings when such buildings must be demolished.

To help define when a cultural resource becomes “significant” within the context of Moreno Valley history, a professional cultural resource manager must conduct an assessment with consideration of an appropriate threshold. Certain cultural resources will have an intrinsic value to the City. City policy suggests that significant cultural resources uncovered during project-related excavation and construction activities should be preserved and/or mitigated to the extent feasible consistent with their intrinsic value.

Prehistoric sites on Mount Russell are located within lands under the jurisdiction of the City and the County of Riverside are part of an unofficial prehistoric district known as the Wolfskill Ranch North Complex, and its general location has been published in the Moreno Valley General Plan Final EIR.[1] Page 5.10-14 of the Moreno Valley General Plan Final EIR notes that the North Complex is located on Open Space and that a project's potential effect to all prehistoric cultural resources in the City, including those of the Wolfskill complex, is considered a significant impact.

4.5.3 Methodology

4.5.3.1 Phase 1 Research

a. Cultural Resource Assessment

Over the past ten years, a number of cultural resource assessments have been conducted on the project site and in surrounding areas. The following information summarizes the results of those surveys as described in Tables 1 and 2 from the Cultural Resources Assessment conducted for the project. There are 45 archaeological Native American and historical resource sites in the general area of the project, with most being milling features or slicks in the Mount Russell area.[2]

Table 4.5.A lists 11 sites were identified in the southwest portion of the project site, which is designated "Open Space" in the Specific Plan and will not be disturbed. These sites are all milling features associated with the Mount Russell Range and will not be affected by development of the project.

Table 4.5.A: Cultural Resources Identified in the Southwest Portion of the Project Site

CA-RIV-610	CA-RIV-3238	CA-RIV-3345	CA-RIV-8006
CA-RIV-860	CA-RIV-3343	CA-RIV-3346*	CA-RIV-8007**
CA-RIV-2993	CA-RIV-3344	CA-RIV-3347	

* Includes a midden.
** Renamed from CA-RIV-2775, 2776, and 2777.

It should be noted that the cultural assessments for the project do not show the specific locations of the cultural resource sites. This information is restricted from the public, and is considered confidential and protected under CEQA, to protect the resources from illegal or inappropriate damage or theft. The project's Cultural Resources Assessment fulfills the requirements of CEQA as outlined in Section 4.5.6.2, *Significant Impacts*. (*See, e.g. Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200.)

The project's cultural assessments also found five sites within the project area during previous excavations for the MWD pipeline (four sites) and the EMWD Gilman tunnel (the fifth site CA-RIV-6200) that will not be affected by development within the project:[3]

- CA-RIV-6065 (P33-8168);
- CA-RIV-6066 (P33-8169);
- CA-RIV-6067 (P33-8170);
- CA-RIV-6068 (P33-8171); and
- CA-RIV-6200 (P33-8709).

---

[1] City of Moreno Valley General Plan EIR, 2006
[2] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., September 2014.
[3] Ibid.

All of these sites are buried prehistoric Native American artifacts found during trench work except CA-RIV-6200, which was a deeply buried hearth (21 feet below ground surface). All of these resources remain in their original locations and will not be disturbed by the development of the project.

Four (4) historic-era cultural resource sites were identified within the project site in areas that could be affected by development as outlined in Tables 1 and 2 from the project cultural assessment:[1]

- CA-RIV-4201H (historic foundation remnants and trash);
- CA-RIV-4210H (old farm location);
- CA-RIV-5862 (historic era 2-room farmhouse); and
- P33-11621 (historic farmstead in the open space area of the project).

CA-RIV-4201H consists of historic foundation remnants and historical trash (e.g., bottles, nails, and broken dishes) along Virginia Street. Old topographic maps and photographs show a historic farm complex here. This site was Phase 2 tested by MBA in 2011 and found to be not significant according to CEQA criteria. CA-RIV-4210H consists of a historic structure, foundations, and trash deposits. Old topographic maps and photographs show a farm complex at this location. The MBA report indicates this site was Phase II-tested and found to be not significant under CEQA. CA-RIV-5862 consists of a historic era two-room farm structure, but it is on MWD property and is not considered a significant cultural resource under CEQA. P33-11621 is a historic farmstead but is within the open space property in the southern portion of the project site and will not be directly affected by construction within the project.[2]

In addition, there are seven rural residential properties within the project site that may contain historic buildings or resources, but these are private property and MBA staff did not access them and no detailed assessment was conducted. The Specific Plan designates these properties as “Light Logistics” and they will eventually be developed. There is evidence that at least one structure located east of Redlands Boulevard and north of Brodiaea Avenue was built around 1900. These sites will be investigated in connection with any development proposals affecting these properties.

In November 1988, the Cultural Preservation Advisory Board (CPAB) of the City of Moreno Valley designated the entire length of Alessandro Boulevard as a City Historical Landmark (Resolution CPAB 88-2). At that time, the CPAB made the alignment, right-of-way, and name of Alessandro part of the historical designation. Alessandro Boulevard was first established in 1890 and over the years has served as a San Bernardino County Road, Riverside County Road, a California State Highway, part of the transcontinental U.S. Route 60, part of the “Jack Rabbit Trail,” and a City boulevard (Hamner 2003). Resolution CPAB 88-2 was adopted to ensure the maintenance, enhancement, or protection of a street of historical significance. Over the years, various portions of Alessandro Boulevard have been modernized to enhance traffic flow throughout the City, but the original routing has remained unchanged.

4.5.3.2 Phase II Testing

Based on the results of Phase I survey work on a portion of project-related lands (i.e., plowed and vacant parcels) performed in August and September of 2005, Phase II testing of certain prehistoric cultural resources, located in the southwest portion of the site, was undertaken in the summer of 2006. A monitor representing the Soboba Band of Luiseño Indians was in attendance. Additional properties in the Specific Plan were surveyed in the summer and fall of 2007. The last pieces of agricultural land within the Specific Plan boundary were surveyed in July 2011. Known as the Lee Property, these

---

[1] Ibid.

[2] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

exhibited two previously recorded historic-era cultural resources. MBA also re-located prehistoric archaeological site CA-RIV-3347 during the July 2011 survey. The Phase I surveys had revealed three historic-era cultural resource sites, ten prehistoric-era cultural resource sites, and six isolated artifacts located within the boundaries of the project, but not in areas planned for development within the Specific Plan. Each resource was recorded.

In early 2006, a subsurface significance-testing program (Phase II testing) on a series of nine prehistoric cultural resources located at the southwest portion of the project site was conducted to determine if these resources should be considered significant under CEQA. The Phase II-tested sites included:

- CA-RIV-610
- CA-RIV-860
- CA-RIV-3238
- CA-RIV-3343
- CA-RIV-3344
- CA-RIV-3345
- CA-RIV-3346
- CA-RIV-8006
- CA-RIV-8007

NOTE: The following changes have been made due to revision to the Specific Plan project size.

All of these sites are milling features, and CA-RIV-8006 and -8007 are milling slicks. The testing work revealed that only one of these sites exhibited evidence of intact subsurface cultural resources (CA-RIV-3346). For this reason, CA-RIV-3346 should be considered a significant cultural resource for the purposes of CEQA.[1] MBA also determined that the other eight prehistoric sites lacked additional subsurface resources.[2] The MBA report concluded that development of the Specific Plan would not impact the nine prehistoric sites, so no further research on these sites was recommended unless the project created proposed physical disturbance (grading) of these areas.[3] The 74.3 acres of open space shown in the Specific Plan (previously referenced Figure 3.8) encompasses all of the nine prehistoric sites identified by MBA. Therefore, development under the project will not have a significant impact on archaeological resources.

Several buried and isolated prehistoric resources were detected during the monitoring phase of the Highland Fairview Corporate Park Project,[4] located adjacent to the northern edge of the Specific Plan. Likewise, several buried sites adjacent to Davis Road were detected in connection with the 1998 Inland Feeder Project by MWD. Given previous finds in the project area, MBA concluded that certain portions of the project site have a “high” and “moderate” probability of containing significant buried cultural resources, while other areas of the project site have a “low” probability of containing significant buried cultural resources. The high probability areas are within 1,000 feet of the base of the southwestern foothills, while the moderate probability areas are within 2,000 feet of the same area

4.5.3.3 Native American Consultation (SB 18)

MBA contacted the NAHC in March 2011 requesting a Sacred Lands File search for the project area in order to determine if there were records of cultural resources in the area. The response from the NAHC was received on March 25, 2011, indicating that no sacred lands or traditional cultural properties are known to the NAHC within the 3,714 acres of the project area, including the Specific Plan area, Conservation Areas, and Public Facilities. However, other cultural sites have been found in the uplands outside of the project area (i.e., Lake Perris National Recreation Area to the southwest and the San Jacinto Wildlife Area to the south).

---

[1] Ibid.
[2] Ibid.
[3] Ibid.
[4] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

Pursuant to SB 18, on February 29, 2012, MBA sent information-request letters to each of the 11 tribal entities identified by the NAHC (see previously referenced Table 2.C for a summary of the correspondence in this regard). In response, two tribes requested government-to-government consultation under SB 18 during the 90-day notification period (Pechanga and Soboba). The City met with the Pechanga Tribe on May 30, 2012, and with the Soboba Tribe on November 27, 2012. No other Native American entities requested a government-to-government consultation meeting. In addition, several tribes provided information to the City regarding cultural resources to be included in the EIR but did not include a consultation request.

4.5.3.4 Paleontological Contacts

MBA contacted Eric Scott of the Division of Geological Sciences of the San Bernardino County Museum on June 2005 requesting a paleontological records check of the original Moreno Highlands Specific Plan area. Mr. Scott's paleontological review showed that the project area rests entirely on exposures of Holocene (Recent) alluvium and granitic bedrock. Both the alluvium and the bedrock have low potential for fossil deposits to be uncovered during grading. However, the Holocene alluvium rests upon a veneer of Older Pleistocene alluvium and San Timoteo Formation deposits, both of which are highly sensitive for fossil resources.

MBA's monitoring work at the Highland Fairview Corporate Park project, located north and adjacent to this project area, included monitoring for paleontological resources. During construction of the Highland Fairview Corporate Park, it was shown that shallow soils (0 to 20 feet) did not contain paleontological resources. Therefore, MBA recommends that full-time paleontological monitoring on this project should take place only in those portions of the project where earthmoving occurs 20 feet or more below existing grade.

4.5.4 Thresholds of Significance

4.5.4.1 Importance of Cultural Resources

Prior to determining whether a cultural resource is significant under *CEQA Guidelines* and therefore subject to mitigation, a threshold of significance must be developed prior to testing/evaluation. This procedure is recommended by the Office of Historic Preservation (OHP)/State Prehistoric Preservation Officer (SHPO). The threshold of significance is simply a point where the qualities of significance are defined during the analysis such that the resource can be defined as a historical resource. An adverse effect to a historic resource is regarded as the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource will be reduced such that it no longer meets the significance criteria. In lay terms, should an analysis show that future development will destroy elements that make the cultural resource historical, but leave non-unique elements intact, then the significance of the resource will be lost and there must be mitigation for that loss.

CEQA Section 15064.5, Determining the Significance of Impacts to Archaeological and Historical Resources, states that:

> "Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources (Pub. Res. Code §5024.1, Title 14 CCR, Section 4852) including the following:
>
> (A) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
>
> (B) Is associated with the lives of persons important in our past;

(C) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

(D) Has yielded, or may be likely to yield, information important in prehistory or history."

If a prehistoric cultural resource is tested, it is traditionally held that buried features such as hearths, burials, and middens could hold analytical information that will pass the significance threshold and make the site eligible for the cultural resource under Criterion D alone (listed above) For resources created after the historic period began (post-1769 AD) and which are at least 45 years old, analysis of the condition and integrity of exposed features may cause the resource to pass Criterion A, B, C, and/or D thresholds (shown above).

For buildings and other structures at least 45 years old, the completeness and integrity of the structural architecture may cause the site to pass Criterion A, B, and/or C thresholds. The threshold should be associated with the site context or theme. If sets of unusual artifacts, buried but unusual buildings, or human remains are detected during tests of cultural resources in the project site, or if a historical review of the resource finds that it was once associated with a person and/or event of historical significance at the State/National level, such resources will likely be considered potentially significant for California Register/National Register listing. In the event that the significance of the historical resource will be reduced below the threshold because of development, feasible mitigation must be developed.

4.5.4.2 Definition of Cultural Resource Sites and Isolates

Prehistoric and historic cultural resources can vary in form and function from area to area, but it is a "site" as opposed to isolated artifacts and certain features that must be considered significant. Prehistoric and historic cultural resource sites are defined in this study as three or more items, such as lithics, stone tools, glass, cans, etc., that are not from a single source or material found within a 10 square meter area. There is no limit to the physical size of a site.

Sites that could qualify as significant are typically more than 45 years old or have the potential to be more than 45 years old. These definitions assume that items found in an area with a diversity of materials can represent more than a single activity at a location. Discrete components of a site may be identified to represent repeated activity, such as milling stations, hearths, or isolated structures. Isolated artifacts and certain isolated features do not meet these minimal criteria. Isolates could consists of one or two cans, stone flakes, one metate fragment or fence posts, brass section markers, or well heads. Potential impacts to isolates need not be mitigated.

4.5.4.3 CEQA Thresholds

Based on Appendix G of the *CEQA Guidelines*, the effects of a project on cultural resources are considered to be significant if the project would:

- Cause a substantial adverse change in the significance of a historical resource as defined in *CEQA Guidelines* Section 15064.5;
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to *CEQA Guidelines* Section 15064.5;
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; and/or
- Result in any disturbance of human remains, including those interred outside of formal cemeteries.

4.5.5 Less than Significant Impacts

The following impacts were determined to be less than significant. In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.

4.5.5.1 Human Remains

Threshold	Would the project disturb any human remains, including those interred outside of formal cemeteries?

The project site is currently undeveloped. No evidence suggesting the project site has been utilized in the past for human burials has been identified. In the unlikely event that human remains are discovered during grading or construction activities within the project site, compliance with State law (Health and Safety Code § 7050.5) (HSC § 7050.5) would be required. These requirements are imposed on any construction activity in which human remains are detected, and include the following provisions:

- There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:
  - The coroner of the county in which the remains are discovered must be contacted to determine that no investigation of the cause of death is required; and
  - If the coroner determines the remains to be Native American:
    - The coroner shall contact the Native American Heritage Commission within 24 hours.
    - The NAHC shall identify the person or persons it believes to be the most likely descended from the deceased Native American.
    - The most likely descendant may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code § 5097.98 (PRC § 5097.98), or
  - Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further and future subsurface disturbance pursuant to PRC § 5097.98(e).
    - The NAHC is unable to identify a most likely descendant.
    - The most likely descendant is identified by the NAHC, fails to make a recommendation within 48 hours of being granted access to the site; or
    - The landowner or his authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner.

There is a small possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. In the event of an accidental discovery or recognition of any human remains, California State Health and Safety Code § 7050.5 dictates that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to CEQA regulations and PRC § 5097.98. Compliance with existing State law would ensure that impacts related to the discovery of buried human remains would be less than significant and no mitigation is required.

4.5.6 Significant Impacts

The following potential impacts were determined to be potentially significant. In each of the following issues, mitigation measures have been recommended to reduce the significance of impacts.

4.5.6.1 Archaeological Resources

Impact 4.5.6.1: *The project has the potential to affect known or previously undetected subsurface archaeological resources.*

Threshold	Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

Review of all cultural resource factors in and near the project site suggests that the project site is sensitive for archaeological resources in the southwestern portion of the site and the Specific Plan has set aside these 74.3 acres as open space (Planning Area 30) to permanently protect these resources. There is no evidence that any other cultural resources are located in or near the project area; however, two tribes indicated a desire to consult with the City under SB 18 regarding the potential of such resources on the site.

The nine prehistoric cultural resources located near the southwestern portion of the project site were Phase II tested for significance: CA-RIV-610, CA-RIV-860, CA-RIV-3238, CA-RIV-3343, CA-RIV-3344, CA-RIV-3345, CA-RIV-3346, CA-RIV-8006, and CA-RIV-8007. Of these nine sites, only CA-RIV-3346 (milling features and a "midden") is considered a significant resource under *CEQA Guidelines* because it exhibited evidence of intact subsurface cultural resources (MBA 2014). The project cultural assessment concluded that all the identified prehistoric sites are outside of the development area of the Specific Plan and thus there would be no significant impact to archaeological resources from the development.

Unknown Cultural Resources. It is possible that unknown cultural resources could be discovered during project-related construction. The land within 1,000 feet of exposed granitic bedrock outcrop areas in the southwesterly corner of the project is considered to have "high" sensitivity, while areas located within 2,000 feet of this area are considered to have "moderate" sensitivity. The remainder of the site is considered to have "low" sensitivity for cultural resources. As set forth below, a qualified archaeologist should be retained by the City to monitor any earthmoving in the areas of high and moderate sensitivity.

In addition, a number of project-related improvements, including the SR-60/Theodore Street / World Logistics Center Parkway interchange, SR-60/Gilman Springs Road interchange, three reservoir sites, water, sewer, and storm drain connections, debris basins, etc. are off site and cultural surveys will be conducted when specific sites are identified for these off-site improvements.

Project or Specific Plan Design Features. The 74.3-acre open space area in the southwest corner of the WLCSP encompasses the entire foothill area some of which is considered sensitive for archaeological resources. This area is designated as Open Space in the Specific Plan and only the extension of Cactus Avenue and passive open space uses will be permitted in this area. The updated cultural report by MBA determined that potential impacts to cultural resources from constructing Cactus Avenue through this area could be reduced to less than significant levels by the implementation of the mitigation measures already proposed for project grading (MM 4.5.6.1C through 4.5.6.1E).

~~*The following mitigation measure had been revised in response to Comments A-3-23 in Letter A-3 from the Pechanga Temecula Band of Luiseño Mission Indians, A-5-6 in Letter A-5 from Soboba Band of Luiseño Indians, et al.*~~

Mitigation Measures. The following measures are proposed to help reduce potential impacts on known, unknown, or potential archaeological or historical resources to less than significant levels. The wording of the measures has been changed from the Original DEIR to address specific comments made by the Pechanga Tribe. The Tribe did request that the survey area limitations outlined in Measures 4.5.6.1C and 4.5.6.1D be removed. After consultation with the project archaeologist the measures have been modified to refer to specific planning areas within the WLC Specific Plan as shown below:

4.5.6.1A Prior to the approval of any grading permit for any of the “Light Logistics” parcels, the parcels shall be evaluated for significance by a qualified archaeologist. A Phase 1 Cultural Resources Assessment shall be conducted by the project archaeologist and an appropriate tribal representative(s) on each of the “Light Logistics” parcel to determine if significant archaeological or historical resources are present.

A Phase 2 significance evaluation shall be completed for any of these sites in order to determine if they contain significant archaeological or historical resources. Cultural resources include but are not limited to stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. All resources determined to be prehistoric or historic shall be documented using DPR523 forms for archival research/storage in the Eastern Information Center (EIC). If the particular resource is determined to be not significant, no further documentation is required. If prehistoric resources are determined to be significant, they shall be considered for relocation or archival documentation. If any resource is determined to be significant, a Phase 3 recovery study shall be conducted to recover remaining significant cultural artifacts. If prehistoric archaeological/cultural resources are discovered during the Phase 1 survey and it is determined that they cannot be avoided through site design, they shall be subject to a Phase 2 testing program. The project archaeologist in consultation with appropriate tribal group(s) shall determine the significance of the resource(s) and determine the most appropriate disposition of the resource(s) in accordance with applicable laws, regulations and professional practices (per Cultural Report MM CR-1, MM CR-2, MM CR-7 Table 3, pg.74).

4.5.6.1B Prior to the issuance of any grading or ground-disturbing permit for construction of off-site improvements a qualified archaeologist shall be retained to prepare a Phase I cultural resource assessment (CRA) of the project site if an up to date Phase I cultural resource assessment is not available for the site at the time of development per Cultural Report MM CR-5, Table 3, pg.74).

Appropriate tribal representatives as identified by the City shall be invited by the Project Archeologist to participate in this assessment.

If archaeological resources are discovered during construction activities, no further excavation or disturbance of the area where the resources were found shall occur until a qualified archaeologist evaluates the find. If the find is determined to be a unique archaeological resource, appropriate action shall be taken to (a) plan construction to avoid the archeological sites (the preferred alternative); (b) cap or cover archeological sites with a layer of soil before building on the affected project location; or (c) excavate the site to adequately recover the scientifically consequential information from and about the resource. At the discretion of the project archaeologist, work may continue on other parts of the project site while the unique archaeological resource mitigation takes place. This measure shall be implemented to the satisfaction of the Planning Official.

If the project archaeologist, in consultation with the monitoring Tribe(s), determines that the find is a unique archaeological resource, the resource site shall be evaluated and recorded in accordance with requirements of the State Office of Historic Preservation (OHP). If the resource is determined to be significant, data shall be collected by the qualified archaeologist and the findings of the report shall be submitted to the City. If the find is determined to be not significant no mitigation is necessary.

Should a future project-level analysis show that cultural resource site CA-RIV-3346 will be directly or partially impacted by project-level construction, an Addendum cultural resource report must be prepared and include an analysis of the alternatives associated with mitigation for impacts to this resource following CEQA Guidelines Section 15126.4(b)(3). This information must be included in any project-level CEQA compliance documentation. It should be noted that Phase 3 data recovery is an acceptable mitigation action under CEQA Guidelines Section 15126.4(b)(3)(C) (per Cultural Report MM CR-3,Table 3, pg.74).

Should it be determined through a future project-level EIR analysis that prehistoric cultural resource sites CA-RIV-2993 and/or CA-RIV-3347 shall be directly impacted by future construction, these sites must be Phase 2 tested for significance (per Cultural Report MM CR-4, Table 3, pg.74).

4.5.6.1C Prior to the issuance of any grading permits a qualified archaeologist shall be retained to monitor all grading and shall invite tribal groups to participate in the monitoring. Project-related archaeological monitoring shall include the following requirements per Cultural Report MM CR-6, MM CR-8, Table 3, pg.74):

1. All earthmoving shall be monitored to a depth of ten (10) feet below grade by the Project Archaeologist or his/her designated representative. Once all areas of the development project that have been cut to 10 feet below existing grade have been inspected by the monitor, the Project Archaeologist may, at his or her discretion, terminate monitoring if and only if no buried cultural resources have been detected;
2. If buried cultural resources are detected, monitoring shall continue until 100 percent of virgin earth within the specific project area has been disturbed and inspected by the Project Archaeologist or his/her designated representative.
3. Grading shall cease in the area of a cultural artifact or potential cultural artifact as delineated by the Project Archaeologist or his/her designated representative. A setback~~buffer~~ of at a minimum 25 feet around the cultural item shall be established to allow for assessment of the resource. Grading may continue in other areas of the site while the particular find are investigated; and
4. If prehistoric cultural resources are uncovered during grading, they shall be Phase 2 tested by the Project Archaeologist, and evaluated for significance in accordance with §15064.5(f) of the CEQA Guidelines. Appropriate actions for significant resources as determined by the Phase 2 testing include but are not limited to avoidance or capping, incorporation of the site in green space, parks, or delineation into open space. If such measures are not feasible, Phase 3 data recovery of the significant resource will be required, and curation of recovered artifacts and/or reburial, shall be required. A report associated with Phase 2 testing or Phase 3 data recovery must be delivered to the City and, if necessary, the museum where any recovered artifacts have been curated.
5. No further grading shall occur in the area of the discovery until the City approves specific actions to protect identified resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the City where they would be afforded long-term preservation to allow future scientific study.

6. The developer shall make reasonable efforts to avoid, minimize, or mitigate significant adverse impacts on cultural resources The State Historic Preservation Office (SHPO) and local Native American tribes will be consulted and the Advisory Council on Historic Preservation will be notified within 48 hours of the find in compliance with 36 CFR 800.13(b)(3). This measure shall be implemented to the satisfaction of the Planning Official.

4.5.6.1D Prior to the issuance of any grading permit the project archaeologist shall invite interested Tribal Group(s) representatives to monitor grading activities. Qualified representatives of the Tribal Group(s) shall be granted access to the project site to monitor grading as long as they provide 48-hour notice to the developer of their desire to monitor, so the developer can make appropriate safety arrangements on the site. This measure shall be implemented to the satisfaction of the Planning Official.

4.5.6.1E It is possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources (archaeological or historical). In the event that buried cultural resources are discovered during grading and no Project Archaeologist or Historian is present, grading operations shall stop in the immediate vicinity of the find and a qualified archaeologist shall be retained to determine the most appropriate course of action regarding the resource. The Archeologist shall make recommendations to the City on the actions that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with §15064.5 of the *CEQA Guidelines*. Cultural resources could consist of, but are not limited to, stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area shall be recorded on appropriate California Department of Parks and Recreation forms and evaluated for significance in terms of CEQA criteria. If the resources are determined to be unique historic resources as defined under §15064.5 of the *CEQA Guidelines*, appropriate protective actions for significant resources such as avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds shall be implemented by the project archaeologist and the City.

No further grading shall occur in the area of the discovery until the City and project archaeologist approve the measures to address these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the City where they would be afforded long-term preservation to allow future scientific study.

Level of Significance After Mitigation. Adherence to **Mitigation Measures 4.5.6.1A** through **4.5.6.1E** will reduce potential impacts to archaeological resources to less than significant levels.

4.5.6.2 Historic Resources

Impact 4.5.6.2: *The project has the potential to directly or indirectly affect local historical resources.*

Threshold	Would the project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5 of the *State CEQA Guidelines*?

The California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion in the California Register, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;

2. It is associated with the lives of persons important to local, California, or national history;
3. It embodies the distinctive characteristics of a type, period, region, or method or construction, or represents the work of a master, or possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

The California Register requires that a resource possess integrity, which is defined as "the authenticity of a historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance" (California Office of Historic Preservation 1999). To retain integrity, a resource should have its original location, design, setting, materials, workmanship, feeling, and association. Which of these factors is most important depends on the particular criterion under which the resource is considered eligible for listing (California Office of Historic Preservation 1999).

The prehistoric sites recorded within or adjacent to the project boundaries are typical example of common resource type; a prehistoric milling complex lacking temporally diagnostic artifacts or a "single-use resource extraction and processing location." Although broadly associated with prehistoric Native American occupation, the sites do not represent unique archaeological information. The sites are not associated with significant events or persons, and do not embody distinctive characteristics of a type, period, or method of construction, nor do they appear to have the potential to yield information important in prehistory. Therefore, they do not meet any of the above criteria and are not eligible for listing in the California Register. However, they do constitute locally important examples of Native American activity and are not considered a historical resource under CEQA. Impacts to these sites relative to Native American resources are addressed in more detail in Section 4.5.6.1, *Archaeological Resources*.

The project site contains two previously identified historic sites: CA-RIV-4201H and CA-RIV-4210H. Both of these are historic-era homesteads and previously contained farm buildings and related out-buildings. They were located in the eastern portion of the Specific Plan, but MBA could find no remains of these facilities or related artifacts. The MBA report concludes the buildings were demolished and/or their materials removed for disposal or reuse at some point in the past.

There are seven rural residential structures and associated out-buildings currently present on the project site, and one (APN 478-220-009) near Redlands Boulevard contains a farm building that was built around 1900 and may be one of the oldest surviving buildings of the historic Moreno community.[1] No other evidence of past structures or unique features was identified; however, access to the seven rural residential properties was not available at the time of survey, and it appears from general observations, historical aerial photographs, and historical records that one or more of these buildings may be older than 40 years. Without more information, there is a possibility that removal of these buildings could represent a significant impact to historic structures, features, or resources, and mitigation is required.

Local Historical Resources: Alessandro Boulevard. In connection with the development of the Town of Moreno in the 1890s as part of the Bear Valley and Alessandro Development Company's real estate venture, Alessandro Boulevard was constructed across much of the project site. The roadway has been in continuous use in largely its same location since that time. In 1988, the City adopted Resolution CPAB 88-2 recognizing the landmark status of this roadway and providing for the preservation of its 120-foot right-of-way through the City. Alessandro Boulevard was designated as a City Historic Landmark in 1988 "assure the maintenance, enhancement, or protection of a street of historical significance." Over the years, various portions of Alessandro Boulevard have been modernized to enhance traffic flow throughout the City, but the original routing has remained unchanged. Alessandro Boulevard within the WLCSP would retain its original alignment but the roadway would be enhanced to serve modern traffic needs.

---

[1] *Cultural Resources Assessment*, Michael Brandman Associates, Inc., April 24, 2012.

This has been done in multiple areas along Alessandro Boulevard in the past to better serve the needs of the community (i.e., Streets C and E originally indicated in the DEIR and Specific Plan that circulated for public review). See Figure 4.5.1. Based on these project revisions, the proposed WLCSP will not affect the integrity of the landmark status, as the significance of the Landmark status is associated with the original location of the boulevard since 1890 and the retention of the original name of the boulevard across the City. These aspects would remain and the impacts would not be considered significant since the California Register requires that a resource possess integrity, which is defined as “the authenticity of a historical resource’s physical identity evidenced by the survival of characteristics that existed during the resource’s period of significance” (California Office of Historic Preservation 1999). To retain integrity, a resource should have its original location, design, setting, materials, workmanship, feeling, and association. Which of these factors is most important depends on the particular criterion under which the resource is considered eligible for listing (California Office of Historic Preservation 1999). Alessandro Boulevard integrity is retained in the original location; however, design, setting, materials feeling have changed over time through modifications to the road throughout the City, and thus the impacts of the WLCSP would not be significant in the context of the overall conditions of Alessandro Boulevard.

Approximately 1,350 feet of Alessandro Boulevard east of Merwin Street would be closed to through traffic to keep trucks from using Alessandro Boulevard through the residential neighborhoods to the west of the WLC. Eliminating vehicular use of this portion of Alessandro Boulevard would not have a significant impact on the landmark status of the road, as the name and the original routing would be retained. These are the two key characters of the landmark status. This portion of road would be designed to keep access open to non-vehicular users, including pedestrians and bicyclists. Both the original route and name would be retained in keeping with the main aspects of the landmark designation.

In recognition of the historical significance of Alessandro Boulevard and in compliance with Resolution CPAB 88-2, the project will retain and protect the Alessandro Boulevard right-of-way through the project. The conceptual circulation plan for the WLC contained in the Specific Plan (Exhibit 3-1) incorporates nearly all of the current Alessandro alignment. Where the ultimate roadway right-of-way varies from the historic right-of-way, the historic right-of-way will be retained and may be improved with walks, trails, landscaping or similar compatible improvements. Prior to approval of any development including or adjacent to the historic Alessandro Boulevard right-of-way, a concept plan for its entire length shall be submitted to and approved by the Planning Commission. These requirements are contained in the Specific Plan in Section 12.9 “Alessandro Boulevard – Historical Landmark.” Retaining Streets C and E as proposed in the DEIR would have resulted in a potentially significant impact to a historical resource (Alessandro Boulevard), Mitigation Measure 4.5.6.2C has been introduced to keep Alessandro Boulevard in its original alignment. Therefore, any impact is less than significant.

In addition, historical evidence indicates Juan Bautista de Anza traveled through the project area (i.e., along the base of Mt. Russell from south to northwest), which should be acknowledged as part of the trail proposed within the Specific Plan.

Specific Plan Design Features. The Specific Plan was revised to show the realignment of Streets C and E to follow the historical alignment of Alessandro Boulevard and the eastern extension of Cactus Avenue through a part of the on-site Open Space area.

THIS PAGE INTENTIONALLY LEFT BLANK

The following mitigation measure had been revised in response to Comments A-3-23, A-5-6, et al (see FEIR Volume 1, Table 2.A).

Mitigation Measures. Mitigation Measure 4.5.6.1A requires surveying the seven occupied parcels for archaeological resources since these properties could not be surveyed at the time the EIR was prepared. These surveys will identify the potential for significant historical resources on these properties. In addition, the following measure will further reduce the potential impacts of the project on historical resources:

4.5.6.2A If any historic resources are found during implementation of Mitigation Measure 4.5.6.1A, the Project Archaeologist or Historian (as appropriate) shall offer any artifacts or resources to the Moreno Valley Historical Society (MVHS) or the Eastern Information Center/County Museum or the Western Science Center in Hemet as appropriate for archival storage. From the time any artifacts are turned over to the Moreno Valley Historical Society or other appropriate historical group, the developer shall have no further responsibility for their management or maintenance.

In addition, the following measure is proposed to acknowledge the route of Juan Bautista de Anza through the project area as an important historical event:

4.5.6.2B As part of construction of the trail segment connecting Redlands Boulevard to the California Department of Fish and Wildlife property, the developer shall contribute $5,000 to the City for the installation of a historical marker acknowledging the passing of Juan Bautista de Anza through this area during his exploration of California. This measure shall be incorporated into trail plans for this segment which will be subject to review and approval by the City Park and Recreation Department in consultation with the Moreno Valley Historical Society.

4.5.6.2C Streets C and E shall follow the historical alignment of Alessandro Boulevard and shall be named Alessandro Boulevard.

Level of Impact After Mitigation. Implementation of the Specific Plan as revised and **Mitigation Measures 4.5.6.1A, 4.5.6.2A,** and, **4.5.6.2B 4.5.6.2C** will help reduce potential impacts to historical resources to less than significant levels.

4.5.6.3 Paleontological Resources

Impact 4.5.6.3: *The project has the potential to affect previously undetected subsurface paleontological resources.*

Threshold	Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

As described in the *Paleontological Resources Assessment*, no paleontological resources were observed during the field survey. The majority of the project site is underlain by a thin veneer of Holocene alluvium that caps Pleistocene alluvial sediments. In addition, there is a small outcrop of Cretaceous granite that is exposed on the surface, and likely within the subsurface in some areas as well. The results of the assessment indicate that there are no known paleontological resources located within the project limits or within a one mile radius around the project site. The Holocene Alluvium that is exposed on the surface has a low sensitivity for containing paleontological resources. The Cretaceous granitic rocks that are exposed in a small area of the project have no sensitivity for containing paleontological resources. However, the Pleistocene Alluvium that exists in the subsurface of the project has produced paleontological resources in many areas of the Inland Empire and Southern California area.

The portions of the site underlain by older Pleistocene alluvium and San Timoteo Formation rock units should be assigned a “moderate” paleontological sensitivity because these deposits have yielded paleontological resources in other areas in the past. Overall, the project site is considered to have a moderate paleontological sensitivity; therefore, impacts are considered potentially significant and mitigation is required.

Specific Plan Design Features. The Specific Plan does not contain any policies regarding paleontological resources.

Mitigation Measures. The following mitigation measures have been identified to address potential impacts to paleontological resources that may be located within the project limits:

4.5.6.3A Prior to the issuance of any grading permits, a City-approved Paleontologist shall be retained to conduct paleontological monitoring as needed for all grading related to development. Development monitoring shall include the following actions:

1. Monitoring must occur in areas where excavations are expected to exceed twenty (20) feet in depth, in areas where fossil-bearing formations are found during grading, and in all areas found to contain, or are suspected of containing, fossil-bearing formations.
2. To avoid construction delays, paleontological monitors shall be equipped to salvage fossils and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates if they are unearthed.
3. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of specimens.
4. Monitoring may be reduced if the potentially fossiliferous units described herein are not present, or, if present, are determined upon exposure and examination by the Project Paleontologist to have low potential to contain fossil resources . This measure shall be implemented to the satisfaction of the Planning Official. The Project Paleontologist and the Project Archaeologist described in Mitigation Measure 4.5.6.1C may be the same person if he/she meets the qualifications of both positions per Cultural Report MM PR-1, Table 4, pg.76).

4.5.6.3B Prior to the issuance of any permits for the construction of off-site improvements, a qualified paleontologist shall conduct an assessment for paleontological resources on each off-site improvement location. If any site is determined to have a potential for exposing paleontological resources, the project paleontologist shall monitor off-site grading/excavation, subject to coordination with the City. Development monitoring shall include the following mitigation measures:

1. Monitoring must occur in areas where excavations are expected to reach fossil-bearing formations during grading. This monitoring must be conducted by the Project Paleontologist in all areas found to or suspected of containing fossil-bearing formations.
2. To avoid construction delays, the Project Paleontologist shall be equipped to salvage fossils and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates as they are unearthed.
3. The Project Paleontologist shall be empowered to temporarily halt or divert equipment to allow removal of specimens.

4. Monitoring may be reduced if the potentially fossiliferous units described herein are not present, or, if present, are determined upon exposure and examination by the Project Paleontologist to have low potential to contain fossil resources.

Level of Significance After Mitigation. Adherence to **Mitigation Measures 4.5.6.3A** and **4.5.6.3B** will reduce potential impacts to paleontological resources to less than significant levels.

~~4.5.7 Cumulative Impacts~~

~~The cumulative area for cultural resources is the City of Moreno Valley and the western portion of Riverside County. Implementation of the proposed project and related off-site improvements would require measures to identify, recover, and/or record any cultural and/or paleontological resource that may occur within the project limits. Although unlikely to occur, potential impacts associated with human remains would be reduced to a less than significant level through adherence to existing State law. With implementation of the recommended mitigation measures, potential impacts to archaeological or paleontological resources from future development will be reduced to less than significant levels. Since this region contains archaeological, historical, and paleontological resources that have been found in the past, future development in the surrounding region may impact these resources as well. However, implementation of the mitigation measures outlined in this document, and other CEQA documents for development projects in the area, will help reduce potential impacts to cultural resources to less than significant levels. With implementation of the project-level mitigation for future development identified in Section 4.5.6, the proposed project will not have significant impacts related to cultural resources, and will also not make any significant contributions to cumulatively considerable impacts relative to cultural resources. Therefore, no additional mitigation is required.~~

THIS PAGE INTENTIONALLY LEFT BLANK

~~4.6 GEOLOGY AND SOILS: TABLE OF CONTENTS~~

~~FIGURE~~

~~TABLE~~

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

NOTE TO READERS. *The cumulative portion of Section 4.6 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.6 of this Revised Sections of the FEIR. All other portions of Section 4.6 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.6 means that the corresponding portion of Section 4.6 in the FEIR remains unchanged or has been deleted.*~~*This section has been revised in response to public comments received on the Programmatic DEIR which have resulted in project changes, updates to technical studies and revisions to EIR sections and proposed Mitigation Measures.*~~

4.6 GEOLOGY AND SOILS

This section describes the location of the project relative to the known geologic features and soil conditions and qualitatively evaluates potential impacts. Additionally, this chapter evaluates whether development on the project site would significantly be affected by fault rupture, seismic shaking, erosion or unstable slopes, liquefaction, settlement, expansive soils, or other soil or geologic conditions.

~~*NOTE: The following changes have been made due to revision of the Specific Plan project size.*~~

For the reader's reference, this EIR been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development. ~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The following documents were prepared to analyze the geologic impacts of the WLC project:

- *Preliminary Geotechnical Evaluation for Environmental Impact Report the World Logistics Center Specific Plan South of Highway 60 Between Redlands Boulevard and Gilman Springs Road City of Moreno Valley, California.* Leighton and Associates, Inc. original dated January 23, 2013 updated September 2014. (Appendix G).
- *Response to NOP Comments for the World Logistics Center Specific Plan.* Leighton and Associates, Inc. May 2012 (Appendix G).
- *"Preliminary Geotechnical Report, Tentative Parcel Map 35629, Moreno Valley, California, Project No. 111061-108," by Leighton and Associates, Inc. June 15, 2007.*
- *"Update Preliminary Geotechnical Report, Tentative Parcel Map 35629, Highland Fairview Corporate Park, City of Moreno Valley, California, Project No. 111061-108," by Leighton and Associates, Inc. April 30, 2008.*
- *"Update Geotechnical Report, Moreno Highlands Specific Plan Area, Southeast Corner of Highway 60 and Redlands Boulevard, City of Moreno Valley, California, Project No. 111061-108," by Leighton and Associates, Inc. July 21, 2008.*
- *"Preliminary Geotechnical Evaluation for Environmental Impact Report, "The Highlands Specific Plan," South of Highway 60 between Redlands Boulevard and Gilman Springs Road, City of Moreno Valley, California, Project No. 111061-127", by Leighton and Associates, Inc. December 13, 2011.*

In addition, the analysis contained in this section is based on the following reference documents:

- Moreno Valley General Plan, Safety Element, July 11, 2006;
- U.S. Department of Agriculture, Natural Resources Conservation Service, Soil Survey Geographic (SSURGO) database for Western Riverside Area, California, September 15, 2003; and
- Geotechnical reports, comments, and responses to comments on geotechnical issues from the Westridge, Skechers, and ProLogis Environmental Impact Reports (various dates).

4.6.1 Existing Setting

The City lies within the Perris Block, a structural unit that is located within the Peninsular Range Geomorphic Province, one of the major geologic provinces of southern California. The Perris Block is a large mass of granitic rock generally bounded by the San Jacinto Fault, the Elsinore Fault, the Santa Ana River, and a non-defined southeast boundary. The Perris Block has had a history of vertical land movements of several thousand feet due to shifts in the Elsinore and San Jacinto Faults. The materials within the valley area are characterized by Pliocene-Pleistocene-aged alluvium ranging from relatively thin (20 feet to 200 feet) to intermediate thickness (up to 2,000 feet), which overlies the older granitic bedrock. The rocky, mountainous areas, including the Box Springs Mountains and the Mount Russell/Lake Perris State Recreation area, have underlying granitic bedrock that consists of quartz diorite, and displays granite rock outcrops and large boulders. The Badlands range, at the eastern end of the area, comprises deposits of what was once an inland sea later elevated and deformed by geologic processes, before becoming severely eroded to its present state. This area consists of folded semi-consolidated sedimentary sandstone, siltstone, and shale. The project is located within the northern portion of the San Jacinto Valley, a fault-bounded tectonic basin that has evolved from movement along the San Jacinto fault system resulting in a down-dropped northwest-trending trough.

The existing setting for geology and soils includes faulting and seismicity, soils, and geologic and seismic hazards, which are discussed below.

4.6.1.1 Faulting and Seismicity

Pursuant to Public Resources Code Section 2690 *et seq*. Leighton & Associates prepared a geotechnical report that analyzes the seismic hazards underlying the project site. Much of the information set forth below and throughout this document is taken from that report. The project site, like the rest of Southern California, is located within a seismically active region as a result of being located near the active margin between the North American and Pacific tectonic plates. The principal source of seismic activity is movement along the northwest-trending regional fault systems such as the San Andreas, San Jacinto, and Elsinore Fault Zones. Currently, these fault systems accommodate up to approximately 55 millimeters per year (mm/yr) of slip between the plates. The on-site San Jacinto Fault Zone is estimated to accommodate slip of approximately 12 mm/yr. However, geodetic measurements between 1973 and 1981 show that the San Jacinto and San Andreas Faults currently have comparable strain rates. It has been estimated that an average slip rate of as much as 20 mm/yr occurs for the San Jacinto Fault. The San Jacinto Fault zone presents a substantial seismic hazard in Southern California.

By definition of the California Geological Survey, an active fault is a fault, which has had surface displacement within Holocene time (about the last 11,000 years). This definition is used in delineating Earthquake Fault Zones as mandated by the Alquist-Priolo Geologic Hazards Zones Act of 1972 and as most recently revised in 2007 as the Alquist-Priolo Earthquake Fault Zoning Act and Earthquake Fault Zones. The intent of this act is to require fault investigations on sites located within Earthquake Fault Zones to ensure that certain inhabited structures are not constructed across the traces of active faults. The nearest Alquist-Priolo zoned “active faults” is the on-site Claremont Segment of the San Jacinto Fault Zone (see Figure 4.6.1). The western portion of the site is crossed by the City of Moreno Valley Seismic Zone and the postulated trace of the Casa Loma Fault. The nearest off-site fault zones include Casa Loma Segment of the San Jacinto Fault Zone, located 1.6 miles to the south, the San Andreas Fault Zone, located 12.7 miles northeast, and the Glen Ivy Segment of the Elsinore Fault is located approximately 22.7 miles to the southwest of the site.

4.6.1.2 Soils

Based on the *Soil Survey of Western Riverside County,* the project area contains 20 different soil-mapping units belonging to 10 different soil series. (See Table 4.6.A below and Figure 4.2.1 in Section 4.2.) A soil series is a group of soils with similar profiles. These profiles include major horizons with similar thickness, arrangement, and other distinct characteristics. The project site is dominated by San Emigdio loam (SgA and SgC) and San Emigdio fine sandy loam (SeC2), with smaller inclusions of Arbuckle loam (AkC), Badland (BaG), Gorgonio loamy sand (GhC), Greenfield sandy loam (GyA, GyD2), Hanford coarse sandy loam (HcC and HcD2), Metz loamy sand (MdC and MeD), Metz loamy fine sand (MfA), Metz gravelly sandy loam (MID), Ramona sandy loam (RdD2), Rockland (RtF), San Emigdio fine sandy loam (SeA and SeD2), and San Timoteo loam (SmE2).[1]

4.6.1.3 Geologic and Seismic Hazards

Geologic and seismic hazards discussed in this subsection include the following:

- Surface rupture;
- Ground shaking;
- Liquefaction;
- Subsidence and seismic settlement;
- Landslides/slope stability; and
- Compressible, expansive and collapsible soils.

Surface Rupture. Surface rupture occurs where displacement or fissuring occurs along a fault zone. While primary ground damage due to earthquake fault rupture typically results in a relatively small percentage of the total damage in an earthquake, the location of structures or facilities too close to a rupturing fault can cause profound damage. It is difficult to reduce the hazards of surface rupture through structural design. The primary method to avoid this hazard is to either set structures and facilities away from active faults, or avoid their construction in close proximity to an active fault.

Faults throughout southern California have formed over millions of years. Some of these faults are considered inactive under present geologic conditions, and other faults are known to be active.[1] Such faults have either generated earthquakes in historic times (200 years), or show geologic and geomorphic indications of movement within the last 11,000 years. Faults that have moved in the relatively recent geological past are generally presumed to be the most likely candidates to generate

---

[1] The Alquist-Priolo Earthquake Fault Zoning Act defines *active faults* as those that show proven displacement of the ground surface within about the last 11,000 years. *Potentially active faults* are those that show evidence of movement within the last 1.6 million years.

damaging earthquakes in the lifetimes of residents, buildings, or communities. As previously identified, the Claremont Segment of the San Jacinto Fault Zone is located on the eastern portion of the site; therefore, ground surface rupture is an identified seismic hazard within the project limits.

Ground Shaking. The vast majority of earthquake damage is caused by ground shaking. Source effects include earthquake size, location, and distance. The bigger and closer the earthquake is, the more severe the damage will be. The exact way that rocks and other earth materials move along the fault can also influence shaking, as can the subsurface orientation of the fault.

Path effects are caused by seismic waves that change direction as they travel through the earth's contrasting layers, just as light bounces (reflects) and bends (refracts) as it moves from air to water. Sometimes this can focus seismic energy at one location, and cause damage in unexpected areas.

Site effects are brought about by seismic waves that slow down in the loose sediments and weathered rock at the surface of the earth. As they slow, their energy converts from speed to amplitude, which increases shaking. This is identical to the behavior of ocean waves. As the waves slow down near shore, their crests grow higher. Sometimes, too, seismic waves get trapped at the surface and resonate. Whether resonance will occur depends on the period (the length) of the incoming waves. Waves, soils and buildings all have resonant periods. When these match, tremendous damage can occur.

The primary threat associated with on-site and the nearby faults previously identified is the intensity of ground shaking that could be generated at the project site.

Liquefaction. Liquefaction occurs primarily in saturated, loose, fine-to-medium-grained soils in areas where the groundwater table is within 50 feet of the surface. Shaking suddenly causes soils to lose strength and behave as a liquid. Excess water pressure is vented upward through fissures and soil cracks, and a water-soil slurry bubbles onto the ground surface. The resulting features are called “sand boils,” “sand blows,” or “sand volcanoes.” Liquefaction-related effects include loss of bearing strength, ground oscillations, lateral spreading, and flow failures or slumping. Based on Figure 6-3 of the Safety Element of the City’s General Plan, the project site is not located in an area identified as having a liquefaction potential. Site-specific geotechnical studies by Leighton have concluded the project site has a very low potential for liquefaction.

Subsidence and Seismic Settlement. Ground subsidence is typically a gradual settling or sinking of the ground surface with little or no horizontal movement, although fissures (cracks and separations) can result from lowering of the ground surface.

The common causes of subsidence that can produce small or local collapses to broad regional subsidence include:

- Dewatering of peat or organic soils;
- Dissolution in limestone aquifers;
- First-time wetting of moisture-deficient, low-density soils (hydrocompaction);
- Natural compaction;
- Liquefaction;
- Crustal deformation;
- Ground shaking;

- Subterranean mining; and
- Withdrawal of fluids (groundwater, petroleum, or geothermal).

Most of the damage caused by subsidence is the result of oil, gas, or groundwater extraction from below the ground surface, or the organic decomposition of peat deposits. Ground subsidence may occur as a response to natural forces such as earthquake movements, which can cause abrupt elevation changes of several feet or densification of low density granular soils during an earthquake event that may cause several inches of settlement.

Landslides/Slope Stability. Significant factors that contribute to slope failure include slope height and steepness, shear strength and orientation of weak layers in the underlying geologic units, and pore water pressures. There are no known landslides within the project area; however, a large older landslide has been mapped primarily off site on the northeasterly flanks of Mount Russell, near the southwest portion of the property. The landslide appears to have originated on the higher slopes (off site) and moved northeast, partially onto the subject property.

Alluvial Soil. Alluvial soil was encountered in all exploratory borings, fault trenches, and test pits excavated at the site.[1] The alluvial soils were deposited as part of a complex depositional environment and generally include interbedded fine sands and silts with varying amounts of clay. The yellow-brown to medium gray recent alluvial soils (younger alluvium) are found in drainages and believed to constitute the upper surficial materials (upper 3 to 10 feet). The deeper materials (older alluvium and older fan-deposits) are generally dark yellow-brown to dark gray and consist of silty fine sand to sandy silt with interbedded lenses of silt clay and sandy gravel. The alluvium along the southeastern side of the site is significantly denser and contains considerable amounts of coarser sands and gravel. Pertinent engineering characteristics of the encountered alluvium are summarized below:

- **Compressibility Characteristics.** The alluvium is generally loose in the upper 10 to 15 feet in most areas. At depths greater than 15 feet, the alluvium is generally medium dense. The results of testing by Leighton also indicate a high rebound potential during unloading for some of the tested alluvium. This rebound affect may cause some elevation rise in areas of significant excavation.
- **Expansive Soils.** Expansive soils generally have a significant amount of clay particles that can give up water (shrink) or take on water (swell). The change in volume exerts stress on buildings and other loads placed on these soils. The extent of shrink/swell is influenced by the amount and kind of clay in the soil. The occurrence of these soils is often associated with geologic units having marginal stability. The majority of the site materials are expected to have a low expansive potential; however, expansive soils are known to exist on site. The more expansive soils are expected to be localized and associated with interbedded silt and clay layers.
- **Collapse Potential.** Hydroconsolidation, or soil collapse, typically occurs in recently deposited Holocene (less than 10,000 years before present time) soils that were deposited in an arid or semi-arid environment. Soils prone to collapse are commonly associated with man-made fill, wind-laid sands and silts, and alluvial fan and mudflow sediments deposited during flash floods. Particles of these soils, which typically contain minute pores and voids, may be partially supported by clay or silt, or chemically cemented with carbonates. When saturated, collapsible soils undergo a rearrangement of their grains and the water removes the cohesive (or cementing) material, and a rapid, substantial settlement may occur. An increase in surface water infiltration (such as from irrigation) or a rise in the groundwater table, combined with the weight of a building or structure, may initiate settlement, causing foundations and walls to crack. Soil borings and laboratory testing

---

[1] *Preliminary Geotechnical Evaluation for Environmental Impact Report World Logistics Center Specific Plan South of Highway 60 Between Redlands Boulevard and Gilman Springs Road City of Moreno Valley, California.* Leighton and Associates, Inc. January 2013.

conducted by Leighton determined that on-site soils have low to moderate potential for collapse with the exemption of dispersed areas just south of the extension of Eucalyptus Avenue.[1]

4.6.1.4 Off-site Improvements

After the approximate locations of the various project-related off-site improvements were identified (e.g., reservoirs, and the World Logistics Center /Theodore Street/SR-60 interchange), the project geologist (Leighton) conducted a brief geotechnical assessment of the various off-site areas to identify the potential for geotechnical constraints (see Appendix G). Leighton concluded that none of the off-site improvement areas had substantial seismic or seismically related constraints, but did recommend additional testing and evaluation for localized soil constraints once specific improvement footprints had been established.

4.6.1.5 NOP/Scoping Comments

Several members of the public said the EIR should examine potential seismic and other impacts related to the San Jacinto Fault Zone, as well as the Casa Loma and Farm Road Faults. These comments were addressed by the project geologist and geotechnical consultant (Leighton) and are addressed in Sections 4.6.5 and 4.6.6 in relation to project impacts.

4.6.2 Policies and Regulations

4.6.2.1 State Regulations

Alquist-Priolo Earthquake Fault Zoning Act. The major State legislation regarding earthquake fault zones is the *Alquist-Priolo Earthquake Fault Zoning Act* (A-P Act). In 1972, the State of California began delineating “Earthquake Fault Zones” (called Special Studies Zones prior to 1994) around and along faults that are “sufficiently active” and “well defined” to reduce fault-rupture risks to structures for human occupancy (California Public Resources Code Sections 2621–2630). The boundary of an “Earthquake Fault Zone” is generally 500 feet from major active faults and from 200 to 300 feet from well-defined minor faults. The mapping of active faults has been completed by the State Geologist, and these maps are distributed to all affected cities, counties, and State agencies for their use in developing planning policies and controlling renovation or new construction.

Before a project can be permitted within an identified Earthquake Fault Zone, cities and counties must require a geologic investigation to demonstrate that proposed buildings will not be constructed across active faults. A site-specific evaluation and written report must be prepared by a licensed geologist. If an active fault is identified, a structure intended for human occupancy cannot be placed over the trace of the fault and must be set back from the fault.

The A-P Act only addresses the hazard of surface fault rupture and is not directed toward other earthquake hazards.

The Seismic Hazards Mapping Act. Passed in 1990, the Seismic Hazards Mapping Act (SHMA) addresses non-surface fault rupture earthquake hazards, including strong ground shaking, liquefaction, and seismically induced landslides. The California Geological Survey (CGS) is the principal State agency charged with implementing the 1990 SHMA. Pursuant to the SHMA, the CGS is directed to provide local governments with seismic hazard zone maps that identify areas susceptible to amplified shaking, liquefaction, earthquake-induced landslides, and other ground failures. The goal is to minimize loss of life and property by identifying and mitigating seismic hazards. The seismic hazard zones

---

[1] Ibid.

delineated by the CGS are referred to as "zones of required investigation." Site-specific geotechnical hazard investigations are required by SHMA when construction projects fall within these areas.

Natural Hazards Disclosure Act. Effective June 1, 1998, the Natural Hazards Disclosure Act requires that sellers of real property and their agents provide prospective buyers with a "Natural Hazard Disclosure Statement" when the property being sold lies within one or more State-mapped hazard areas. If a property is located in a Seismic Hazard Zone as shown on a map issued by the State Geologist, the seller or the seller's agent must disclose this fact to potential buyers.

4.6.2.2 Local Policies

City of Moreno Valley General Plan Policies. The City of Moreno Valley General Plan includes policies and goals related to geologic and seismic hazards. The following goals and policies are applicable to the WLC project.

Safety Element

Goal 6.1 To achieve acceptable levels of protection from natural and man-made hazards to life, health and property.

Goal 6.2 To have emergency services which are adequate to meet minor emergency and major catastrophic situations.

Safety Element Objectives and Policies

Objective 6.1

Minimize the potential for loss of life and protect residents, workers, and visitors to the City from physical injury and property damage due to seismic ground shaking and secondary effects.

Policies:

6.1.1 Reduce the effects from fault rupture and liquefaction hazards through the identification and recognition of potentially hazardous conditions and areas as they relate to the San Jacinto fault zone and the high and very high liquefaction hazard zones. During the review of future development projects, the City shall require geologic studies and mitigation for fault rupture hazards in accordance with the Alquist-Priolo Special Study Zones Act. Additionally, future geotechnical studies shall contain calculations for seismic settlement on all alluvial sites identified as having high or very high liquefaction potential. Should the calculations show a potential for liquefaction, appropriate mitigation shall be identified and implemented.

6.1.2 Require all new developments, existing critical and essential facilities and structures to comply with the most recent Uniform Building Code seismic design standards.

4.6.3 Methodology

The analysis of potential geologic and soil-related impacts is based upon the preliminary site specific geotechnical study prepared by Leighton and Associates, the City's Safety Element of the General Plan, literature prepared by the California Department of Mines and Geology (CDMG), information from the federal Natural Resources Conservation Service (NRCS), mapping published by the United States Geological Survey (USGS), and other documents such as the City's Building Code, and the City's Standard Design Guidelines, which were reviewed and summarized to establish existing conditions. In determining the level of significance, the analysis assumes that construction and operation of the project would comply with relevant Federal and State laws and regulations, as well as City General Plan policies.

4.6.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts to geology and soils are based on *CEQA Guidelines* (2011). A project would have a significant impact related to geology and soils if it would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Maps issued by the State Geologist for the area or based on other substantial evidence of a known fault.
  - Strong seismic ground shaking.
  - Seismic-related ground failure, including liquefaction.
  - Landslides.
- Result in substantial soil erosion or the loss of topsoil;
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-site or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994 or most current edition), creating substantial risks to life or property; and/or
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.

4.6.5 Less than Significant Impacts

The following impacts were determined to be less than significant. In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards and policies would reduce potential impacts to a less than significant level.

4.6.5.1 Landslides and Rockfalls

Threshold	Would the project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

A large older landslide has been mapped primarily off site on the north easterly flanks of Mount Russell, near the southwest portion of the property. The landslide appears to have originated on the higher slopes off site, and moved northeast, partially onto the subject property. The Specific Plan designates 74.3 acres in the southwestern portion of the property as open space. This 74.3 acres includes the steepest slopes on site (i.e., the Mount Russell foothills), which will reduce the potential for significant landslide or rockfall impacts on the project to less than significant levels; therefore, no mitigation is needed.

4.6.5.2 Soil Erosion or Loss of Topsoil

Threshold	Would the project result in substantial soil erosion or the loss of topsoil?

The project includes the grading of approximately 2,684 acres for the construction of the proposed logistics buildings. In addition, the project proposes the construction of various infrastructure improvements both on site and off site. These improvements include the construction of on-site and off-site water, sewer, freeway interchange and roadway/intersection improvements, debris basins, reservoirs, water and sewer lines, utility substations, etc. These activities have the potential to cause erosion both on site and off site.

Development of the site would require the movement of on-site soils. Portions of the site have been and are being used for dry farming, and several rural residences are present. Prior to the issuance of grading permits, the project proponent will be required to prepare and submit detailed grading plans as each phase is developed. These plans will be prepared in conformance with applicable standards of the City's Grading Ordinance. Construction of off-site utility and roadway improvements will also result in the movement of soil. Plans are not available at this time for off-site improvements but that construction will be subject to the same permitting and plan checking processes.

Development of the site and related off-site improvements would involve the disturbance of more than one acre; therefore, the project is required to obtain a National Pollutant Discharge Elimination System (NPDES) permit. A Storm Water Pollution Prevention Plan (SWPPP) will also be required to address erosion and discharge impacts associated with the proposed on-site grading. Compliance with storm water regulations include minimizing storm water contact with potential pollutants by providing covers and secondary containment for construction materials, designating areas away from storm drain systems for storing equipment and materials and implementing good housekeeping practices at the construction site. The following SWPPP components will reduce potential impacts of soil erosion or loss of topsoil to less than significant levels:

- Protect all storm drain inlets and streams located near the construction site to prevent sediment-laden water from entering the storm drain system.
- Prevent erosion by implementing one or more of the following soil stabilization practices: mulching, surface roughening, permanent or temporary seeding.
- Limit vehicular access to and from the site. Stabilize construction entrances/exits to minimize the track out of dirt and mud onto adjacent streets. Conduct frequent street sweeping.
- Protect stockpiles and construction materials from winds and rain by storing them under a roof, secured impermeable tarp or plastic sheeting.
- Avoid storing or stockpiling materials near storm drain inlets, gullies or streams.
- Phase grading operations to limit disturbed areas and duration of exposure.
- Perform major maintenance and repairs of vehicles and equipment off site.
- Wash out concrete mixers only in designated washout areas at the construction site.
- Set-up and operate small concrete mixers on tarps or heavy plastic drop cloths.
- Keep construction sites clean by removing trash, debris, wastes, etc. on a regular basis.
- Clean up spills immediately using dry clean-up methods (e.g., absorbent materials such as cat litter, sand or rags for liquid spills; sweeping for dry spills such as cement, mortar or fertilizer) and by removing the contaminated soil from spills on dirt areas.
- Maintain all vehicles and equipment in good working condition. Inspect frequently for leaks, and repair promptly.
- Cover open dumpsters with secured tarps or plastic sheeting. Clean out dumpsters only in approved locations on the construction site.
- Arrange for an adequate debris disposal schedule to insure that dumpsters do not overflow.

A preliminary WQMP was prepared for the WLCSP and is included in Appendix J-2. The preliminary WQMP contains the following post-construction measures, which will help reduce potential impacts to soil erosion to less than significant levels and identifies measures to treat and/or limit the entry of contaminants into the storm drain system:

- *Maximize the permeable area.* A significant portion of the project will remain pervious for the purposes of landscaping, water quality treatment, and flood detention. By incorporating more pervious, lower Runoff Coefficient (C factor) surfaces into the project, lower volumes of runoff will be produced.
- *Incorporate landscaped ~~buffer~~setback areas between sidewalks and streets.* Bioretention areas between sidewalks and streets will be incorporated and serve the dual purpose of landscaping and water quality treatment.
- *Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought-tolerant trees and large shrubs.* Although most of the project area will require mass grading, some existing native trees and shrubs will be preserved where feasible.
- *Use natural drainage systems.* The majority of the project site currently sheet flows to small earthen ditches. Under the proposed condition, most of these natural ditches will be removed, with the exception of one natural drainage course. This natural drainage path, located at the eastern portion of the project, will be maintained under the proposed condition.
- *Where soils conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.* Infiltration basins will be proposed where soil conditions are appropriate.
- *Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.* Detention basins and/or infiltration basins will be provided on site. The locations of these facilities will be shown in the project-specific WQMP.
- *Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.* Street, sidewalk, and parking design will incorporate minimum street widths that still meet City requirements and emergency access requirements.
- *Reduce widths of street where off-street parking is available.* Street design will incorporate minimum street widths that still meet City requirements and emergency access requirements.
- *Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.* The use of impervious surfaces for decorative purposes will be minimized where possible.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

- *Conserve natural areas.* There are 1,205 acres of natural areas that will be designated as undisturbed open space. The project designates 1,086 acres of CDFW land, and an additional 44 acres of natural areas maintained by utility companies, and 74.3 acres within the WLC Specific Plan, for Open Space use.
- *Development sites will be designed to contain and infiltrate roof runoff, or direct roof runoff to vegetative swales or ~~buffer~~setback areas, where feasible.* Runoff from impervious areas will sheet flow or be directed to Treatment Control BMPs.
- *Where landscaping is proposed, impervious sidewalks, walkways, and trails will be designed to drain into adjacent landscaping.* Streets, sidewalks, and parking lots will sheet flow to landscaping/bioretention areas.

- *Increase the use of vegetated drainage swales in lieu of underground piping or imperviously lined swales.* Runoff from impervious areas will sheet flow to vegetated swales, bioretention areas, infiltration basins, and/or detention basins.
- *Rural swale system: street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings.* Streets will sheet flow to adjacent landscaping/bioretention areas.
- *Urban curb/swale system; street slopes to curb, periodic swale inlets drain to vegetated swale/biofilter.* Streets will sheet flow to adjacent landscaping/bioretention areas.
- *Design driveways to drain into landscaping prior to discharging to the MS4.* Driveways will sheet flow to adjacent landscaping/bioretention areas.
- *Uncovered parking may be paved with a permeable surface, or designed to drain into landscaping prior to discharging to the MS4.* Parking lots will sheet flow to adjacent landscaping/bioretention areas.

The WQMP is incorporated by reference and/or attached to the project's SWPPP as the Post-Construction Management Plan.

As soils covering the project site have a slight-to-high erosion hazard potential and because the project would be required to adhere to the City's Grading Ordinance, obtain an NPDES Permit, and prepare an SWPPP and a WQMP, construction and operational impacts associated with soil erosion hazards are considered to be less than significant, and no mitigation is required.

Grading for off-site improvements would require subsequent grading permits or related approvals from both the City and County of Riverside, depending on the improvement and its location. Most roadway and intersection improvements will occur within existing rights-of-way or on land that has been previously disturbed. The SWPPP and the WQMP establish performance standards for future development, and implementation the identified measures in those plans will reduce potential erosion impacts to less than significant levels (See also Section 4.9, *Hydrology and Water Quality*, for a discussion of potential issues associated with soil erosion during construction and project operations).

4.6.5.3 Septic Tanks

Threshold	Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

All buildings within the project will be connected to existing wastewater facilities (sewer) owned and operated by the Eastern Municipal Water District. Septic tanks will not be used anywhere within the project. No mitigation is required.

4.6.5.4 Seismic-Related Ground Failure

Threshold	Would the project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic ground failure?

NOTE: The following changes have been made due to revision to the Specific Plan project size.

Development of the project will result in the construction of up to 40.6 million square feet of logistics warehouse uses. The project site is located within Seismic Zone 4 as defined by the Uniform Building

Code (UBC). Exhibit S4 of the Safety Element of the City's General Plan indicates that the project site is not located in an area susceptible to landslides or slope instability.

The project site lies on relatively flat terrain (±2% grade) and no landslide areas or mass movement were observed on site. The only steep topographical features are located in the southwest corner of the project area (see Section 4.6.6.3 below). This area is designated for Open Space uses and is not proposed for development.

The project does not propose any activity known to cause damage by subsidence (e.g., oil, gas, or groundwater extraction). Settlement generally occurs within areas of loose, granular soils with relatively low density. The project site is underlain by relatively dense alluvial and dense sedimentary bedrock materials at depth and the potential for settlement is considered low. Because the project site does not exhibit characteristics of a high potential for subsidence or settlement, impacts are considered less than significant. No mitigation is required.

The potential for liquefaction generally occurs during strong ground shaking within relatively cohesionless loose sediments where the groundwater is typically less than 50 feet below the surface. Because the project site does not exhibit characteristics of a high potential for liquefaction induced settlement (i.e., relatively dense soils with groundwater levels in excess of 100 feet), impacts are considered less than significant. No mitigation is required.

4.6.6 Significant Impacts

The following impacts were determined to be potentially significant. In each of the following issues, mitigation measures have been recommended to reduce the significance of the identified impacts.

4.6.6.1 Fault Rupture

Impact 4.6.6.1: *Future development permitted by the project would locate development in an area susceptible to fault rupture.*

Threshold	Would the project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Maps issued by the State Geologist for the area or based on other substantial evidence of a known fault.

Surface rupture occurs where displacement or fissuring occurs along a fault zone. While primary ground damage due to earthquake fault rupture typically results in a relatively small percentage of the total damage in an earthquake, the location of structures or facilities too close to a rupturing fault can cause profound damage. The primary method to avoid this hazard is to either set structures and facilities away from active faults, or avoid their construction in close proximity to an active fault.

Faults throughout southern California have formed over millions of years. Some of these faults are generally considered inactive under present geologic conditions and other faults are known to be active.[1] Such faults have either generated earthquakes in historic times (within the last 200 years) or show geologic and geomorphic indications of movement during the last 11,000 years. Faults that have

---

[1] The Alquist-Priolo Earthquake Fault Zoning Act defines *active faults* as those that show proven displacement of the ground surface within about the last 11,000 years. *Potentially active faults* are those that show evidence of movement within the last 1.6 million years.

moved in the relatively recent geological past are generally presumed to be the most likely candidates to generate damaging earthquakes in the lifetimes of residents, buildings, or communities.

The Seismic Hazards Mapping Act establishes a statewide public safety standard for mitigation of earthquake hazards. According to the Act the minimum level of mitigation for a project "should reduce the risk of ground failure during an earthquake to a level that does not cause the collapse of a building intended for human occupancy," though generally not to a level of no ground failure to all. Moreover, the California Building Code 2010 (CBC) establishes standards for seismic safety in the design and construction of buildings, and includes "significant building design and construction criteria that have been tailored for California earthquake conditions." It "provides standards that must be met to safeguard life or limb, health, property, and public welfare by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all buildings and structures within its jurisdiction." Chapter 18 of the UBC specifies the required level of soil investigation. It contains requirements applicable to buildings and foundations, which take into consideration reduction of potential seismic hazards.

The CBC requires geologic and earthquake engineering reports for all proposed construction, prepared by a California-certified engineering geologist in consultation with a California-registered geotechnical engineer, the purpose of which is to identify geologic and seismic conditions that may require project mitigations. (Cal. Code Regs., Title 24, §§ 1802.7.1, 1802.7.2.) The report must contain data which provide an assessment of the nature of the site and potential for earthquake damage based on appropriate investigations of the regional and site geology, project foundation conditions and the potential seismic shaking at the site. (Cal. Code Regs., Title. 24, § 1802.7.2.) The CBC also requires a geotechnical report, which would provide evaluations of the soil conditions of the site and the potential geologic/seismic hazards affecting the site. The report must include site-specific evaluations of design criteria related to the nature and extent of foundation materials, groundwater conditions, liquefaction potential, settlement potential, slope stability, and potential site ground motion. (Cal. Code Regs., Title. 24, § 1802.81.)”

City Ordinance 9.08.160 states “In accordance with provisions of the Alquist-Priolo Special Studies Zone Act (Division 2, Chapter 7.5 of the Public Resource Code) and the Public Health and Safety Element of the City General Plan, a geologic investigation shall be required for any development proposal involving structures for human occupancy within the special study zone for the San Jacinto Fault, as identified on the special studies zone maps prepared by the state of California Department of Conservation, or the Casa Loma Fault, as identified on the seismic zone map in the City General Plan. Geologic investigations shall be prepared by a geologist registered in the state of California and shall be reviewed for acceptance by a geologist registered in the state of California who is either an employee or under contract to the City. Geologic investigations shall consider ground shaking as the greatest potential risk and include a thorough evaluation of potential hazards based upon soils types, slope stability, proximity to fault lines and expected magnitude. Copies of all geologic investigations shall be kept on file in the office of the City building official.”

The western portion of the site is crossed by the City of Moreno Valley Seismic Zone, a postulated trace of the Casa Loma Fault and the Farm Road Strand. A detailed fault investigation was performed by Leighton for these projected faults. Although no active faulting was observed, some local discontinuous fracturing was observed and documented. Because of the potential for ground movements in this area, mitigation is required.

Specific Plan Design Features. The Specific Plan does not contain any policies that specifically address seismic limitations, but does acknowledge that all future development will require the preparation of site-specific geotechnical reports to ensure compliance with all applicable standards.

Mitigation Measures. State law prohibits the construction and placement of habitable structures[1] over the trace of an active fault pursuant to the Alquist-Priolo Act. The A-P Earthquake Fault Zone is located on the eastern border of the project site (refer to Figure 4.6.1). Trenching conducted by Leighton across the Claremont Segment of the San Jacinto Fault in the eastern area of the project site identified the location of a portion of the fault; however, the entire length of the fault through the project site was not trenched. Although no habitable structure can be located on an active fault per State law, fault rupture hazard represents a potential significant seismic hazard on site that would require mitigation. To ensure fault rupture impacts are appropriately mitigated, the following measures has been identified:

4.6.6.1A Prior to approval of any projects for development between Redlands Boulevard and ~~Theodore Street~~World Logistics Center Parkway, south of Dracaea Avenue (projected east from Redlands Boulevard), and the area south of Alessandro from the western boundary along the Mount Russell toe of slope easterly into the site 1,500 feet, the City shall determine if a detailed fault study of the Casa Loma Fault Zone area is required based on available evidence. If necessary, any additional geotechnical investigations shall be prepared by a qualified geologist and determine if structural setbacks are needed, and shall identify specific remedial earthwork and/or foundation recommendations. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur. Structures intended for human occupancy shall not be located within any structural setback zone as determined by those studies. This measure shall be implemented to the satisfaction of the City Engineer in consultation with the Project Geologist.

4.6.6.1B Prior to approval of any projects for development within or adjacent to the San Jacinto Alquist-Priolo Earthquake Fault Zone, the City shall review and approve a geotechnical fault study prepared by a qualified geologist to confirm the alignment and size of any required building setbacks related to the fault zone. If necessary, this study shall identify a “special foundation or grading remediation zone” for the areas supporting structures intended for human occupancy where coseismic deformation (fractures) is observed. This zone shall be determined after subsurface evaluation based on proposed building locations. Specific remedial earthwork and foundation recommendations shall be evaluated as necessary based on proposed building locations. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet

---

[1] California Code of Regulations, Section 3601 states, “A structure for human occupancy is any structure used or intended for supporting or sheltering any use of occupancy, which is expected to have a human occupancy rate of more than 2,000 person-hours per year.”

current Building Code requirements. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur.

This study may involve trenching to adequately identify the location of the Claremont segment of the San Jacinto Fault Zone that crosses the eastern portion of the World Logistics Center Specific Plan property. This measure shall be implemented to the satisfaction of the City Engineer in consultation with the Project Geologist.

4.6.6.1C Prior to the approval of grading permits, or permits for construction of off-site improvements, the City shall review and approve plans confirming that the project has been designed to withstand anticipated ground shaking and other geotechnical and soil constraints (e.g., settlement). The project proponent shall submit plans to the City as appropriate for review and approval prior to issuance of grading permits or issuance of permits for the construction of any offsite improvements. This measure shall be implemented to the satisfaction of the City Engineer

Level of Impact After Mitigation. Adherence to the measures identified in the geotechnical investigations, as well as other requirements identified and required by the City, will ensure fault rupture hazards are reduced to a less than significant level.

4.6.6.2 Ground Shaking

Impact 4.6.6.2: *Future development permitted by the project would locate development in an area susceptible to strong seismic ground shaking.*

Threshold	Would the project expose persons or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong ground shaking?

Southern California is a seismically active area and, therefore, will continue to be subject to ground shaking resulting from seismic activity on regional faults. Ground shaking from earthquakes associated with nearby and more distant faults is expected to occur during the lifetime of the project. The level of potential ground motion is considered moderate to high in the City of Moreno Valley and, therefore, in the project area.

Project or Specific Plan Design Features. The Specific Plan does not contain any policies that specifically address seismic limitations, but does acknowledge that all future development will require the preparation of site-specific geotechnical reports to ensure compliance with all applicable standards.

Mitigation Measures. In accordance with the City's General Plan Safety Element (Objective 6.1),[1] project development will require geological and geotechnical investigations by State-licensed professionals. The geotechnical investigations will provide design considerations and earthwork recommendations to ensure that ground shaking impacts are appropriately mitigated. In addition,

---

[1] Moreno Valley General Plan, Chapter 9 Goals and Objectives, pg. 9-30.

California Code of Regulations (CCR), Title 24, also known as the California Building Standards Code, contains building design and construction requirements relating to fire and life safety, and structural safety. The CBC also includes standards designed to ensure that structures within California are built to withstand expected levels of seismic activity for each earthquake region throughout the State. Specifically, Part 2 of Title 24, including Chapters 4, 16-18, and Appendix J provide guidance regarding grading, soils, and construction techniques related to seismic protection. These codes are provided to protect public safety and ensure that all structures built in the State can withstand anticipated seismic ground shaking and other related geotechnical and soils constraints.

To ensure ground shaking impacts are appropriately mitigated, the following measure is recommended:

4.6.6.2A Prior to issuance of building permits for any portion of the project site, a site-specific, design level geotechnical investigation for each parcel shall be submitted to the City , which would comply with all applicable state and local code requirements, and includes an analysis of the expected ground motions at the site from known active faults using accepted methodologies. The report shall determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults. The report shall also determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur. In addition, adherence to **Mitigation Measure 4.6.6.1C** addresses impacts of off-site improvements in this regard.

Level of Significance After Mitigation. Adherence to the measures identified in the geotechnical investigations, as well as other requirements identified and required by the City, will ensure ground shaking hazards are reduced to a less than significant level.

4.6.6.3 Unstable Soils

Impact 4.6.6.3: *Future development permitted by the project may locate development in an area with expansive soils.*

Threshold	Would the project be located on expansive soil, creating substantial risks to life or property?

As previously identified, expansive soils generally have a substantial amount of clay particles, which can give up water (shrink) or absorb water (swell). The change in the volume exerts stress on buildings and other loads placed on these soils. The extent or range of the shrink/swell is influenced by the amount and kind of clay present in the soil. Expansive soils can be widely dispersed and they can occur in hillside areas as well as low-lying alluvial basins. On-site soils (Dv and Wb soils) are identified as having a moderate to low shrink-swell potential. Because the potential exists to locate development on moderately expansive soils, impacts are considered significant and mitigation is required.

Project or Specific Plan Design Features. The Specific Plan does not contain any policies that specifically address seismic limitations, but does acknowledge that all future development will require the preparation of site-specific geotechnical reports to ensure compliance with all applicable standards.

Mitigation Measures. In accordance with the City's General Plan Safety Element (Implementation Measure I.E.1) and as indicated previously, development of the project will require geological and geotechnical investigations by State-licensed professionals. To ensure impacts from expansive soils are addressed for specific development sites, adherence to **Mitigation Measures 4.6.6.3A** through **4.6.6.3C** will be required.

4.6.6.3A Each Plot Plan application for development shall include a site-specific, design level geotechnical investigation for each parcel, in compliance with all applicable state and local code requirements, and including an analysis of the expected soil hazards at the site. The report shall determine:

1. Structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults.
2. The final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements.

Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigations in the site-specific geotechnical investigations. In addition, the project structural engineer shall review the site specific investigations, provide any additional necessary mitigation to meet the California Building Code requirements, and incorporate all applicable mitigations from the investigation into the structural design plans and shall ensure that all structural plans for the project meet current Building Code requirements. These investigations shall identify any site-specific impacts from compressible and expansive soils based on the actual location of individual pads proposed in the future, so that differential movement can be further verified or evaluated in view of the actual foundation plan and imposed fill or structural loads. Additionally, a registered geotechnical engineer shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical mitigations contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure, and all other relevant construction permits. The City Building Division shall review and approve plans to confirm that the siting, design and construction of all structures and facilities are in accordance with the regulations established in the California Building Code (California Code of Regulations, Title 24), and/or professional engineering standards appropriate for the seismic zone in which such construction may occur.

Compliance with this measure will ensure that future buildings are designed to protect the structure and occupants from on-site soil limitations, consistent with State Building Code requirements. This measure shall be implemented to the satisfaction of the City Engineer.

4.6.6.3B Any cut slopes in excess of five (5) feet in vertical height shall be constructed as "replacement fill slopes" per the project geotechnical report, due to the variable nature of the onsite alluvial soils. This measure shall be implemented to the satisfaction of the City Land Development Division and the City Engineer in consultation with the Project Geologist.

4.6.6.3C During all grading activities, a geotechnical engineer shall monitor site preparation, removal of unsuitable soils, mapping of all earthwork excavations, approval of imported earth materials, fill placement, foundation installation, and other geotechnical operations. Laboratory testing of subsurface materials to confirm compacted dry density and moisture content, consolidation potential, corrosion potential, expansion potential, and resistance value (R-value) shall be performed prior to and during grading as appropriate. This measure shall be implemented to the satisfaction of the City Engineer in consultation with the Project Geologist.

Level of Impact After Mitigation. Implementation of **Mitigation Measures 4.6.6.3A** through **4.6.6.3C**, and adherence to actions identified in subsequent geotechnical investigations, as well as other requirements identified and required by the City, will ensure that the potential impact from expansive soils are reduced to a less than significant level.

~~4.6.7 Cumulative Impacts~~

~~The cumulative area for geologic issues is the City of Moreno Valley and western Riverside County, within the larger context of southern California due to regional seismicity. The project area has potential geotechnical and soils constraints, as the entire southern California area contains a number of major regional and local faults, including the San Andreas, San Jacinto, and Elsinore Faults.~~

~~The presence of regional faults creates the potential for damage to structures or injury to persons during seismic events. However, City, County, and State regulations provide guidelines for development in areas with geologic constraints and ensure that the design of buildings is in accordance with applicable CBC standards and other applicable standards, which reduces potential property damage and human safety risks to less than significant levels. Anticipated development in the City and surrounding area in general will not have a cumulatively considerable impact on earth resources, nor will regional geotechnical constraints have a cumulatively considerable impact on the proposed WLC project or cumulative projects, as long as proper design and engineering are implemented based on available seismic and other geotechnical data. The proposed WLC project represents an incremental portion of this potential impact, so the project will not have cumulatively significant impacts in this regard.~~

~~Because it is reasonable to conclude that all development within seismically active areas will be required to adhere to applicable State regulations, CBC standards, and the design and siting standards required by local agencies, a less than significant cumulative impact would occur with implementation of the proposed WLC project.~~

~~4.7 GREENHOUSE GAS EMISSIONS, CLIMATE CHANGE, AND SUSTAINABILITY: TABLE OF CONTENTS~~

~~FIGURES~~

~~TABLES~~

NOTE TO READERS. *This portion of the Revised Sections of the FEIR replaces portions of Section 4.7 of the FEIR. The cumulative portion of Section 4.7 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.7 of this Revised Sections of the FEIR. The absence of reference to a portion of Section 4.7 means that the corresponding portion of Section 4.7 in the FEIR remains unchanged or has been deleted.*~~*This section has been revised in response to public comments received on the Programmatic DEIR which have resulted in project changes, updates to technical studies and revisions to EIR sections and proposed Mitigation Measures.*~~

4.7 GREENHOUSE GAS EMISSIONS, CLIMATE CHANGE, AND SUSTAINABILITY

Although not required by the Judge's ruling, portions of the Traffic and Circulation analysis have been revised to: (1) Show the effect of using the trip generation rates shown in the most recent edition of the Institute of Transportation Engineer's Trip Generation Manual. (2) Show the effect of the inclusion of the over 300 projects that cumulatively contribute to traffic impacts. As a result, Section 4.7 Greenhouse Gas Emissions, Climate Change, and Sustainability, Section 6.7 Greenhouse Gas Emissions, Climate Change, and Sustainability Cumulative, along with Appendix A, Air Quality, Greenhouse Gas, and Health Risk Assessment Report, have also been revised to show the effect of incorporating the applicable data from the revised traffic analysis.

This section provides a discussion of global climate change, existing regulations pertaining to global climate change, and an analysis of greenhouse gas (GHG) emissions associated with the World Logistics Center project. This analysis examines the short-term construction and long-term operational impacts and evaluates the effectiveness of measures incorporated as part of the project design.

This section analyzes the World Logistics Center project's potential climate impacts based on the following technical studies:

Air Quality, Greenhouse Gas, and Health Risk Assessment Report World Logistics Center Specific Plan (ESA, 2018) contained in Appendix A of this Revised Sections of the FEIR.

World Logistics Center (WLC) Transportation Energy Technical Study, May 2018, Environmental Science Associates.

World Logistics Center (WLC) Comparison of Renewable Energy Technologies report, May 2018, WSP.

4.7.1 EXISTING SETTING

4.7.1.1 Global Climate Change

Global climate change is the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred by some scientists and policy makers to "global warming" because it helps convey the notion that there are other changes in addition to rising temperatures.

Climate change refers to any significant change in measures of climate such as temperature, precipitation, or wind, lasting for decades or longer (U.S. Environmental Protection Agency [EPA], 2007). Climate change may result from:

- Natural factors, such as changes in the sun's intensity or slow changes in the Earth's orbit around the sun;
- Natural processes within the climate system (e.g., changes in ocean circulation); and/or
- Human activities that change the atmosphere's composition (e.g., through burning fossil fuels) and the land surface (e.g., deforestation, reforestation, urbanization, and desertification).

The primary observed effect of global climate change has been a rise in the average global tropospheric[1] temperature of 0.36 degrees Fahrenheit (°F) per decade, determined from meteorological measurements worldwide between 1990 and 2005. Climate change modeling shows that further warming could occur, which would induce additional changes in the global climate system during the current century. Changes to the global climate system, ecosystems, and the environment of California could include higher sea levels, drier or wetter weather, changes in ocean salinity, changes in wind patterns or more energetic aspects of extreme weather, including droughts, heavy precipitation, heat waves, extreme cold and increased intensity of tropical cyclones (hurricanes). Specific effects in California might include a decline in the Sierra Nevada snowpack, erosion of California's coastline, and seawater intrusion in the Delta.

Human activities, such as fossil fuel combustion and land use changes release carbon dioxide (CO_2) and other compounds, cumulatively termed greenhouse gases (GHGs). GHGs are effective in trapping infrared radiation that otherwise would have escaped the atmosphere, thereby warming the atmosphere, the oceans, and earth's surface (USEPA, 2007). Many scientists believe that "most of the warming observed over the last 50 years is attributable to human activities" (Intergovernmental Panel on Climate Change [IPCC], 2007d). The increased amounts of CO_2 and other GHGs are alleged to be the primary causes of the human-induced component of warming.

GHGs are present in the atmosphere naturally, released by natural sources, or formed from secondary reactions taking place in the atmosphere. They include CO_2, methane (CH_4), nitrous oxide (N_2O), and ozone (O_3). In the last 200 years, substantial quantities of GHGs have been released into the atmosphere. These extra emissions are increasing GHG concentrations in the atmosphere, enhancing the natural greenhouse effect, which is believed to be causing global climate change. While human-made GHGs include CO_2, CH_4, and N_2O, some (like chlorofluorocarbons [CFCs]) are completely new to the atmosphere.

GHGs vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The global warming potential is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere ("atmospheric lifetime"). The GWP of each gas is measured relative to CO_2, the most abundant GHG. The definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of CO_2 over a specified time period. GHG emissions are typically measured in terms of metric tons of "CO_2 equivalents" (mt CO_2e or $MTCO_2e$).

Methane is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Human-made sources include the mining and burning of fossil fuels; digestive processes in ruminant animals such as cattle; rice paddies; and the burying of waste in landfills. As for CO_2, the major removal process of atmospheric CH_4—chemical

---

[1] The troposphere is the zone of the atmosphere characterized by water vapor, weather, winds, and decreasing temperature with increasing altitude.

breakdown in the atmosphere—cannot keep pace with source emissions, and CH_4 concentrations in the atmosphere are increasing.

Worldwide emissions of GHGs in 2010 were approximately 47,351 million mt CO_2e (World Resources Institute [WRI], 2018). Emissions from the top five countries and the European Union accounted for approximately 57 percent of the total global GHG emissions, according to the most recently available data. The United States was the number two producer of GHG emissions, contributing 13 percent of the emissions. The primary GHG emitted by human activities in the United States was CO_2, representing approximately 82 percent of total GHG emissions. CO_2 from fossil fuel combustion, the largest source of GHG emissions, accounted for approximately 85 percent of the GHG emissions (WRI, 2018).

In 2016, the United States emitted approximately 5.3 billion mt CO_2e or approximately 16.5 tons per year (tpy) per person. Of the six major sectors nationwide (electric power industry, transportation, industry, agriculture, commercial, and residential), the electric power industry and transportation sectors combined account for approximately 72 percent of the GHG emissions; the majority of the electrical power industry and all of the transportation emissions are generated from direct fossil fuel combustion. Between 1990 and 2016, total United States GHG emissions rose approximately 2.8 percent (USEPA, 2018b).

World carbon dioxide emissions are expected to increase by 1.9 percent annually between 2001 and 2025 (USEIA, 2017). Much of the increase in these emissions is expected to occur in the developing world where emerging economies, such as China and India, fuel economic development with fossil energy. Developing countries' emissions are expected to grow above the world average at 2.7 percent annually between 2001 and 2025; and surpass emissions of industrialized countries near 2018.

The California Air Resources Board (CARB) is responsible for developing the California Greenhouse Gas Emission Inventory. This inventory estimates the amount of GHGs emitted into and removed from the atmosphere by human activities within the State of California and supports the Assembly Bill (AB) 32 Climate Change Program. The most recent inventory of GHG emissions in California estimated 440.4 million mt CO_2e in 2015 (CARB, 2017d). This is a 2.2 percent increase in GHG emissions from 1990. The top contributor of emissions in 2015 was transportation, which contributed 37 percent of the emissions. The second highest sector was industrial (21 percent), which includes sources from refineries, general fuel use, oil and gas extraction, and cement plants. According to CARB, California is on track to meet the 2020 GHG reduction target codified in California Health and Safety Code (HSC), Division 25.5, also known as The Global Warming Solutions Act of 2006 (AB 32) (CARB, 2016a).

4.7.1.2 Effects of Global Climate Change

Climate change is a change in the average weather of the earth that is measured by alterations in wind patterns, storms, precipitation, and temperature. These changes are assessed using historical records of temperature changes occurring in the past, such as during previous ice ages. Many of the concerns regarding climate change use these data to extrapolate a level of statistical significance specifically focusing on temperature records from the last 150 years (the Industrial Age) that differ from previous climate changes in rate and magnitude.

The International Panel on Climate Change (IPCC) constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. In its Fourth Assessment Report, the IPCC predicted that the global mean surface temperature change for 2081-2100 relative to the period from 1986 to 2005 , given six scenarios, could range from 0.3 degrees Celsius (°C) to 4.8 °C. Regardless of analytical methodology, global average temperatures and sea levels are expected to rise under all scenarios (IPCC, 2007c). The IPCC concluded that global climate change was largely the result of human activity, mainly the burning of fossil fuels. However, the scientific literature is not consistent regarding many of the aspects of global warming or climate change, including actual temperature changes during the 20th century, the accuracy of the IPCC report, and contributions of human versus non-human activities.

Effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme weather events, and degradation of air quality. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems. Heat-related problems include heat rash and heat stroke. In addition, climate-sensitive diseases may increase, such as those spread by mosquitoes and other disease-carrying insects. Such diseases include malaria, dengue fever, yellow fever, and encephalitis. Extreme events such as flooding and hurricanes can displace people and agriculture. Global warming may also contribute to air quality problems from increased frequency of smog and particulate air pollution.

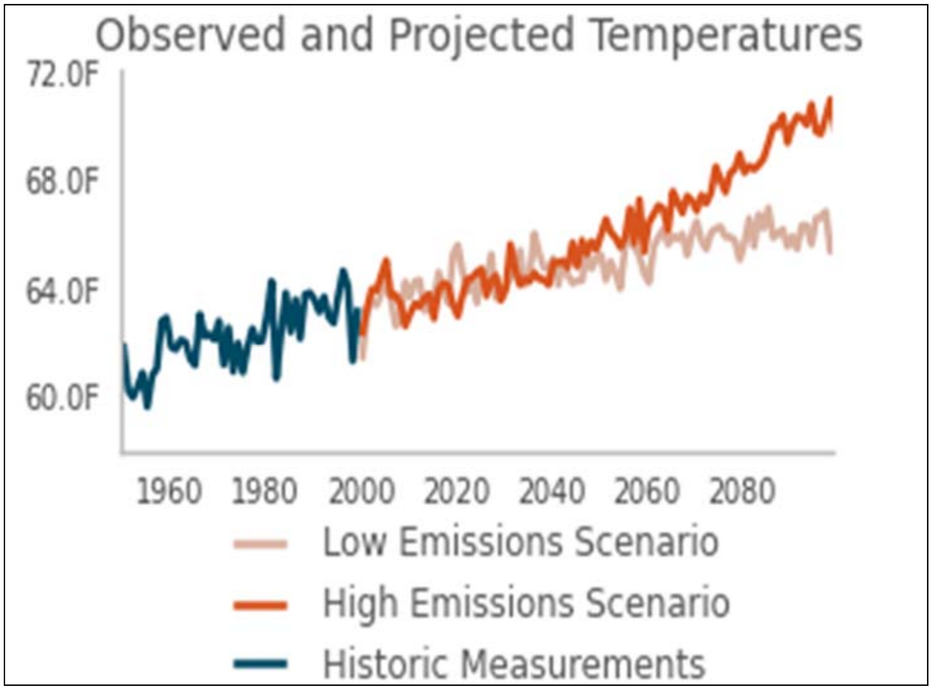
Additionally, the following climate change effects, which are based on trends established by the IPCC, can be expected in California over the course of the next century:

- A diminishing Sierra snowpack declining by 70 percent to 90 percent, threatening the State's water supply. If GHG emissions continue unabated, more precipitation will fall as rain instead of snow, and the snow that does fall will melt earlier.
- A rise in sea levels resulting in the displacement of coastal businesses and residences. During the past century, sea levels along California's coast have risen about seven inches. If emissions continue unabated and temperatures rise into the higher anticipated warming range, sea level is expected to rise an additional 22 to 35 inches by the end of the century. Elevations of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. (Note: This condition would not affect the project area as it is a significant distance away from coastal areas.)
- An increase in temperature and extreme weather events. Climate change is expected to lead to increases in the frequency, intensity, and duration of extreme heat events and heat waves in California. More heat waves can exacerbate chronic disease or heat-related illness.
- Increased risk of large wildfires if rain increases as temperatures rise. Precipitation, winds, temperature, and vegetation influence wildfire risk; therefore, wildfire risk is not uniform throughout the state. Changes in current precipitation patterns could influence that risk. As an example, wildfires in the grasslands and chaparral ecosystems of *southern* California are estimated to increase by approximately 30 percent toward the end of the 21st century because more winter rain will stimulate the growth of more plant fuel available to burn in the fall. In contrast, a hotter, drier climate could promote up to 90 percent more *northern* California fires by the end of the century by drying out and increasing the flammability of forest vegetation.
- Increasing temperatures from 8 to 10.4°F under the higher emission scenarios, leading to a 25 percent to 35 percent increase in the number of days ozone pollution levels are exceeded in most urban areas (see below).
- Increased vulnerability of forests due to forest fires, pest infestation, and increased temperatures.
- Reductions in the quality and quantity of certain agricultural products. The crops and products likely to be adversely affected include wine grapes, fruit, nuts, and milk.
- Exacerbation of air quality problems. If temperatures rise to the medium warming range, there could be 75 to 85 percent more days with weather conducive to ozone formation in Los Angeles and the San Joaquin Valley, relative to today's conditions. This is more than twice the increase expected if rising temperatures remain in the lower warming range. This increase in air quality problems could result in an increase in asthma and other health-related problems.

- A decrease in the health and productivity of California's forests. Climate change can cause an increase in wildfires, an enhanced insect population, and establishment of non-native species.
- Increased electricity demand, particularly in the hot summer months.
- Increased ground-level ozone formation due to higher reaction rates of ozone precursors.

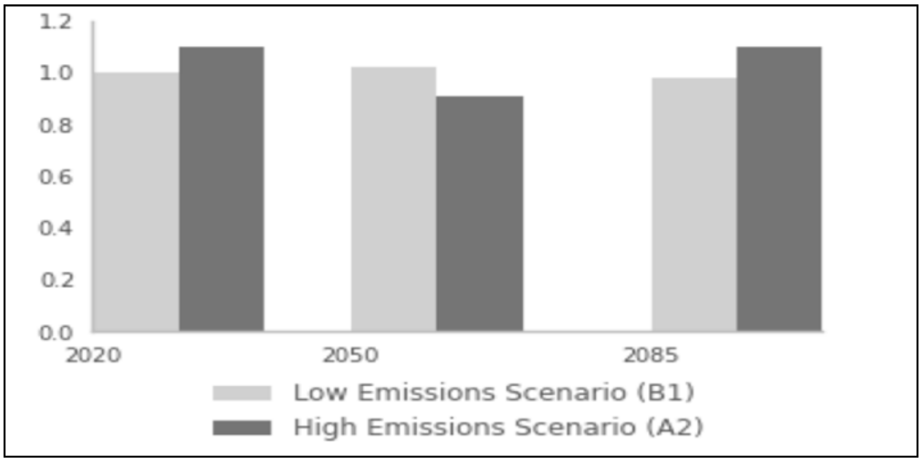
Consequences of Climate Change in Moreno Valley. The figure below displays a chart of measured historical and projected annual average temperatures in the Moreno Valley area. As shown in the figure, temperatures are expected to rise in the low and high GHG emissions scenarios.

Water for the project would be provided by the Eastern Municipal Water Department (EMWD). The EMWD 2015 Urban Water Management Plan considered the impact of climate change on water supplies as part of its long-term strategic planning. One of the outcomes of climate change could be more frequent limitations on imported supplies. To limit the impact of climate change, EMWD's long-term planning focuses on the development of reliable local resources and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD's service area.



The figure below displays the fire risk in Moreno Valley relative to 2010 levels. The figure displays the projected increase in potential area burned given three different 30-year averaging periods ending in 2020, 2050, and 2085 and two different scenarios (A2, B1). The data are modeled solely on climate projections and do not take landscape and fuel sources into account (there is very little combustible material in the project area). The data modeled the ratio of additional fire risk for an area as compared to the expected burned area. The data are shown in the figure below and indicate that under the low-emissions scenario, the additional wildfire risk is about 1, which means that wildfire risk is expected to remain about the same. Under the high-emission scenario, additional risk is variable with a slight increase.

Wildfire Risk in Moreno Valley



4.7.2 REGULATORY SETTING

4.7.2.1 Federal Regulations/Standards

Clean Vehicles. Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the United States. On April 1, 2010, the EPA and the Department of Transportation's Highway Traffic and Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce greenhouse gas emissions and improve fuel economy for new cars and trucks sold in the United States.

The first phase of the national program applied to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. The vehicles had to meet an estimated combined average emissions level of 250 grams of carbon dioxide per mile, equivalent to 35.5 miles per gallon if the automobile industry were to meet this carbon dioxide level solely through fuel economy improvements. Together, these standards were designed to cut carbon dioxide emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). In August 2012, standards were adopted for model year 2017 through 2025 for passenger cars and light-duty trucks. By 2025, vehicles are required to achieve 54.5 mpg (if GHG reductions are achieved exclusively through fuel economy improvements) and 163 grams of CO_2 per mile. According to the USEPA, a model year 2025 vehicle would emit one-half of the GHG emissions from a model year 2010 vehicle (EPA 2012).

On October 25, 2010, the EPA and the U.S. Department of Transportation proposed the first national standards to reduce greenhouse gas emissions and improve fuel efficiency of heavy-duty trucks and buses (also known as "Phase 1"). For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20 percent reduction in carbon dioxide emissions and fuel consumption by the 2018 model year. For heavy-duty pickup trucks and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10 percent reduction for gasoline vehicles and up to a 15 percent reduction for diesel vehicles by 2018 model year (12% and 17% respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles (includes other vehicles like buses, refuse trucks, concrete mixers; everything except for combination tractors and heavy-duty pickups and vans), the agencies are proposing engine and vehicle standards starting in the 2014 model year, which would achieve up to a 10 percent reduction in fuel consumption and carbon dioxide emissions by the 2018 model year. Building on the success of the standards, the EPA and U.S. Department of Transportation jointly finalized additional standards (called “Phase 2”) for medium- and heavy-duty vehicles through model year 2027 that will improve fuel efficiency and cut carbon pollution. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons.

4.7.2.2 State Regulations/Standards

California Code of Regulations Title 24, Part 6. The California Energy Code (Title 24, Section 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California’s energy consumption. These standards include provisions applicable to all buildings, residential and nonresidential, which describe requirements for documentation and certificates that the building meets the standards. These provisions include mandatory requirements for efficiency and design of energy systems, including space conditioning (cooling and heating), water heating, and indoor and outdoor lighting systems and equipment, and appliances. California’s Building Energy Efficiency Standards are updated on an approximately three-year cycle as technology and methods have evolved. The 2016 Standards, effective January 1, 2017, focus on several key areas to improve the energy efficiency of newly constructed buildings and additions and alterations to existing buildings, and include requirements that will enable both demand reductions during critical peak periods and future solar electric and thermal system installations. The next code update (2019) is expected to focus on integrating solar photovoltaic (PV) and other renewables with energy storage, taking Title 24 another step closer toward the state’s zero net energy (ZNE) goals as spelled out in the California Energy Efficiency Strategic Plan (CEC, 2011), calling for all new residential construction to be ZNE by 2020 and all new commercial construction to be ZNE by 2030.

California Code of Regulations Title 24, Part 11. The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California Department of Housing and Community Development in 2008. CALGreen standards require new residential and commercial buildings to comply with mandatory measures under five topical areas: planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt which encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code went into effect January 1, 2017.

Renewable Electricity Standards. There have been several renewable electricity senate bills in California. On September 12, 2002, Governor Gray Davis signed SB 1078 requiring California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 changed the due date to 2010 instead of 2017. On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewables Portfolio Standard (RPS) target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Governor Schwarzenegger also directed the CARB (Executive Order S-21-09) to adopt a regulation by July 31, 2010, requiring the state’s load serving entities to meet a 33 percent renewable energy target by 2020. The CARB approved the Renewable Electricity Standard on September 23, 2010, by Resolution 10-23. Senate Bill X1-2 (2011) codifies the Renewable Electricity Standard into law.

Senate Bill 350: The Clean Energy and Pollution Reduction Act of 2015 (Chapter 547, Statutes of 2015) was approved by Governor Brown on October 7, 2015. SB 350 (1) increases the standards of the California RPS program by requiring that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by December 31, 2030; (2) requires the State Energy Resources Conservation and Development Commission to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by January 1, 2030; (3) provides for the evolution of the Independent System Operator (ISO) into a regional organization; and (4) requires the state to reimburse local agencies and school districts for certain costs mandated by the state through procedures established by statutory provisions. Among other objectives, the Legislature intends to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.

Pavley Regulation, Advanced Clean Cars (ACC), and the California Mobile Source Strategy. Assembly Bill 1493 (2002) requires CARB to set GHG emission standards for passenger vehicles, light duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009. In setting these standards, CARB must consider cost effectiveness, technological feasibility, economic impacts, and provide maximum flexibility to manufacturers. The federal Clean Air Act ordinarily preempts state regulation of motor vehicle emission standards; however, California is allowed to set its own standards with a federal waiver from the USEPA, granted in 2009. Known as the Pavley Clean Car Standards, AB 1493 regulated GHG emissions from new passenger vehicles (light duty automobiles and medium duty vehicles) from 2009 through 2016.

In January 2012, CARB approved the Advanced Clean Cars (ACC) program, a new emissions-control program for model years 2015 through 2025. The program includes components to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. The zero emissions vehicle (ZEV) program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles (PHEV) in the 2018 to 2025 model years (CARB, 2017f).

In May 2016, CARB released the updated Mobile Source Strategy that demonstrates how the State can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years, through a transition to zero-emission vehicles (ZEVs), cleaner transit systems and reduction of vehicle miles traveled. The Mobile Source Strategy calls for 1.5 million ZEVs (including plug-in hybrid electric, battery-electric, and hydrogen fuel cell vehicles) by 2025 and 4.2 million ZEVs by 2030. It also calls for more stringent GHG requirements for light-duty vehicles beyond 2025 as well as GHG reductions from medium-duty and heavy-duty vehicles and increased deployment of zero-emission trucks primarily for class 3 – 7 “last mile” delivery trucks in California. Statewide, the Mobile Source Strategy would result in a 45 percent reduction in GHG emissions, and a 50 percent reduction in the consumption of petroleum-based fuels (CARB, 2016c).

Executive Order B-16-2012 (Zero-Emission Vehicles). This executive order indicates that all State entities under the Governor’s control support and facilitate the rapid commercialization of zero-emission vehicles. The order contains a target similar to Executive Order S-3-05, but for the transportation sector instead of all sectors: that California target for 2050 a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels. Executive order B-16-2012 also indicates that the CARB, the California Energy Commission, the Public Utilities Commission and other relevant agencies are ordered to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve the following:

- By 2015: The State’s major metropolitan areas able to accommodate zero-emission vehicles, each with infrastructure plans and streamlined permitting; the State’s manufacturing sector expend zero-emission vehicle and component manufacturing; an increase in the private sector’s investment in zero-emission vehicle infrastructure; and the State’s academic and research institutions contributing to zero-emission vehicle research, innovation and education.
- By 2020: The State’s zero-emission vehicle infrastructure ability to support up to one million vehicles; the costs of zero-emission vehicles competitive with conventional combustion vehicles;

zero-emission vehicles accessible to mainstream consumers; widespread use of zero-emission vehicles for public transportation and freight transport; and a decrease in transportation sector GHG emissions as a result of the switch to zero-emission vehicles; electric vehicle charging integrated into the electricity grid.

- By 2025: over 1.5 million zero-emission vehicles on California roads; easy access to zero-emission vehicle infrastructure in California; the zero-emission vehicle industry strong and sustainable part of California's economy; and California's vehicles displace at least 1.5 billion gallons of petroleum fuels per year.

Sustainable Freight Action Plan. Executive Order B-32-15 directed the State to establish targets to improve freight efficiency, transition to zero emission technologies, and increase the competitiveness of California's freight transport system. The targets are not mandates, but rather aspirational measures of progress towards sustainability for the State to meet and try to exceed. The targets include:

- System Efficiency Target: Improve freight system efficiency by 25 percent by increasing the value of goods and services produced from the freight sector, relative to the amount of carbon that it produces by 2030.
- Transition to Zero Emission Technology Target: Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize near-zero emission freight vehicles and equipment powered by renewable energy by 2030.
- Increased Competitiveness and Economic Growth Targets: Establish a target or targets for increased State competitiveness and future economic growth within the freight and goods movement industry based on a suite of common-sense economic competitiveness and growth metrics and models developed by a working group comprised of economists, experts, and industry. These targets and tools will support flexibility, efficiency, investment, and best business practices through State policies and programs that create a positive environment for growing freight volumes and jobs, while working with industry to mitigate potential negative economic impacts. The targets and tools will also help evaluate the strategies proposed under the Action Plan to ensure consideration of the impacts of actions on economic growth and competitiveness throughout the development and implementation process.

California Transportation Plan 2040. The California Transportation Plan (CTP) 2040 provides a long-range policy framework to meet future mobility needs and reduce GHG emissions. The CTP defines goals, performance-based policies, and strategies to achieve maximum feasible emission reductions in order to attain a statewide reduction in GHG emissions.

The CTP 2040 recognizes that the Governor is committed to reduce by one-half current petroleum use in cars and trucks; increase from one-third to one-half the electricity derived from renewable sources; double the efficiency savings of existing buildings and make heating fuels cleaner; reduce the release of methane, black carbon, and other short-lived climate pollutants; and manage farm and rangelands, forests, and wetlands to store more carbon.

Transportation GHG reduction strategies within the CTP 2040 include demand management (including telecommuting/working at home, increased carpoolers, and increase car sharing), mode shift (including transit service improvements, high-speed rail, bus rapid transit, expanded bike and pedestrian facilities, carpool land occupancy requirements, and increased HOV lanes), travel cost (implement expanded pricing policies), and operational efficiency (incident/emergency management, Caltrans' Master Plan, ITS/TSM, and eco-driving).

Low Carbon Fuel Standard, Executive Order S-01-07. The Governor signed Executive Order S-01-07 on January 18, 2007. The order mandated that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In particular, the executive order established a Low Carbon Fuel Standard and directed the Secretary for Environmental

Protection to coordinate the actions of the California Energy Commission (CEC), the CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. The CARB adopted the Low Carbon Fuel Standard on April 23, 2009. The Low Carbon Fuel Standard requires producers of petroleum based fuels to reduce the carbon intensity of their products, beginning with a quarter of a percent in 2011, ending in a 10 percent total reduction in 2020. Petroleum importers, refiners and wholesalers can either develop their own low carbon fuel products, or buy LCFS Credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas or hydrogen. The Low Carbon Fuel Standard was challenged in the United States District Court in Fresno in 2011. The court's ruling issued on December 29, 2011, included a preliminary injunction against the CARB's implementation of the rule. The Ninth Circuit Court of Appeals stayed the injunction on April 23, 2012 pending final ruling on appeal, allowing the CARB to continue to implement and enforce the regulation and vacated the injunction on September 18, 2013, and remanded the case to the district court for further consideration. With the adoption of the 2017 Scoping Plan Update, the Low Carbon Fuel Standard has been increased to an 18 percent reduction in carbon intensity by 2030.

Senate Bill 1383. This bill creates goals for short-lived climate pollutant (SLCP) reductions in various industry sectors. The SLCPs included under this bill – including methane, fluorinated gases, and black carbon – are GHGs that are much more potent than carbon dioxide and can have detrimental effects on human health and climate change. SB 1383 requires the CARB to adopt a strategy to reduce methane by 40%, hydrofluorocarbon gases by 40%, and anthropogenic black carbon by 50% below 2013 levels by 2030. The methane emission reduction goals include a 75% reduction in the level of statewide disposal of organic waste from 2014 levels by 2025. **Executive Order S-3-05.** Executive Order S-3-05 was signed by Governor Schwarzenegger in 2005 proclaiming California is vulnerable to the impacts of climate change. It states that increased temperatures could reduce the Sierra Nevada's snowpack, worsen California's air quality problems, and potentially cause a rise in sea levels. The Executive Order establishes total GHG emission targets including emissions reductions to the 2000 level by 2010, and the 1990 level by 2020, and to 80 percent below the 1990 level by 2050. The 2050 reduction goal represents what scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be an aggressive, but achievable, mid-term target.

Assembly Bill 32 (AB 32). California's major initiative for reducing GHG emissions is outlined in AB 32, the "Global Warming Solutions Act," passed by the California State legislature on August 31, 2006. This effort aims at reducing GHG emissions to 1990 levels by 2020. The original 2020 GHG emissions limit was 427 million mt CO_2e. The current 2020 GHG emissions limit is 431 million mt CO_2e. AB 32 requires the CARB to prepare a Scoping Plan that outlines the main State strategies for meeting the 2020 deadline and to reduce GHGs that contribute to global climate change.

The Scoping Plan was approved by the CARB on December 11, 2008, and includes measures to address GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste, among other measures (CARB, 2008b). The Scoping Plan includes a range of GHG reduction actions that may include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms such as a cap-and-trade system. The Scoping Plan, even after Board approval, remains a recommendation. The measures in the Scoping Plan will not be binding until after they are adopted through the normal rulemaking process. The CARB rule-making process includes preparation and release of each of the draft measures, public input through workshops and a public comment period, followed by a CARB hearing and rule adoption.

Pursuant to AB 32, the CARB and the Climate Action Team (CAT)[2] did the following:

---

[2] CAT is a consortium of representatives from State agencies who have been charged with coordinating and implementing GHG emission reduction programs that fall outside of CARB's jurisdiction.

- Adopted a list of discrete early action measures;
- Established a statewide GHG emissions cap for 2020 based on 1990 emissions and adopted mandatory reporting rules for significant sources of GHG;
- Indicated how emission reductions will be achieved from significant GHG sources via regulations, market mechanisms and other actions; and
- Adopted regulations to achieve the maximum technologically feasible and cost-effective reductions in GHG, including provisions for using both market mechanisms and alternative compliance mechanisms.

In June 2007, the CARB approved a list of 37 early action measures, including three discrete early action measures (Low Carbon Fuel Standard, Restrictions on High Global Warming Potential Refrigerants, and Landfill Methane Capture). Discrete early action measures are measures that were required to be adopted as regulations and made effective no later than January 1, 2010, the date established by Health and Safety Code (HSC) Section 38560.5. The CARB adopted additional early action measures in October 2007 (CARB, 2007a) that tripled the number of discrete early action measures. These measures relate to truck efficiency, port electrification, reduction of perfluorocarbons from the semiconductor industry, reduction of propellants in consumer products, proper tire inflation, and sulfur hexafluoride (SF_6) reductions from the non-electricity sector. The combination of early action measures was estimated to reduce statewide GHG emissions by nearly 16 million mt CO_2e (CARB, 2007b).

AB 32 codifies Executive Order S-3-05's[3] year 2020 goal by requiring that statewide GHG emissions be reduced to 1990 levels by the year 2020.

The first AB 32 Scoping Plan, published in 2008, identified a future cap-and-trade program covering refineries, power plants, industrial facilities, and transportation fuels as a central element of California's overall strategy to reduce GHG emissions to 1990 levels. More information on the Scoping Plan and California's Cap and Trade program is provided below.

Amendments to California Global Warming Solutions Act of 2006: Emission Limit (Senate Bill 32): Signed into law on September 8, 2016, Senate Bill (SB) 32 (Amendments to California Global Warming Solutions Act of 2006: Emission Limit) amends HSC Division 25.5 and codifies the 2030 target in the recent Executive Order B-30-15 (40 percent below 1990 levels by 2030). The 2030 target is intended to ensure that California remains on track to achieve the goal set forth by Executive Order B-30-15 to reduce statewide GHG emissions by 2050 to 80 percent below 1990 levels. SB 32 states the intent of the legislature to continue to reduce GHGs for the protection of all areas of the state and especially the state's most disadvantaged communities, which are disproportionately impacted by the deleterious effects of climate change on public health (California Legislative Information Website 2017). SB 32 was passed with companion legislation AB 197, which provides additional direction for developing the Scoping Plan. In 2016, the California State Legislature adopted SB 32 and its companion bill AB 197, and both were signed by Governor Brown. SB 32 amends HSC Division 25.5 and establishes a new climate pollution reduction target of 40 percent below 1990 levels by 2030, while AB 197 includes provisions to ensure the benefits of state climate policies reach into disadvantaged communities.

California Cap and Trade Program. Authorized by the California Global Warming Solutions Act of 2006 (AB 32), the cap-and-trade program is a core strategy that California is using to meet its statewide GHG reduction targets for 2020 and 2030, and ultimately achieve an 80 percent reduction from 1990 levels by 2050. Pursuant to its authority under AB 32, CARB has designed and adopted a California Cap-and-Trade Program to reduce GHG emissions from major sources (deemed "covered entities") by

---

[3] Executive Order S-3-05 establishes greenhouse gas emission reduction targets for California.

setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32's emission-reduction mandate of returning to 1990 levels of emissions by 2020 (CA, 2013a). Under the Cap-and-Trade program, an overall limit is established for GHG emissions from capped sectors (e.g., electricity generation, petroleum refining, cement production, fuel suppliers, and large industrial facilities that emit more than 25,000 metric tons CO2e per year) and declines over time, and facilities subject to the cap can trade permits to emit GHGs. The statewide cap for GHG emissions from the capped sectors commenced in 2013 and declines over time, achieving GHG emission reductions throughout the Program's duration (CA, 2013b). On July 17, 2017 the California legislature passed Assembly Bill 398, extending the Cap-and-Trade program through 2030.

The Cap-and-Trade Regulation provides a firm cap, ensuring that the 2020 and 2030 statewide emission limits will not be exceeded. An inherent feature of the Cap-and-Trade Program is that it does not direct GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are assured on a State-wide basis.

Since 2015, fuels, such as gasoline, diesel, and natural gas, have been covered under the Cap-and-Trade Program. Fuel suppliers are required to reduce GHG emissions by supplying low carbon fuels or purchasing pollution permits, called "allowances," to cover the GHGs produced when the conventional petroleum-based fuel they supply is combusted.

2008 Scoping Plan. The California State Legislature adopted AB 32 in 2006 which focuses on reducing greenhouse gases (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) to 1990 levels by the year 2020. Pursuant to the requirements in AB 32, the CARB adopted the Climate Change Scoping Plan (Scoping Plan) in 2008, which outlines actions recommended to obtain that goal. The Scoping Plan calls for an "ambitious but achievable" reduction in California's greenhouse gas emissions, cutting approximately 30 percent from BAU emission levels projected for 2020, or about 10 percent from today's levels. On a per-capita basis, that means reducing annual emissions of 14 tons of carbon dioxide for every man, woman, and child in California down to about 10 tons per person by 2020.

The Scoping Plan (CARB, 2008b) contains the following 18 strategies to reduce the State's emissions:

1. *California Cap-and-Trade Program Linked to Western Climate Initiative.* Implement a broad-based California Cap-and-Trade program to provide a firm limit on emissions. Link the California cap-and-trade program with other Western Climate Initiative Partner programs to create a regional market system to achieve greater environmental and economic benefits for California. Ensure California's program meets all applicable AB 32 requirements for market-based mechanisms.
2. *California Light-Duty Vehicle Greenhouse Gas Standards.* Implement adopted standards and planned second phase of the program. Align zero-emission vehicle, alternative and renewable fuel and vehicle technology programs with long-term climate change goals.
3. *Energy Efficiency.* Maximize energy efficiency building and appliance standards; pursue additional efficiency including new technologies, policy, and implementation mechanisms. Pursue comparable investment in energy efficiency from all retail providers of electricity in California.
4. *Renewable Portfolio Standard.* Achieve 33 percent renewable energy mix statewide. Renewable energy sources include (but are not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas.
5. *Low Carbon Fuel Standard.* Develop and adopt the Low Carbon Fuel Standard.
6. *Regional Transportation-Related Greenhouse Gas Targets.* Develop regional greenhouse gas emissions reduction targets for passenger vehicles. This measure refers to SB 375.
7. *Vehicle Efficiency Measures.* Implement light-duty vehicle efficiency measures.

8. *Goods Movement.* Implement adopted regulations for the use of shore power for ships at berth. Improve efficiency in goods movement activities.
9. *Million Solar Roofs Program.* Install 3,000 MW of solar-electric capacity under California's existing solar programs.
10. *Medium/Heavy-Duty Vehicles.* Adopt medium and heavy-duty vehicle efficiency measures.
11. *Industrial Emissions.* Require assessment of large industrial sources to determine whether individual sources within a facility can cost-effectively reduce greenhouse gas emissions and provide other pollution reduction co-benefits. Reduce greenhouse gas emissions from fugitive emissions from oil and gas extraction and gas transmission. Adopt and implement regulations to control fugitive methane emissions and reduce flaring at refineries.
12. *High Speed Rail.* Support implementation of a high-speed rail system.
13. *Green Building Strategy.* Expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings.
14. *High Global Warming Potential Gases.* Adopt measures to reduce high global warming potential gases.
15. *Recycling and Waste.* Reduce methane emissions at landfills. Increase waste diversion, composting, and commercial recycling. Move toward zero-waste.
16. *Sustainable Forests.* Preserve forest sequestration and encourage the use of forest biomass for sustainable energy generation.
17. *Water.* Continue efficiency programs and use cleaner energy sources to move and treat water.
18. *Agriculture.* In the near-term, encourage investment in manure digesters and at the five-year Scoping Plan update determine if the program should be made mandatory by 2020.

2014 Scoping Plan Update. This First Update to California's Climate Change Scoping Plan (2014 Scoping Plan Update) was developed by the CARB in collaboration with the Climate Action Team and reflects the input and expertise of a range of state and local government agencies. The Update reflects public input and recommendations from business, environmental, environmental justice, utilities and community-based organizations provided in response to the release of prior drafts of the Update, a Discussion Draft in October 2013, and a draft Proposed Update in February 2014.

This report highlights California's success to date in reducing its GHG emissions and lays the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050. The First Update includes recommendations for establishing a mid-term emissions limit that aligns with the State's long-term goal of an emissions limit 80 percent below 1990 levels by 2050 and sector-specific discussions covering issues, technologies, needs, and ongoing State activities to significantly reduce emissions throughout California's economy through 2050. The focus areas include energy, transportation, agriculture, water, waste management, and natural and working lands (CARB, 2014a). With respect to the transportation sector, California has outlined several steps in the State's zero emission vehicle (ZEV) Action Plan to further support the market and accelerate its growth. Committed implementation of the actions described in the plan will help meet Governor Brown's 2012 Executive Order (EO) B-16-2012, which—in addition to establishing a more specific 2050 GHG target for the transportation sector of 80 percent from 1990 levels—called for 1.5 million ZEVs on California's roadways by 2025.

Achieving such an aggressive 2050 target will require innovation and unprecedented advancements in energy demand and supply (CARB, 2014a). Emissions from 2020 to 2050 will have to decline at more than twice the rate of that which is needed to reach the 2020 statewide emissions limit. In addition to our climate objectives, California also must meet federal clean air standards. Emissions of criteria air pollutants, including ozone precursors (primarily oxides of nitrogen, or NOX) and particulate matter, must be reduced by an estimated 90 percent by 2032 to comply with federal air quality standards. The scope and scale of emission reductions necessary to improve air quality is similar to that needed to meet long-term climate targets. Achieving both objectives will align programs and investments to leverage limited resources for maximum benefit.

2017 Scoping Plan Update. On December 14, 2017, CARB approved the final version of California's 2017 Climate Change Scoping Plan (2017 Scoping Plan Update), which outlines the proposed framework of action for achieving the 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels (CARB, 2017e). The 2017 Scoping Plan Update identifies key sectors of the implementation strategy, which includes improvements in low carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target Statewide 2030 emissions limit is 260 MMTCO2e, and that further commitments will need to be made to achieve an additional reduction of 50 MMTCO2e beyond current policies and programs. The cornerstone of the 2017 Scoping Plan Update is an expansion of the Cap-and-Trade program to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2050 limit set forth by E.O. B-30-15.

The 2017 Scoping Plan Update's strategy for meeting the 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030. These include:

- Extending the low carbon fuel standard (LCFS) beyond 2020 and increasing the carbon intensity reduction requirement to 18 percent by 2030;
- SB 350, which increase renewables portfolio standard (RPS) to 50 percent and requires a doubling of energy efficiency for existing buildings by 2030;
- The 2016 Mobile Source Strategy is estimated to reduce emissions from mobile sources including an 80 percent reduction in smog-forming emissions and a 45 percent reduction in diesel particulate matter from 2016 level in the South Coast Air Basin, a 45 percent reduction in GHG emissions, and a 50 percent reduction in the consumption of petroleum-based fuels;
- The Sustainable Freight Action Plan to improve freight efficiency and transition to zero emission freight handling technologies (described in more detail below);
- SB 1383, which requires a 50 percent reduction in anthropogenic black carbon and a 40 percent reduction in hydrofluorocarbon and methane emissions below 2013 levels by 2030; and
- Assembly Bill 398, which extends the state Cap-and-Trade Program through 2030.

With respect to project-level GHG reduction actions and thresholds for individual development projects, the 2017 Scoping Plan Update Indicates,

> *Beyond plan-level goals and actions, local governments can also support climate action when considering discretionary approvals and entitlements of individual projects through CEQA. Absent conformity with an adequate geographically-specific GHG reduction plan as described in the preceding section above, CARB recommends that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development (CARB, 2017e).*

4.7.2.3 Regional Regulations

Southern California Association of Governments (SCAG) Sustainable Communities Strategy (SCS) within Regional Transportation Plan (RTP) demonstrates the region's ability to attain and exceed the GHG emission reduction targets set by the CARB. The SCS outlines the plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375, as evidenced by several Compass Blueprint Demonstration Projects and various county transportation improvements. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and complements the proposed transportation network, which emphasizes system preservation, active transportation, and transportation demand management measures.

The RTP/SCS exceeds its greenhouse gas emission-reduction targets set by the CARB by achieving an 8 percent reduction by 2020, an 18 percent reduction by 2035, and a 21 percent reduction by 2040 compared to the 2005 level on a per capita basis. Table 4.7-1 shows the assumptions regarding Moreno Valley that SCAG used in its 2016 analysis.

Table 4.7-1: SCAG Assumptions for Moreno Valley

Year	Population	Households	Employment
2012	197,600	51,800	31,400
2040	256,600	73,000	83,200

Source: Southern California Association of Governments 2016
(http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS_DemographicsGrowthForecast.pdf)

The RTP also includes an appendix on Goods Movement, which describes a process to develop and deploy needed technologies for improving efficiency of goods movement, along with key action steps for public sector agencies to help move the region to that objective. The 2016 RTP/SCS reaffirms zero- and near zero-emission technologies as a priority, and establishes the regional path forward towards improving the goods movement system.

4.7.2.4 City of Moreno Valley Climate Action Strategy

The City of Moreno Valley approved the Energy Efficiency and Climate Action Strategy (Strategy) in October 2012. The Strategy identifies ways that the City can reduce energy and water consumption and greenhouse gas emissions as an organization (its employees and the operation of its facilities) and outlines the actions that the City can encourage and community members can employ to reduce their own energy and water consumption and greenhouse gas emissions. The Strategy contains the following policies to reduce greenhouse gas emissions in 2010 by 15 percent by 2020:

R2-T1	*Land Use Based Trips and VMT Reduction Policies.* Encourage the development of Transit Priority Projects along High Quality Transit Corridors identified in the SCAG Sustainable Communities Plan, to allow a reduction in vehicle miles traveled.
R2-T3	*Employment-Based Trip Reductions.* Require a Transportation Demand Management (TDM) program for new development to reduce automobile travel by encouraging ride-sharing, carpooling, and alternative modes of transportation.
R2-E1	*New Construction Residential Energy Efficiency Requirements.* Require energy efficient design for all new residential buildings to be 10 percent beyond the current Title 24 standards.
R2-E2	*New Construction Residential Renewable Energy.* Facilitate the use of renewable energy (such as solar [photovoltaic] panels or small wind turbines) for new residential developments. Alternative approach would be the purchase of renewable energy resources off site.

R2-E5	*New Construction Commercial Energy Efficiency Requirements.* Require energy efficient design for all new commercial buildings to be 10 percent beyond the current Title 24 standards.
R3-E1	*Energy Efficient Development, and Renewable Energy Deployment Facilitation and Streamlining.* Updating of codes and zoning requirements and guidelines to further implement green building practices. This could include incentives for energy-efficient projects.
R3-L2	*Heat Island Plan.* Develop measures that address “heat islands.” Potential measures include using strategically placed shade trees, using paving materials with a Solar Reflective Index of at least 29, an open grid pavement system, or covered parking.
R2-W1	*Water Use Reduction Initiative.* Consider adopting a per capita water use reduction goal which mandates the reduction of water use of 20 percent per capita with requirements applicable to new development and with cooperative support of the water agencies.
R3-W1	*Water Efficiency Training and Education.* Work with EMWD and local water companies to implement a public information and education program that promotes water conservation.
R2-S1	*City Diversion Program.* For solid waste, consider a target of increasing the waste diverted from the landfill to a total of 75 percent by 2020.

4.7.3 METHODOLOGY

Bearing in mind that CEQA does not require “perfection” but instead “adequacy, completeness, and a good faith effort at full disclosure,” the analysis of project GHG emissions and climate change is based on methodologies and information available at the time this Revised Sections of the FEIR was prepared. Many uncertainties exist regarding the precise relationship between specific levels of GHG emissions and the ultimate impact on global climate. Significant uncertainties also exist regarding the reduction potential of mitigation strategies. Thus, while information is presented below to assist the public and the City’s decision-makers in understanding the project’s potential contribution to global climate change impacts, the information available to the City is not sufficiently detailed to allow a direct comparison between particular project characteristics and particular climate change impacts, nor between any particular proposed mitigation measure and any reduction in climate change impacts.

The recommended approach for GHG analysis included in the California Governor’s Office of Planning and Research (OPR’s) June 2008 release is to: (1) identify and quantify GHG emissions, (2) assess the significance of the impact on climate change, and (3) if significant, identify alternatives and/or mitigation measures to reduce the impact below a level of significance (Governor’s Office of Planning and Research, 2008). Neither the CEQA statute nor Guidelines prescribe quantitative thresholds of significance or a particular methodology for performing an impact analysis; as with most environmental topics, significance criteria are left to the judgment and discretion of the lead agency.

The June 2008 OPR guidance provides some additional direction regarding planning documents as follows: “CEQA can be a more effective tool for GHG emissions analysis and mitigation if it is supported and supplemented by sound development policies and practices that will reduce GHG emissions on a broad planning scale and that can provide the basis for a programmatic approach to project-specific CEQA analysis and mitigation. For local government lead agencies, adoption of General Plan policies and certification of General Plan EIRs that analyze broad jurisdiction-wide impacts of GHG emissions can be part of an effective strategy for addressing cumulative impacts and for streamlining later project-specific CEQA reviews.”

Pursuant to SB 97, the OPR must develop guidelines for analysis of the effects of GHG emissions. As part of this process, the OPR asked CARB technical staff to recommend statewide interim thresholds of significance for GHGs. The CARB released a preliminary draft staff proposal in October 2008 that included initial suggestions for significance criteria related to industrial, commercial, and residential projects. However, CARB's staff did not adopt or suggest any new statewide thresholds. The OPR finalized its revised *CEQA Guidelines* without reference to CARB's draft proposal.

In March 2010, *CEQA Guidelines* amendments were adopted and include the following direction regarding determination of significant impacts from GHG emissions (Section 15064.4):

(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in Section 15064. A lead agency should make a good-faith effort, based on available information, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

    (1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; or

    (2) Rely on a qualitative analysis or performance based standards.

(b) A lead agency may consider the following when assessing the significance of impacts from greenhouse gas emissions on the environment:

    (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.

    (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

    (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such regulations or requirements must be adopted by the relevant public agency through a public review process and must include specific requirements that reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

CEQA Guidelines Section 15064(b) provides that the "determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data," and further, states that an "ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting."

The analysis takes into account the following:

- *CalEEMod.* The latest version of CalEEMod (Version 2016.3.2) was utilized to calculate GHG emissions from the following source categories: construction energy, waste, land use change, architectural coatings and water. For a detailed description of the assumptions used to estimate the GHG emissions, refer to the Air Quality, Greenhouse Gas, and Health Risk Assessment Report.

- *Operational Mobile Assumptions***.** Operational mobile GHG emissions were estimated using the same procedures for the air quality analysis (which includes using EMFAC2014), which is consistent with updated Traffic Impact Analysis. Please refer to Section 4.3.3.2 in the Air Quality Section of this Revised Sections of the FEIR or the revised Air Quality, Greenhouse Gas, and Health Risk Assessment (2018) for a list of those changes.
- *Vehicle Fuel Assumptions:* Mobile emissions in this analysis utilizes EMFAC2014's projected vehicle fuel mix for Phase 1 buildout year 2025 and project buildout year 2040. EMFAC2014 does not include population assumptions for electric or natural gas-fueled trucks. Section 4.17, Energy, of this Revised Sections of the FEIR addresses the potential penetration of electric trucks and potential use in association with the project. Although the State has set targets for zero-emission vehicles, it would be speculative to assume that the High Penetration scenario discussed in Section 4.17 would be practicable or feasible by 2025 or by 2040. The Low and Medium Penetration scenarios discussed in Section 4.17 are possible; however, as a worst-case analysis, the greenhouse gas analysis included herein does not factor in any potential emissions reductions provided by electric or natural gas-fueled trucks. For informational purposes only, emissions associated with the Medium Penetration scenario has been taken into account to show further emissions reduction potential.

For a detailed discussion of GHG emissions source and methodology, refer to Appendix A of this Revised Sections of the FEIR.

4.7.4 THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, climate change/greenhouse gas emissions impacts would occur if the World Logistics Center project would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment (i.e., exceeds the SCAQMD's 10,000 mt CO_2e emissions screening threshold of significance); and/or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Global climate change may result in significant adverse effects to the environment that will be experienced worldwide, with some specific effects observed in California. AB 32 requires statewide GHG emissions reductions to 1990 levels by 2020, and SB 32 requires statewide GHG emissions reductions to 40 percent below 1990 levels by 2030. Although these statewide reductions are now mandated by law, no generally applicable GHG emission threshold has yet been established.

State CEQA Guidelines Section 15064(b) provides that "…the determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data," and further, that an "ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting." The *State CEQA Guidelines* further indicate that even when thresholds are established, they may include "identifiable quantitative, qualitative or performance level of a particular environmental effect" (*State CEQA Guidelines*, Section 15064.7).

Some policymakers and regulators suggest that a zero emissions threshold would be appropriate when evaluating GHGs and their potential effect on climate change. Such a rule appears inconsistent with the State's approach to mitigation of climate change impacts. AB 32 and SB 32 do not prohibit all new GHG emissions; rather, they require a reduction in statewide emissions to a given level. Thus, AB 32 and SB 32 recognize that GHG emissions will continue to occur; increases will result from certain activities, but reductions must occur elsewhere.

Individual projects incrementally contribute toward the potential for global climate change (GCC) on a cumulative basis in concert with all other past, present, and probable future projects. While individual projects are unlikely to measurably affect GCC, each of these projects incrementally contributes toward the potential for GCC on a cumulative basis, in concert with all other past, present, and probable future projects. This analysis examines whether the project's emissions should be considered cumulatively significant.

In order to evaluate the significance of a proposed project's environmental impacts related to GHG emissions, it is necessary to identify quantitative or qualitative thresholds which, if exceeded, would constitute a finding of significance. As previously described, while project-related GHG emissions can be estimated the direct impact of such emissions on climate change and global warming cannot be determined on the basis of available science. There is no evidence at this time that the World Logistics Center project would directly affect GCC. The SCAQMD has adopted a quantitative GHG emission significance threshold to assess direct impacts from industrial projects where the SCAQMD is the lead agency. The SCAQMD and other air quality agencies agree that GHG and GCC should be assessed as a potentially significant cumulative impact rather than a project-specific impact.

The following is an excerpt from the SCAQMD (Draft Guidance Document – Interim CEQA Greenhouse Gas [GHG] Significance Threshold, October 2008):

> *"The overarching policy objective with regard to establishing a GHG significance threshold for the purposes of analyzing GHG impacts pursuant to CEQA is to establish a performance standard or target GHG reduction objective that will ultimate contribute to reducing GHG emissions to stabilize climate change. Full implementation of the Governor's Executive Order S-3-05 would reduce GHG emissions 80 percent below 1990 levels or 90 percent below current levels by 2050. It is anticipated that achieving the Executive Order's objective would contribute to worldwide efforts to cap GHG concentrations at 450 ppm, thus, stabilizing global climate.*
>
> *As described below, staff's recommended interim GHG significance threshold proposal uses a tiered approach to determining significance. Tier 3, which is expected to be the primary tier by which the AQMD will determine significance for projects where it is the lead agency, uses the Executive Order S-3-05 goal as the basis for deriving the screening level."*

This project utilizes Tier 3 of the SCAQMD's draft threshold and compares the project's uncapped greenhouse gas emissions to the SCAQMD's threshold for industrial projects, 10,000 mt CO_2e per year. Therefore, the threshold used for this project was based on the goal in Executive Order S-3-05. If the project's uncapped emissions are under the threshold, then the project would be in compliance with Executive Order S-3-05.

In September 2013, the SCAQMD adopted two Negative Declarations stating that GHG emissions subject to the ARB Cap-and-Trade Program do not count against the 10,000 MT CO2e significance threshold the SCAQMD applies when acting as a lead agency. In addition, the San Joaquin Valley Air Pollution Control District (SJVAPCD) has recently taken this one issue a step further and adopted a policy: "CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation." This policy applies when the SJVAPCD is the lead agency and when it is a responsible agency. In short, the SJVAPCD "has determined that GHG emissions increases that are covered under ARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…." The SJVAPCD classifies ARB's Cap-and-Trade Program as an approved GHG emission reduction plan or GHG mitigation program under CEQA Guidelines Section 15064(h) (3). Here are some other pertinent excerpts from that policy:

- "Consistent with CCR §15064(h)(3), the District finds that compliance with ARB's Cap-and-Trade regulation would avoid or substantially lessen the impact of project-specific GHG emissions on global climate change."
- "The District therefore concludes that GHG emissions increases subject to ARB's Cap-and-Trade regulation would have a less than significant individual and cumulative impact on global climate change."
- "[I]t is reasonable to conclude that implementation of the Cap-and-Trade program will and must fully mitigate project-specific GHG emissions for emissions that are covered by the Cap-and-Trade regulation."
- "[T]he District finds that, through compliance with the Cap-and-Trade regulation, project-specific GHG emissions that are covered by the regulation will be fully mitigated."

The policy acknowledges that "combustion of fossil fuels including transportation fuels used in California (on and off road including locomotives), not directly covered at large sources, are subject to Cap-and-Trade requirements, with compliance obligations starting in 2015." As such, the SJVAPCD concludes that GHG emissions associated with vehicle miles traveled (VMT) cannot constitute significant increases under CEQA. This regulatory conclusion is therefore directly applicable to the WLC project because VMT is by far the largest source of project GHG emissions.

The consideration of only uncapped GHG emissions to determine the significance of those emissions under CEQA used by the SCAQMD and the SJVAPCD was validated in Association of Irritated Residents v. Kern County Board of Supervisors, 17 Cal. App. 5th 708 (2017). The EIR's GHG analysis properly relied on compliance with California's cap-and-trade program to conclude that GHG emissions would be less than significant.

4.7.5 LESS THAN SIGNIFICANT IMPACTS

Due to the size of the project, all potential impacts related to greenhouse gas emissions are considered to be potentially significant.

4.7.6 SIGNIFICANT IMPACTS

4.7.6.1 Greenhouse Gas Emissions

Impact	Would the proposed project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Future development that could occur within the World Logistics Center project site could generate GHG emissions during both construction and operation activities. The following activities are associated with the World Logistics Center project and could directly or indirectly contribute to the generation of GHG emissions:

- **Removal of Vegetation (Land Use Change) and Sequestration:** Carbon sequestration is the process of capture and storage of carbon dioxide; trees, vegetation, and soil store carbon in their tissues and wood. The net removal of vegetation for construction from land use change results in a loss of the carbon sequestration in plants. However, planting additional vegetation (sequestration) would result in additional carbon sequestration and would lower the carbon footprint of the project.
- **Construction Activities:** During construction of the World Logistics Center project, GHGs would be emitted through the operation of construction equipment and from worker and builder supply vendor vehicles, each of which typically uses fossil-based fuels to operate. The combustion of fossil-based fuels creates GHGs such as CO_2, CH_4, and N_2O. Leaks from installation of refrigeration equipment for air conditioning may occur.

- **Gas, Electric, and Water Use:** Natural gas use results in the emissions of CH_4 (the major component of natural gas) and CO_2 from the combustion of natural gas. Electricity use can result in GHG production if the electricity is generated by combusting fossil fuel. Conveying water to the project and treating wastewater also uses electricity.
- **Solid Waste Disposal:** Solid waste generated by the World Logistics Center project could contribute to GHG emissions in a variety of ways. Landfilling and other methods of disposal use energy for transporting and managing the waste, and they produce additional GHGs to varying degrees. Landfilling, the most common waste management practice, results in the release of CH_4 from the anaerobic decomposition of organic materials. CH_4 is approximately 21 times more potent than CO_2. Landfill CH_4 can also be a source of energy. In addition, many materials in landfills do not decompose fully, and the carbon that remains is sequestered in the landfill and not released into the atmosphere.
- **Motor Vehicle Use:** Transportation associated with the World Logistics Center project would result in GHG emissions from the combustion of fossil fuels and the use of electricity in daily automobile and truck trips.
- **On-site Equipment:** During operation of the World Logistics Center project, there would be on-site equipment operating, including yard trucks, emergency generators, and forklifts.

Construction Emissions. The World Logistics Center project would emit GHGs mainly from direct sources such as combustion of fuels from worker vehicles and construction equipment, as shown in Table 4.7-2. The GHG emissions are from all phases of construction. The SCAQMD recommends that construction emissions be averaged over a 30-year period.

Table 4.7-2: Construction Greenhouse Gas Emissions (without mitigation)

Year	Annual Emissions (mt CO_2e)
2020	11,783
2021	11,447
2022	15,056
2023	11,036
2024	20,704
2025	12,384
2026	14,241
2027	11,982
2028	14,057
2029	12,930
2030	15,605
2031	11,894
2032	17,188
2033	15,872
2034	11,839
2035	14,082
Total	222,098
Averaged over 30 years	**7,403**
Capped: Fuel-Based Emission Sources Averaged over 30 years	**7,334**
Uncapped: Refrigerant Installation and Construction Waste Averaged over 30 years	**34**

Table 4.7-2: Construction Greenhouse Gas Emissions (without mitigation)

Year	Annual Emissions (mt CO_2e)

mt CO_2e = metric tons of carbon dioxide equivalents.
Note: The SCAQMD recommends that construction emissions be averaged over a 30-year period.
Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2018
Sources include onsite construction equipment, worker trips, haul trips, vendor trips, refrigerant installation for the air conditioning in the offices, construction waste, and water use. Values presented in the table may not equal the sum due to rounding.

Total Emissions, Worst-Case Scenario. Operational or long-term emissions occur over the life of the project. Included for informational purposes, operational emissions for a worst-case buildout condition are shown in Table 4.7-3. This is a worst-case analysis because it assumes that the entire project would be built-out in 2018. The emissions are presented by greenhouse gas (in tons per year), which was also converted to metric tons of carbon dioxide equivalents (mt CO_2e). The vehicle emissions in the table represent travel within the South Coast Air Basin. The emissions do not take into account mitigation measures to reduce emissions, such as the use of model year 2010 and later diesel trucks on the project site. As shown in the table, the project's uncapped emissions are over the SCAQMD's significance threshold of 10,000 mt CO_2e per year. Therefore, emissions are potentially significant.

The analysis presented in Table 4.7-3 also represents a worst-case analysis because the emission factors do not take into account implementation of California's Mobile Source Strategy and the full reductions expected from newer trucks and cars as a result of the Pavley regulations, the Low Carbon Fuel Standard, and California's Advanced Clean Car program. The emissions are estimated using emission factors from EMFAC2014, CARB's emission factor model, for the year 2018.

Table 4.7-3: Annual Project Operational GHG Emissions (Worst-Case 2018 Analysis at Buildout)

Source	Individual Emissions (tons)					Greenhouse Gas Emissions (mt CO_2e)
	Carbon Dioxide	Methane	Nitrous Oxide	Hydrofluoro-carbons	Black Carbon	
AB 32/SB 32 Capped Emissions						
Mobile (net)	285,523	3.17	1.56	0.00	6.27	263,840
Other	81,599	71.50	185.20	0.00	0.70	126,199
Total	367,122	74.67	186.77	0.00	6.97	390,039
Uncapped Emissions	**9,804**	**504.67**	**0.00**	**1.95**	**0.00**	**22,974**
					Threshold	**10,000**
					Significant?	**Yes**

Notes:
mt CO_2e = metric tons of carbon dioxide equivalents, which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072.
The "other" emissions include the non-mobile capped emissions as presented in Table 4.7-4. below.
Source: *ESA*, 2018

Total Project Emissions. Table 4.7-4 shows the unmitigated project emissions at buildout, including estimates of the project's mobile emissions estimates for future years based on EMFAC emission factors for the actual year assessed, which take into account the Pavley regulations, the Low Carbon Fuel Standard, and California's Advanced Clean Car program. Emissions are shown by individual GHG (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, and black carbon) and totaled used the common unit of metric tons CO2e based on the global warming potential of each gas. Emissions estimates for electricity and natural gas do not account for Project Design Features (described in

Energy Section 4.17.5) that improve building energy efficiency and maximize the use of on-site renewable energy

Table 4.7-4 shows project emissions separated into capped and uncapped sectors, as defined by California's cap-and-trade program. California's cap-and-trade program is enforceable and meets the requirements of AB 32 and SB 32. The program began on January 1, 2012, placing GHG emissions limits on capped sectors (e.g., electricity generation, petroleum refining, cement production, and large industrial facilities that emit more than 25,000 MT CO2e per year), and enforcing compliance obligations beginning with 2013 emissions. Vehicle fuels were placed under the cap in 2015, and with the passage of AB 398, the program was extended through 2030. The Cap-and-Trade Program allocates emissions permits across covered entities in each sector.

As shown in Table 4.7-4, the majority of the project's GHG emissions are from sources that are subject to the requirements of the Cap-and-Trade Program. AB 32/SB 32 capped emissions are shown for informational purposes, as those emissions are not compared with the SCAQMD's significance threshold.

Table 4.7-4: Project GHG Emissions at Buildout by GHG (Unmitigated)

Source	**Emissions (tons per year)**					**GHG Emissions (mt CO_2e)**

Table 4.7-4: Project GHG Emissions at Buildout by GHG (Unmitigated)

Source	Emissions (tons per year)					GHG Emissions (mt CO_2e)
	Carbon Dioxide	Methane	Nitrous Oxide	HFCs	Black Carbon	

mt CO_2e = metric tons of carbon dioxide equivalents which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons [HFC] – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072. <0.01 = less than 0.01

1 – Electricity and natural gas emissions estimates are based on minimum compliance with 2016 Title 24 building standards

2 - Capped construction emissions are from on-road and off-road vehicles, electricity use for equipment, and water use. Uncapped construction emissions are from refrigerants and construction waste. Construction emissions are amortized over 30 years.

Source: *ESA, 2018*

The total emissions estimates for the project, summarized in Table 4.7-5, include both construction and operations emissions, and do not account for Project Design Features (described in Energy Section 4.17.5) that improve building energy efficiency and maximize the use of on-site renewable energy; nor do they account for the project's mitigation measures. Table 4.7-5 shows a summary of AB 32/SB 32 capped and uncapped project emissions (unmitigated) for each year between 2020 and buildout. As shown in the table, the uncapped emissions in the year 2026 and after are over the SCAQMD's significance threshold of 10,000 mt CO_2e per year. Therefore, emissions are potentially significant, and mitigation is required.

Table 4.7-5: Project GHG Emissions (Year by Year without Mitigation)

Notes:

mt CO_2e = metric tons of carbon dioxide equivalents which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072.

1 – Electricity and natural gas emissions estimates are based on minimum compliance with 2016 Title 24 building standard; includes electricity use by on-site EV chargers.

2 – Capped construction emissions are from on-road and off-road vehicles, electricity use for equipment, and water use. Uncapped construction emissions are from refrigerants and construction waste. Construction would not occur at buildout; however, according to SCAQMD recommendations, it is included at buildout as the average over 30 years.

Source: *ESA, 2018*

Project Design Features. The WLCSP incorporates site and building designs (Project Design Features) that emphasize conservation of water and energy, which in turn help reduce greenhouse gas emissions (WLCSP September 2014, Section 1.3.2, Green Building-Sustainable Development). The revised Project Design Features, as outlined in the *Comparison of Renewable Energy Technologies* report (WSP, 2018) and explained in detail in Energy Section 4.17.5, go substantially beyond that previous commitment with energy conservation measures (ECMs) that exceed minimal compliance with current (2016) Title 24 requirements by about 17 percent at Phase 1 and 16 percent at full buildout, and a commitment to maximize the use of onsite rooftop solar PV generation,.

Mitigation Measures. The following mitigation measures would reduce the GHG emissions impact of the WLC project. Mitigation measures 4.7.6.1B, 4.7.6.1C, and 4.7.5.1D were previously included in the 2015 FEIR as Utilities Mitigation Measures 4.16.4.6.1A, 4.16.4.6.1B, and 4.16.4.6.1C to address building energy, but energy impacts have now been removed from the Utilities section and considered in the standalone Energy section of this Revised Sections of the FEIR (Section 4.17).

4.7.6.1A The World Logistics Center project shall implement the following requirements to reduce solid waste and greenhouse gas emissions from construction and operation of project development:

a) Prior to January 1, 2020, divert a minimum of 50 percent of landfill waste generated by operation of the project. After January 1, 2020, development shall divert a minimum of 75 percent of landfill waste. In January of each calendar year after project approval the developer and/or Property Owners Association shall certify the percentage of landfill waste diverted on an annual basis.

b) Prior to January 1, 2020, recycle and/or salvage at least 50 percent of non-hazardous construction and demolition debris. After January 1, 2020, recycle and/or salvage at least 75 percent of non-hazardous construction and demolition debris. In January of each calendar year after project approval the developer and/or Property Owners Association shall certify the percentage of landfill waste diverted on an annual basis.

Develop and implement a construction waste management plan that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be sorted on-site or co-mingled. Calculations can be done by weight or volume, but must be consistent throughout.

c) The applicant shall submit a Recyclables Collection and Loading Area Plan for construction related materials prior to issuance of a building permit with the Building Division and for operational aspects of the project prior to the issuance of the occupancy permit to the Public Works Department. The plan shall conform to the Riverside County Waste Management Department's Design Guidelines for Recyclable Collection and Loading Areas.

d) Prior to issuance of certificate of occupancy, the recyclables collection and loading area shall be constructed in compliance with the Recyclables Collection and Loading Area plan.

e) Prior to issuance of certificate of occupancy, documentation shall be provided to the City confirming that recycling is available for each building.

f) Within six months after occupancy of a building, the City shall confirm that all tenants have recycling procedures set in place to recycle all items that are recyclable, including but not limited to paper, cardboard, glass, plastics, and metals.

g) The property owner shall advise all tenants of the availability of community recycling and composting services.

h) Existing onsite street material shall be recycled for new project streets to the extent feasible.

4.7.6.1B (Previously Included as Utilities Mitigation Measure 4.16.4.6.1A for building energy). Each application for a building permit shall include energy calculations to demonstrate compliance with California Energy Efficiency Standards (Title 24, Part 6). Plans shall show the following:

- Energy-efficient roofing systems, such as "cool" roofs, that reduce roof temperatures significantly during the summer and therefore reduce the energy requirement for air conditioning.
- Cool pavement materials such as lighter-colored pavement materials, porous materials, or permeable or porous pavement, for all roadways and walkways not within the public right-of-way, to minimize the absorption of solar heat and subsequent transfer of heat to its surrounding environment.
- Energy-efficient appliances that achieve the 2016 California Appliance Energy Efficiency Standards (e.g.,EnergyStar® Appliances) and use of sunlight-filtering window coatings or double-paned windows

4.7.6.1C (Previously Included as Utilities Mitigation Measure 4.16.4.6.1B building energy). Prior to the issuance of any building permits within the WLC site, each project developer shall submit energy calculations used to demonstrate compliance with the performance approach to the California Energy Efficiency Standards, for each new structure. Plans may include but are not necessarily limited to implementing the following as appropriate:

- High-efficiency air-conditioning with electronic management system (computer) control.
- Isolated High-efficiency air-conditioning zone control by floors/separable activity areas.
- Use of Energy Star ® exit lighting or exit signage.

4.7.6.1D (Previously Included as Utilities Mitigation Measure 4.16.4.6.1C building energy; now modified). Prior to the issuance of a building permit, new development shall demonstrate that each building has implemented the following:

- Install solar panels with a capacity equal to the peak daily demand for the ancillary office uses in each warehouse building or up to the limit allowed by MVU's restriction on distributed solar PV connecting to their grid, whichever is greater;

- Increase efficiency for buildings by implementing either 10 percent over the 2008 Title 24's energy saving requirements or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict; and
- Require the equivalent of "Leadership in Energy and Environmental Design Certified" for the buildings constructed at the World Logistics Center based on Leadership in Energy and Environmental Design Certified standards in effect at the time of project approval.

This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions.

Additionally, the following mitigation measures from other sections of the Revised Sections of the FEIR help reduce GHG emissions. The complete air quality and utilities mitigation measures can be found in the executive summary.

Air Quality Mitigation Measure 4.3.6.2A (construction fuel) would require that construction equipment greater than 50 horsepower be USEPA Tier 4 emissions compliant and limits on-site idling of all diesel-powered construction equipment, delivery vehicles, and delivery trucks to three minutes in any one hour.

AQ Mitigation Measure 4.3.6.3B (long haul trucks). Require the operation of model year 2010 diesel trucks or later.

AQ Mitigation Measure 4.3.6.4A: The following measures shall be incorporated as conditions to any Plot Plan approval within the Specific Plan:

- All tenants shall be required to participate in Riverside County's Rideshare Program.
- Storage lockers shall be provided in each building for a minimum of three percent of the full-time equivalent employees based on a ratio of 0.50 employees per 1,000 square feet of building area. Lockers shall be located in proximity to required bicycle storage facilities.
- Class II bike lanes shall be incorporated into the design for all project streets.
- The project shall incorporate pedestrian pathways between on-site uses.
- Site design and building placement shall provide pedestrian connections between internal and external facilities.
- The project shall provide pedestrian connections to residential uses within 0.25 mile from the project site.
- A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building. In addition, parking facilities with 200 parking spaces or more shall be designed and constructed so that at least six percent of the total parking spaces are capable of supporting future electric vehicle supply equipment (EVSE) charging locations. Sizing of conduit and service capacity at the time of construction shall be sufficient to install Level 2 Electric Vehicle Supply Equipment (EVSE) or greater.
- Each building shall provide indoor and/or outdoor - bicycle storage space consistent with the City Municipal Code and the California Green Building Standards Code. Each building shall provide a minimum of two shower and changing facilities for employees.
- Each building shall provide preferred and designated parking for any combination of low-emitting, fuel-efficient, and carpool/vanpool vehicles equivalent to the number identified in California Green Building Standards Code Section 5.106.5.2 or the Moreno Valley Municipal Code whichever requires the higher number of carpool/vanpool stalls.
- The following information shall be provided to tenants: onsite electric vehicle charging locations and instructions, bicycle parking, shower facilities, transit availability and the schedules, telecommunicating benefits, alternative work schedule benefits, and energy efficiency.

Utilities Mitigation Measure 4.16.1.6.1A would reduce outdoor water usage which in turn reduces energy use associated with the conveyance of that water.

Utilities Mitigation Measure 4.16.1.6.1B would reduce interior water usage, including low flow fittings, fixtures and equipment.

Utilities Mitigation Measure 4.16.1.6.1C would allow reclaimed water to be used for irrigation.

Figure 4.7.1 displays the unmitigated and mitigated uncapped GHG emissions. As shown in the figure, the mitigated uncapped emissions are less than the significance threshold and are therefore less than significant.

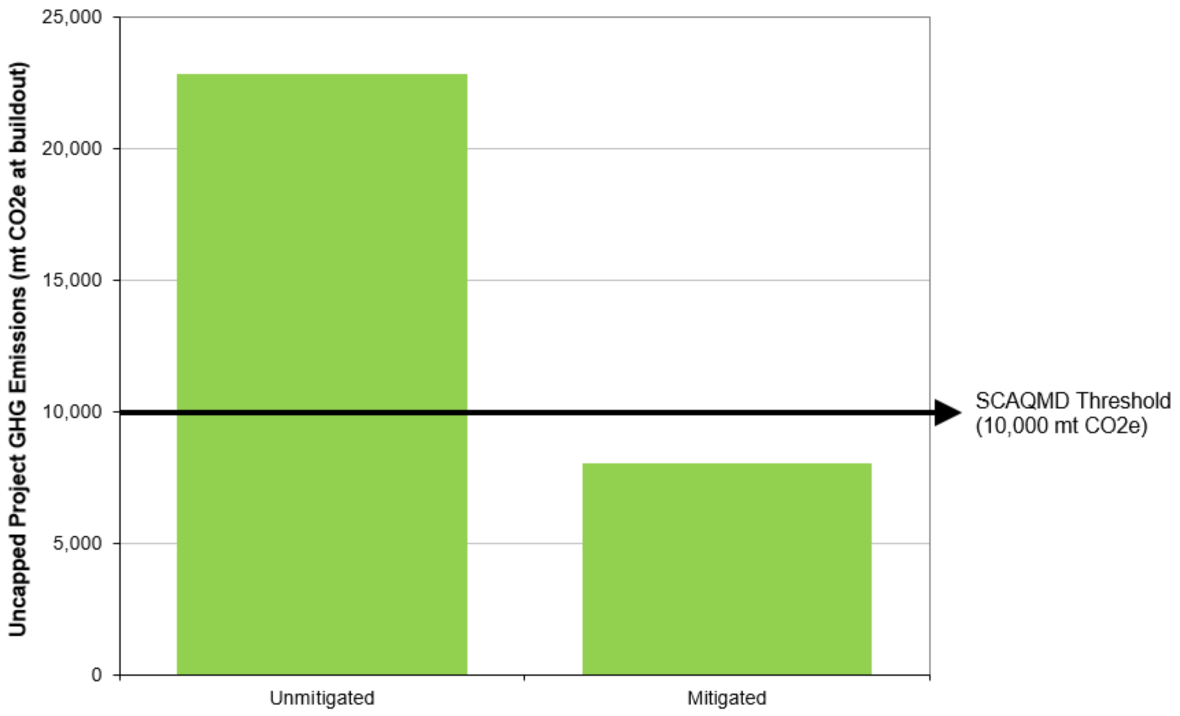

Figure 4.7.1: Uncapped Project GHG Emissions at Buildout

Table 4.7-6 evaluates to what degree the mitigation measures (including the various PDFs of the project as described in Energy Section 4.17.5) will reduce potential GHG emissions.

Table 4.7-7 shows the project GHG emissions with implementation of Project Design Features and mitigation measures, at buildout only. Table 4.7-8 shows the mitigated GHG emissions for each year between 2020 and buildout.

AB 32/SB 32 capped emissions are shown for informational purposes, as those emissions are not compared with the SCAQMD's significance threshold. The tables indicate that with mitigation, the uncapped emissions would not exceed the significance threshold. GHG emissions are less than significant after mitigation.

Level of Impact After Mitigation. Less than significant.

Table 4.7-6: Greenhouse Gas Emissions Reduction Analysis

Category	Operational Mitigation Measure or Project Design Feature[1]	Calculation Method and Reductions
Construction Fuel	**Mitigation Measure 4.3.6.2A** would require that construction equipment be Tier 4.	This reduction was estimated in CalEEMod. Tier 4 construction equipment would have fewer PM2.5 emissions, and therefore black carbon emissions.
Construction Waste	Regulation in the California Green Building Standards require that projects divert (reduce or recycle) at least 50 percent of waste.	This reduction was estimated using the U.S. EPA's Waste Reduction Model (WARM) version 13.
On-road Vehicles: Local	*Project Design Feature:* Local bus service to the area is provided by the Riverside Transit Agency. Local bus routes would typically be extended into the project area when adequate demand is generated from this employment center. Future bus routes could circulate on available looped routes with adequate right-of-way along the major arterial roadways of Redlands Boulevard, Theodore Street, and Alessandro Boulevard. Likewise, the industrial collector roadways provide access to locations nearest building front entrances. Due to building scale, bus stops may be spread out by grouped entrances or centralized gateway drive areas as compared to individual business entries.	The California Air Pollution Control Officer's Association (CAPCOA) report's reduction measure TRT-1 indicates a 5.2 percent reduction in commute vehicle miles traveled for low-density suburbs for inclusion of a commute trip reduction program. However, this reduction is not used in this analysis. In this Revised Sections of the FEIR, no reductions are taken for these measures in order to provide a conservative analysis.
	Mitigation Measure 4.3.6.4A: Class II bike lanes.	
	Mitigation Measure 4.3.6.4A: Participate in Riverside County's rideshare program	
	Mitigation Measure 4.3.6.4A: Lockers for employees.	
	Mitigation Measure 4.3.6.4A: Bicycle storage and changing rooms	
	Project Design Features: The project would have pedestrian circulation, sidewalks, and a multiuse trail.	
	Mitigation Measure 4.3.6.4A*:* Safe pedestrian connections	
	Mitigation Measure 4.3.6.4A: Parking for fuel-efficient vehicles	
On-road Vehicles: Long haul trucks	**Mitigation Measure 4.3.6.3B:** Require model year 2010 diesel trucks or later.	This was implemented by utilizing the emission factors for medium-heavy duty and heavy-heavy duty trucks from EMFAC2014 for year 2010 and after.

Table 4.7-6: Greenhouse Gas Emissions Reduction Analysis

Category	**Operational Mitigation Measure or Project Design Feature[1]**	**Calculation Method and Reductions**
On-road Vehicles: all	*Pavley-I Regulation:* A clean-car standard to reduce greenhouse gas emissions from new passenger vehicles (light duty automobiles and medium duty vehicles) from 2009 through 2016. *Low Carbon Fuel Standard:* A fuel standard that requires a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020. *California Mobile Source Strategy:* This 2016 plan includes targets for zero emission vehicles (ZEVs) that exceed assumptions included in EMFAC 2014. Project design includes supporting infrastructure to accommodate future EV populations consistent with targets in the Mobile Source Strategy.	EMFAC2014 provides emission factors for carbon dioxide that include these regulations. Therefore, both the unmitigated and mitigated emissions account for these regulations.
Electricity and Natural Gas: Title 24	**Mitigation Measures 4.7.6.1B** and **4.7.6.1C** would reduce electricity related emissions. In addition, the project would be LEED certified for buildings and Mitigation Measure 4.7.6.1D would require buildings to exceed Title 24 (2008 version) by 10 percent or comply with the current version in place. Project design includes energy conservation measures that would enable the project to exceed 2016 Title 24 energy standards by approximately 17 percent at Phase 1 and 16 percent at Full Buildout, by lowering electrical demand with implementation of sustainability measures such as high efficiency appliances and skylights.	Reductions from exceeding the requirements of Title 24 (2016) were accounted for in calculations.
Electricity: Lighting	**Mitigation Measures 4.7.6.1C** (lighting efficiency) and **4.7.6.1D** (Title 24) would reduce electricity from lighting. Project design includes energy conservation measures that lower electrical demand with implementation of sustainability measures such as high efficiency lighting and motion sensors.	Reductions due to efficient lighting were accounted for in calculations.
Electricity: Solar	**Mitigation Measure 4.7.6.1D** requires that the project install solar panels. Project design includes on-site solar panel installation.	The estimated electricity generation from onsite solar is 24,083 MWh per year, which is 5.0 percent of the electricity demand at buildout. Therefore, 5.0 percent of the unmitigated electricity-related GHG emissions are reduced by solar generation.
Water	**Mitigation Measure 4.16.1.6.1A** would reduce outdoor water usage	CalEEMod mitigation for water-efficient irrigation systems (6.1% reduction, CalEEMod default)

Table 4.7-6: Greenhouse Gas Emissions Reduction Analysis

Category	Operational Mitigation Measure or Project Design Feature[1]	Calculation Method and Reductions
	Mitigation Measure 4.16.1.6.1B would reduce interior water usage, including low flow fittings, fixtures and equipment.	CalEEMod mitigation for: - low-flow toilet (20% reduction in flow, CalEEMod default) - low flow bathroom faucet (32% reduction in flow, CalEEMod default) - low-flow kitchen faucet (18% reduction in flow, CalEEMod default) - low-flow shower (20% reduction in flow, CalEEMod default)
	Mitigation Measure 4.16.1.6.1C would allow reclaimed water to be used for irrigation.	No reductions are taken for the potential use of reclaimed water.
Waste	**Mitigation Measure 4.7.6.1A***:* Recycling and composting to divert construction and operational waste by at least 50 percent before 2020 and 75 percent thereafter.	The project would commit to reducing construction and operational waste by 50 percent prior to 2020 and 75 percent after; therefore, a 75 percent reduction is applied.
	Project Design Feature: Specific Plan (Section 5.1.6) requires that all development within the project provide enclosures or compactors for trash and recyclable materials.	

[1] Project design features are from the WLC Project Description and WLC Sustainable Energy Plan (WSP, 2018); mitigation measures are shown in Section 1.0, Table 1.B.

Notes:
mt CO_2e = metric tons of carbon dioxide equivalents which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072.
1 - Electricity and natural gas emissions estimates account for PDFs that improve energy efficiency and eliminate the use of building natural gas; includes electricity use by on-site EV chargers.
2 - Capped construction emissions are from on-road and off-road vehicles, electricity use for equipment, and water use. Uncapped construction emissions are from refrigerants and construction waste. Construction would no longer occur at buildout; however, according to SCAQMD recommendations, construction emissions are included as amortized over 30 years.

mt CO_2e = metric tons of carbon dioxide equivalents, which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072.

1 - Electricity and natural gas emissions estimates account for PDFs that improve energy efficiency and eliminate the use of building natural gas; includes electricity use by on-site EV chargers.

2 - Capped construction emissions are from on-road and off-road vehicles, electricity use for equipment, and water use. Uncapped construction emissions are from refrigerants and construction waste. Estimated construction emissions are included prior to buildout; at buildout, the total construction averaged over 30 years is shown.

Source: *ESA, 2018*

Operational Emissions, Scoping Plan Scenario (Included for informational purposes only). The emissions presented under the Scoping Plan scenario (Table 4.7-10) assume successful implementation of the 2017 Scoping Plan Update, which included the Mobile Source Strategy in addition to the Pavley regulations, the Low Carbon Fuel Standard, and California's Advanced Clean Car program. The mobile emissions estimates for future years are based on emission factors that account for higher penetrations of electric vehicles (EVs) than assumed by EMFAC.

The Scoping Plan Scenario assumes that California's 2016 Mobile Source Strategy (MSS) would be implemented as a key strategy in the 2017 Scoping Plan Update for meeting the state's 2030 GHG target (presented in the Energy section as Vehicle Scenario B: Medium EV Penetration). The MSS has a target of 4.2 million zero emission vehicles (ZEVs) in operation statewide by 2030. As explained in the Energy Section, after 2025 the sales and penetration of ZEVs under the MSS start to exceed the numbers assumed by EMFAC 2014. Table 4.7-9 shows that under the MSS approximately 8.4 percent of the passenger vehicle (LDA) and light truck (LDT) fleet is expected to powered by electricity or other zero emission engines by 2025 in the South Coast AQMD region, compared to 6.2 percent using EMFAC 2014 assumptions. By 2040, 42.2 percent of cars and light trucks are expected to be ZEVs in the South Coast AQMD region, compared to 13.7 percent using EMFAC 2014 assumptions.

Table 4.7-9: California and SCAQMD Electric Vehicle (EV) Penetration Estimates

Jurisdiction	Year	EMFAC 2014				Mobile Source Strategy	
		Total LDA + LDT Population	EV Population	% EV	EV Sales in year as % of total	EV Population	% EV

4.7.6.2 Greenhouse Gas Plan, Policy, Regulation Consistency

Impact	Would the proposed project conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

This impact assesses whether the project would conflict with any applicable plans, policies, or regulations, as discussed below.

Federal and State Reduction Strategies. Table 4.7-11 evaluates the consistency of the World Logistics Center project with the various Federal and State energy conservation strategies and other regulations related to GHG emissions.

Table 4.7-11: Project Compliance with Federal/State Greenhouse Gas Reduction Strategies

Strategy	Project Consistency
Mandatory Codes	
California Green Building Code. The Cal Green Code (Title 24, Part 11) prescribes a wide array of measures that would directly and indirectly result in reduction of GHG emissions from the Business as Usual Scenario (California Building Code). The mandatory measures that are applicable to nonresidential projects include site selection, energy efficiency, water efficiency, materials conservation and resource efficiency, and environmental quality measures.	**Consistent.** The project will be required to adhere to the non-residential mandatory measures as required by the Cal Green Code.
Energy Efficiency Measures	
Energy Efficiency. Maximize energy efficiency building and appliance standards, and pursue additional efficiency efforts including new technologies, and new policy and implementation mechanisms. Pursue comparable investment in energy efficiency from all retail providers of electricity in California (including both investor-owned and publicly owned utilities).	**Consistent with Mitigation Incorporated.** The project will comply with current California Building Code (CBC) requirements for building construction. **Mitigation Measures 4.7.6.1B** and **4.7.6.1C** would increase energy efficiency. **Mitigation Measure 4.7.6.1D** would require that the project exceed Title 24 (2008 version) by 10 percent or comply with the current version. The WLC Project Design Features (explained in detail in Energy Section 4.17.5) go further by committing the project to energy conservation measures that will enable the project to exceed the more rigorous 2016 Title 24 requirements by approximately 17 percent at Phase 1 and 16 percent at full buildout.
Renewables Portfolio Standard. Achieve a 50 percent renewable energy mix statewide by 2050. Qualifying renewable energy sources under the RPS include (but are not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas.	**Not Applicable.** The project is not part of the State's power generation grid, but would install solar photovoltaic panels on project roofs pursuant to **Mitigation Measure 4.7.6.1D**. The solar PV would reduce the project's electricity related emissions by approximately 5.0 percent. In addition, Moreno Valley Electric Utility is subject to the Renewable Portfolio Standard.
Water Conservation and Efficiency Measures	
Water Use Efficiency. Increasing the efficiency of water transport and reducing water use would reduce GHG emissions. The CalGreen Code, including the California Plumbing Code (Part 5), promotes water conservation. Title 20 and includes appliance and fixture efficiency standards that promote water conservation.	**Consistent with Mitigation Incorporated.** The project will be required to adhere to the non-residential mandatory measures as required by the Cal Green Code and the Specific Plan outlines a number of water conservation measures, and **Mitigation Measures 4.16.1.6.1A** through **4.16.1.6.1C** will help reduce potential water use even further.

Table 4.7-11: Project Compliance with Federal/State Greenhouse Gas Reduction Strategies

Strategy	Project Consistency
Solid Waste Reduction Measures	
Increase Waste Diversion, Composting, and Commercial Recycling, and Move Toward Zero-Waste. AB 341 mandates commercial recycling and sets a goal that 75 percent of the state's solid waste generated be reduced, recycled, or composted by 2020. AB 1826 adds requirements regarding mandatory commercial organics recycling. SB 1383 requires methane emissions reduction from landfills and sets statewide disposal targets to reduce landfilling of organic waste by 50 percent from the 2014 level by 2020, and 75 percent from the 2014 level by 2025.	**Consistent with Mitigation Incorporated.** Data available from the California Integrated Waste Management Board (CIWMB) indicate that the City of Moreno Valley has not achieved the 50 percent diversion rate. The project will comply with **Mitigation Measure 4.7.6.1A** to help increase solid waste diversion, composting, and recycling. The measure would also require 50 percent diversion of construction waste prior to 2020 and 75 percent diversion starting in 2020.
Transportation and Motor Vehicle Measures	
Pavley Regulations and Vehicle Fuel Efficiency Standards. AB 1493 (Pavley) and the Advanced Clean Car (ACC) program require the State to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of GHG emissions from passenger vehicles and light-duty trucks. Regulations were adopted by the CARB in September 2004 and expanded with the ACC program in 2012.	**Consistent.** The project does not involve the manufacture of vehicles or production of vehicle fuels. However, vehicles that are purchased and used within the project site would comply with any vehicle and fuel standards that the CARB adopts or has adopted. In addition, the project would require that all diesel trucks be 2010 or newer (**Mitigation Measure 4.3.6.3B**) and would be built to support the charging of future electric-powered vehicles anticipated by the Mobile Source Strategy. The Project design also includes supporting infrastructure to accommodate future EV populations consistent with targets in the Mobile Source Strategy.
Light-Duty Vehicle Efficiency Measures. Implement additional measures that could reduce light-duty vehicle GHG emissions. For example, measures to ensure that tires are properly inflated can both reduce GHG emissions and improve fuel efficiency.	
Heavy- and Medium-Duty Fuel and Engine Efficiency Measures. Regulations to require retrofits to improve the fuel efficiency of heavy-duty trucks that could include devices that reduce aerodynamic drag and rolling resistance. This measure could also include hybridization of and increased engine efficiency of vehicles.	
Mobile Source Strategy. This 2016 plan includes a target of 4.2 million zero emission vehicles (ZEVs) by 2030, and GHG reductions from medium-duty and heavy-duty vehicles, and transit. It also includes reductions in GHGs from medium-duty and heavy-duty vehicles via the Phase 2 Medium and Heavy-Duty GHG Standards.	
Low Carbon Fuel Standard. The CARB identified this measure as a Discrete Early Action Measure in the 2008 Scoping Plan. As included in the Mobile Source Strategy, this measure would reduce the carbon intensity of California's transportation fuels by at least 18 percent by 2030.	
Sustainable Freight Action Plan. The 2016 plan directs the State to establish targets to improve freight efficiency, transition to zero emission technologies, and increase the competitiveness of California's freight transport system.	

Table 4.7-11: Project Compliance with Federal/State Greenhouse Gas Reduction Strategies

Strategy	Project Consistency
Regional Transportation-Related GHG Targets. Develop regional GHG emissions reduction targets for passenger vehicles, as required by SB 375. Local governments will play a significant role in the regional planning process to reach passenger vehicle GHG emissions reduction targets. Local governments have the ability to directly influence both the siting and design of new residential and commercial developments in a way that reduces GHGs associated with vehicle travel.	**Not Applicable.** Specific regional emission targets for transportation emissions do not directly apply to the WLC project; regional GHG reduction target development is outside the scope of this project. The project will comply with any plans developed by the City of Moreno Valley.
Measures to Reduce High Global Warming Potential (GWP) Gases.	
Short-Lived Climate Pollutant Strategy. SB 1383 (2016) requires the CARB to approve and implement Short-Lived Climate Pollutant strategy to reduce high GWP GHGs to achieve a statewide reduction in methane by 40%, hydrofluorocarbon gases by 40%, and anthropogenic black carbon by 50% below 2013 levels by 2030.	**Not Applicable.** New products used or serviced on the WLC project site (after implementation of the reduction of GHG gases) would comply with future CARB rules and regulations, as would vehicles (with their refrigerants used in air conditioning systems) visiting the site.

AB = Assembly Bill CARB = California Air Resources Board
GHG = greenhouse gas
Source: based on analysis in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2018

With implementation of applicable strategies/measures, project design features, and mitigation measures, the project's contribution to cumulative GHG emissions would be reduced. In order to ensure that the World Logistics Center project complies with and would not conflict with or impede the implementation of reduction goals identified in AB 32 and SB 32, the Mitigation Measures and Project design Features listed in the above table shall be implemented.

The project will comply with existing State and Federal regulations regarding the energy efficiency of buildings, appliances, and lighting. The warehouse buildings will be built in compliance with the California Building Code to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices. In addition, **Mitigation Measure 4.7.6.1D** requires that the project will exceed the Title 24 energy conservation standards (2008 version) by 10 percent or comply with the current version, while the WLC Project Design Features go even further by committing the project to energy conservation measures that will enable the project to exceed the more rigorous 2016 Title 24 requirements by approximately 17 percent at Phase 1 and 16 percent at full buildout.

CARB Scoping Plan and the California Cap and Trade Program. AB 32 focuses on reducing GHG emissions to 1990 levels by the year 2020, while SB 32 has a target of 40 percent below 1990 levels by 2030. Pursuant to the requirements in AB 32, the CARB adopted the Climate Change Scoping Plan (Scoping Plan) in 2008, which contains a variety of strategies to reduce the State's emissions. The First Update to the Scoping Plan was approved in 2014 and the Second Update was approved in 2017 following the passage of SB 32. As described in Section 4.7.2.2 – State Regulations/Standards, AB 398 extended California's cap-and-trade program through 2030 and the program is adopted as a core strategy in the 2017 Scoping Plan Update for meeting the state's GHG reduction targets for 2020 and 2030. The 2017 Scoping Plan Update incorporates all of the state's GHG reduction strategies included in Table 4.7-11. Table 4.7-12 considers the strategies in 2017 Scoping Plan Update that are not included in Table 4.7-11, indicating that all are either consistent with or not applicable to the project; therefore, the project does not conflict with the Scoping Plan.

Table 4.7-12: Analysis of Additional Measures in the 2017 Scoping Plan Update

Scoping Plan Reduction Measure	Consistency Analysis
1. **California Cap-and-Trade Program Linked to Western Climate Initiative.** Implement a broad-based California Cap-and-Trade program to provide a firm limit on emissions. Link the California cap-and-trade program with other Western Climate Initiative Partner programs to create a regional market system to achieve greater environmental and economic benefits for California. Ensure California's program meets all applicable AB 32 requirements for market-based mechanisms.	**Not Applicable.** California's cap-and-trade system covers products or services (such as electricity) and the cost of the cap-and-trade system would be transferred to the consumers. Large industrial uses are the most likely source of participants for this program, and it is not likely individual logistics warehousing will be an active participant in this program. Under AB 32 and SB 32, emissions from natural gas use, transportation fuel use, and electricity generation are covered under the cap-and-trade program and subject to the program's emission reduction requirements.
16. **Carbon Sequestration in Natural and Working Lands**. Natural and working lands – including forests and agricultural lands – are a key sector in the State's climate change strategy. Storing carbon in trees, other vegetation, soils, and aquatic sediment is an effective way to remove carbon dioxide from the atmosphere. The 2017 Scoping Plan Update describes policies and programs that prioritize protection and enhancement of California's landscapes, and commits the State to finalizing a carbon sequestration and GHG emissions reduction goal for natural and working lands by September 2018	**Not Applicable.** No forested lands exist on site. As reported in the Agriculture and Forestry Resources section 4.2.1, approximately 2,200 acres of the 2,610-acre Specific Plan area is currently dry farmed, mainly with winter wheat. However, the state's Natural and Working Lands Climate Change Implementation Plan has not been adopted, and there is no protection currently in place to preserve the site for agriculture. Further, as described in the Agriculture and Forestry Resources section, the conversion of the existing agricultural lands to urban uses is supported by the City's General Plan policies, and the entire project site and adjacent lands have been designated for urban uses for nearly 20 years by the City. The Agriculture and Forestry Resources section concludes that project implementation will result in less than significant impacts to conversion of Farmland of Local Importance.

Source: CARB, 2017e

City General Plan Policies. The project must also be evaluated against the City's General Plan policies that relate to greenhouse gas emissions, as shown in Table 4.7-13. This analysis shows that the project is consistent with the applicable General Plan objectives and policies, or the particular objective or policy is not applicable to the proposed WLC project.

Table 4.7-13: Consistency with City General Plan Air Quality Policies

Objective or Policy	Project Consistency
Objective 6.6. Promote land use patterns that reduce daily automotive trips and reduce trip distance for work, shopping, school, and recreation.	**Consistent.** The project is providing employment opportunities to Moreno Valley and the surrounding area.
Policy 6.6.1. Provide sites for new neighborhood commercial facilities within close proximity to the residential areas they serve.	**Not Applicable.** The project does not propose the development of neighborhood commercial facilities or residential dwellings.
Policy 6.6.2. Provide multifamily residential development sites in close proximity to neighborhood commercial centers in order to encourage pedestrian instead of vehicular travel.	**Not Applicable.** The project is industrial and does not propose the development of residential uses.
Policy 6.6.3. Locate neighborhood parks in close proximity to the appropriate concentration of residents in order to encourage pedestrian and bicycle travel to local recreation areas.	**Not Applicable.** The project is industrial and does not propose the development of residential uses.

Table 4.7-13: Consistency with City General Plan Air Quality Policies

Objective or Policy	Project Consistency
Objective 6.7. Reduce mobile and stationary source air pollutant emissions.	**Consistent.** The project would be implementing feasible Mitigation Measures to reduce mobile and stationary emissions (**Mitigation Measures 4.3.6.3B, 4.3.6.3C, 4.3.6.3D,** and **4.3.6.4A**).
Policy 6.7.1. Cooperate with regional efforts to establish and implement regional air quality strategies and tactics.	**Not Applicable.** This measure is beyond the scope of the project; the City will continue to work with the SCAQMD in regional planning efforts.
Policy 6.7.2. Encourage the financing and construction of park-and-ride facilities.	**Not Applicable.** The project consists of industrial uses; a park and ride on the project would not be feasible.
Policy 6.7.3. Encourage express transit service from Moreno Valley to the greater metropolitan areas of Riverside, San Bernardino, Orange and Los Angeles Counties.	**Not Applicable.** No express mass transit facilities are designated on the project site or planned on the project site; therefore, this measure is beyond the scope of the project.
Policy 6.7.6. Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code.	**Consistent.** The project will comply with Title 24 requirements.

Policies 6.7.4 and 6.7.5 are discussed in the air quality EIR section, Section 4.3).
Source of objectives and policies: Moreno Valley General Plan (2006).

City Climate Action Strategy. Finally, Table 4.7-14 evaluates the consistency of the World Logistics Center project with the policies of the City's Climate Action Strategy approved in October 2012. As shown below, the project is consistent with the requirements of the Strategy for non-residential development with implementation of project design features and mitigation measures.

Table 4.7-14: Consistency with City Climate Action Strategy

Strategy Items	Project Consistency
R2-T1: Land Use Based Trips and VMT Reduction Policies. Encourage the development of Transit Priority Projects along High Quality Transit Corridors identified in the SCAG Sustainable Communities Plan, to allow a reduction in vehicle miles traveled.	**Not Applicable.** A Transit Priority Project is one that has at least 50 percent residential use based on area, at least 20 units per acre and is within a ½ mile of a major transit stop or High Quality Transit Corridor. A High Quality Transit Corridor is defined as one with 15-minute frequencies during peak commute hours. The project does not include a residential component and is not along a High Quality Transit Corridor nor are there any High Quality Transit Corridors or major transit stops in the vicinity of the project area. As a result, the strategy is not applicable.
R2-T3: Employment-Based Trip Reductions. Require a Transportation Demand Management (TDM) program for new development to reduce automobile travel by encouraging ride-sharing, carpooling, and alternative modes of transportation.	**Consistent** with implementation of **Mitigation Measure 4.3.6.4A.**
R2-E1: New Construction Residential Energy Efficiency Requirements. Require energy efficient design for all new residential buildings to be 10 percent beyond the current Title 24 standards.	**Not Applicable.** This measure applies to residential projects.

Table 4.7-14: Consistency with City Climate Action Strategy

Strategy Items	Project Consistency
R2-E2: New Construction Residential Renewable Energy. Facilitate the use of renewable energy (such as solar (photovoltaic) panels or small wind turbines) for new residential developments. Alternative approach would be the purchase of renewable energy resources offsite.	**Not Applicable.** This measure applies to residential projects.
R2-E5: New Construction Commercial Energy Efficiency Requirements. Require energy efficient design for all new commercial buildings to be 10% beyond the current Title 24 standards.	**Consistent** with **Mitigation Measure 4.7.6.1D.**
R3-E1: Energy Efficient Development, and Renewable Energy Deployment Facilitation and Streamlining. Updating of codes and zoning requirements and guidelines to further implement green building practices. This could include incentives for energy efficient projects.	**Not Applicable.** This refers to updating building and zoning codes and does not apply to this warehousing development plan.
R3-L2: Heat Island Plan. Develop measures that address “heat islands.” Potential measures include using strategically placed shade trees, using paving materials with a Solar Reflective Index of at least 29, an open grid pavement system, or covered parking.	**Consistent.** The Specific Plan indicates that vehicle parking areas are to be landscaped to provide a shade canopy (50 percent coverage at maturity).
R2-W1: Water Use Reduction Initiative. Consider adopting a per capita water use reduction goal which mandates the reduction of water use of 20 percent per capita with requirements applicable to new development and with cooperative support of the water agencies.	**Consistent.** California Green Building Standards Code, Chapter 5, Division 5.3, Section 5.303.2 requires that indoor water use be reduced by 20 percent. Section 5.304.3 requires irrigation controllers and sensors. The Specific Plan also contains a variety of water conservation features. **Mitigation Measures 4.16.1.6.1A, B,** and **C** also provide water reduction measures.
R3-W1: Water Efficiency Training and Education. Work with EMWD and local water companies to implement a public information and education program that promotes water conservation.	**Consistent.** Tenants and owners within the WLC site will provide water conservation information from EMWD and other sources to workers on a regular basis.
R2-S1: City Diversion Program. For Solid Waste, consider a target of increasing the waste diverted from the landfill to a total of 75 percent by 2020.	**Consistent.** The project would incorporate standard City waste reduction features and **Mitigation Measure 4.7.6.1A** (has a target to reduce waste by 75 percent by 2020).
C11: Require that developer recycle existing street material for use as base for new streets.	**Consistent.** Project will implement **Mitigation Measure 4.7.6.1A** where feasible.

Executive Order S-3-05. As discussed in Section 4.7.4, the SCAQMD developed its thresholds based on consistency with California Executive Order S-3-05. As shown in Impact 4.7.6.1, the project’s uncapped GHG emissions would not exceed the SCAQMD’s industrial threshold. Therefore, the project would not conflict with Executive Order S-3-05. This impact is less than significant.

Specific Plan Design Features. The WLCSP contains a sustainability section that emphasizes water and energy conservation throughout the project design, which in turn will help reduce GHG emissions (Section 1.3.2, Green Building-Sustainable Development). The revised WLC Project Design Features (described in detail in Energy Section 4.17.5) go beyond the WLSCP with energy conservation measures that exceed minimal compliance with current (2016) Title 24 requirements by about 17 percent at Phase 1 and 16 percent and full buildout.

Mitigation Measures. Implementation of previously referenced Mitigation Measures 4.3.6.3B, 4.3.6.4A, 4.3.6.3C, 4.3.6.3D, 4.7.6.1A, 4.16.1.6.1A, 4.16.1.6.1B, 4.16.1.6.1C, 4.16.4.6.1A, 4.16.4.6.1B, and 4.16.4.6.1C will help reduce project-related GHG emissions and therefore make it more consistent with GHG reduction plans, policies, and/or regulations.

As previously identified, implementation of the WLC project could result in the development of an approximately 40.6 million square foot high cube-logistics distribution logistics. The project includes a variety of physical attributes and operational programs that would help reduce operational-source pollutant emissions from worker commuting, including GHG emissions. Future development that would occur under the project would be consistent with greenhouse gas emission reduction strategies and policies, including the City's Climate Change Strategy. The project would implement the Mitigation Measures listed above to reduce its contribution to GHG emissions and to ensure it does not conflict with or impede implementation of reduction goals identified in AB 32, SB 32, Governor's Executive Order S-3-05, and other strategies to help reduce GHGs to the level proposed by the Governor. In addition, the project would also be subject to all applicable regulatory requirements, which would also reduce the GHG emissions of the project. Therefore, the project would not conflict with any applicable plan, program, policy, or regulation related to the reduction of GHG emissions. Impacts are considered less than significant.

Similar to the discussion of cumulative air quality impacts, the project may employ workers locally from the City. This has the benefit of improving the local jobs/housing balance leading to air quality benefits in terms of shorter trip lengths, which lead to lower emissions than if the workforce was derived from distant locations.

The State of California has adopted a number of policies, including AB 32, SB 32, Governor's Executive Order S-3-05, the Pavley vehicle standards, the Advanced Clean Car program, and the Mobile Source Strategy, which collectively provide the structure and commitment to address California's contribution to global climate change. Since the project is consistent with these policies, including being below the SCAQMD threshold for greenhouse gases that was structured in accordance with these State policies, the project is consistent with greenhouse gas plans, policies, and regulations and impacts are less than significant after mitigation.

Level of Impact After Mitigation. Less than significant.

~~This section provides a discussion of global climate change, existing regulations pertaining to global climate change, and an analysis of greenhouse gas (GHG) emissions associated with the proposed project. This analysis examines the short-term construction and long-term operational impacts and evaluates the effectiveness of measures incorporated as part of the project design.~~

~~For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone~~

~~1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.~~

~~This section analyzes the proposed project's potential climate impacts based on the following technical study:~~

- ~~*Air Quality, Greenhouse Gas, and Health Risk Assessment Report World Logistics Center Specific Plan* (Michael Brandman Associates/FirstCarbon Solutions, original dated January 2013 revised dated April 2015) contained in Appendix D of this EIR.~~

~~4.7.1 Existing Setting~~

~~4.7.1.1 Global Climate Change~~

~~Global climate change is the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred by some scientists and policy makers to "global warming" because it helps convey the notion that there are other changes in addition to rising temperatures.~~

~~Climate change refers to any significant change in measures of climate such as temperature, precipitation, or wind, lasting for decades or longer (U.S. Environmental Protection Agency [EPA], 2007). Climate change may result from:~~

- ~~Natural factors, such as changes in the sun's intensity or slow changes in the Earth's orbit around the sun;~~
- ~~Natural processes within the climate system (e.g., changes in ocean circulation); and/or~~
- ~~Human activities that change the atmosphere's composition (e.g., through burning fossil fuels) and the land surface (e.g., deforestation, reforestation, urbanization, and desertification).~~

~~The primary observed effect of global climate change has been a rise in the average global tropospheric[1] temperature of 0.36 degrees Fahrenheit (°F) per decade, determined from meteorological measurements worldwide between 1990 and 2005. Climate change modeling shows that further warming could occur, which would induce additional changes in the global climate system during the current century. Changes to the global climate system, ecosystems, and the environment of California could include higher sea levels, drier or wetter weather, changes in ocean salinity, changes in wind patterns or more energetic aspects of extreme weather, including droughts, heavy precipitation, heat waves, extreme cold and increased intensity of tropical cyclones (hurricanes). Specific effects in~~

---

[1] ~~The troposphere is the zone of the atmosphere characterized by water vapor, weather, winds, and decreasing temperature with increasing altitude.~~

~~California might include a decline in the Sierra Nevada snowpack, erosion of California's coastline, and seawater intrusion in the Delta.~~

~~Human activities, such as fossil fuel combustion and land use changes release carbon dioxide (CO_2) and other compounds, cumulatively termed greenhouse gases (GHGs). GHGs are effective in trapping infrared radiation that otherwise would have escaped the atmosphere, thereby warming the atmosphere, the oceans, and earth's surface (EPA, 2007). Many scientists believe that "most of the warming observed over the last 50 years is attributable to human activities."[1] The increased amounts of CO_2 and other GHGs are alleged to be the primary causes of the human-induced component of warming.~~

~~GHGs are present in the atmosphere naturally, released by natural sources, or formed from secondary reactions taking place in the atmosphere. They include CO_2, methane (CH_4), nitrous oxide (N_2O), and ozone (O_3). In the last 200 years, substantial quantities of GHGs have been released into the atmosphere. These extra emissions are increasing GHG concentrations in the atmosphere, enhancing the natural greenhouse effect, which is believed to be causing global climate change. While human-made GHGs include CO_2, CH_4, and N_2O, some (like chlorofluorocarbons [CFCs]) are completely new to the atmosphere.~~

~~GHGs vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The global warming potential is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere ("atmospheric lifetime"). The GWP of each gas is measured relative to CO_2, the most abundant GHG. The definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of CO_2 over a specified time period. GHG emissions are typically measured in terms of metric tons of "CO_2 equivalents" (mt CO_2e or $MTCO_2e$).~~

~~Methane is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Human-made sources include the mining and burning of fossil fuels; digestive processes in ruminant animals such as cattle; rice paddies; and the burying of waste in landfills. As for CO_2, the major removal process of atmospheric CH_4—chemical breakdown in the atmosphere—cannot keep pace with source emissions, and CH_4 concentrations in the atmosphere are increasing.~~

~~Worldwide emissions of GHGs in 2010 were approximately 47,183 million mt CO_2e[2] Emissions from the top five countries and the European Union accounted for approximately 55 percent of the total global GHG emissions, according to the most recently available data. The United States was the number two producer of GHG emissions, contributing 14 percent of the emissions. The primary GHG emitted by human activities in the United States was CO_2, representing approximately 84 percent of total GHG emissions. CO_2 from fossil fuel combustion, the largest source of GHG emissions, accounted for approximately 80 percent of the GHG emissions.[3]~~

~~In 2009, the United States emitted approximately 6.6 billion mt CO_2e or approximately 25 tons per year (tpy) per person. Of the six major sectors nationwide (electric power industry, transportation, industry, agriculture, commercial, and residential), the electric power industry and transportation sectors combined account for approximately 62 percent of the GHG emissions; the majority of the electrical~~

[2] ~~World Resources Institute, CAIT 2.0. 2013. Climate Analysis Indicators Tool: WRI's Climate Data Explorer. Washington, DC. Available at: http://cait2.wri.org. Accessed February 11, 2014.~~

[3] ~~Ibid.~~

~~power industry and all of the transportation emissions are generated from direct fossil fuel combustion. Between 1990 and 2006, total United States GHG emissions rose approximately 14.7 percent.[1]~~

~~World carbon dioxide emissions[2] are expected to increase by 1.9 percent annually between 2001 and 2025. Much of the increase in these emissions is expected to occur in the developing world where emerging economies, such as China and India, fuel economic development with fossil energy. Developing countries' emissions are expected to grow above the world average at 2.7 percent annually between 2001 and 2025; and surpass emissions of industrialized countries near 2018.~~

~~The California Air Resources Board (CARB) is responsible for developing the California Greenhouse Gas Emission Inventory. This inventory estimates the amount of GHGs emitted into and removed from the atmosphere by human activities within the State of California and supports the Assembly Bill (AB) 32 Climate Change Program. The most recent inventory of GHG emissions in California estimated 458.68 million mt CO_2e in 2012.[3] This is a 1.7 percent increase in GHG emissions from 2011 and the first emissions increase since 2007. This increase was driven primarily by strong economic growth, the unexpected closure of the San Onofre Nuclear Generating Station, and drought conditions that limited instate hydropower generation. Since 2000, GHG emissions have decreased by 1.6 percent (from 466 to 459 million mt CO_2e) after reaching a peak of 493 million mt CO_2e in 2004. The top contributor of emissions in 2012 was transportation, which contributed 37 percent of the emissions. The second highest sector was industrial (22 percent), which includes sources from refineries, general fuel use, oil and gas extraction, and cement plants. The CARB staff has projected statewide GHG emissions for the year 2020 to be 509.4 million mt CO_2e.~~[4]

~~The methodology used to estimate the GHG emissions from transportation differs from that used to estimate the GHG emissions for the project. The California inventory is based on fuel sales in California, while the project inventory is based on trip generation rates provided by the Traffic Impact Analysis for the project and are conservative due to the fact that conservative trip generation rates were used to estimate vehicle trips.~~

~~4.7.1.2 Effects of Global Climate Change~~

~~Climate change is a change in the average weather of the earth that is measured by alterations in wind patterns, storms, precipitation, and temperature. These changes are assessed using historical records of temperature changes occurring in the past, such as during previous ice ages. Many of the concerns regarding climate change use these data to extrapolate a level of statistical significance specifically focusing on temperature records from the last 150 years (the Industrial Age) that differ from previous climate changes in rate and magnitude.~~

~~The International Panel on Climate Change (IPCC) constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. In its Fourth Assessment Report, the IPCC predicted that the global mean temperature change from 1990 to 2100, given six scenarios, could range from 1.1 degrees Celsius (°C) to 6.4 °C. Regardless of analytical methodology, global average temperatures and sea levels are expected to rise under all scenarios (IPCC 2007a). The IPCC concluded that global climate change was largely the result of human activity, mainly the burning of fossil fuels. However, the scientific literature is not consistent regarding many of~~

[4] ~~California Air Resources Board. Forecast for Updated Scoping Plan. May 27, 2014. www.arb.ca.gov/cc/inventory/data/tables/2020_bau_forecast_by_scoping_category_2014-05-22.pdf~~

~~the aspects of global warming or climate change, including actual temperature changes during the 20th century, the accuracy of the IPCC report, and contributions of human versus non-human activities.~~

~~Effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme weather events, and degradation of air quality. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems. Heat-related problems include heat rash and heat stroke. In addition, climate-sensitive diseases may increase, such as those spread by mosquitoes and other disease-carrying insects. Such diseases include malaria, dengue fever, yellow fever, and encephalitis. Extreme events such as flooding and hurricanes can displace people and agriculture. Global warming may also contribute to air quality problems from increased frequency of smog and particulate air pollution.~~

~~Additionally, the following climate change effects, which are based on trends established by the IPCC, can be expected in California over the course of the next century:~~

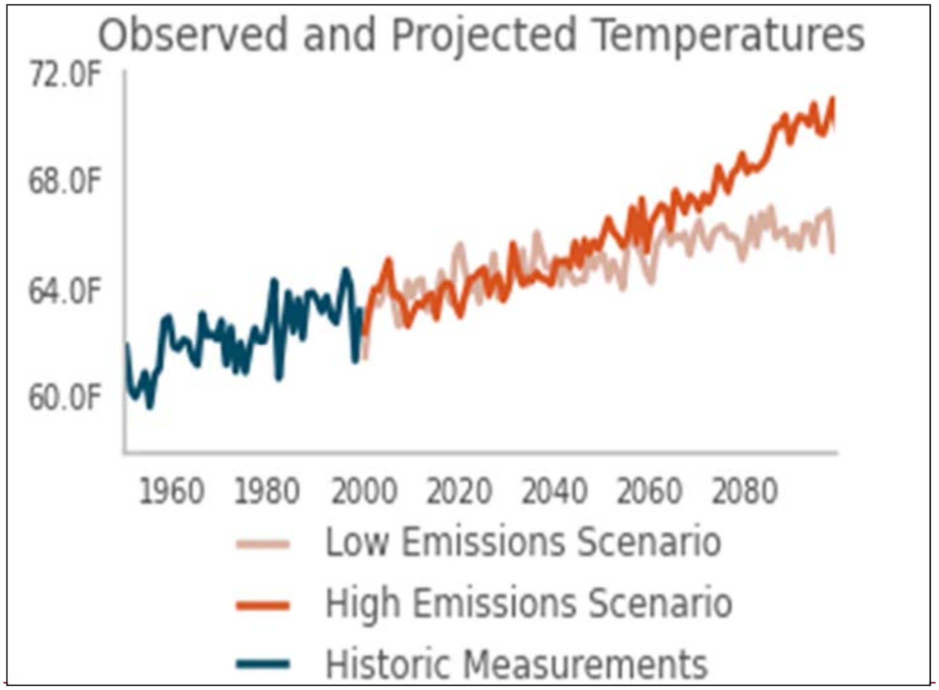
- ~~A diminishing Sierra snowpack declining by 70 percent to 90 percent, threatening the State's water supply. If GHG emissions continue unabated, more precipitation will fall as rain instead of snow, and the snow that does fall will melt earlier.~~
- ~~A rise in sea levels resulting in the displacement of coastal businesses and residences. During the past century, sea levels along California's coast have risen about seven inches. If emissions continue unabated and temperatures rise into the higher anticipated warming range, sea level is expected to rise an additional 22 to 35 inches by the end of the century. Elevations of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. (Note: This condition would not affect the project area as it is a significant distance away from coastal areas.)~~
- ~~An increase temperature and extreme weather events. Climate change is expected to lead to increases in the frequency, intensity, and duration of extreme heat events and heat waves in California. More heat waves can exacerbate chronic disease or heat-related illness.~~
- ~~Increased risk of large wildfires if rain increases as temperatures rise. Precipitation, winds, temperature, and vegetation influence wildfire risk; therefore, wildfire risk is not uniform throughout the state. Changes in current precipitation patterns could influence that risk. As an example, wildfires in the grasslands and chaparral ecosystems of *southern* California are estimated to increase by approximately 30 percent toward the end of the 21st century because more winter rain will stimulate the growth of more plant fuel available to burn in the fall. In contrast, a hotter, drier climate could promote up to 90 percent more *northern* California fires by the end of the century by drying out and increasing the flammability of forest vegetation.~~
- ~~Increasing temperatures from 8 to 10.4°F under the higher emission scenarios, leading to a 25 percent to 35 percent increase in the number of days ozone pollution levels are exceeded in most urban areas (see below).~~
- ~~Increased vulnerability of forests due to forest fires, pest infestation, and increased temperatures.~~
- ~~Reductions in the quality and quantity of certain agricultural products. The crops and products likely to be adversely affected include wine grapes, fruit, nuts, and milk.~~
- ~~Exacerbation of air quality problems. If temperatures rise to the medium warming range, there could be 75 to 85 percent more days with weather conducive to ozone formation in Los Angeles and the San Joaquin Valley, relative to today's conditions. This is more than twice the increase expected if rising temperatures remain in the lower warming range. This increase in air quality problems could result in an increase in asthma and other health-related problems.~~
- ~~A decrease in the health and productivity of California's forests. Climate change can cause an increase in wildfires, an enhanced insect population, and establishment of non-native species.~~

- ~~Increased electricity demand, particularly in the hot summer months.~~
- ~~Increased ground-level ozone formation due to higher reaction rates of ozone precursors.~~

~~*Note: The following text regarding specific consequences of climate change in Moreno Valley was in the 2013 report; minor revisions were made and it has been added to this section.*~~

~~**Consequences of Climate Change in Moreno Valley.** The figure below displays a chart of measured historical and projected annual average temperatures in the Moreno Valley area. As shown in the figure, temperatures are expected to rise in the low and high GHG emissions scenarios.~~

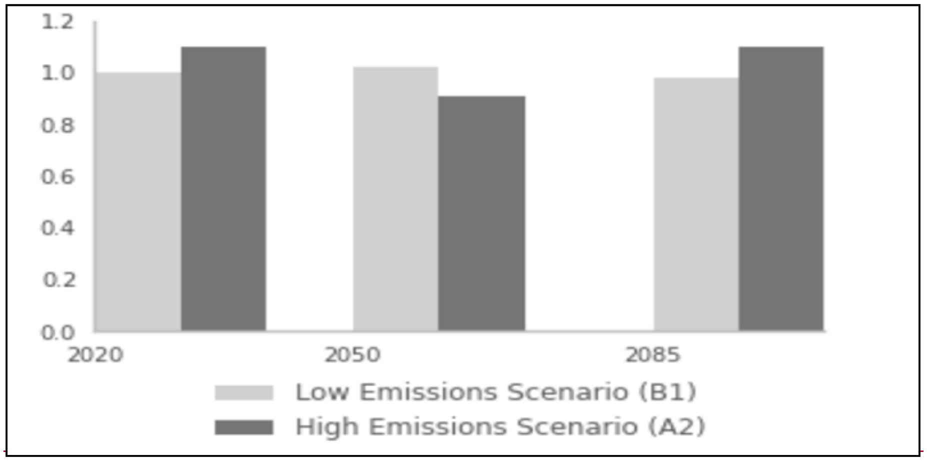
~~Water for the project would be provided by the Eastern Municipal Water Department (EMWD). The EMWD 2010 Urban Water Management Plan considered the impact of climate change on water supplies as part of its long-term strategic planning. One of the outcomes of climate change could be more frequent limitations on imported supplies. To limit the impact of climate change, EMWD's long-term planning focuses on the development of reliable local resources and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD's service area.~~



~~The figure below displays the fire risk in Moreno Valley relative to 2010 levels. The figure displays the projected increase in potential area burned given three different 30-year averaging periods ending in 2020, 2050, and 2085 and two different scenarios (A2, B1). The data are modeled solely on climate projections and do not take landscape and fuel sources into account (there is very little combustible material in the project area). The data modeled the ratio of additional fire risk for an area as compared to the expected burned area. The data are shown in the figure below and indicate that under the low-emissions scenario, the additional wildfire risk is about 1, which means that wildfire risk is expected to remain about the same. Under the high-emission scenario, additional risk is variable with a slight~~

~~increase. Other areas in California, such as the area near the border with Oregon, are projected to have a 9-fold increase in potential area burned.~~

~~Wildfire Risk in Moreno Valley~~



~~4.7.1.3 Greenhouse Gases~~

~~The most common greenhouse gases include water vapor, carbon dioxide, methane, nitrous oxides, chlorofluorocarbons, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, ozone, and aerosols. Greenhouse gases defined by AB 32 include carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride.~~

~~Natural processes and human activities emit greenhouse gases. The presence of greenhouse gases in the atmosphere affects the earth's temperature. Many scientists believe that emissions from human activities, such as electricity production and vehicle use, have led to elevated concentrations of these gases in the atmosphere beyond the level of naturally occurring concentrations. Table 4.7.A lists greenhouse gases, the effects of each greenhouse gas, and some of the sources for each of the greenhouse gases.~~

~~Climate change is driven by radiative forcings and feedbacks. Radiative forcing is the difference between the incoming energy and outgoing energy in the climate system. In other terms, radiative forcing is the energy absorbed by the greenhouse gas that would otherwise be lost to space. Positive forcing tends to warm the surface while negative forcing tends to cool it. A feedback is a climate process that can strengthen or weaken a forcing. For example, when ice or snow melts, it reveals darker land underneath, which absorbs more radiation and causes more warming.~~

~~In order to attempt to quantify the impact of greenhouse gases, the gases are assigned global warming potentials. Individual greenhouse gas compounds have varying global warming potential and atmospheric lifetimes. Carbon dioxide, the reference gas for global warming potential, has a global warming potential of one. The global warming potential of a greenhouse gas is a potential of a gas or aerosol to trap heat in the atmosphere compared to the reference gas, carbon dioxide, and is a measurement of the radiative forcing of a gas. There are positive (warming) and negative (cooling) forcings. To describe how much global warming a given type and amount of greenhouse gas may cause, the carbon dioxide equivalent is used. The calculation of the carbon dioxide equivalent is a consistent methodology for comparing greenhouse gas emissions since it normalizes various greenhouse gas emissions to a consistent reference gas, carbon dioxide. Carbon dioxide as a molecule has a certain potential for warming; other molecules have a different potential. For example, methane's~~

~~warming potential of 21 indicates that methane has 21 times greater warming effect than carbon dioxide on a molecule per molecule basis. A carbon dioxide equivalent is the mass emissions of an individual greenhouse gas multiplied by its global warming potential.~~

~~*Note: The following information is added in response to comments received on the Draft EIR. In addition, black carbon is now estimated in the GHG inventory.*~~

~~**Black Carbon.** A specific aerosol of concern is black carbon. Black carbon is a light absorbing component of particulate matter and is formed by the incomplete combustion of fossil fuels, biofuels, and biomass. The following is additional information on black carbon:~~

- ~~Black carbon is emitted directly into the atmosphere in the form of fine particles ($PM_{2.5}$).~~
- ~~Black carbon contributes to the adverse impacts on human health, ecosystems, and visibility associated with $PM_{2.5}$.~~
- ~~Black carbon influences climate by: 1) directly absorbing light, 2) reducing the reflectivity (“albedo”) of snow and ice through deposition, and 3) interacting with clouds.~~
- ~~The direct and snow/ice albedo effects of black carbon are widely understood to lead to climate warming. However, the globally averaged net climate effect of black carbon also includes the effects associated with cloud interactions, which are not well quantified and may cause either warming or cooling. Therefore, though most estimates indicate that black carbon has a net warming influence, a net cooling effect cannot be ruled out.~~

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

~~Table 4.7.A: Greenhouse Gas Properties, Effects, and Sources~~

~~Constituent~~	**~~Description and Physical Properties~~**	**~~Health Effects~~**	**~~Sources~~**
~~Water Vapor~~	~~Water vapor (H_2O) is the most abundant, important, and variable greenhouse gas in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered to be a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization.~~	~~There are no health effects from water vapor. When some pollutants come in contact with water vapor, they can dissolve and then the water vapor can be a transport mechanism to enter the human body.~~	~~The main source of water vapor is evaporation from the oceans (approximately 85%). Other sources include evaporation from other water bodies, sublimation (change from solid to gas) from sea ice and snow, and transpiration from plant leaves.~~
~~Carbon Dioxide~~	~~Carbon dioxide (CO_2) is an odorless, colorless natural greenhouse gas.~~	~~Outdoor levels of carbon dioxide are not high enough to result in negative health effects.~~	~~Carbon dioxide is emitted from natural and anthropocentric (human) sources. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic out gassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood.~~
~~Methane~~	~~Methane (CH_4) is an extremely effective GHG with a global warming potential of 21, though its atmospheric concentration is less than carbon dioxide and its lifetime in the atmosphere is brief (10–12 years) compared to other greenhouse gases.~~	~~There are no health effects from methane.~~	~~Methane has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of methane. Other anthropocentric sources include fossil-fuel combustion and biomass burning.~~
~~Nitrous Oxide~~	~~Nitrous oxide (N_2O), also known as laughing gas, is a colorless greenhouse gas. It has a lifetime of 114 years. Its global warming potential is 310.~~	~~Nitrous oxide can cause dizziness, euphoria, and sometimes slight hallucinations. In small doses it is harmless. In some cases, heavy and extended use can cause Olney's Lesions (brain damage).~~	~~Concentrations of nitrous oxide also began to rise at the beginning of the Industrial Revolution. In 1998, the global concentration was 314 ppb. Nitrous oxide is produced by microbial processes in soil and water, including those reactions that occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant, e.g., in whipped cream bottles. It is also used in potato chip bags to keep chips fresh. It is used in rocket engines and in race cars.~~
~~Chloro-fluorocarbons~~	~~Chlorofluorocarbons (CFCs) are gases formed synthetically by replacing all hydrogen atoms in methane or ethane (C_2H_6) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). Global warming potentials range from 3,800 to 8,100.~~	~~In confirmed indoor locations, working with CFC-113 or other CFCs is thought to have resulted in death by cardiac arrhythmia (heart frequency too high or too low) or asphyxiation.~~	~~CFCs have no natural source, but were first synthesized in 1928. They were used for refrigerants, aerosol propellants, and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and was extremely successful, so much so that levels of the major CFCs are now remaining level or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.~~
~~Hydro-fluorocarbons~~	~~Hydrofluorocarbons (HFCs) are synthetic man-made chemicals that are used as a substitute for CFCs. Out of all the greenhouse gases, they are one of three groups with the highest global warming potential (depending on the gas, ranges from 140 to 11,700). Prior to 1990, the only significant emissions were HFC-23. HFC-134a use is increasing due to its use as a refrigerant.~~	~~None.~~	~~HFCs are man-made for applications such as automobile air conditioners and refrigerants.~~
~~Per-fluorocarbons~~	~~Perfluorocarbons (PFCs) have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF_4) and hexafluoroethane (C_2F_6). Global warming potentials range from 6,500 to 9,200.~~	~~None.~~	~~The two main sources of PFCs are primary aluminum production and semiconductor manufacture.~~
~~Sulfur Hexafluoride~~	~~Sulfur hexafluoride (SF_6) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. It also has the highest GWP of any gas evaluated, 23,900. Concentrations in the 1990s were about 4 ppt. It has a lifetime of 3,200 years.~~	~~In high concentrations in confined areas, the gas presents the hazard of suffocation because it displaces the oxygen needed for breathing.~~	~~Sulfur hexafluoride is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.~~
~~Aerosols~~	~~Aerosols are particles emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols.~~	~~Similar health effects associated with particulate matter (see Section 4.3, Air Quality, for a description of the health effects of particulate matter).~~	~~Sulfate aerosols are emitted when fuel containing sulfur is burned. Another source of aerosols (in the form of black carbon or soot) is the result of incomplete combustion or the incomplete burning of fossil fuels. Although particulate matter regulation has been lowering aerosol concentrations in the United States, global concentrations are likely increasing as a result of other sources around the world.~~

~~Source: LSA Associates 2012 as summarized from the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report,* 2015~~

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

- ~~Sensitive regions such as the Arctic and the Himalayas are particularly vulnerable to the warming and melting effects of black carbon.~~
- ~~Black carbon is emitted with other particles and gases, many of which exert a cooling influence on climate. Therefore, estimates of the net effect of black carbon emissions sources on climate should include the offsetting effects of these co-emitted pollutants. This is particularly important for evaluating mitigation options.~~
- ~~Black carbon's short atmospheric lifetime (days to weeks), combined with its strong warming potential, means that targeted strategies to reduce black carbon emissions can be expected to provide climate benefits within the next several decades.~~
- ~~The different climate attributes of black carbon and long-lived GHGs make it difficult to interpret comparisons of their relative climate impacts based on common metrics.~~
- ~~Based on recent emissions inventories, the majority of global black carbon emissions come from Asia, Latin America, and Africa. Emissions patterns and trends across regions, countries and sources vary significantly.~~
- ~~Control technologies are available to reduce black carbon emissions from a number of source categories.~~
- ~~Black carbon mitigation strategies, which lead to reductions in $PM_{2.5}$, can provide substantial public health and environmental benefits.~~

~~4.7.1.4 Greenhouse Gas Inventories~~

~~The City of Moreno Valley estimated greenhouse gas emissions for the community for 2007 and 2010 and projected emissions for 2020 are shown in Table 4.7.B, which shows the reduced 2020 emissions are below the reduction target. The emissions shown are not actual emissions but are estimated using calculations and assumptions. The emissions represent emissions from the community of Moreno Valley (as opposed to the city government operations). Only select years were estimated based on data available.~~

~~Source: Table 9, City of Moreno Valley Greenhouse Gas Analysis, 2012.~~

~~The existing WLC project site is largely vacant with scattered dry farming that generates minimal greenhouse gas emissions. For the purposes of this analysis, a zero baseline will be assumed to identify the "worst case" emissions (i.e., GHG emissions from the entire WLC project without removal of any existing GHG emissions).~~

~~4.7.2 Regulatory Setting~~

~~4.7.2.1 International Regulation of Climate Change~~

~~**Intergovernmental Panel on Climate Change (IPCC).** In 1988, the United Nations created the IPCC to provide independent scientific information regarding climate change to policymakers. The IPCC does not conduct research itself, but rather compiles information from a variety of sources into reports regarding climate change and its impacts. The IPCC has thereafter periodically released reports on climate change, and in 2007 released its Fourth Assessment Report which concluded most global climate change was the result of human activity, mainly the burning of fossil fuels (see Section 4.7.1.1).~~

~~**United Nations Framework Convention on Climate Change.** On March 21, 1994, the United States joined a number of countries around the world in signing the United Nations Framework Convention on Climate Change (Convention). Under the Convention, governments gather and share information on greenhouse gas emissions, national policies, and best practices; launch national strategies for addressing greenhouse gas emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change.~~

~~**Kyoto Protocol.** The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing greenhouse gas emissions at average of five per cent against 1990 levels over the five-year period 2008-2012. The Convention (discussed above) encouraged industrialized countries to stabilize emissions; however, the Protocol commits them to do so. Developed countries have contributed more emissions over the last 150 years; therefore, the Protocol places a heavier burden on developed nations under the principle of "common but differentiated responsibilities." The United States has not entered into force of the Kyoto Protocol.~~

~~Moreover, since the United States declined to ratify the Kyoto Protocol in 1995, it has become increasingly clear that global climate change cannot be addressed without limiting GHG emissions from developing, as well as developed, countries. According to many sources, China has already surpassed the United States as the world's largest GHG emitter and is building new coal-fired power plants at a rate of approximately one per week. A recent study conducted by economists at the UC Berkeley and UC San Diego estimated that China's CO_2 emissions are growing by as much as 11 percent annually. In 2007, China released its first national plan on climate change, which includes goals related to increasing energy efficiency and increasing use of renewable resources. The plan, however, makes no commitments regarding reduction of GHG emissions.~~

~~Like China, India is already one of the top emitters of GHGs and continues to grow rapidly. India has recently pledged to take more action to fight global warming, for example, by pursuing solar energy, urging energy efficiency, and conservation, but it has not set any concrete goals in these areas, let alone pledged to reduce its carbon emissions. To the contrary, India's emissions are projected to increase fourfold by 2030 (see "Melting Asia," *The Economist*, June 5, 2008). Similarly, Brazil, the largest economy in South America, and another rapidly developing country, has no national policy requiring it to reduce carbon emissions. Brazil's carbon emissions increased by more than 60 percent between 1990 and 2004, and are projected to continue to rise at a similar pace (see International Energy Agency, World Energy Outlook 2006).~~

~~The Kyoto Protocol expired in 2012. Formal negotiations to replace the protocol officially began in December 2007 at the UNFCCC Climate Change Conference in Bali, Indonesia (http://unfccc.int/.php). Whether a workable agreement can be reached, however, remains to be seen, as the United States~~

~~continues to press for an agreement that requires firm commitments from developing nations, and countries like China and India continue to oppose binding targets (see http://news.bbc.co.uk/////.stm).~~

~~In addition, it should be noted that most mitigation measures that address greenhouse gas reduction typically parallel those that reduce the consumption of energy (i.e., electricity and natural gas). Reducing energy use in a market economy typically reduces the cost of energy. However, a reduced cost of energy can release pent-up demand (latent demand) for energy use, particularly in less developed portions of the world, such as Africa and Asia. As such, it is not clear how much energy use reduction in California or the U.S. would actually reduce worldwide energy use. The same would apply to measures to reduce greenhouse gas emissions.~~

~~4.7.2.2 Federal Regulations/Standards~~

~~Prior to the last decade, there have been no concrete Federal regulations of greenhouse gases or major planning for climate change adaptation. The following are actions regarding the Federal government, greenhouse gases, and fuel efficiency.~~

~~**Greenhouse Gas Endangerment.** *Massachusetts v. EPA* (Supreme Court Case 05-1120) was argued before the United States Supreme Court on November 29, 2006, in which it was petitioned that the EPA regulate four greenhouse gases, including carbon dioxide, under Section 202(a)(1) of the Clean Air Act. A decision was made on April 2, 2007, in which the Supreme Court found that greenhouse gases are air pollutants covered by the Clean Air Act. The Court held that the EPA Administrator must determine whether emissions of greenhouse gases from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding greenhouse gases under section 202(a) of the Clean Air Act:~~

- ~~*Endangerment Finding:* The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases—carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride—in the atmosphere threaten the public health and welfare of current and future generations.~~
- ~~*Cause or Contribute Finding:* The Administrator finds that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution, which threatens public health and welfare.~~

~~These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing greenhouse gas emissions standards for vehicles, as discussed in the section “Clean Vehicles” below.~~

~~In September 2011, the EPA Office of Inspector General evaluated the EPA’s compliance with established policy and procedures in the development of the endangerment finding, including processes for ensuring information quality. The evaluation concluded that the technical support document should have had more rigorous EPA peer review.~~

~~In June 2012, a Federal appeals court rejected a lawsuit against the EPA. The suit alleged that the EPA violated the law by relying almost exclusively on data from the United Nations IPCC rather than doing its own research or testing data according to Federal standards. The U.S. Chamber of Commerce and the National Association of Manufacturers (with others) filed petitions to the U.S. Court of Appeals – D.C. Circuit to rehear the case. The EPA and Department of Justice provided a response on October 12, 2012.~~

~~**Clean Vehicles.** Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the United States. On April 1, 2010, the EPA and the Department of Transportation's Highway Traffic and Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce greenhouse gas emissions and improve fuel economy for new cars and trucks sold in the United States.~~

~~The first phase of the national program would apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. The vehicles must meet an estimated combined average emissions level of 250 grams of carbon dioxide per mile, equivalent to 35.5 miles per gallon if the automobile industry were to meet this carbon dioxide level solely through fuel economy improvements. Together, these standards would cut carbon dioxide emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). The EPA and the National Highway Safety Administration are working on a second-phase rule to establish national standards for light-duty vehicles for model years 2017 and beyond.~~

~~On October 25, 2010, the EPA and the U.S. Department of Transportation proposed the first national standards to reduce greenhouse gas emissions and improve fuel efficiency of heavy-duty trucks and buses. For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20 percent reduction in carbon dioxide emissions and fuel consumption by the 2018 model year. For heavy-duty pickup trucks and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10 percent reduction for gasoline vehicles and up to a 15 percent reduction for diesel vehicles by 2018 model year (12% and 17% respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles (includes other vehicles like buses, refuse trucks, concrete mixers; everything except for combination tractors and heavy-duty pickups and vans), the agencies are proposing engine and vehicle standards starting in the 2014 model year, which would achieve up to a 10 percent reduction in fuel consumption and carbon dioxide emissions by the 2018 model year.~~

~~**Mandatory Reporting of GHG.** The Consolidated Appropriations Act of 2008, passed in December 2007, requires the establishment of mandatory GHG reporting requirements. On September 22, 2009, the EPA issued the Final Mandatory Reporting of Greenhouse Gases rule. The rule requires reporting of GHG emissions from large sources and suppliers in the United States, and is intended to collect accurate and timely emissions data to inform future policy decisions. Under the rule, suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions, are required to submit annual reports to the EPA.~~

~~This rule does not apply to high cube logistics developers within the WLC Project because, although the project would emit more than 25,000 mt CO_2e per year of GHGs, the rule only applies to the following categories: fossil fuel suppliers and industrial gas suppliers, direct GHG emitters, and manufacturers of heavy-duty and off-road vehicles and engines. The EPA's Applicability Tool was used to determine if the project developer would need to report the GHG emissions. The source categories that are required to report GHG emissions (i.e., production, manufacturing, electricity generation, and industrial waste landfills) did not apply to the project.~~

~~**New Source Review Prevention of Significant Deterioration (GHG Tailoring Rule).** The EPA issued a final rule on May 13, 2010, that establishes thresholds for greenhouse gases that define when permits under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit programs are required for new and existing industrial facilities. Operating permits are legally enforceable documents that permitting authorities issue to air pollution sources after the source has~~

~~begun to operate. Title V Operating Permits are required from Title V of the Clean Air Act. This final rule "tailors" the requirements of these Clean Air Act permitting programs to limit which facilities will be required to obtain Prevention of Significant Deterioration and Title V permits. In the preamble to the revisions to the Federal Code of Regulations, the EPA states:~~

> *~~This rulemaking is necessary because without it the Prevention of Significant Deterioration and Title V requirements would apply, as of January 2, 2011, at the 100 or 250 tons per year levels provided under the Clean Air Act, greatly increasing the number of required permits, imposing undue costs on small sources, overwhelming the resources of permitting authorities, and severely impairing the functioning of the programs. EPA is relieving these resource burdens by phasing in the applicability of these programs to greenhouse gas sources, starting with the largest greenhouse gas emitters. This rule establishes two initial steps of the phase-in. The rule also commits the agency to take certain actions on future steps addressing smaller sources, but excludes certain smaller sources from Prevention of Significant Deterioration and Title V permitting for greenhouse gas emissions until at least April 30, 2016.~~*

~~EPA estimates that facilities responsible for nearly 70 percent of the national greenhouse gas emissions from stationary sources will be subject to permitting requirements under this rule. This includes the nation's largest greenhouse gas emitters—power plants, refineries, and cement production facilities.~~

~~On December 23, 2010, the EPA issued a series of rules that put the necessary regulatory framework in place to ensure that 1) industrial facilities can get Clean Air Act permits covering their GHG emissions when needed and 2) facilities emitting GHGs at levels below those established in the Tailoring Rule do not need to obtain Clean Air Act permits.~~

~~**Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units.** As required by a settlement agreement, the EPA proposed new performance standards for emissions of carbon dioxide for new affected fossil fuel-fired electric utility generating units on March 27, 2012. New sources greater than 25 megawatt would be required to meet an output based standard of 1,000 pounds of carbon dioxide per megawatt-hour.~~

~~**Cap and Trade.** Cap and trade refers to a policy tool where emissions are limited to a certain amount and can be traded, or provides flexibility on how the emitter can comply. Successful examples in the United States include the Acid Rain Program and the~~ ~~NO_X~~ ~~Budget Trading Program in the northeast. There is no Federal cap and trade program currently and no pending legislation exists to establish a cap and trade program.~~

~~**Energy Policy and Conservation Act.** The Energy Policy and Conservation Act of 1975 sought to ensure that all vehicles sold in the U.S. would meet certain fuel economy goals. Through this Act, Congress established the first fuel economy standards for on-road motor vehicles in the U.S. Pursuant to the Act, the National Highway Traffic and Safety Administration (NHTSA), which is part of the U.S. Department of Transportation (USDOT), is responsible for establishing additional vehicle standards and for revising existing standards. Since 1990, the fuel economy standard for new passenger cars has been 27.5 miles per gallon (mpg). Since 1996, the fuel economy standard for new light trucks (gross vehicle weight of 8,500 pounds or less) has been 20.7 mpg. The Corporate Average Fuel Economy (CAFE) program, administered by the EPA, was created to determine vehicle manufacturers' compliance with the fuel economy standards. The EPA calculates a CAFE value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information generated under the CAFE program, the USDOT is authorized to assess penalties for noncompliance. Please also refer to the subsection, "Clean Vehicles," above.~~

~~**Energy Policy Act of 1992.** The Energy Policy Act (EPAct) of 1992 was passed to reduce the country's dependence on foreign petroleum and improve air quality. EPAct includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. EPAct requires certain Federal, State, and local governments and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are also included in EPAct. Federal tax deductions will be allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the Act to consider a variety of incentive programs to help promote AFVs.~~

~~**Energy Policy Act of 2005.** The Energy Policy Act of 2005 includes provisions for renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a Federal purchase requirement for renewable energy.~~

~~4.7.2.3 State Regulations/Standards~~

~~**California Code of Regulations Title 24, Part 6.** Enacted in 1978, this part of the California Code established energy efficiency standards for residential and nonresidential buildings in response to a legislative mandate to reduce California's energy consumption. These standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The most recent standards (2013 Building Energy Efficiency Standards) were adopted and went into effect went into effect July 1, 2014.[1] Such standards include the provision of cool roofs, demand control ventilation, skylights for day-lighting in buildings, thermal breaks for metal building roofs, and lighting power limits. These standards are expected to reduce the growth in electricity use of residential and non-residential buildings. Continual updates to Title 24 along with the State's implementation of AB 1493 and SB 1368 will have a major impact on the State's attainment of the AB 32 goals.~~

~~**California Code of Regulations Title 24, Part 11.** This part of the California Code is known as the California Green Building Standards Code (CALGreen Code) and was enacted to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts with positive environmental impacts and through encouragement of sustainable construction practices. The CALGreen Code is not intended to substitute for or be identified as meeting the certification requirements of any green building program that is not established and adopted by the California Building Standards Commission (CBSC). This update to Part 11 of Title 24 of the California Code of Regulations was effective January 1, 2011. Key provisions of the CALGreen Code that apply to the type of new non-residential development proposed for the project site are as follows:~~

~~Division 5.1—Planning and Design~~

~~Section 5.106 Site Development~~

~~5.106.4 Bicycle Parking and Changing Rooms:~~

> ~~*Short-term bicycle parking*. If the new project or an addition or alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5 percent of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1).~~

---

[1] ~~*2013 Building Energy Efficiency Standards for Residential and Nonresidential Buildings,* California Energy Commission, effective July 1, 2014, http://www.energy.ca.gov/title24/2013standards/~~

~~*Long-term bicycle parking*. For buildings with over 10 tenant-occupants or alterations that add 10 or more tenant vehicular parking spaces, provide secure bicycle parking for 5 percent of tenant vehicular parking spaces being added, with a minimum of one space. Acceptable parking facilities shall be convenient from the street and shall meet the following: 1. Covered, lockable enclosures with permanently anchored racks for bicycles; 2. Lockable bicycle rooms with permanently anchored racks; or 3. Lockable, permanently anchored bicycle lockers (5.106.4.2).~~

~~5.106.5 Clean Air Vehicle Parking: For new projects or additions or alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles [201 spaces and over require at least 8 percent] (5.106.5.2).~~

~~5.106.8 Light Pollution Reduction (specific backlight, uplight, and glare ratings)~~

~~5.106.10 Grading and Paving: Construction plans shall indicate how site grading or a drainage system will manage all surface water flows to keep water from entering buildings.~~

~~Division 5.2—Energy Efficiency~~

~~Section 5.201.1 Energy Efficiency (Mandatory energy efficiency standards through California Code of Regulations, Title 24, Part 6)~~

~~Division 5.3—Water Efficiency and Conservation~~

~~Section 5.303 Indoor Water Use~~

~~5.303.1 Meters: Separate water meters for buildings in excess of 50,000 sq. ft or buildings projected to consume more than 1,000 gallons per day.~~

~~5.303.2 Twenty Percent Savings: Use of plumbing fixtures and fittings that will reduce the overall use of potable water within the building by 20 percent, based on the maximum allowable water use per fixture and fitting as required by the California Building Code (California Code of Regulations, Title 24, Part 2)~~

~~5.304.3 Irrigation design: Automatic irrigation system controllers installed at the time of final inspection shall be weather- or soil moisture-based controllers that adjust irrigation in response to changes in plant needs; weather-based controllers.~~

~~5.303.4 Wastewater Reduction: Each building shall reduce by 20 percent wastewater by one of the following methods: 1. The installation of water-conserving fixtures or 2. Use of non-potable water systems (5.303.4).~~

~~5.303.6 Plumbing Fixtures and Fittings~~

~~Section 5.304 Outdoor Water Use~~

~~5.304.1 Water Budget: A water budget shall be developed for landscape irrigation use that conforms to the local water efficient landscape ordinance or to the California Department of Water Resources Model Water Efficient Landscape Ordinance where no local ordinance is applicable.~~

~~5.304.2 Outdoor Water Use (separate submeters or metering devices)~~

~~5.304.3 Irrigation Design (irrigation controllers and sensors)~~

~~Division 5.4—Material Conservation and Resource Efficiency~~

~~Section 5.407 Water Resistance and Moisture Management~~

~~Section 5.408 Construction Waste Reduction, Disposal and Recycling~~

~~5.408.1 and 5.408.3 Construction Waste Diversion: Recycle and/or salvage for reuse a minimum 50 percent of the nonhazardous construction and demolition waste. 100 percent of~~

~~trees, stumps, rocks and associated vegetation and soils resulting from land clearing shall be reused or recycled.~~

~~5.408.2 Construction Waste Management Plan~~

~~Section 5.410 Building Maintenance and Operation~~

~~5.410.1 and 5.713.10 Recycling by Occupants: Provide readily accessible areas that serve the entire building and are identified for the depositing, storage and collection of non-hazardous materials for recycling.~~

~~Division 5.5—Environmental Quality~~

~~Section 5.504 Pollutant Control~~

~~5.504.3 Covering of Duct Openings and Protection of Mechanical Equipment During Construction~~

~~5.504.4 Finish Material Pollutant Control: Low-pollutant emitting interior finish materials such as adhesives, paints, carpet, and flooring~~

~~5.404.5.3 Filters: Minimum Efficiency Reporting Value (MERV) of 8 or higher in mechanically ventilated buildings.~~

~~**California Code of Regulations Titles 14 and 27.** These parts of the California Code require energy-efficient practices as part of solid and hazardous waste handling and disposal.~~

~~**Pavley Regulations and Fuel Efficiency Standards.** California AB 1493, enacted on July 22, 2002, required the CARB to develop and adopt regulations that reduce greenhouse gases emitted by passenger vehicles and light duty trucks. The regulation was stalled by automaker lawsuits and by the EPA's denial of an implementation waiver. On January 21, 2009, the CARB requested that the EPA reconsider its previous waiver denial. On January 26, 2009, President Obama directed that the EPA assess whether the denial of the waiver was appropriate. On June 30, 2009, the EPA granted the waiver request. On September 8, 2009, the U.S. Chamber of Commerce and the National Automobile Dealers Association sued the EPA to challenge its granting of the waiver to California for its standards. California assisted the EPA in defending the waiver decision. The U.S. District Court for the District of Columbia denied the Chamber's petition on April 29, 2011.~~

~~The standards phase in during the 2009 through 2016 model years. When fully phased in, the near term (2009–2012) standards will result in about a 22 percent reduction compared with the 2002 fleet, and the mid-term (2013–2016) standards will result in about a 30 percent reduction. Several technologies stand out as providing significant reductions in emissions at favorable costs. These include discrete variable valve lift or camless valve actuation to optimize valve operation rather than relying on fixed valve timing and lift as has historically been done; turbocharging to boost power and allow for engine downsizing; improved multi-speed transmissions; and improved air conditioning systems that operate optimally, leak less, and/or use an alternative refrigerant.~~

~~**Low Carbon Fuel Standard, Executive Order S-01-07.** The Governor signed Executive Order S-01-07 on January 18, 2007. The order mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In particular, the executive order established a Low Carbon Fuel Standard and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission (CEC), the CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. The CARB adopted the Low Carbon Fuel Standard on April 23, 2009. The Low Carbon Fuel Standard requires producers of petroleum based fuels to reduce~~

~~the carbon intensity of their products, beginning with a quarter of a percent in 2011, ending in a 10 percent total reduction in 2020. Petroleum importers, refiners and wholesalers can either develop their own low carbon fuel products, or buy LCFS Credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas or hydrogen. The Low Carbon Fuel Standard was challenged in the United States District Court in Fresno in 2011. The court's ruling issued on December 29, 2011, included a preliminary injunction against the CARB's implementation of the rule. The Ninth Circuit Court of Appeals stayed the injunction on April 23, 2012 pending final ruling on appeal, allowing the CARB to continue to implement and enforce the regulation and vacated the injunction on September 18, 2013, and remanded the case to the district court for further consideration.~~

~~**Senate Bill (SB) 1368.** In 2006, the State Legislature adopted SB 1368, which was subsequently signed into law by the Governor. SB 1368 directs the California Public Utilities Commission (CPUC) to adopt a performance standard for greenhouse gas emissions for the future power purchases of California utilities. SB 1368 seeks to limit carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. Because of the carbon content of its fuel source, a coal-fired plant cannot meet this standard because such plants emit roughly twice as much carbon as combined cycle natural gas power plants. Accordingly, the new law will effectively prevent California's utilities from investing in, financially supporting, or purchasing power from new coal plants located in or out of the State. Thus, SB 1368 will lead to dramatically lower greenhouse gas emissions associated with California's energy demand, as SB 1368 will effectively prohibit California utilities from purchasing power from out-of-state producers that cannot satisfy the performance standard for greenhouse gas emissions required by SB 1368. The CPUC adopted the regulations required by SB 1368 on August 29, 2007.~~

~~**SB 97 and the *CEQA Guidelines* Update.** Passed in August 2007, SB 97 added Section 21083.05 to the Public Resources Code. The code states "(a) On or before July 1, 2009, the Office of Planning and Research shall prepare, develop, and transmit to the Resources Agency guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption. (b) On or before January 1, 2010, the Resources Agency shall certify and adopt guidelines prepared and developed by the California Governor's Office of Planning and Research (OPR) pursuant to subdivision (a)." Section 21097 was also added to the Public Resources Code. It provided CEQA protection until January 1, 2010, for transportation projects funded by the Highway Safety, Traffic Reduction, Air Quality, and Port Security Bond Act of 2006 or projects funded by the Disaster Preparedness and Flood Prevention Bond Act of 2006, in stating that the failure to analyze adequately the effects of greenhouse gases would not violate CEQA.~~

~~On April 13, 2009, the OPR submitted to the Secretary for Natural Resources its recommended amendments to the *CEQA Guidelines* for addressing greenhouse gas emissions. On July 3, 2009, the Natural Resources Agency commenced the Administrative Procedure Act rulemaking process for certifying and adopting these amendments pursuant to Public Resources Code section 21083.05. Following a 55-day public comment period and two public hearings, the Natural Resources Agency proposed revisions to the text of the *CEQA Guidelines* amendments. The Natural Resources Agency transmitted the adopted amendments and the entire rulemaking file to the Office of Administrative Law on December 31, 2009. On February 16, 2010, the Office of Administrative Law approved the Amendments, and filed them with the Secretary of State for inclusion in the California Code of Regulations. The Amendments became effective on March 18, 2010.~~

~~The CEQA Amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of greenhouse gas emissions in CEQA documents. The CEQA Amendments fit within the existing CEQA framework by amending existing *CEQA Guidelines* to reference climate change.~~

~~A new section, *CEQA Guidelines* Section 15064.4, was added to assist agencies in determining the significance of GHG emissions. The new section allows agencies the discretion to determine whether a quantitative or qualitative analysis is best for a particular project. However, the *CEQA Guidelines* offer little guidance on the crucial next step in this assessment process—how to determine whether the project's estimated greenhouse gas emissions are significant or cumulatively considerable.~~

~~Also amended were *CEQA Guidelines* Sections 15126.4 and 15130, which address mitigation measures and cumulative impacts respectively. Greenhouse gas mitigation measures are referenced in general terms, but no specific measures are championed. The revision to the cumulative impact discussion requirement (Section 15130) simply directs agencies to analyze greenhouse gas emissions in an EIR when a project's incremental contribution of emissions may be cumulatively considerable; however, it does not answer the question of how to determine whether emissions are cumulatively considerable.~~

~~Section 15183.5 permits programmatic greenhouse gas analysis and later project-specific tiering. A tiered project is a project that was addressed in a certified program document, such as an EIR or Mitigated Negative Declaration. The *CEQA Guidelines* state the following:~~

> ~~Lead agencies may analyze and mitigate the significant effects of greenhouse gas emissions at a programmatic level, such as in a general plan, a long range development plan, or a separate plan to reduce greenhouse gas emissions. Later project-specific environmental documents may tier from and/or incorporate by reference that existing programmatic review. Project-specific environmental documents may rely on an EIR containing a programmatic analysis of greenhouse gas emissions (Section 15183.5(a)).~~

~~Compliance with plans for the reduction of GHG emissions can support a determination that a project's cumulative effect is not cumulatively considerable, according to proposed Section 15183.5(b).~~

~~In addition, the amendments revised Appendix F of the *CEQA Guidelines*, which focuses on energy conservation. The sample environmental checklist in the *CEQA Guidelines'* Appendix G was amended to include greenhouse gas impact questions, which are used in this analysis (see Section 4.7.4).~~

~~**Executive Order S-3-05.** Executive Order S-3-05 was signed by Governor Schwarzenegger in 2005 proclaiming California is vulnerable to the impacts of climate change. It states that increased temperatures could reduce the Sierra Nevada's snowpack, worsen California's air quality problems, and potentially cause a rise in sea levels. The Executive Order establishes total GHG emission targets including emissions reductions to the 2000 level by 2010, and the 1990 level by 2020, and to 80 percent below the 1990 level by 2050. The 2050 reduction goal represents what scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be an aggressive, but achievable, mid-term target.~~

~~**Assembly Bill 32 (AB 32).** California's major initiative for reducing GHG emissions is outlined in AB 32, the "Global Warming Solutions Act," passed by the California State legislature on August 31, 2006. This effort aims at reducing GHG emissions to 1990 levels by 2020. The original 2020 GHG emissions limit was 427 million mt CO_2e. The current 2020 GHG emissions limit is 431 million mt CO_2e. AB 32 requires the CARB to prepare a Scoping Plan that outlines the main State strategies for meeting the 2020 deadline and to reduce GHGs that contribute to global climate change.~~

~~The Scoping Plan was approved by the CARB on December 11, 2008, and includes measures to address GHG emission reduction strategies related to energy efficiency, water use, and recycling and~~

~~solid waste, among other measures.[1] The Scoping Plan includes a range of GHG reduction actions that may include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms such as a cap-and-trade system. The Scoping Plan, even after Board approval, remains a recommendation. The measures in the Scoping Plan will not be binding until after they are adopted through the normal rulemaking process. The CARB rule-making process includes preparation and release of each of the draft measures, public input through workshops and a public comment period, followed by a CARB hearing and rule adoption.~~

~~Pursuant to AB 32, the CARB and the Climate Action Team (CAT)[2] did the following:~~

- ~~Adopted a list of discrete early action measures;~~
- ~~Established a statewide GHG emissions cap for 2020 based on 1990 emissions and adopted mandatory reporting rules for significant sources of GHG;~~
- ~~Indicated how emission reductions will be achieved from significant GHG sources via regulations, market mechanisms and other actions; and~~
- ~~Adopted regulations to achieve the maximum technologically feasible and cost-effective reductions in GHG, including provisions for using both market mechanisms and alternative compliance mechanisms.~~

~~In June 2007, the CARB approved a list of 37 early action measures, including three discrete early action measures (Low Carbon Fuel Standard, Restrictions on High Global Warming Potential Refrigerants, and Landfill Methane Capture). Discrete early action measures are measures that were required to be adopted as regulations and made effective no later than January 1, 2010, the date established by Health and Safety Code (HSC) Section 38560.5. The CARB adopted additional early action measures in October 2007[3] that tripled the number of discrete early action measures. These measures relate to truck efficiency, port electrification, reduction of perfluorocarbons from the semiconductor industry, reduction of propellants in consumer products, proper tire inflation, and sulfur hexafluoride (SF_6) reductions from the non-electricity sector. The combination of early action measures was estimated to reduce statewide GHG emissions by nearly 16 million mt CO_2e.~~[4]

~~AB 32 codifies Executive Order S-3-05's[5] year 2020 goal by requiring that statewide GHG emissions be reduced to 1990 levels by the year 2020.~~

~~The AB 32 Scoping Plan identifies a cap-and-trade program as one of the strategies California will employ to reduce the GHG emissions that cause climate change. The program is a central element of AB 32 and covers major sources of GHG emissions in the State such as refineries, power plants, industrial facilities, and transportation fuels. The regulation includes an enforceable GHG cap that will decline over time. The CARB will distribute allowances, which are tradable permits, equal to the emission allowed under the cap. The program started on January 1, 2012, with the first offset credit auctions in November 2012 and an enforceable compliance obligation beginning with 2013 GHG emissions. For the first two years of the program, large industrial emitters will receive 90 percent of their allowances for free in a soft start meant to give companies time to reduce emissions through new technologies or other means. The cap, or number of allowances, will decline over time in an effort to drastically reduce greenhouse gas emissions by 2050.~~

---

[2] ~~CAT is a consortium of representatives from State agencies who have been charged with coordinating and implementing GHG emission reduction programs that fall outside of CARB's jurisdiction.~~

[3] ~~CARB. 2007. *Expanded List of Early Action Measures to Reduce Greenhouse Gas Emissions in California Recommended for Board Consideration*. October.~~

[4] ~~CARB. 2007. "ARB approves tripling of early action measures required under AB 32." News Release 07-46. http://www.arb.ca.gov/newsrel/nr102507.htm. October 25.~~

[5] ~~Executive Order S-3-05 establishes greenhouse gas emission reduction targets for California.~~

~~The California Chamber of Commerce filed suit[1] challenging the validity of the state's cap-and-trade program. The suit challenges the California Air Resources Board's authority as stated under AB 32 to sell the permits, called "allowances," for the purpose of generating revenue for the state. It is also challenging the sale of allowances as an illegal tax, arguing that taxes need a two-thirds vote by the Legislature. The suit was rejected on November 12, 2013, by the California Superior Court.~~

~~**Scoping Plan.** The California State Legislature adopted AB 32 in 2006 which focuses on reducing greenhouse gases (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) to 1990 levels by the year 2020. Pursuant to the requirements in AB 32, the CARB adopted the Climate Change Scoping Plan (Scoping Plan) in 2008, which outlines actions recommended to obtain that goal. The Scoping Plan calls for an "ambitious but achievable" reduction in California's greenhouse gas emissions, cutting approximately 30 percent from BAU emission levels projected for 2020, or about 10 percent from today's levels. On a per-capita basis, that means reducing annual emissions of 14 tons of carbon dioxide for every man, woman, and child in California down to about 10 tons per person by 2020.~~

~~The Scoping Plan[2] contains the following 18 strategies to reduce the State's emissions:~~

- ~~*California Cap-and-Trade Program Linked to Western Climate Initiative.* Implement a broad-based California Cap-and-Trade program to provide a firm limit on emissions. Link the California cap-and-trade program with other Western Climate Initiative Partner programs to create a regional market system to achieve greater environmental and economic benefits for California. Ensure California's program meets all applicable AB 32 requirements for market-based mechanisms.~~
- ~~*California Light-Duty Vehicle Greenhouse Gas Standards.* Implement adopted standards and planned second phase of the program. Align zero-emission vehicle, alternative and renewable fuel and vehicle technology programs with long-term climate change goals.~~
- ~~*Energy Efficiency.* Maximize energy efficiency building and appliance standards; pursue additional efficiency including new technologies, policy, and implementation mechanisms. Pursue comparable investment in energy efficiency from all retail providers of electricity in California.~~
- ~~*Renewable Portfolio Standard.* Achieve 33 percent renewable energy mix statewide. Renewable energy sources include (but are not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas.~~
- ~~*Low Carbon Fuel Standard.* Develop and adopt the Low Carbon Fuel Standard.~~
- ~~*Regional Transportation-Related Greenhouse Gas Targets.* Develop regional greenhouse gas emissions reduction targets for passenger vehicles. This measure refers to SB 375.~~
- ~~*Vehicle Efficiency Measures.* Implement light-duty vehicle efficiency measures.~~
- ~~*Goods Movement.* Implement adopted regulations for the use of shore power for ships at berth. Improve efficiency in goods movement activities.~~
- ~~*Million Solar Roofs Program.* Install 3,000 MW of solar-electric capacity under California's existing solar programs.~~
- ~~*Medium/Heavy-Duty Vehicles.* Adopt medium and heavy-duty vehicle efficiency measures.~~
- ~~*Industrial Emissions.* Require assessment of large industrial sources to determine whether individual sources within a facility can cost-effectively reduce greenhouse gas emissions and provide other pollution reduction co-benefits. Reduce greenhouse gas emissions from fugitive~~

~~[1] The Huffington Post, November 14, 2012, http://www.huffingtonpost.com////s-cap-and-trade_n_2131251.html).~~
~~[2] Scoping Plan Reduction Measures from California Air Resources Board 2008.~~

~~emissions from oil and gas extraction and gas transmission. Adopt and implement regulations to control fugitive methane emissions and reduce flaring at refineries.~~

~~*High Speed Rail.* Support implementation of a high-speed rail system.~~

~~*Green Building Strategy.* Expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings.~~

~~*High Global Warming Potential Gases.* Adopt measures to reduce high global warming potential gases.~~

~~*Recycling and Waste.* Reduce methane emissions at landfills. Increase waste diversion, composting, and commercial recycling. Move toward zero-waste.~~

~~*Sustainable Forests.* Preserve forest sequestration and encourage the use of forest biomass for sustainable energy generation.~~

~~*Water.* Continue efficiency programs and use cleaner energy sources to move and treat water.~~

~~*Agriculture.* In the near-term, encourage investment in manure digesters and at the five-year Scoping Plan update determine if the program should be made mandatory by 2020.~~

~~The First Update to the Scoping Plan was approved by the CARB on May 22, 2014. The First Update builds upon the initial Scoping Plan with new strategies and recommendations. The Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The Update defines CARB's climate change priorities for the next five years and sets the groundwork to reach California's post-2020 climate goals set forth in Executive Orders S-3-05 and B-16-2012. The Update highlights California's progress toward meeting the near-term 2020 GHG emission reduction goals defined in the initial Scoping Plan. It will also evaluate how to align the State's longer-term GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use.~~

~~**Executive Order B-16-2012 (Zero-Emission Vehicles).** This executive order indicates that all State entities under the Governor's control support and facilitate the rapid commercialization of zero-emission vehicles. The order contains a target similar to Executive Order S-3-05, but for the transportation sector instead of all sectors: that California target for 2050 a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels. Executive order B-16-2012 also indicates that the CARB, the California Energy Commission, the Public Utilities Commission and other relevant agencies are ordered to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve the following:~~

- ~~By 2015: The State's major metropolitan areas able to accommodate zero-emission vehicles, each with infrastructure plans and streamlined permitting; the State's manufacturing sector expend zero-emission vehicle and component manufacturing; an increase in the private sector's investment in zero-emission vehicle infrastructure; and the State's academic and research institutions contributing to zero-emission vehicle research, innovation and education.~~
- ~~By 2020: The State's zero-emission vehicle infrastructure ability to support up to one million vehicles; the costs of zero-emission vehicles competitive with conventional combustion vehicles; zero-emission vehicles accessible to mainstream consumers; widespread use of zero-emission vehicles for public transportation and freight transport; and a decrease in transportation sector GHG emissions as a result of the switch to zero-emission vehicles; electric vehicle charging integrated into the electricity grid.~~
- ~~By 2025: over 1.5 million zero-emission vehicles on California roads; easy access to zero-emission vehicle infrastructure in California; the zero-emission vehicle industry strong and sustainable part~~

~~of California's economy; and California's vehicles displace at least 1.5 billion gallons of petroleum fuels per year.~~

~~**Greenhouse Gas Emissions Performance Standard for Power Plants.** On January 25, 2007, the CPUC adopted an interim GHG emissions performance standard. This standard is a facility-based emissions standard requiring all new long-term commitments for baseload generation to serve California consumers with power plants that have emissions no greater than a combined cycle gas turbine plant. The established level is 1,100 pounds of~~ ~~CO_2~~ ~~per megawatt-hour.~~

~~**Senate Bill 375.** SB 375 was signed into law on October 1, 2008. SB 375 provides emissions-reduction goals around which regions can plan, integrates disjointed planning activities, and provides incentives for local governments and developers to implement "smart growth" planning and development strategies, including reducing the average VMT to reduce commuting distances and reduce criteria and greenhouse gas air pollutant emissions. SB 375 has three major components:~~

- ~~Using the regional transportation planning process to achieve reductions in GHG emissions consistent with AB 32's goals;~~
- ~~Offering CEQA incentives to encourage projects that are consistent with a regional plan that achieves GHG emission reductions; and~~
- ~~Coordinating the regional housing needs allocation process with the regional transportation process while maintaining local authority over land use decisions.~~

~~SB 375 requires each Metropolitan Planning Organization (MPO) to include a Sustainable Communities Strategy (SCS) in the regional transportation plan that demonstrates how the region will meet the greenhouse gas emission targets and creates CEQA streamlining incentives for projects that are consistent with the regional SCS. The focus of SB 375 is on placement of new residential projects and coordinated transportation planning.~~

~~**Renewable Electricity Standards.** There have been several renewable electricity senate bills in California. On September 12, 2002, Governor Gray Davis signed SB 1078 requiring California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 changed the due date to 2010 instead of 2017. On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Governor Schwarzenegger also directed the CARB (Executive Order S-21-09) to adopt a regulation by July 31, 2010, requiring the state's load serving entities to meet a 33 percent renewable energy target by 2020. The CARB approved the Renewable Electricity Standard on September 23, 2010, by Resolution 10-23. Senate Bill X1-2 (2011) codifies the Renewable Electricity Standard into law.~~

~~**SmartWay Partners.** SmartWay effectively refers to aerodynamic and rolling resistance requirements geared toward reducing fuel consumption. Most large trucking fleets driving newer vehicles are compliant with SmartWay design requirements. CARB's Tractor-Trailer Greenhouse Gas Regulation requires that all 2010 and older model year tractors that pull 53-foot or longer box type trailers must use SmartWay verified low rolling resistance tires beginning January 1, 2013.~~

~~The EPA has evaluated the fuel saving benefits of various devices through emissions and fuel economy testing, demonstration projects and technical literature review. As a result, EPA has determined the following types of technologies provide fuel saving and/or emission reducing benefits when used properly in their designed applications:~~

- ~~**Idle Reduction Technologies** allow engine operators to refrain from long-duration idling of the main propulsion engine by using an alternative technology. An idle reduction technology is generally defined as the installation of a technology or device that:~~
    - ~~Reduces unnecessary main engine idling of the vehicle or equipment; and/or~~
    - ~~Is designed to provide services (e.g., heat, air conditioning, and/or electricity) to the vehicle or equipment that would otherwise require the operation of the main drive engine while the vehicle or equipment is temporarily parked or remains stationary.~~
- ~~**Aerodynamic Technologies** minimize drag and improve airflow over the entire tractor-trailer vehicle. Aerodynamic technologies include gap fairings that reduce turbulence between the tractor and trailer, side skirts that minimize wind under the trailer, and rear fairings that reduce turbulence and pressure drop at the rear of the trailer.~~
- ~~**Low Rolling Resistance Tires:** Certain tire models can reduce NO$_X$ emissions and fuel use by 3 percent or more, relative to the best-selling new tires for line haul class 8 tractor trailers. These improvements are achieved under the following conditions:~~
    - ~~Tires are used on the axle positions stated on the list below.~~
    - ~~Verified low rolling resistance tires are installed on all of the axle positions of the tractor and trailer.~~
    - ~~All tires must be properly inflated according to the manufacturer's specifications.~~
- ~~**Retrofit Technologies:** Diesel retrofit technologies that the EPA has approved or conditionally approved, such as:~~
    - ~~Diesel Particulate Filter (DPF);~~
    - ~~CMX Catalyst Muffler;~~
    - ~~Selective Catalytic Reduction (SCR) System;~~
    - ~~Diesel Oxidation Catalyst (DOC); and~~
    - ~~Diesel Oxidation Catalyst (DOC) plus CDTi Closed Crankcase Ventilation (CCV) System.~~

~~Within each of these categories, the EPA has verified specific products and continues to evaluate and verify new products. Although the EPA has verified the fuel saving and/or emission reducing benefits of the listed products, it does not endorse the purchase of products or services from any specific vendor.~~

~~4.7.2.4 Regional Regulations~~

~~*Note: the subsection "Scoping Plan" was moved from this section to the California Regulation section following AB 32, because it is not a regional plan but a state plan.*~~

~~**Southern California Association of Governments (SCAG) Sustainable Communities Strategy (SCS) within Regional Transportation Plan (RTP)** demonstrates the region's ability to attain and exceed the GHG emission reduction targets set by the CARB. The SCS outlines the plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375, as evidenced by several Compass Blueprint Demonstration Projects and various county transportation improvements. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and complements the proposed transportation~~

~~network, which emphasizes system preservation, active transportation, and transportation demand management measures.~~

~~The RTP/SCS exceeds its greenhouse gas emission-reduction targets set by the CARB by achieving a 9 percent reduction by 2020 and 16 percent reduction by 2035 compared to the 2005 level on a per capita basis. Table 4.7.C shows the assumptions regarding Moreno Valley that SCAG used in its analysis.~~

~~Table 4.7.C: SCAG Assumptions for Moreno Valley~~

~~Year~~	~~Population~~	~~Households~~	~~Employment~~
~~2008~~	~~187,400~~	~~51,100~~	~~32,300~~
~~2020~~	~~213,700~~	~~60,000~~	~~48,000~~
~~2035~~	~~255,200~~	~~72,800~~	~~64,400~~

~~Source: Southern California Association of Governments 2012 and the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report,* 2015.~~

~~The RTP also includes an appendix on the Goods Movement, which provides an overview of the regional goods movement and initiatives to facilitate it. Strategies in the RTP that include the Local Jurisdiction as a responsible party, that could be applicable to the project, and that pertain to air quality or greenhouse gases are shown in Table 4.7.D. Many of the strategies are similar to the project's mitigation measures (see Section 4.7.6.1) and project design features.~~

~~Table 4.7.D: Select Regional Transportation Plan Strategies~~

~~Strategy~~	~~Responsible Party*~~	~~Project Consistency~~
~~Encourage the use of range-limited battery electric and other alternative fueled vehicles through policies and programs, such as, but not limited to, neighborhood oriented development, complete streets, and electric (and other alternative fuel) vehicle supply equipment in public parking lots.~~	~~Local Jurisdictions, COGs, SCAG, CTCs~~	~~Consistent with **Mitigation Measures 4.3.6.3B** (non-diesel yard trucks), **4.3.6.3C** (alternative fuel station), and **4.3.6.4A** (electric vehicle charging stations).~~
~~Support projects, programs, and policies that support active and healthy community environments that encourage safe walking, bicycling, and physical activity by children, including, but not limited to development of complete streets, school siting policies, joint use agreements, and bicycle and pedestrian safety education.~~	~~Local Jurisdictions and CTCs~~	~~Consistent with **Mitigation Measure 4.3.6.4A** (bicycle lanes, storage lockers, and pedestrian connections/pathways).~~
~~Engage in a strategic planning process to determine the critical components and implementation steps for identifying and addressing open space resources, including increasing and preserving park space, specifically in park-poor communities.~~	~~Local Jurisdictions and CTCs~~	~~The project is consistent with City's goal of conserving open space. As compared to the Moreno Highlands Specific Plan, the proposed project would change the zoning on 910 acres of the CDFW Conservation Buffer Area from residential to open space. In addition, the proposed project preserves the zoning of 74 acres of open space in the southwest corner of the project site for passive open space and recreation uses. Finally, a network of trails has been proposed within the project site to provide public trail access to the Lake Perris Recreational Area and the San Jacinto Wildlife Area.~~

~~Table 4.7.D: Select Regional Transportation Plan Strategies~~

~~**Strategy**~~	~~**Responsible Party***~~	~~**Project Consistency**~~
~~Develop first-mile/last-mile strategies on a local level to provide an incentive for making trips by transit, bicycling, walking, or neighborhood electric vehicle or other zero emission vehicle options.~~	~~Local Jurisdictions and CTCs~~	~~Consistent with **Mitigation Measure 4.3.6.4A** (Riverside County's Rideshare Program), bicycle lanes, and pedestrian access.~~
~~Encourage transit fare discounts and local vendor product and service discounts for residents and employees of transit oriented development/high quality transit areas or for a jurisdiction's local residents in general who have fare media~~	~~Local Jurisdictions~~	~~Not applicable. This measure is for areas in transit-oriented development.~~
~~Encourage the implementation of a Complete Streets policy that meets the needs of all users of the streets, roads and highways including bicyclists, children, persons with disabilities, motorists, neighborhood electric vehicle (NEVs) users, movers of commercial goods, pedestrians, users of public transportation and seniors for safe and convenient travel in a manner that is suitable to the suburban and urban contexts within the region.~~	~~Local Jurisdictions, COGs, SCAG, CTCs~~	~~Although the project is not implementing what is labeled as a "Complete Streets" policy, the project would include bicycle lanes and pedestrian access (**Mitigation Measure 4.3.6.4A**) and would implement handicapped access pursuant to current regulations.~~
~~Support work-based programs that encourage emission reduction strategies and incentivize active transportation commuting or ride-share modes.~~	~~SCAG, Local Jurisdictions~~	~~Consistent through **Mitigation Measure 4.3.6.4A** (Riverside County's Rideshare Program; designated parking for carpool/van pools).~~
~~Develop infrastructure plans and educational programs to promote active transportation options and other alternative fueled vehicles, such as neighborhood electric vehicles, and consider collaboration with local public health departments, walking/biking coalitions, and/or Safe Routes to School initiatives, which may already have components of such educational programs in place.~~	~~Local Jurisdictions~~	~~Consistent with **Mitigation Measures 4.3.6.4A** (bicycle lanes, pedestrian access, electric vehicle charging) and **4.3.6.3C** (alternative fueling infrastructure).~~
~~Encourage the development of telecommuting programs by employers through review and revision of policies that may discourage alternative work options.~~	~~Local Jurisdictions and CTCs~~	~~Not applicable. Tenants may choose to implement telecommuting if feasible.~~
~~Emphasize active transportation and alternative fueled vehicle projects as part of complying with the Complete Streets Act (AB 1358).~~	~~State, SCAG, Local Jurisdictions~~	~~Consistent with **Mitigation Measure 4.3.6.3C** (alternative fueling station) and **Mitigation Measure 4.3.6.4A** (electric vehicle charging stations)~~

~~* Abbreviations:~~
~~SCAG = Southern California Association of Governments~~
~~CTCs = county transportation commissions~~
~~COGs = subregional councils of governments~~
~~Source: Southern California Association of Governments 2012 and the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015.~~

~~SB 375 took effect in 2009 and required regional municipal planning organizations to develop regional land use plans that demonstrate how the regions will achieve compliance with the GHG reduction goals~~

~~of AB 32. Cities located within these regions are then required, in turn, to update their General Plans in accordance with the regional plans. Non-compliance with SB 375 will result in transportation funds being withheld from the regional and/or local agency. To date, the regional municipal planning organization for Riverside County (the Western Riverside Council of Governments, or WRCOG) has not adopted a regional plan that is in compliance with SB 375.~~

~~**South Coast Air Quality Management District.** In April 2008, the SCAQMD, in order to provide guidance to local lead agencies on determining the significance of GHG emissions identified in CEQA documents, convened a "GHG CEQA Significance Threshold Working Group."[1] The goal of the working group is to develop and reach consensus on an acceptable CEQA significance threshold for GHG emissions that would be utilized on an interim basis until the CARB (or some other State agency) develops statewide guidance on assessing the significance of GHG emissions under CEQA.~~

~~Initially, SCAQMD staff presented the working group with a significance threshold that could be applied to various types of projects—residential, non-residential, industrial, etc. However, the threshold is still under development. In December 2008, staff presented the SCAQMD Governing Board with a significance threshold for stationary source projects in which it is the lead agency. This threshold uses a tiered approach to determine a project's significance, with 10,000 metric tons (mt) of carbon dioxide equivalent (CO_2e) as a screening numerical threshold.~~

~~In September 2010, the Working Group released additional revisions, which recommended a project-level efficiency target of 4.8 mt CO_2e per service population (SP) as a 2020 target and 3.0 mt CO_2e, per SP as a 2035 target. The recommended plan-level target for 2020 was 6.6 mt CO_2e and the plan level target for 2035 was 4.1 mt CO_2e. The SCAQMD has not announced when staff is expecting to present a finalized version of these thresholds to the Governing Board.~~

~~The SCAQMD has also adopted Rules 2700, 2701, and 2702 to establish a voluntary program to encourage, quantify, and certify voluntary GHG emission reductions in the SCAQMD's jurisdiction. The CARB adopted a resolution regarding the adoption of GHG accounting protocols that distinguishes between the offset certification programs that were developed for the voluntary market, and the program that must be developed to certify offsets to be used under CARB's cap-and-trade rule. This resolution withdrew CARB approval of voluntary protocols but would not impact the use of these protocols for voluntary purposes. Protocols in Rules 2701 and 2702 are voluntary protocols, which no longer have CARB's approval.~~

~~4.7.2.5 City of Moreno Valley General Plan Policies~~

~~The City adopted its General Plan in 2006. The General Plan does not contain policies directly related to greenhouse gases; however, it does have some air quality[2] policies applicable to the proposed project that are related to reducing greenhouse gases, as shown below:~~

~~**Objective 6.6**~~	~~Promote land use patterns that reduce daily automotive trips and reduce trip distance for work, shopping, school, and recreation.~~
~~**Objective 6.7**~~	~~Reduce mobile and stationary source air pollutant emissions.~~
~~**Policy 6.7.1**~~	~~Cooperate with regional efforts to establish and implement regional air quality strategies and tactics.~~
~~**Policy 6.7.2**~~	~~Encourage the financing and construction of park-and-ride facilities.~~

---

[1] ~~For more information see: http://www.aqmd.gov/ceqa/handbook/GHG/GHG.html.~~

[2] ~~Policies 6.7.4 and 6.7.5 are discussed in the Air Quality EIR Section, 4.3.~~

~~**Policy 6.7.3**~~ ~~Encourage express transit service from Moreno Valley to the greater metropolitan areas of Riverside, San Bernardino, Orange and Los Angeles Counties.~~

~~**Policy 6.7.6**~~ ~~Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code.~~

~~4.7.2.6 City of Moreno Valley Climate Action Strategy~~

~~The City of Moreno Valley approved the Energy Efficiency and Climate Action Strategy (Strategy) in October 2012. The Strategy identifies ways that the City can reduce energy and water consumption and greenhouse gas emissions as an organization (its employees and the operation of its facilities) and outlines the actions that the City can encourage and community members can employ to reduce their own energy and water consumption and greenhouse gas emissions. The Strategy contains the following policies to reduce greenhouse gas emissions in 2010 by 15 percent by 2020:~~

~~R2-T1~~ ~~*Land Use Based Trips and VMT Reduction Policies.* Encourage the development of Transit Priority Projects along High Quality Transit Corridors identified in the SCAG Sustainable Communities Plan, to allow a reduction in vehicle miles traveled.~~

~~R2-T3~~ ~~*Employment-Based Trip Reductions.* Require a Transportation Demand Management (TDM) program for new development to reduce automobile travel by encouraging ride-sharing, carpooling, and alternative modes of transportation.~~

~~R2-E1~~ ~~*New Construction Residential Energy Efficiency Requirements.* Require energy efficient design for all new residential buildings to be 10 percent beyond the current Title 24 standards.~~

~~R2-E2~~ ~~*New Construction Residential Renewable Energy.* Facilitate the use of renewable energy (such as solar [photovoltaic] panels or small wind turbines) for new residential developments. Alternative approach would be the purchase of renewable energy resources off site.~~

~~R2-E5~~ ~~*New Construction Commercial Energy Efficiency Requirements.* Require energy efficient design for all new commercial buildings to be 10 percent beyond the current Title 24 standards.~~

~~R3-E1~~ ~~*Energy Efficient Development, and Renewable Energy Deployment Facilitation and Streamlining.* Updating of codes and zoning requirements and guidelines to further implement green building practices. This could include incentives for energy-efficient projects.~~

~~R3-L2~~ ~~*Heat Island Plan.* Develop measures that address “heat islands.” Potential measures include using strategically placed shade trees, using paving materials with a Solar Reflective Index of at least 29, an open grid pavement system, or covered parking.~~

~~R2-W1~~ ~~*Water Use Reduction Initiative.* Consider adopting a per capita water use reduction goal which mandates the reduction of water use of 20 percent per capita with requirements applicable to new development and with cooperative support of the water agencies.~~

~~R3-W1~~ ~~*Water Efficiency Training and Education.* Work with EMWD and local water companies to implement a public information and education program that promotes water conservation.~~

~~R2-S1~~ ~~*City Diversion Program.* For solid waste, consider a target of increasing the waste diverted from the landfill to a total of 75 percent by 2020.~~

~~4.7.3 Methodology~~

~~Bearing in mind that CEQA does not require “perfection” but instead “adequacy, completeness, and a good faith effort at full disclosure,” the analysis of project GHG emissions and climate change is based on methodologies and information available at the time this EIR was prepared. Many uncertainties exist regarding the precise relationship between specific levels of GHG emissions and the ultimate impact on global climate. Significant uncertainties also exist regarding the reduction potential of mitigation~~

~~strategies. Thus, while information is presented below to assist the public and the City's decision-makers in understanding the project's potential contribution to global climate change impacts, the information available to the City is not sufficiently detailed to allow a direct comparison between particular project characteristics and particular climate change impacts, nor between any particular proposed mitigation measure and any reduction in climate change impacts.~~

~~The recommended approach for GHG analysis included in the California Governor's Office of Planning and Research (OPR's) June 2008 release is to: (1) identify and quantify GHG emissions, (2) assess the significance of the impact on climate change, and (3) if significant, identify alternatives and/or mitigation measures to reduce the impact below a level of significance.[1] Neither the CEQA statute nor Guidelines prescribe quantitative thresholds of significance or a particular methodology for performing an impact analysis; as with most environmental topics, significance criteria are left to the judgment and discretion of the lead agency.~~

~~The June 2008 OPR guidance provides some additional direction regarding planning documents as follows: "CEQA can be a more effective tool for GHG emissions analysis and mitigation if it is supported and supplemented by sound development policies and practices that will reduce GHG emissions on a broad planning scale and that can provide the basis for a programmatic approach to project-specific CEQA analysis and mitigation. For local government lead agencies, adoption of General Plan policies and certification of General Plan EIRs that analyze broad jurisdiction-wide impacts of GHG emissions can be part of an effective strategy for addressing cumulative impacts and for streamlining later project-specific CEQA reviews."~~

~~Pursuant to SB 97, the OPR is in the process of developing guidelines for analysis of the effects of GHG emissions. As part of this process, the OPR has asked CARB technical staff to recommend statewide interim thresholds of significance for GHGs. The CARB released a preliminary draft staff proposal in October 2008 that included initial suggestions for significance criteria related to industrial, commercial, and residential projects.~~

~~In March 2010, *CEQA Guidelines* amendments were adopted and include the following direction regarding determination of significant impacts from GHG emissions (Section 15064.4):~~

> ~~(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in Section 15064. A lead agency should make a good-faith effort, based on available information, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:~~
>
> > ~~(1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; or~~
> >
> > ~~(2) Rely on a qualitative analysis or performance based standards.~~
>
> ~~(b) A lead agency may consider the following when assessing the significance of impacts from greenhouse gas emissions on the environment:~~
>
> > ~~(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.~~

~~[1] State of California, 2008. Governor's Office of Planning and Research. *CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review*. June 19.~~

~~(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.~~

~~(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such regulations or requirements must be adopted by the relevant public agency through a public review process and must include specific requirements that reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.~~

~~*CEQA Guidelines* Section 15064(b) provides that the "determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data," and further, states that an "ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting."~~

~~On February 3, 2011 the SCAQMD released the California Emissions Estimator Model (CalEEMod) Emissions Inventory Model. CalEEMod was updated in July 2013, after publication of the Draft EIR; therefore, the emissions were remodeled using the new version for the Final EIR. The latest version of CalEEMod was utilized to calculate GHG emissions from the following source categories: construction, energy, waste, land use change, and water. For a detailed description of the assumptions used to estimate the GHG emissions, refer to the Air Quality, Greenhouse Gas, and Health Risk Assessment Report.~~

~~As a result of comments on the Draft EIR, the GHG inventory was revised as follows:~~

- ~~**Revisions to Construction Assumptions.** Construction related GHG emissions were estimated using the same procedures as for air quality. For a list of the changes to the construction emissions methodology, please refer to Section 4.3.3.1 in the Air Quality Final EIR or the revised Air Quality, Greenhouse Gas, and Health Risk Assessment (2015).~~
- ~~**Revisions to Operational Mobile Assumptions**. Operational mobile GHG emissions were estimated using the same procedures for the air quality analysis. The new emission factors model was used (EMFAC2014). Please refer to Section 4.3.3.2 in the Air Quality Final EIR or the revised Air Quality, Greenhouse Gas, and Health Risk Assessment (2015) for a list of those changes.~~
- ~~**Addition of Onsite Equipment Emissions.** During operation of the project, there would be on-site equipment operating on the project site. Yard trucks are trucks that are used in moving trailers and containers short distances around the warehouses. Emergency generators would be run for testing purposes. Fuel powered forklifts are assumed for the light industrial uses; however, the warehouse and distribution centers would use electric forklifts, which would not have emissions.~~
- ~~**Addition of Black Carbon Emissions Estimation.** The analysis in the Draft EIR did not estimate black carbon emissions, which may contribute to climate change. This analysis includes an estimate of black carbon emissions for both construction and operation.~~
- ~~**New Waste Generation Factors**. The new version of CalEEMod has revised operational waste generation factors, which results in less estimated waste generated during operation and less greenhouse gas emissions.~~
- ~~**Land Use Change.** In the Draft EIR, the GHG emissions from the land use change (conversion of dry farming to a built up environment), was included as a one-time occurrence in the construction emissions. For the Final EIR, these emissions are operational and occur every year.~~

~~4.7.4 Thresholds of Significance~~

~~Based on Appendix G of the *CEQA Guidelines*, climate change/greenhouse gas emissions impacts would occur if the proposed project would:~~

- ~~Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment (i.e., exceeds the SCAQMD's 10,000 mt CO_2e emissions screening threshold of significance); and/or~~
- ~~Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.~~

~~Global climate change may result in significant adverse effects to the environment that will be experienced worldwide, with some specific effects observed in California. AB 32 requires statewide GHG emissions reductions to 1990 levels by 2020. Although these statewide reductions are now mandated by law, no generally applicable GHG emission threshold has yet been established.~~

~~*State CEQA Guidelines Section* 15064(b) provides that "…the determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data," and further, that an "ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting." The *State CEQA Guidelines* further indicate that even when thresholds are established, they may include "identifiable quantitative, qualitative or performance level of a particular environmental effect" (*State CEQA Guidelines*, Section 15064.7).~~

~~Some policymakers and regulators suggest that a zero emissions threshold would be appropriate when evaluating GHGs and their potential effect on climate change. Such a rule appears inconsistent with the State's approach to mitigation of climate change impacts. AB 32 does not prohibit all new GHG emissions; rather, it requires a reduction in statewide emissions to a given level. Thus, AB 32 recognizes that GHG emissions will continue to occur; increases will result from certain activities, but reductions must occur elsewhere.~~

~~Individual projects incrementally contribute toward the potential for global climate change (GCC) on a cumulative basis in concert with all other past, present, and probable future projects. While individual projects are unlikely to measurably affect GCC, each of these projects incrementally contributes toward the potential for GCC on a cumulative basis, in concert with all other past, present, and probable future projects. This analysis examines whether the project's emissions should be considered cumulatively significant.~~

~~In order to evaluate the significance of a proposed project's environmental impacts related to GHG emissions, it is necessary to identify quantitative or qualitative thresholds which, if exceeded, would constitute a finding of significance. As previously described, while project-related GHG emissions can be estimated the direct impact of such emissions on climate change and global warming cannot be determined on the basis of available science. There is no evidence at this time that the proposed project would directly affect GCC. The SCAQMD has adopted a quantitative GHG emission significance threshold to assess direct impacts from industrial projects where the SCAQMD is the lead agency. The SCAQMD and other air quality agencies agree that GHG and GCC should be assessed as a potentially significant cumulative impact rather than a project-specific impact.~~

~~The following is an excerpt from the SCAQMD (*Draft Guidance Document – Interim CEQA Greenhouse Gas [GHG] Significance Threshold,* October 2008):~~

> ~~*"The overarching policy objective with regard to establishing a GHG significance threshold for the purposes of analyzing GHG impacts pursuant to CEQA is to establish a performance standard or*~~

> ~~*target GHG reduction objective that will ultimate contribute to reducing GHG emissions to stabilize climate change. Full implementation of the Governor's Executive Order S-3-05 would reduce GHG emissions 80 percent below 1990 levels or 90 percent below current levels by 2050. It is anticipated that achieving the Executive Order's objective would contribute to worldwide efforts to cap GHG concentrations at 450 ppm, thus, stabilizing global climate.*~~
>
> ~~*As described below, staff's recommended interim GHG significance threshold proposal uses a tiered approach to determining significance. Tier 3, which is expected to be the primary tier by which the AQMD will determine significance for projects where it is the lead agency, uses the Executive Order S-3-05 goal as the basis for deriving the screening level."*~~

~~This project utilizes Tier 3 of the SCAQMD's draft threshold and compares the project's uncapped greenhouse gas emissions to the SCAQMD's threshold for industrial projects, 10,000 mt CO_2e per year. Therefore, the threshold used for this project was based on the goal in Executive Order S-3-05. If the project's uncapped emissions are under the threshold, then the project would be in compliance with Executive Order S-3-05.~~

~~In September 2013, the SCAQMD adopted two Negative Declarations last year stating that GHG emissions subject to the ARB Cap-and-Trade Program do not count against the 10,000 MT CO2e significance threshold the SCAQMD applies when acting as a lead agency. In addition, the San Joaquin Valley Air Pollution Control District (SJVAPCD) has recently taken this one issue step further and adopted a policy: "CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation." This policy applies when the SJVAPCD is the lead agency and when it is a responsible agency. In short, the SJVAPCD "has determined that GHG emissions increases that are covered under ARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…." The SJVAPCD classifies ARB's Cap-and-Trade Program as an approved GHG emission reduction plan or GHG mitigation program under CEQA Guidelines Section 15064(h) (3). Here are some other pertinent excerpts from that policy:~~

- ~~"Consistent with CCR §15064(h)(3), the District finds that compliance with ARB's Cap-and-Trade regulation would avoid or substantially lessen the impact of project-specific GHG emissions on global climate change."~~
- ~~"The District therefore concludes that GHG emissions increases subject to ARB's Cap-and-Trade regulation would have a less than significant individual and cumulative impact on global climate change."~~
- ~~"[I]t is reasonable to conclude that implementation of the Cap-and-Trade program will and must fully mitigate project-specific GHG emissions for emissions that are covered by the Cap-and-Trade regulation."~~
- ~~"[T]he District finds that, through compliance with the Cap-and-Trade regulation, project-specific GHG emissions that are covered by the regulation will be fully mitigated."~~

~~The policy acknowledges that "combustion of fossil fuels including transportation fuels used in California (on and off road including locomotives), not directly covered at large sources, are subject to Cap-and-Trade requirements, with compliance obligations starting in 2015." As such, the SJVAPCD concludes that GHG emissions associated with vehicle miles traveled (VMT) cannot constitute significant increases under CEQA. This regulatory conclusion is therefore directly applicable to the WLC project because VMT is by far the largest source of project GHG emissions.~~

~~In the IPCC Assessment Report (IPCC 2007b, Synthesis Report), the IPCC acknowledges that man-made warming and sea level rise would continue for centuries due to the time scales associated with climate processes and feedback even if GHG concentration were to be stabilized. The IPCC further found that both past and future man-made CO_2 emissions will continue to contribute to warming and~~

~~sea level rise for more than a millennium, due to the time scales required for the removal of CO_2 from the atmosphere. Furthermore, the IPCC assessment noted that the definition of what is a dangerous man-made interference with the climate system and, consequently, the limits to be set for policy purposes are complex tasks that can only be partially based on science, as such definitions inherently involve normative judgments (IPCC 2007b – Working Group III).~~

~~4.7.5 Less than Significant Impacts~~

~~Due to the size of the project, all potential impacts related to greenhouse gas emissions are considered to be potentially significant.~~

~~4.7.6 Significant Impacts~~

~~4.7.6.1 Greenhouse Gas Emissions~~

~~Threshold~~	~~Would the proposed project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?~~

~~Future development that could occur within the proposed project site could generate GHG emissions during both construction and operation activities. The following activities are associated with the proposed project and could directly or indirectly contribute to the generation of GHG emissions:~~

- ~~**Removal of Vegetation (Land Use Change) and Sequestration:** Carbon sequestration is the process of capture and storage of carbon dioxide; trees, vegetation, and soil store carbon in their tissues and wood. The net removal of vegetation for construction from land use change results in a loss of the carbon sequestration in plants. However, planting additional vegetation (sequestration) would result in additional carbon sequestration and would lower the carbon footprint of the project.~~
- ~~**Construction Activities:** During construction of the project, GHGs would be emitted through the operation of construction equipment and from worker and builder supply vendor vehicles, each of which typically uses fossil-based fuels to operate. The combustion of fossil-based fuels creates GHGs such as CO_2, CH_4, and N_2O.~~
- ~~**Gas, Electric, and Water Use:** Natural gas use results in the emissions of CH_4 (the major component of natural gas) and CO_2 from the combustion of natural gas. Electricity use can result in GHG production if the electricity is generated by combusting fossil fuel. Conveying water to the project and treating wastewater also uses electricity.~~
- ~~**Solid Waste Disposal:** Solid waste generated by the project could contribute to GHG emissions in a variety of ways. Landfilling and other methods of disposal use energy for transporting and managing the waste, and they produce additional GHGs to varying degrees. Landfilling, the most common waste management practice, results in the release of CH_4 from the anaerobic decomposition of organic materials. CH_4 is approximately 21 times more potent than CO_2. Landfill CH_4 can also be a source of energy. In addition, many materials in landfills do not decompose fully, and the carbon that remains is sequestered in the landfill and not released into the atmosphere.~~
- ~~**Motor Vehicle Use:** Transportation associated with the proposed project would result in GHG emissions from the combustion of fossil fuels in daily automobile and truck trips.~~
- ~~**On-site Equipment:** During operation of the project, there would be on-site equipment operating, including yard trucks, emergency generators, and forklifts.~~

~~**Construction Emissions.** The project would emit GHGs mainly from direct sources such as combustion of fuels from worker vehicles and construction equipment, as shown in Table 4.7.E. The GHG emissions are from all phases of construction.~~

~~Table 4.7.E: Construction Greenhouse Gas Emissions (without mitigation)~~

~~**Year**~~	~~**Annual Emissions (mt CO_2e)**~~
~~2015~~	~~14,315~~
~~2016~~	~~14,396~~
~~2017~~	~~19,052~~
~~2018~~	~~14,515~~

~~2030~~	~~14,500~~
~~**Total**~~	~~264,861~~
~~**Averaged over 30 years**~~	~~**8,829**~~
~~**Capped: Fuel-Based Emission Sources Averaged over 30 years**~~	~~**8,823**~~
~~**Uncapped: Refrigerant Installation and Construction Waste Averaged over 30 years**~~	~~**6**~~

~~mt CO_2e = metric tons of carbon dioxide equivalents.~~
~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report,* 2015~~
~~Sources include onsite construction equipment, worker trips, haul trips, vendor trips, refrigerant installation for the air conditioning in the offices, construction waste, and water use.~~

~~**Operational Emissions, Worst-Case Scenario.** Operational or long-term emissions occur over the life of the project. Operational emissions for a worst-case buildout condition are shown in Table 4.7.F. The emissions are presented by greenhouse gas (in tons per year), which was also converted to metric tons of carbon dioxide equivalents (mt CO_2e). The vehicle emissions in the table represent travel within the South Coast Air Basin. The emissions do not take into account mitigation measures to reduce emissions, such as the use of model year 2010 and later medium and heavy-heavy duty trucks on the project site. As shown in the table, the project's uncapped emissions are over the SCAQMD's significance threshold of 10,000 mt CO_2e per year. Therefore, emissions are potentially significant.~~

~~The analysis presented in Table 4.7.F also represents a worst-case analysis because the emission factors do not take into account full reductions from regulation or reductions from newer trucks and cars. The emissions are estimated using emission factors from EMFAC2014, CARB's emission factor model, for the year 2012.~~

~~Table 4.7.F: Project Operational GHG Emissions (Worst-Case 2012 Analysis at Buildout)~~

~~Source~~	~~Individual Emissions (tons/year)~~					~~Greenhouse Gas Emissions (mt CO$_2$e)~~
	~~Carbon Dioxide~~	~~Methane~~	~~Nitrous Oxide~~	~~Hydrofluoro-carbons~~	~~Black Carbon~~	
~~AB 32 Capped Emissions~~						
~~Mobile~~	~~370,445~~	~~9.75~~	~~2.18~~	~~0.00~~	~~37.19~~	~~362,507~~
~~Other~~	~~137,884~~	~~8.11~~	~~1.16~~	~~0.00~~	~~2.65~~	~~127,503~~
~~Total~~	~~508,329~~	~~17.86~~	~~3.34~~	~~0.00~~	~~39.84~~	~~490,010~~
~~Uncapped Emissions~~	**~~9,689~~**	**~~504.08~~**	**~~0.00~~**	**~~0.62~~**	**~~0.00~~**	**~~19,237~~**
					~~Threshold~~	**~~10,000~~**
					~~Significant?~~	**~~Yes~~**

~~Notes:~~
~~mt CO$_2$e = metric tons of carbon dioxide equivalents, which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072.~~
~~The “other” emissions include the non-mobile capped emissions as presented in Table 4.7.G below.~~
~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report,* 2015~~

~~**Operational Emissions, Annual Reasonable Scenario.** The emissions presented herein are a reasonable scenario, because unlike the worst-case scenario displayed above, the mobile emissions use emission factors for the actual year assessed. The motor vehicle and truck emissions for Phase 1 (2016 to 2022) use emission factors for the year 2022, whereas motor vehicle and truck emissions for Phase 2 (2023 to buildout, 2031) use emission factors for the year 2035.~~

~~CARB has designed a California cap-and-trade program that is enforceable and meets the requirements of AB 32. The program began on January 1, 2012, with an enforceable compliance obligation beginning with its 2013 GHG emissions inventory. Some of the project’s GHG emissions are subject to the requirements of the AB 32 Cap and Trade Program and will have a GHG allocation based on current GHG emissions levels. The AB32 Cap-and-Trade Program has divided allocations into sectors. The transportation and electricity sectors would be covered by the cap-and-trade program.~~

~~Table 4.7.G shows the unmitigated project emissions at buildout by individual GHG (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, and black carbon). Those emissions are converted to mt CO$_2$e based on the global warming potential of the gas/aerosol. The table also shows the emissions divided by AB 32 capped and uncapped emissions. AB 32 capped emissions are shown for informational purposes, as those emissions are not compared with the SCAQMD’s significance threshold. As shown in the table, the uncapped emissions exceed the threshold and are significant.~~

~~Notes:~~

~~mt CO~~$_2$~~e = metric tons of carbon dioxide equivalents which is calculated from the emissions (tons/year) by multiplying by the individual global warming potential (carbon dioxide – 1, methane – 21, nitrous oxide – 310, hydrofluorocarbons – 1500, black carbon 760) and converted to metric tons by multiplying by 0.9072.~~

~~* Construction would not occur at buildout; however, according to SCAQMD recommendations, it is included at buildout as the average over 30 years.~~

~~Source: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report,* 2015~~

~~Compared with emissions as estimated in the DEIR, motor vehicle emissions at buildout were reduced by about 164,000 mt CO$_2$e/year (435,000 to 271,000) for the following reasons. First, the emission factors used in the revised analysis are from EMFAC2014 instead of EMFAC2007 (as used in the DEIR). Secondly, the unmitigated emissions in the revised analysis include reductions from current regulation; in the DEIR, only the mitigated emissions accounted for regulation. Finally, the total vehicle miles traveled decreased from 1,249,400 miles per day to 1,034,800 miles per day (a reduction of 214,600 miles/day). This decrease reflects more realistic vehicle and truck patterns provided by the revised Traffic Impact Analysis which modeled the expected vehicle trips and volumes from the project instead of a general average of 50 miles per truck trip.~~

~~Waste emissions were reduced by approximately 136,000 mt CO$_2$e/year because the new version of CalEEMod (2013) lowered its waste generation rates for warehouse development.~~

~~**Use of Cap-and-Trade Program Benefits for Project Impacts.** The SCAQMD issued Negative Declarations last year stating that GHG emissions subject to the ARB Cap-and-Trade Program do not count against the 10,000 MT CO2e significance threshold the SCAQMD applies when acting as a lead agency. In addition, the San Joaquin Valley Air Pollution Control District (SJVAPCD) has recently taken this one issue step further and adopted a policy: "CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation." This policy applies when the SJVAPCD is the lead agency and when it is a responsible agency. In short, the SJVAPCD "has determined that GHG emissions increases that are covered under ARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…." The SJVAPCD classifies ARB's Cap-and-Trade Program as an approved GHG emission reduction plan or GHG mitigation program under CEQA Guidelines Section 15064(h) (3). Here are some other pertinent excerpts from that policy:~~

- ~~"Consistent with CCR §15064(h)(3), the District finds that compliance with ARB's Cap-and-Trade regulation would avoid or substantially lessen the impact of project-specific GHG emissions on global climate change."~~
- ~~"The District therefore concludes that GHG emissions increases subject to ARB's Cap-and-Trade regulation would have a less than significant individual and cumulative impact on global climate change."~~
- ~~"[I]t is reasonable to conclude that implementation of the Cap-and-Trade program will and must fully mitigate project-specific GHG emissions for emissions that are covered by the Cap-and-Trade regulation."~~
- ~~"[T]he District finds that, through compliance with the Cap-and-Trade regulation, project-specific GHG emissions that are covered by the regulation will be fully mitigated."~~

~~The policy acknowledges that "combustion of fossil fuels including transportation fuels used in California (on and off road including locomotives), not directly covered at large sources, are subject to Cap-and-Trade requirements, with compliance obligations starting in 2015." As such, the SJVAPCD concludes that GHG emissions associated with vehicle miles traveled (VMT) cannot constitute significant increases under CEQA. This regulatory conclusion is therefore directly applicable to the WLC project because VMT is by far the largest source of project GHG emissions.~~

~~**Specific Plan Design Features.** The WLCSP incorporates site and building designs that emphasize conservation of water and energy, which in turn help reduce greenhouse gas emissions (WLCSP September 2014, Section 1.3.2, Green Building-Sustainable Development). Table 4.7.I evaluates to what degree various design features of the proposed project will reduce potential GHG emissions.~~

~~**Mitigation Measures.** Table 4.7.I evaluates to what degree the mitigation measures recommended in other impact sections will reduce potential GHG emissions. The only mitigation measure that is required is the following.~~

~~**4.7.6.1A** The project shall implement the following requirements to reduce solid waste and greenhouse gas emissions from construction and operation of project development:~~

~~a) Prior to January 1, 2020, divert a minimum of 50 percent of landfill waste generated by operation of the project. After January 1, 2020, development shall divert a minimum of 75 percent of landfill waste. In January of each calendar year after project approval the developer and/or Property Owners Association shall certify the percentage of landfill waste diverted on an annual basis.~~

~~b) Prior to January 1, 2020, recycle and/or salvage at least 50 percent of non-hazardous construction and demolition debris. After January 1, 2020, recycle and/or salvage at least 75 percent of non-hazardous construction and demolition debris. In January of each calendar year after project approval the developer and/or Property Owners Association shall certify the percentage of landfill waste diverted on an annual basis.~~

~~Develop and implement a construction waste management plan that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be sorted on-site or co-mingled. Calculations can be done by weight or volume, but must be consistent throughout.~~

~~c) The applicant shall submit a Recyclables Collection and Loading Area Plan for construction related materials prior to issuance of a building permit with the Building Division and for operational aspects of the project prior to the issuance of the occupancy permit to the Public Works Department. The plan shall conform to the Riverside County Waste Management Department's Design Guidelines for Recyclable Collection and Loading Areas.~~

~~d) Prior to issuance of certificate of occupancy, the recyclables collection and loading area shall be constructed in compliance with the Recyclables Collection and Loading Area plan.~~

~~e) Prior to issuance of certificate of occupancy, documentation shall be provided to the City confirming that recycling is available for each building.~~

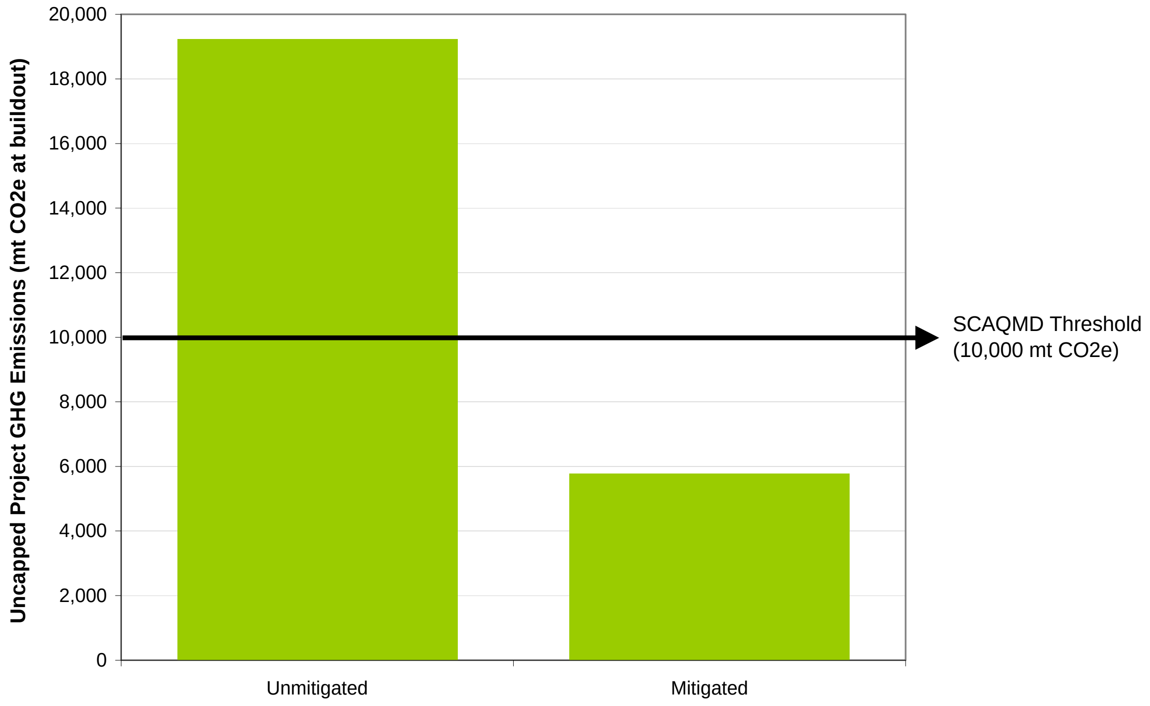
~~f) Within six months after occupancy of a building, the City shall confirm that all tenants have recycling procedures set in place to recycle all items that are recyclable, including but not limited to paper, cardboard, glass, plastics, and metals.~~

~~g) The property owner shall advise all tenants of the availability of community recycling and composting services.~~

~~h) Existing onsite street material shall be recycled for new project streets to the extent feasible.~~

~~**Level of Impact After Mitigation.** Less than significant (original DEIR conclusion was significant).~~

~~Figure 4.7.1 displays the unmitigated and mitigated uncapped GHG emissions. As shown in the figure, the mitigated uncapped emissions are less than the significance threshold and are less than significant.~~



~~Figure 4.7.1: Uncapped Project GHG Emissions at Buildout~~

~~Table 4.7.J shows the GHG emissions and mitigation reductions after implementation of mitigation at buildout only. Table 4.7.K shows the mitigated GHG emissions through construction of the project to buildout.~~

~~AB 32 capped emissions are shown for informational purposes, as those emissions are not compared with the SCAQMD's significance threshold. The tables indicate that after implementation of **Mitigation Measure 4.7.6.1A**, the uncapped emissions would not exceed the significance threshold. GHG emissions are less than significant after mitigation.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~**Table 4.7.I: Greenhouse Gas Emissions Reduction Analysis**~~

~~**Category**~~	~~**Operational Mitigation Measure or Project Design Feature[1]**~~	~~**Calculation Method and Reductions**~~
~~Construction Fuel~~	~~**Mitigation Measure 4.3.6.2A** would require that construction equipment be Tier 4.~~	~~This reduction was estimated in CalEEMod. Tier 4 construction equipment would have fewer PM2.5 emissions, and therefore black carbon emissions.~~
~~Construction Waste~~	~~Regulation in the California Green Building Standards require that projects divert (reduce or recycle) at least 50 percent of waste.~~	~~This reduction was estimated using the U.S. EPA's Waste Reduction Model (WARM) version 13.~~
~~Vehicles: Local~~	~~*Project Design Feature:* Local bus service to the area is provided by the Riverside Transit Agency. Local bus routes would typically be extended into the project area when adequate demand is generated from this employment center. Future bus routes could circulate on available looped routes with adequate right-of-way along the major arterial roadways of Redlands Boulevard, Theodore Street, and Alessandro Boulevard. Likewise, the industrial collector roadways provide access to locations nearest building front entrances. Due to building scale, bus stops may be spread out by grouped entrances or centralized gateway drive areas as compared to individual business entries.~~	~~The California Air Pollution Control Officer's Association (CAPCOA) report's reduction measure TRT-1 indicates a 5.2 percent reduction in commute vehicle miles traveled for low-density suburbs for inclusion of a commute trip reduction program. However, this reduction is not used in this analysis.~~ ~~The trip generation rates for which the unmitigated emissions were based are not necessarily based on development with pedestrian connections. Therefore, CalEEMod includes pedestrian connections as part of its mitigation module.~~ ~~In the Draft EIR, the measures shown to the left were estimated to reduce local vehicle emissions by 3 percent. However, with the revised methods for estimating the motor vehicle and truck emissions (calculations are now based on more realistic trip lengths), this reduction would be more difficult to quantify. Therefore, no reductions are taken for these measures in order to provide a conservative analysis.~~
	~~**Mitigation Measure 4.3.6.4A:** Class II bike lanes.~~	
	~~**Mitigation Measure 4.3.6.4A:** Participate in Riverside County's rideshare program~~	
	~~**Mitigation Measure 4.3.6.4A:** Lockers for employees.~~	
	~~**Mitigation Measure 4.3.6.4A:** Bicycle storage and changing rooms~~	
	~~*Project Design Features:* The project would have pedestrian circulation (, sidewalks, and a multiuse trail.~~	
	~~**Mitigation Measure 4.3.6.4A***:* Safe pedestrian connections~~	
	~~**Mitigation Measure 4.3.6.4A:** Parking for fuel-efficient vehicles~~	
~~Long haul trucks~~	~~**Mitigation Measure 4.3.6.3B:** Require model year 2010 medium-heavy duty and heavy-heavy duty trucks or later.~~	~~This was implemented by changing the emission factors for medium-heavy duty and heavy-heavy duty trucks from the CalEEMod default to the EMFAC2014 for year 2010 and after.~~
~~Vehicles and Trucks~~	~~*Pavley I Regulation:* A clean-car standard to reduce greenhouse gas emissions from new passenger vehicles (light duty automobiles and medium duty vehicles) from 2009 through 2016.~~ ~~*Low Carbon Fuel Standard:* A fuel standard that requires a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020.~~	~~EMFAC2014 provides emission factors for carbon dioxide that include these regulations. Therefore, both the unmitigated and mitigated emissions account for these regulations.~~

~~**Table 4.7.I: Greenhouse Gas Emissions Reduction Analysis**~~

~~Category~~	~~Operational Mitigation Measure or Project Design Feature[1]~~	~~Calculation Method and Reductions~~
~~Electricity and Natural Gas: Title 24~~	~~**Mitigation Measures 4.16.4.6.1A** and **4.16.4.6.1B** would reduce electricity related emissions. In addition, the project would require LEED certification for buildings and would require buildings to exceed Title 24 (2008 version) by 10 percent or comply with the current version in place.~~	~~This measure was applied in CalEEMod through its mitigation measure module (10 percent beyond Title 24 checkbox).~~
~~Electricity, Lighting~~	~~**Mitigation Measures 4.16.4.6.1B** (lighting efficiency) and **4.16.4.6.1C** (Title 24) would reduce electricity from lighting.~~	~~These measures are accounted for in CalEEMod by using its mitigation measure module, "Install High Efficiency Lighting," with a reduction of 10 percent.~~
~~Solar~~	~~**Mitigation Measure 4.16.4.6.1C** requires that the project install solar panels.~~	~~The estimated electricity generation from onsite solar is 19,739 MWh per year, which is 5.2 percent of the electricity demand at buildout (376,426 MWh). Therefore, 5.2 percent of the unmitigated GHG emissions are reduced by solar generation.~~
~~Water~~	~~**Mitigation Measure 4.16.1.6.1A** would reduce outdoor water usage~~	~~CalEEMod mitigation for water-efficient irrigation systems (6.1% reduction, CalEEMod default)~~
	~~**Mitigation Measure 4.16.1.6.1B** would reduce interior water usage, including low flow fittings, fixtures and equipment.~~	~~CalEEMod mitigation for:~~ ~~- low-flow toilet (20% reduction in flow, CalEEMod default)~~ ~~- low flow bathroom faucet (32% reduction in flow, CalEEMod default)~~ ~~- low-flow kitchen faucet (18% reduction in flow, CalEEMod default)~~ ~~- low-flow shower (20% reduction in flow, CalEEMod default)~~
	~~**Mitigation Measure 4.16.1.6.1C** would allow reclaimed water to be used for irrigation.~~	~~No reductions are taken for the potential use of reclaimed water.~~
~~Waste~~	~~**Mitigation Measure 4.7.6.1A**: Recycling and composting availability and reduce operational waste by at least 25 percent before 2020 and 75 percent after.~~	~~The project would commit to reducing operational waste by 25 percent prior 2020 and 75 percent after; therefore, a percent reduction is applied.~~
	~~*Project Design Feature:* Specific Plan (Section 5.1.6) requires that all development within the project provide enclosures or compactors for trash and recyclable materials.~~	

~~[1] Project design features are from the Project Description, mitigation measures are shown in Section 1.0, Table 1.B.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~4.7.6.2 Greenhouse Gas Plan, Policy, Regulation Consistency~~

~~Threshold~~	~~Would the proposed project conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?~~

~~This impact assesses whether the project would conflict with any applicable plans, policies, or regulations, as discussed below.~~

~~**Federal and State Reduction Strategies.** Table 4.7.L evaluates the consistency of the proposed project with the various Federal and State energy conservation and other regulations related to GHG emissions.~~

~~Table 4.7.L: Project Compliance with Federal/State Greenhouse Gas Reduction Strategies~~

~~Strategy~~	~~Project Compliance~~
~~Mandatory Codes~~	
~~**California Green Building Code.** The Cal Green Code prescribes a wide array of measures that would directly and indirectly result in reduction of GHG emissions from the Business as Usual Scenario (California Building Code). The mandatory measures that are applicable to nonresidential projects include site selection, energy efficiency, water efficiency, materials conservation and resource efficiency, and environmental quality measures.~~	~~**Compliant.** The project will be required to adhere to the non-residential mandatory measures as required by the Cal Green Code.~~
~~Energy Efficiency Measures~~	
~~**Energy Efficiency.** Maximize energy efficiency building and appliance standards, and pursue additional efficiency efforts including new technologies, and new policy and implementation mechanisms. Pursue comparable investment in energy efficiency from all retail providers of electricity in California (including both investor-owned and publicly owned utilities).~~	~~**Compliant with Mitigation Incorporated.** The proposed project will comply with current California Building Code (CBC) requirements for building construction, including the Title 24 energy conservation standards, which will help reduce GHG emissions. In addition, the project will include various energy-efficient building design features and mitigation (**Mitigation Measures 4.16.4.6.1A, B,** and **C**) to help further reduce GHG emissions.~~
~~**Renewables Portfolio Standard.** Achieve a 33 percent renewable energy mix statewide. This means that 33 percent of the electricity sold in California must be generated by renewable energy (solar, wind, etc.).~~	~~**Not applicable.** The project is not part of the State's power generation grid, but would install solar photovoltaic panels on project roofs pursuant to **Mitigation Measure 4.16.4.6.1C**. The solar would reduce the project's electricity related emissions by approximately 5.2 percent. In addition, Moreno Valley Electric Utility purchases its power from Southern California Edison, which is subject to the Renewable Portfolio Standard.~~
~~**Green Building Strategy.** Expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings.~~	~~**Compliant.** The proposed project will comply with current CBC requirements for building construction, including the Title 24 energy conservation standards.~~

~~Table 4.7.L: Project Compliance with Federal/State Greenhouse Gas Reduction Strategies~~

~~Strategy~~	~~Project Compliance~~
~~Water Conservation and Efficiency Measures~~	
~~**Water Use Efficiency.** Continue efficiency programs and use cleaner energy sources to move and treat water. Approximately 19 percent of all electricity, 30 percent of all natural gas, and 88 million gallons of diesel are used to convey, treat, distribute and use water and wastewater. Increasing the efficiency of water transport and reducing water use would reduce GHG emissions.~~	~~**Compliant with Mitigation Incorporated.** The Specific Plan outlines a number of water conservation measures, and **Mitigation Measures 4.16.1.6.1A** through **4.16.1.6.1C** will help reduce potential water use even further.~~
~~Solid Waste Reduction Measures~~	
~~**Increase Waste Diversion, Composting, and Commercial Recycling, and Move Toward Zero-Waste.** Increase waste diversion from landfills beyond the 50 percent mandate to provide for additional recovery of recyclable materials. Composting and commercial recycling could have substantial GHG reduction benefits. In the long term, zero-waste policies that would require manufacturers to design products to be fully recyclable may be necessary.~~	~~**Compliant with Mitigation Incorporated.** Data available from the California Integrated Waste Management Board (CIWMB) indicate that the City of Moreno Valley has not achieved the 50 percent diversion rate. The project will comply with **Mitigation Measure 4.7.5.1A** to help increase solid waste diversion, composting, and recycling. The measure would also have a goal to reduce waste by 75 percent by 2020.~~
~~Transportation and Motor Vehicle Measures~~	
~~**Vehicle Climate Change Standards.** AB 1493 (Pavley) required the State to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of GHG emissions from passenger vehicles and light-duty trucks. Regulations were adopted by the CARB in September 2004.~~	~~**Compliant.** The project does not involve the manufacture of vehicles. However, vehicles that are purchased and used within the project site would comply with any vehicle and fuel standards that the CARB adopts or has adopted. In addition, the project would require medium-heavy and heavy-heavy duty trucks be 2010 or newer (**Mitigation Measure 4.3.6.3B**).~~
~~**Light-Duty Vehicle Efficiency Measures.** Implement additional measures that could reduce light-duty vehicle GHG emissions. For example, measures to ensure that tires are properly inflated can both reduce GHG emissions and improve fuel efficiency.~~	
~~**Adopt Heavy- and Medium-Duty Fuel and Engine Efficiency Measures.** Regulations to require retrofits to improve the fuel efficiency of heavy-duty trucks that could include devices that reduce aerodynamic drag and rolling resistance. This measure could also include hybridization of and increased engine efficiency of vehicles.~~	
~~**Low Carbon Fuel Standard.** The CARB identified this measure as a Discrete Early Action Measure. This measure would reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020.~~	

~~Table 4.7.L: Project Compliance with Federal/State Greenhouse Gas Reduction Strategies~~

~~Strategy~~	~~Project Compliance~~
~~**Regional Transportation-Related Greenhouse Gas Targets.** Develop regional GHG emissions reduction targets for passenger vehicles. Local governments will play a significant role in the regional planning process to reach passenger vehicle GHG emissions reduction targets. Local governments have the ability to directly influence both the siting and design of new residential and commercial developments in a way that reduces GHGs associated with vehicle travel.~~	~~**Compliant.** Specific regional emission targets for transportation emissions do not directly apply to this project; regional GHG reduction target development is outside the scope of this project. The project will comply with any plans developed by the City.~~
~~**Measures to Reduce High Global Warming Potential (GWP) Gases.** The CARB has identified Discrete Early Action measures to reduce GHG emissions from the refrigerants used in car air conditioners, semiconductor manufacturing, and consumer products. The CARB has also identified potential reduction opportunities for future commercial and industrial refrigeration, changing the refrigerants used in auto air conditioning systems, and ensuring that existing car air conditioning systems do not leak.~~	~~**Compliant.** New products used or serviced on the project site (after implementation of the reduction of GHG gases) would comply with future CARB rules and regulations.~~

~~AB = Assembly Bill CARB = California Air Resources Board GHG = greenhouse gas~~
~~Source: based on analysis in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015~~

~~With implementation of applicable strategies/measures project design features, and mitigation measures, the project's contribution to cumulative GHG emissions would be reduced. In order to ensure that the proposed project complies with and would not conflict with or impede the implementation of reduction goals identified in AB 32, the Mitigation Measures listed in the above table shall be implemented.~~

~~**CARB Scoping Plan.** AB 32 focuses on reducing GHG emissions (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) to 1990 levels by the year 2020. Pursuant to the requirements in AB 32, the CARB adopted the Climate Change Scoping Plan (Scoping Plan) in 2008, which contains a variety of strategies to reduce the State's emissions. The First Update to the Scoping Plan was approved in 2014. The project will comply with existing State and Federal regulations regarding the energy efficiency of buildings, appliances, and lighting. The warehouse buildings will be built in compliance with the California Building Code to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices. In addition, **Mitigation Measure 4.16.4.6.1A** states the project will exceed the Title 24 energy conservation standards (2008 version) by 10 percent or comply with the current version. As shown in Table 4.7.M, the strategies are either consistent with or not applicable to the project; therefore, the project does not conflict with the Scoping Plan.~~

~~**Table 4.7.M: Analysis of Scoping Plan Reduction Measures**~~

~~**Scoping Plan Reduction Measure**~~	~~**Consistency Analysis**~~
~~1. *California Cap-and-Trade Program Linked to Western Climate Initiative.* Implement a broad-based California Cap-and-Trade program to provide a firm limit on emissions. Link the California cap-and-trade program with other Western Climate Initiative Partner programs to create a regional market system to achieve greater environmental and economic benefits for California. Ensure California's program meets all applicable AB 32 requirements for market-based mechanisms.~~	~~**Not Applicable.** This cap-and-trade system covers products or services (such as electricity) and the cost of the cap-and-trade system would be transferred to the consumers. Large industrial uses are the most likely source of participants for this program, and it is not likely individual logistics warehousing will be an active participant in this program. Under AB 32, emissions from natural gas use, transportation fuel use, and electricity generation are covered under the cap-and-trade program and subject to the program's emission reduction requirements.~~
~~2. *California Light-Duty Vehicle Greenhouse Gas Standards.* Implement adopted standards and planned second phase of the program. Align zero-emission vehicle, alternative and renewable fuel and vehicle technology programs with long-term climate change goals.~~	~~**Applicable.** This is a statewide measure that cannot be implemented by an individual project applicant or lead agency. When this measure is initiated, the standards would be applicable to the light-duty vehicles that would access the project site.~~
~~3. *Energy Efficiency.* Maximize energy efficiency building and appliance standards; pursue additional efficiency including new technologies, policy, and implementation mechanisms. Pursue comparable investment in energy efficiency from all retail providers of electricity in California.~~	~~**Applicable.** This is a measure for the state to increase its energy efficiency standards. However, the project will increase its energy efficiency through existing regulation and project design by implementing current Title 24 energy standards and green building characteristics. In addition, **Mitigation Measures 4.16.4.6.1A** and **B** would increase energy efficiency and **Mitigation Measures 4.16.4.6.1C** would require exceeding Title 24 (2008 version) by 10 percent or comply with the version in place at the time.~~
~~4. *Renewable Portfolio Standard.* Achieve 33 percent renewable energy mix statewide. Renewable energy sources include (but are not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas.~~	~~**Partially Applicable.** This is a measure applicable to the utility provider for the project. However, the project would provide on-site solar (**Mitigation Measure 4.16.4.6.1C**).~~
~~5. *Low Carbon Fuel Standard.* Develop and adopt the Low Carbon Fuel Standard.~~	~~**Applicable.** This is a statewide measure that cannot be implemented by an individual project applicant or lead agency. However, when this measure is initiated, the standard would be applicable to the fuel used by vehicles that would access the project site.~~
~~6. *Regional Transportation-Related Greenhouse Gas Targets.* Develop regional greenhouse gas emissions reduction targets for passenger vehicles. This measure refers to SB 375.~~	~~**Applicable.** The project is not directly related to developing greenhouse gas emission reduction targets. However, this project will improve the jobs/ratio for the City and thereby help reduce commuter-related emissions. For a discussion of the Regional Transportation Plan and the Sustainable Communities Strategy, refer to Table 4.7.D above.~~
~~7. *Vehicle Efficiency Measures.* Implement light-duty vehicle efficiency measures.~~	~~**Applicable.** When this measure is initiated, the standards would be applicable to the light-duty vehicles that would access the project site.~~

~~**Table 4.7.M: Analysis of Scoping Plan Reduction Measures**~~

~~Scoping Plan Reduction Measure~~	~~Consistency Analysis~~
~~8. *Goods Movement.* Implement adopted regulations for the use of shore power for ships at berth. Improve efficiency in goods movement activities.~~	~~**Not Applicable.** The project does not propose any changes to maritime, rail, or intermodal facilities or forms of transportation. However, the project is related to goods movement and provides logistics warehousing away from port areas.~~
~~9. Million Solar Roofs Program. Install 3,000 MW of solar-electric capacity under California's existing solar programs.~~	~~**Applicable.** This measure is to increase solar throughout California, which is being done by various electricity providers and existing solar programs. Pursuant to **Mitigation Measure 4.16.4.6.1C**, the project will be incorporating onsite solar panels.~~
~~10. Medium/Heavy-Duty Vehicles. Adopt medium and heavy-duty vehicle efficiency measures.~~	~~**Applicable.** This is a statewide measure that cannot be implemented by an individual project applicant or lead agency. However, when this measure is initiated, the standards would be applicable to the vehicles that access the project site. In addition**, Mitigation Measure 4.3.6.3B** requires that trucks be model year 2010 or newer.~~
~~11. *Industrial Emissions.* Require assessment of large industrial sources to determine whether individual sources within a facility can cost-effectively reduce greenhouse gas emissions and provide other pollution reduction co-benefits. Reduce greenhouse gas emissions from fugitive emissions from oil and gas extraction and gas transmission. Adopt and implement regulations to control fugitive methane emissions and reduce flaring at refineries.~~	~~**Not Applicable.** This measure would apply to the direct greenhouse gas emissions at major industrial facilities emitting more than 0.5 million mt CO_2e (500,000 mt CO_2e) per year. It is not anticipated that the project would emit more than 500,000 mt CO_2e per year; however, the project is not considered a single facility but would consist of multiple warehouse buildings. The project is a "project" under CEQA but not one facility, which is why a programmatic EIR is being prepared. This measure would be applicable to power plants, refineries, cement plants, and other related sources. In addition, most emissions from the project are indirect since the majority of the emissions are from trucks and motor vehicles.~~
~~12. High Speed Rail. Support implementation of a high-speed rail system.~~	~~**Not Applicable.** This is a statewide measure that cannot be implemented by a project applicant or lead agency.~~
~~13. Green Building Strategy. Expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings.~~	~~**Applicable.** The State now requires development to use various green building practices. The project will implement green building strategies through existing regulation. In addition, **Mitigation Measures 4.16.4.6.1A** and **B** would increase energy efficiency. **Mitigation Measure 4.16.4.6.1C** would require that the project exceed Title 24 (2008 version) by 10 percent or comply with the current version.~~
~~14. High Global Warming Potential Gases. Adopt measures to reduce high global warming potential gases.~~	~~**Applicable.** When this measure is initiated, it would be applicable to the high global warming potential gases that would be used by the project (such as in air conditioning).~~

~~**Table 4.7.M: Analysis of Scoping Plan Reduction Measures**~~

~~Scoping Plan Reduction Measure~~	~~Consistency Analysis~~
~~15. Recycling and Waste. Reduce methane emissions at landfills. Increase waste diversion, composting, and commercial recycling. Move toward zero-waste.~~	~~**Not Applicable.** The project would not contain a landfill. The State wishes to help increase waste diversion, and the project would reduce waste with implementation of mitigation.~~
~~16. *Sustainable Forests.* Preserve forest sequestration and encourage the use of forest biomass for sustainable energy generation.~~	~~**Not Applicable.** No forested lands exist on site.~~
~~17. *Water.* Continue efficiency programs and use cleaner energy sources to move and treat water.~~	~~**Not Applicable.** This is a measure for State and local agencies. However, the project would reduce water through project design (i.e., implementation of the Specific Plan) and **Mitigation Measures 4.16.6.1A** through **4.16.6.1C**.~~
~~18. *Agriculture.* In the near term, encourage investment in manure digesters and at the five-year Scoping Plan update determine if the program should be made mandatory by 2020.~~	~~**Not Applicable.** No grazing, feedlot, or other agricultural activities that generate manure occur on site or are proposed to be implemented by the project.~~

~~Sources: California Air Resources Board 2008, *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015~~

~~**City General Plan Policies.** The project must also be evaluated against the City's General Plan policies that relate to greenhouse gas emissions, as shown in Table 4.7.N. This analysis shows that the project is consistent with the applicable General Plan objectives and policies, or the particular objective or policy is not applicable to the proposed WLC project.~~

~~**Table 4.7.N: Consistency with City General Plan Air Quality Policies**~~

~~Objective or Policy~~	~~Project Consistency~~
~~**Objective 6.6.** Promote land use patterns that reduce daily automotive trips and reduce trip distance for work, shopping, school, and recreation.~~	~~**Consistent.** The project is providing employment opportunities to Moreno Valley and the surrounding area.~~
~~**Policy 6.6.1.** Provide sites for new neighborhood commercial facilities within close proximity to the residential areas they serve.~~	~~**Not Applicable.** The project does not propose the development of neighborhood commercial facilities or residential dwellings.~~
~~**Policy 6.6.2.** Provide multifamily residential development sites in close proximity to neighborhood commercial centers in order to encourage pedestrian instead of vehicular travel.~~	~~**Not Applicable.** The project is industrial and does not propose the development of residential uses.~~
~~**Policy 6.6.3.** Locate neighborhood parks in close proximity to the appropriate concentration of residents in order to encourage pedestrian and bicycle travel to local recreation areas.~~	~~**Not Applicable.** The project is industrial and does not propose the development of residential uses.~~
~~**Objective 6.7.** Reduce mobile and stationary source air pollutant emissions.~~	~~**Consistent.** The project would be implementing feasible Mitigation Measures to reduce mobile and stationary emissions (**Mitigation Measures 4.3.6.3B, 4.3.6.3C, 4.3.6.3D,** and **4.3.6.4A**).~~
~~**Policy 6.7.1.** Cooperate with regional efforts to establish and implement regional air quality strategies and tactics.~~	~~**Not Applicable.** This measure is beyond the scope of the project; the City will continue to work with the SCAQMD in regional planning efforts.~~
~~**Policy 6.7.2.** Encourage the financing and construction of park-and-ride facilities.~~	~~**Not Applicable.** The project consists of industrial uses; a park and ride on the project would not be feasible.~~

~~Table 4.7.N: Consistency with City General Plan Air Quality Policies~~

~~**Objective or Policy**~~	~~**Project Consistency**~~
~~**Policy 6.7.3.** Encourage express transit service from Moreno Valley to the greater metropolitan areas of Riverside, San Bernardino, Orange and Los Angeles Counties.~~	~~**Not Applicable.** No express mass transit facilities are designated on the project site or planned on the project site; therefore, this measure is beyond the scope of the project.~~
~~**Policy 6.7.6.** Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code.~~	~~**Consistent.** The project will comply with Title 24 requirements.~~

~~Policies 6.7.4 and 6.7.5 are discussed in the air quality EIR section, Section 4.3).~~
~~Source of objective and policy: Moreno Valley General Plan (2006).~~
~~Source of project consistency: *Air Quality, Greenhouse Gas, and Health Risk Assessment Report*, 2015~~

~~**City Climate Action Strategy.** Finally, Table 4.7.O evaluates the consistency of the proposed project with the policies of the City's Climate Action Strategy approved in October 2012. As shown below and in Appendix D of the revised Air Quality, Greenhouse Gas, and Health Risk Assessment, the project is consistent with the requirements of the Strategy for non-residential development with implementation of project design features and mitigation measures.~~

~~Table 4.7.O: Consistency with City Climate Action Strategy~~

~~**Strategy Items**~~	~~**Project Consistency**~~
~~**R2-T1:** Land Use Based Trips and VMT Reduction Policies. Encourage the development of Transit Priority Projects along High Quality Transit Corridors identified in the SCAG Sustainable Communities Plan, to allow a reduction in vehicle miles traveled.~~	~~**Not Applicable.** A Transit Priority Project is one that has at least 50 percent residential use based on area, at least 20 units per acre and is within a ½ mile of a major transit stop or High Quality Transit Corridor. A High Quality Transit Corridor is defined as one with 15-minute frequencies during peak commute hours. The proposed project does not include a residential component and is not along a High Quality Transit Corridor nor are there any High Quality Transit Corridors or major transit stops in the vicinity of the project area. As a result, the strategy is not applicable.~~
~~**R2-T3:** Employment-Based Trip Reductions. Require a Transportation Demand Management (TDM) program for new development to reduce automobile travel by encouraging ride-sharing, carpooling, and alternative modes of transportation.~~	~~**Consistent** with implementation of **Mitigation Measure 4.3.6.4A.**~~
~~**R2-E1:** New Construction Residential Energy Efficiency Requirements. Require energy efficient design for all new residential buildings to be 10 percent beyond the current Title 24 standards.~~	~~**Not Applicable.** This measure applies to residential projects.~~
~~**R2-E2:** New Construction Residential Renewable Energy. Facilitate the use of renewable energy (such as solar (photovoltaic) panels or small wind turbines) for new residential developments. Alternative approach would be the purchase of renewable energy resources offsite.~~	~~**Not Applicable.** This measure applies to residential projects.~~
~~**R2-E5:** New Construction Commercial Energy Efficiency Requirements. Require energy efficient design for all new commercial buildings to be 10% beyond the current Title 24 standards.~~	~~**Consistent** with **Mitigation Measure 4.16.4.6.1C.**~~

~~**Table 4.7.O: Consistency with City Climate Action Strategy**~~

~~**Strategy Items**~~	~~**Project Consistency**~~
~~**R3-E1:** Energy Efficient Development, and Renewable Energy Deployment Facilitation and Streamlining. Updating of codes and zoning requirements and guidelines to further implement green building practices. This could include incentives for energy efficient projects.~~	~~**Not Applicable.** This refers to updating building and zoning codes and does not apply to this warehousing development plan.~~
~~**R3-L2:** Heat Island Plan. Develop measures that address "heat islands." Potential measures include using strategically placed shade trees, using paving materials with a Solar Reflective Index of at least 29, an open grid pavement system, or covered parking.~~	~~**Consistent.** The Specific Plan indicates that vehicle parking areas are to be landscaped to provide a shade canopy (50 percent coverage at maturity).~~
~~**R2-W1:** Water Use Reduction Initiative. Consider adopting a per capita water use reduction goal which mandates the reduction of water use of 20 percent per capita with requirements applicable to new development and with cooperative support of the water agencies.~~	~~**Consistent.** California Green Building Standards Code, Chapter 5, Division 5.3, Section 5.303.2 requires that indoor water use be reduced by 20 percent. Section 5.304.3 requires irrigation controllers and sensors. The Specific Plan also contains a variety of water conservation features. **Mitigation Measures 4.16.1.6.1A, B,** and **C** also provide water reduction measures.~~
~~**R3-W1:** Water Efficiency Training and Education. Work with EMWD and local water companies to implement a public information and education program that promotes water conservation.~~	~~**Consistent.** Tenants and owners within the WLCSP will provide water conservation information from EMWD and other sources to workers on a regular basis.~~
~~**R2-S1:** City Diversion Program. For Solid Waste, consider a target of increasing the waste diverted from the landfill to a total of 75 percent by 2020.~~	~~**Consistent.** The project would incorporate standard City waste reduction features and **Mitigation Measure 4.7.6.1A** (has a target to reduce waste by 75 percent by 2020).~~
~~**C11:** Require that developer recycle existing street material for use as base for new streets.~~	~~**Consistent.** Project will implement **Mitigation Measure 4.7.6.1A** where feasible.~~

~~**Executive Order S-3-05.** As discussed in Section 4.7.4, the SCAQMD developed its thresholds based on consistency with California Executive Order S-3-05. As shown in Impact 4.7.6.1, the project's uncapped GHG emissions would not exceed the SCAQMD's industrial threshold. Therefore, the project would not conflict with Executive Order S-3-05. This impact is less than significant.~~

~~**Specific Plan Design Features.** The WLCSP contains a sustainability section that emphasizes water and energy conservation throughout the project design, which in turn will help reduce GHG emissions (Section 1.3.2, Green Building-Sustainable Development).~~

~~**Mitigation Measures.** Implementation of previously referenced **Mitigation Measures 4.3.6.3B, 4.3.6.4A, 4.3.6.3C, 4.3.6.3D, 4.7.6.1A, 4.16.1.6.1A, 4.16.1.6.1B, 4.16.1.6.1C, 4.16.4.6.1A, 4.16.4.6.1B,** and **4.16.4.6.1C** will help reduce project-related GHG emissions and therefore make it more consistent with GHG reduction plans, policies, and/or regulations.~~

~~**Level of Significance After Mitigation.** Less than significant (original DEIR conclusion was significant). As previously identified, implementation of the proposed project could result in the~~

~~development of an approximately 40.6 million square foot high cube-logistics distribution logistics. The proposed project includes a variety of physical attributes and operational programs that would help reduce operational-source pollutant emissions from worker commuting, including GHG emissions. Future development that would occur under the proposed project would be consistent with greenhouse gas emission reduction strategies and policies, including the City's Climate Change Strategy. The project would implement the Mitigation Measures listed above to reduce its contribution to GHG emissions and to ensure it does not conflict with or impede implementation of reduction goals identified in AB 32, Governor's Executive Order S-3-05, and other strategies to help reduce GHGs to the level proposed by the Governor. In addition, the project would also be subject to all applicable regulatory requirements, which would also reduce the GHG emissions of the project. Therefore, the proposed project would not conflict with any applicable plan, program, policy, or regulation related to the reduction of GHG emissions. Impacts are considered less than significant.~~

~~Similar to the discussion of cumulative air quality impacts, the project may employ workers locally from the City. This has the benefit of improving the local jobs/housing balance leading to air quality benefits in terms of shorter trip lengths, which lead to lower emissions than if the workforce was derived from distant locations.~~

~~The analysis in the EIR concluded that the Project's contributions to climate change are less than significant. Given (i) the global nature of climate change; (ii) uncertainty regarding the extent to which anthropogenic sources are the true causes of any increase in the earth's temperatures; and (iii) the lack of emissions controls being imposed by the world's most rapidly developing nations, even if there is a causal relationship between anthropogenic emissions and an increase in the world's temperature, it is difficult to argue that an individual Project's cumulative contribution to climate change is foreseeable and cumulatively considerable. Nonetheless, the State of California has adopted a number of policies, including AB32, Governor's Executive Order S-3-05, and Pavley I, that provide the structure and commitment to address California's contribution to global climate change. Since the proposed project is consistent with these policies, including being below the SCAQMD threshold for greenhouse gases that was structured in accordance with these State policies, the project is consistent with greenhouse gas plans, policies and regulations.~~

~~4.7.7 Cumulative Impacts~~

~~Given the findings of AB 32, of SB 97, and the requirements of CEQA, the Lead Agency must determine whether a project will or will not have a cumulatively considerable contribution to greenhouse gas emissions and global climate change. Due to the lack of guidance for determining the significance of cumulative impacts to climate change from projects, and out of an overabundance of caution, the project has been evaluated to determine whether emissions of greenhouse gases have been minimized to the extent feasible with current technology and measures.~~

~~While it is not possible for any one development project to have a significant impact on global warming or climate change, the proposed project will contribute to cumulative GHG emissions in California. Cumulatively, the buildout of the proposed project would contribute approximately from 12,000 metric tons of CO_2e in its first year of construction up to 386,000 mt CO_2e per year at buildout (with mitigation). Of those emissions at buildout, the majority, 98 percent, are within the AB 32 cap meaning that total emissions will not increase due to the cap-and-trade program. The remainder, approximately 6,000 mt CO_2e per year at buildout, represents an increase in uncapped emissions, which is 0.001 percent of California's total emissions of 458.68 million mt of CO_2e in 2012 for the entire State. Comparing the state inventory to the project's inventory is not a straightforward comparison because different methods are utilized in each inventory. The mitigation measures discussed above will reduce the project's emissions of GHGs to below significance. The~~

~~CARB is currently in the process of designing regulations to monitor, limit, and ultimately reduce California GHG emissions, but there are as yet no adopted numerical or quantifiable standards for assessing the significance of cumulative impacts from projects in the South Coast Air Basin.~~

~~Cumulatively, the emissions from electricity production (which are capped under the requirements of AB 32) would comprise approximately 26 percent of the project's total CO_2e emissions. Water usage and solid waste disposal emissions comprise approximately 2 percent of the project's total CO_2e emissions while the emissions from vehicle exhaust would comprise approximately 70 percent of the project's total CO_2e emissions. The emissions from vehicle exhaust are controlled by the State and Federal governments and are outside the control of the City. The remaining CO_2e emissions are primarily associated with building systems. The proposed project is required to comply with existing State and Federal regulations regarding the energy efficiency of buildings, appliances, and lighting, which would reduce the project's electricity demand. The new buildings constructed in accordance with current energy efficiency standards would be more energy-efficient than older buildings.~~

~~With implementation of the strategies and programs described previously, the project is consistent with the strategies to reduce California's emissions to the levels proposed in Executive Order S-3-05. In addition, emissions not covered or capped by AB 32 are below the significance threshold. Therefore, cumulative impacts are less than significant.~~

~~4.8 HAZARDS AND HAZARDOUS MATERIALS: TABLE OF CONTENTS~~

~~TABLE~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

NOTE TO READERS. *The cumulative portion of Section 4.8 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.8 of this Revised Sections of the FEIR. All other portions of Section 4.8 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.8 means that the corresponding portion of Section 4.8 in the FEIR remains unchanged or has been deleted.*~~*A number of comments were made regarding hazardous materials, mainly potential pesticide contamination*[1]*. In response, the mitigation measures in this section have been revised. Otherwise, no major revisions have been made to this section in response to comments.*~~

4.8 HAZARDS AND HAZARDOUS MATERIALS

This section describes and analyzes the potential impact to human health and the environment due to the exposure to hazardous materials or conditions that could be encountered as a result of the construction activities within the WLC project area and also the operational activities of the project. Potential effects include those associated with the routine transport, use, or disposal of hazardous materials; reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment; safety hazards associated with the project's existing agricultural use, impairment/interference with adopted emergency response plans or emergency evacuation plans, and exposure of people or structures to risks involving wildland fires.

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

For the reader's reference, this EIR has been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development.

~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland~~

~~[1] *Letters F-7A and F-7B from Lozeau Drury LLP (Comments F-7A-18, -21 and -22 and F-7B-2) and in Letter F-8 from Shute Mihaly.*~~

~~Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The evaluation was based on review of available information included with the application, review of previous Phase I Environmental Site Assessments for the WLC project area, and review of other published materials. This section is based in part on the following reports, which are included as Appendix I of this EIR:

- *Phase I Environmental Site Assessment Reports,* World Logistic Center Specific Plan WLC project area—approximately 3,820 acres in the WLC planning area, south of State Route 60 (SR-60) between Redlands Boulevard and Gilman Springs Road, extending to the southerly City Limit, LOR Geotechnical Group, Inc., 18 reports for various locations within the WLC project area prepared between June 10, 2003–May 28, 2008, plus one comprehensive Phase 1 as recent as January 2013.

4.8.1 Existing Setting

4.8.1.1 Project Site History

The project area is approximately 3,714 acres and is located in Rancho Belago, the eastern portion of the City of Moreno Valley, in northwestern Riverside County. The area is bounded by State Route 60 (SR-60) to the north, Gilman Springs Road to the east, Redlands Boulevard to the west, and the City boundary to the south.

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

Within the project area, 2,610 acres will be covered by the World Logistics Center Specific Plan, which is planned to be developed with up to 40.6 million square feet of modern logistics facilities. The remainder of the project area, approximately 1,104 acres is owned by the State and by existing utility facilities. This area will be designated as permanent open space and will allow the continued operation of the utility facilities.

The majority of the project area is vacant undeveloped land. There are seven existing single-family homes with associated ranch/farm buildings located throughout the project area. The project area has been historically used for dry-farming and livestock grazing, and portions of it are currently being dry farmed. There are currently no flood control facilities that are owned, operated, or maintained by the Riverside County Flood Control and Water Conservation District (RCFCWCD). Over the years, 18 separate Phase I Environmental Site Assessments (ESAs) have been conducted covering a large majority of the property (Table 4.8.A).

Table 4.8.A: Project-Related Phase 1 Hazmat Reports

Location	Date	Conclusion and Follow Up Action
Group A Properties consisting of 352 acres located between Redlands Boulevard and Gilman Hot Springs Road to the east and west and Eucalyptus and Davis Roads to the north and south.	6/10/03	*No Further Action:* No recognized environmental conditions associated with the site.

Table 4.8.A: Project-Related Phase 1 Hazmat Reports

Location	Date	Conclusion and Follow Up Action
Colville Property, 17.8 acres (2 parcels, APNs 478-240-006 and 007) located on the southwest corner of Alessandro Boulevard and World Logistics Center Parkway~~Theodore Street~~.	2/23/04	*No Further Action:* No recognized environmental conditions associated with the site.
13241 Theodore Street.	2/11/05	Clean up of one empty 55-gallon metal drum and trash and debris for disposal in a Class III municipal landfill; no further remedial action necessary.
Kerr Stock Farm Properties: 12600 and 12560 Sinclair Street; 4 parcels, 120± acres, located southeast of Redlands Boulevard and SR-60; *Triana Property*, 12540 Sinclair Street (APN: 477-090-001), southeast of Redlands Boulevard and SR-60; *Smith Property*, 0.88-acre property at 12550 Sinclair Street (APN 477-090-013).	5/5/03	Several 55-gallon and smaller containers of paint, both latex and oil base containers, and waste oil found; containers and stained soil are to be removed and properly disposed of. Dumped green waste and household trash and debris to be removed; two aboveground fuel tanks to be removed. Based on the age of structures, an asbestos and lead-based paint survey should be conducted prior to demolition. No further remedial action necessary upon removal of above-noted items.
Sanindon Property, 19± acres (APNs 477-090-004 and 006) located southeast of Sinclair Street and SR-60.	9/10/03	*No Further Action:* No recognized environmental conditions associated with the site.
APNs 478-240-011, 017, 026, 027, and 030, 46.5+-acre vacant property, located on the southeast corner of Brodiaea Avenue and Sinclair Street.	4/30/04	*No Further Action:* No recognized environmental conditions associated with the site.
Chehade Property, 2 parcels (APNs 478-240-24 and 29) 18.75 acres, southwest of Alessandro Boulevard and World Logistics Center Parkway~~Theodore Street~~.	12/29/04	Removal of one 55-gallon waste oil drum. Surface-stained surrounding soil to be removed and properly disposed of. No further remediation necessary.
APNs 478-240-019, 025, and 028.	4/11/05	Significant illegal dumping of trash and debris, but all appears suitable for disposal in a Class III municipal landfill; ten tires present, additional disposal fees may be incurred; metal 5-gallon bucket about half full with racing fuel, located in the southeast portion of Parcel 028 west of the east boundary and southeast of the old borrow pit quarry area; bucket should be lawfully transported off site and properly disposed of or recycled. No further remedial action required.
Mabon Property (APN 477-080-042) 8.8+ acres.	2/28/05	*No Further Action:* No recognized environmental conditions associated with the site.

Table 4.8.A: Project-Related Phase 1 Hazmat Reports

Location	Date	Conclusion and Follow Up Action
APNs 477-090-008 through 012 and 477-100-011 through 014, 69.5± acres.	11/30/04	Trash and debris present appeared suitable for disposal in a Class III municipal landfill, but forty tires, including some large-sized tires, may require special disposal fees. A black 5-gallon bucket, approximately one-third full of waste oil, observed at north end of the drainage channel. Very minor oil-stained soil and organic debris was noted. The oil stained soil is insignificant in extent and is of no environmental concern, the 5-gallon bucket of waste oil should be properly disposed of or recycled. No further remedial action required.
APN 477-090-007, northeast corner of Sinclair Street and Fir Avenue.	4/25/07	*No Further Action:* No recognized environmental conditions associated with the site.
APNs 477-080-027, 028, 029, and 030, 36.7+ acres of vacant land, southeast corner of Ironwood Avenue and Sinclair Street.	3/24/05	*No Further Action:* No recognized environmental conditions associated with the site.
APNs 478-240-005 and 008.	3/1/06	Illegal dumping of trash and debris, especially on the south end near the boundary. All of the trash and debris observed appear to be suitable for disposal in a Class Ill municipal landfill. No further remedial action required.
Himada Property, 30050 Dracaea Avenue, (APN 422-070-033)	7/9/07	Significant amounts of trash and debris are present and appear suitable for disposal in a Class Ill municipal landfill. No drums, barrels, or other containers were observed; one partially crushed vehicle battery and minor oil-stained soils were observed, battery should be properly transported off site for recycling or disposal. The minor oil stained soils is a *de minimis* condition and should be mitigated as a result of normal grading activities. No further remedial action required.
Sunnymead Poultry Group "C" Properties consisting of 421 acres east of World Logistics Center Parkway~~Theodore Street~~ and north of Alessandro Boulevard.	5/5/03	A former chicken ranch made up 75 acres and the remainder was dry-farmed. Former underground storage tanks (USTs) converted to aboveground storage tanks (ASTs) were present at the chicken ranch, which was undergoing demolition. Soil samples collected during and after demolition activities confirmed the removal of hydrocarbon-affected soil. Soil samples collected from beneath the location of the two former USTs at 6, 8, and 10 feet deep had no reported concentrations of petroleum hydrocarbons. Pesticide sampling (42 samples) indicated all results below residential limits. No further action.

Source: Phase 1 Environmental Site Assessment Reports (various), LOR Geotechnical.

Historic land uses noted for the WLC project area included tree farms (olives/citrus), rural residential uses, a horse ranch, minor auto repair related to residential users, two dairies, and a chicken ranch. However, the tree orchards were not sustained and the horse, dairy, and chicken ranches ceased operating several years ago as well. Present land use is limited to dry farming, undeveloped vacant land, and seven residential structures. In 1992, the City approved a master-planned, mixed-use community called “Moreno Highlands” on most of the project site but no uses within this community were ever built.

Dry-land farming does not typically apply pesticides or other agricultural chemicals. The ESAs did not find significant residual pesticides within the project area. Soil sampling conducted within limited site characterizations revealed trace concentrations of pesticides present in the near-surface soils at some of the sampling locations. However, the sample results showed concentrations of pesticides to be below the Environmental Protection Agency’s (EPA’s) Preliminary Remediation Goals for residential properties, which indicated that no further sampling was necessary and unrestricted use of the property was allowed.

~~*NOTE: The following information was added to clarify or expand on the issue of agricultural chemicals raised in Letter F-7A, F-7B, and F-8.*~~

The commenters all expressed the opinion that the Phase 1 documents for the project site did not provide an accurate assessment of current soil conditions. The many Phase 1 reports done on many parcels throughout the WLC property and over a long period of time constitute an extensive random sampling of the on-site soils, and demonstrate the site does not contain widespread soil contamination from pesticides. Dry farming does not use a variety of agricultural chemicals because it relies on ambient rainfall and other conditions to support the limited crops grown on the site. Many of the organo-chloro-phosphate (OCP) based chemicals used for more intensive irrigated crops are not used in dry farming due to their cost and lack of irrigation to distribute the chemicals. In addition, the chemicals used in dry farming typically break down quickly in the soil and are not broadcast but rather applied by hand sprayers, so any applications would be necessarily limited. There is no practical reason why intense crop herbicides or pesticides like DDT would be used in conjunction with dry farming in general, and there is no evidence such chemicals were used on the WLC site in the past. In fact, onsite soil sampling conducted for the Phase 1 reports found no evidence of significant OCP contamination on the WLC site. The chicken ranch and related facilities that were on the site for a time are in the process of being removed, including any surficial materials with waste products. There has been no empirical evidence presented that would demonstrate there is actual contamination by agricultural chemicals or wastes on the WLC site.

According to records from the State Department of Toxic Substances Control (DTSC), dry farmed agricultural properties of the WLC project site have had pesticides like 2,4-Dichlorophenoxyacetic acid, commonly called 2, 4, D applied in the past. 2, 4 D is the 3rd most common herbicide used in the US and can be purchased at retailers like Home Depot and Lowes. 2,4 D has a half-life of a few days to two weeks, depending on site conditions (available water, sun etc.). Within a few months after application, the residual amount of pesticide is less than 1 percent. Dry farming operations, and any pesticide application, will have ceased well before the actual grading of the site, and any current pesticide application, will have biodegraded to less than significant levels. 2,4 D was the most common pesticide applied to the site, often combined with Agri-Dex (as indicated in the DTSC records) which is used as a wetting agent to increase absorption of the 2, 4 D. The DTSC records indicate these chemicals were applied to grapes on the site, but there are no areas of cultivated grapes at present on the WLC site. It is possible some of these materials were used on the rural residences on the site, however the 2, 4 D and Agri-Dex were by far the most common chemical used on the site by weight in 2010, which accounted for almost a thousand pounds of chemical applied. Other chemicals applied to properties within the WLC site during that time include pyrethrins, spinosad, beta-cyfluthrin, sulfur, “Roundup” (glyphosate), “scythe, and rimsuffuron mainly as herbicides and fungicides, but less than one pound of each of these materials was typically applied at a given time, so the overall potential exposure is considered to be relatively minor at present. Therefore, there is no evidence there will be adverse environmental impacts on adjacent property owners or WLC site workers from past pesticide applications at the site, including 2, 4 D. However, to err on the side of caution, Mitigation Measure 4.8.6.1A has been modified to include soil sampling for agricultural chemicals prior to grading of the 7 rural residential lots where it is possible more chemical materials were applied in more concentrated locations than broadcast on large wheat fields.

The Phase I ESAs noted some illegal dumping of trash and debris, including paints, tires and trash, which has occurred on and around the project area. Most of the trash and debris observed appeared to be suitable for disposal in a Class Ill municipal landfill. Prior to development, all containers of hazardous materials and waste will need to be lawfully transported off site for disposal or recycling by a licensed hazardous waste transporter.

Former aboveground and belowground fuel storage tanks associated with the former chicken ranch were removed. Hydrocarbon-affected soil associated with the aboveground storage tanks (ASTs) and other chicken ranch operations were removed during demolition activities at the site. During the demolition activities, hazardous waste in 55-gallon drums and smaller, and hydrocarbon-affected soil were removed and transported off site by a licensed hazardous waste hauler for proper disposal.

Given that some of the residential and rural farming-related structures date back to the 1930s and 1940s, it is likely that some of them contain asbestos and lead-based paint. Therefore, it is recommended that the demolition of the structures at the site be performed in accordance with all applicable regulations for the handling of such materials.

The Phase I ESAs revealed no evidence of recognized environmental conditions indicative of releases or threatened releases of hazardous substances on, at, in, or to the WLC project area. A recognized environmental condition is defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.

Several natural gas pipelines (16-inch to 36-inch diameter) cross the site (see also Section 4.16, *Utilities and Service Systems*). At present, the San Diego Gas and Electric Company (SDG&E) company and the Southern California Gas Company (SCGC) maintain these natural gas pipelines under medium and high pressure across the central and southern portions of the site. None of the rural residences on site is located adjacent to any of these existing regional gas lines.

4.8.1.2 Surrounding Area

Major access to the project area is from State Route 60, Redlands Boulevard, Alessandro Boulevard, Gilman Springs Road, and World Logistics Center Parkway~~Theodore Street~~. Redlands Boulevard, World Logistics Center Parkway~~Theodore Street~~, and Gilman Springs Road are north-south roadways that intersect with SR-60.

There is little development adjacent to the eastern and southern boundaries of the project area. The area to the east of the project area is commonly referred to as the Badlands, a rugged area that separates the City of Moreno Valley from San Timoteo Canyon and the City of Beaumont. Due to its steep slopes and canyons, the Badlands area has experienced little development; however, there are approximately ten single-family homes in the area east of Gillman Springs Road adjacent to the project site. The Badlands Sanitary Landfill, operated by the County of Riverside Waste Management Department, is located approximately 1.5 miles northeast of the WLC project area. The area south of the project area is known as the San Jacinto Wildlife Area (SJWA), which includes an “Upland Game Hunting Area”. The SJWA is owned and operated by the California Department of Fish and Wildlife (CDFW) and contains approximately 20,000 acres of restored wetlands and ponds. Hunting is allowed, with the proper state hunting license. Depending on the time of year, hunting in this area includes jackrabbits, rabbits, waterfowl as well as pheasants, chukar, and quail. The SJWA is accessed from Davis Road, off of

Ramona Expressway. In addition to the hunting allowed at the SJWA, there are private hunting clubs that abut the SJWA, including the Mystic Lake Duck Club and the Four Winds Pheasant Club.

The Lake Perris State Recreation Area is immediately southwest of the project site and is owned and operated by the California State Parks Department. It contains approximately 6,000 acres of open space land, which is used both for recreation and preservation of the natural southern California landscape.

A large logistics facility (1.8 million-square foot Skechers facility) is located northwest of the project area. Other developed properties include residential neighborhoods along Redlands Boulevard along the western boundary of the project area. An area of the City known as Old Moreno is adjacent to the southwest portion of the project site (at the intersection of Redlands Boulevard and Alessandro Boulevard). The homes along Merwin Street and Bay Street and east of Redlands Boulevard are the closest sensitive receptors to the project site.

There are two future commercial sites located immediately north of the project area. One is located at the northwest corner of World Logistics Center Parkway~~Theodore Street~~ and Eucalyptus Avenue (approved for 80,000 square feet), and the other is at the northeast corner of Redlands Boulevard and Eucalyptus Avenue (approved for 120,000 square feet). The nearest large-scale commercial development is located on the south side of SR-60 at Moreno Beach Drive, approximately 1.25 miles to the west of the project. This shopping complex includes Walmart and Target along with restaurants and ancillary commercial and service uses, as well as the Moreno Valley Auto Center. The central core of Moreno Valley, which includes other residential neighborhoods and commercial activity, is located approximately three miles west of the project area.

There are no airports in the vicinity of the project area. The nearest airport is March Air Reserve Base (MARB) located approximately seven miles southwesterly of the project area. The MARB is under the authority of the March Joint Powers Authority (MJPA), which acts as the land use authority, in addition to the Redevelopment Agency as well as the March Inland Port Airport Authority are involved in the reuse of the former March Air Force Base. The March Air Field is a joint-use airport, used both for military and civilian purposes. March Inland Port (MIP)[1] is the civilian portion of the airport. The project area is not located within the Airport Influence Area.

There are no existing school facilities within one-quarter of a mile of the project area. Calvary Chapel Christian School is the closest existing school, located approximately 1.17 miles northwest of the project area, north of SR-60. There is a site for a proposed public elementary school, Wilmot Elementary School, located approximately one-quarter of a mile from the project area located on Bay Avenue at Wilmot Street. A Preliminary Environmental Assessment Report (PEA) was prepared for the proposed elementary school site in July 2007.

4.8.1.3 NOP/Scoping Comments

Several residents commented during the NOP period that there are major natural gas facilities located on the WLCSP project site, and were concerned about safety during construction, relocation, and operation of the pipelines. During the scoping meeting, a conservation group representative encouraged the City to look at freeway accident data involving trucks and expressed concern that accidents on the freeway would cause truck drivers to divert off the freeway and onto local streets in Moreno Valley. The WLC project biology report also warned of risks to new project buildings and employees from errant gunfire from the Mystic Lake area (i.e., hunting clubs) (MBA 2013). Several

---

[1] March Inland Port was previously called March Air Reserve Base.

residents also commented that there are major natural gas facilities and pipelines located on the WLCSP project site. These comments are addressed in the following analysis of potential hazards.

4.8.2 Existing Policies and Regulations

4.8.2.1 Federal Regulations

Comprehensive Environmental Response, Compensation, and Liability Act. Discovery of environmental health damage from disposal sites prompted the U.S. Congress to pass the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund). The purpose of the CERCLA is to identify and clean up chemically contaminated sites that pose a significant environmental health threat. The Hazard Ranking System is used to determine whether a site should be placed on the National Priorities List for cleanup activities.

Superfund Amendments and Reauthorization Act. The Superfund Amendments and Reauthorization Act (SARA) pertain primarily to emergency management of accidental releases. It requires formation of State and local emergency planning committees, which are responsible for collecting, material handling, and transportation data for use as a basis for planning. Chemical inventory data are made available to the community at large under the “right-to-know” provision of the law. In addition, SARA also requires annual reporting of continuous emissions and accidental releases of specified compounds. These annual submissions are compiled into a nationwide Toxics Release Inventory (TRI).

Resource Conservation and Recovery Act. The Resource Conservation and Recovery Act (RCRA) Subtitle C addresses hazardous waste generation, handling, transportation, storage, treatment, and disposal. It includes requirements for a system that uses hazardous waste manifests to track the movement of waste from its site of generation to its ultimate disposition. The 1984 amendments to the RCRA created a national priority for waste minimization. Subtitle D establishes national minimum requirements for solid waste disposal sites and practices. It requires states to develop plans for the management of wastes within their jurisdictions. Subtitle I requires monitoring and containment systems for underground storage tanks that hold hazardous materials. Owners of tanks must demonstrate financial assurance for the cleanup of a potential leaking tank.

Hazardous Materials Transportation Act. The Hazardous Materials Transportation Act is the statutory basis for the extensive body of regulations aimed at ensuring the safe transport of hazardous materials on water, rail, highways, in the sky, or in pipelines. It includes provisions for materials classification, packaging, marking, labeling, placarding, and shipping documentation.

4.8.2.2 State Regulations

California Code of Regulations. Most State and Federal regulations and requirements that apply to generators of hazardous waste are spelled out in the California Code of Regulations (CCR), Title 22, Division 4.5. Title 22 contains the detailed compliance requirements for hazardous waste generators, transporters, treatment, storage, and disposal facilities. Because California is a fully authorized State according to RCRA, most RCRA regulations (those contained in 40 Code of Federal Regulations [CFR] 260, et seq.) have been duplicated and integrated into Title 22. However, because the Department of Toxic Substance Control (DTSC) regulates hazardous waste more stringently than the U.S. EPA, the integration of California and Federal hazardous waste regulations that make up Title 22 do not contain as many exemptions or exclusions as does 40 CFR 260. As with the California Health and Safety Code, Title 22 also regulates a wider range of waste types and waste management activities than do the

RCRA regulations in 40 CFR 260. To aid the regulated community, California compiled the hazardous materials, waste and toxics-related regulations contained in CCR, Titles 3, 8, 13, 17, 19, 22, 23, 24, and 27 into one consolidated CCR, Title 26 "Toxics." However, the California hazardous waste regulations are still commonly referred to as Title 22. For the purposes of clarity, because of the extensive reach of Title 22 and Title 26, many common household products sold in grocery stores and home improvement warehouses qualify as hazardous materials. These items include household cleaners, detergents, paint, motor oil, lubricants, glues, pesticides, etc. The term "hazardous materials" is also defined to include many on site materials as well, such as lubricants, fuel, etc. Thus, when this section of the EIR discusses the transport and storage of "hazardous materials," it is referring to the potential transport of bulk products to the project locations and to the temporary storage of such materials at the project sites prior to re-package and transport to subsequent destinations.

Cortese List: Section 65962.5(a). Government Code Section 65962.5 requires the California Environmental Protection Agency (CalEPA) to develop at least annually an updated Hazardous Waste and Substances Sites list (Cortese List). The Cortese List is a planning document used by the State, local agencies, and developers to comply with CEQA requirements in providing information about the location of hazardous materials release sites. Release sites include or hazardous materials release sites may include the following:

- All hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code.
- All land designated as hazardous waste property or border zone property pursuant to Article 11 (commencing with Section 25220) of Chapter 6.5 of Division 20 of the Health and Safety Code.
- All information received by the Department of Toxic Substances Control pursuant to Section 25242 of the Health and Safety Code on hazardous waste disposals on public land.
- All sites listed pursuant to Section 25356 of the Health and Safety Code.
- All sites included in the Abandoned Site Assessment Program.

The California DTSC is responsible for a portion of the information contained in the Cortese List. Other State and local government agencies are required to provide additional hazardous material release information for the Cortese List.

The California Hazardous Material Management Act. The Hazardous Materials Management Act (HMMA) requires that businesses handling or storing certain amounts of hazardous materials prepare a Hazardous Materials Business Emergency Plan (HMBEP), which includes an inventory of hazardous materials stored on site (above specified quantities), an emergency response plan, and an employee training program. An HMBEP is a written set of procedures and information created to help minimize the effects and extent of a release or threatened release of a hazardous material. The intent of the HMBEP is to satisfy Federal and State Community Right-to-Know laws and to provide detailed information for use by emergency responders.

Per the California Health and Safety Code (HSC), Chapter 6.95, Section 25500–25532, an HMBEP must be submitted by any business that handles a hazardous material or a mixture containing a hazardous material in quantities equal to, or greater than:

- A total weight of 500 pounds or a total volume of 55 gallons;
- 200 cubic feet of a compressed gas at standard temperature and pressure; and/or

- A radioactive material handled in quantities for which an emergency plan is required pursuant to Parts 30, 40, or 70 of Chapter 10, Title 10, CFR, or equal to or greater than the amounts specified above, whichever amount is less.

An HMBEP must be prepared prior to facility operation. Any business subject to HMBEP requirements shall submit an amendment of its HMBEP to the local implementing agency when there is:

- A 100 percent or more increase in the quantity of a previously disclosed hazardous material;
- Any handling of a previously undisclosed hazardous material subject to the inventory requirements;
- Change of business address;
- Change of ownership;
- Change of business name; and/or
- Change of contact information.

In addition, any business subject to HMBEP requirements is also required to certify the inventory of hazardous materials handled at the business every year. Businesses are also required to review their HMBEP at least once every three years to determine if a revision is necessary. Once the review has been conducted, the business must certify in writing to the local implementing agency that a review has been completed and necessary changes were made. For businesses within the City of Moreno Valley, HMBEPs are submitted to and approved by the County of Riverside Community Health Agency, Department of Environmental Health.

The California Hazardous Waste Control Law. The Hazardous Waste Control Law (HWCL) is the primary hazardous waste statute in the State of California. The HWCL requires a hazardous waste generator, which stores or accumulates hazardous waste for periods greater than 90 days at an on-site facility or for periods greater than 144 hours at an off-site or transfer facility, which treats, or transports hazardous waste, to obtain a permit to conduct such activities. The HWCL implements RCRA as a “cradle-to-grave” waste management system in the State of California. HWCL specifies that generators have the primary duty to determine whether their wastes are hazardous and to ensure their proper management. The HWCL also establishes criteria for the reuse and recycling of hazardous wastes used or reused as raw materials. The HWCL exceeds Federal requirements by mandating source reduction planning and a much broader requirement for permitting facilities that treat hazardous waste. It also regulates the number of types of wastes and waste management activities that are not covered by federal law with RCRA.

State Aeronautics Act (Public Utilities Code Section 21670, et seq.). The Public Utilities Code (PUC) establishes the requirement for the creation of airport land use commissions for every county in which there is located an airport that is served by a scheduled airline. Additionally, these sections of the Code mandate the preparation of Comprehensive Land Use Plans (CLUP) to provide for the orderly growth of each public airport and the area surrounding the airport. The purpose of CLUPs includes the protection of the general welfare of inhabitants within the vicinity of the airport and the general public.

California Emergency Services Act. Government Code 8550–8692 provides for the assignment of functions to be performed by various agencies during an emergency so that the most effective use may be made of all manpower, resources, and facilities for dealing with any emergency that may occur. The coordination of all emergency services is recognized by the State to mitigate the effects of natural, man-made, or war-caused emergencies which result in conditions of disaster or extreme peril to life, property, and the resources of the State, and generally, to protect the health and safety and preserve the lives and property of the people of the State.

State Fire Plan. The State Board of Forestry and the California Department of Forestry and Fire Protection have drafted a comprehensive update of the State Fire Plan for wildland fire protection in California. The planning process defines a level of service measurement, considers assets at risk, incorporates the cooperative interdependent relationships of wildland fire protection providers, provides for public stakeholder involvement, and creates a fiscal framework for policy analysis.

4.8.2.3 County of Riverside Regulations

Riverside County Department of Community Health. The Department of Environmental Health (DEH) of the Riverside County Community Health Agency is responsible for regulation the operations of businesses and institutions that handle hazardous materials or generate hazardous wastes in the City of Moreno Valley.[1] As part of the State-mandated Certified Unified Programs administered by the CalEPA, the DEH coordinates regulatory and enforcement of the following programs: Household Hazardous Waste, Hazardous Waste Minimization, Underground Storage Tanks (USTs), Hazardous Waste Generator Permits, and Hazardous Materials Handlers Program.

Riverside County Airport Land Use Plan. The Riverside County Airport Land Use Commission (ALUC) assists local agencies by ensuring the development of compatible land uses in the vicinity of existing airports. The ALUC adopted the Airport Land Use Plan (ALUP) for MIP on April 26, 1984. A new ALUC is currently in the process of updating the 1984 ALUP for MIP;[2] however, the portion of this document that pertains to MARB is not available for public review at this time. The ALUP specifies land use restrictions for areas falling within an airport's Influence Area boundaries.

2005 Air Installation Compatible Use Zone (AICUZ) Study. March Air Field is a joint-use airport, used for both military and civilian (MIP) purposes. The airport is owned and regulated by the military. Military installations prepare AICUZ studies to protect vicinity land uses from hazard and noise impacts associated with military airports. The Air Force Reserve (AFRES) completed a new AICUZ for March Air Field in 2005. The AICUZ delineates the clear zones and accident potential zones for the joint use airfield, as well as the noise contours based upon the project flight operations and use of the aviation field. The noise contours include both military and civilian use, as projected in the Federal Aviation Administration (FAA) conformity determination.

4.8.2.4 City of Moreno Valley

General Plan Policies. The Safety Element and the Land Use Element of the General Plan define the following issues and opportunities related to hazards that are relevant to the project:

- **Safety Element**
  - **Issues and Opportunities Section 6.2.8:** Acknowledge natural topography, terrain, volatile fuel types, and local climatic conditions that have resulted in large and damaging wildfires, particularly when the Santa Ana winds blow, increasing the potential for wildland fires. Consider

---

[1] *Section 5.5 Hazards,* Moreno Valley General Plan, Final Program EIR, July 2006.

[2] Riverside County Airport Land Use Commission New Compatibility Plans, http://www.rcaluc.org/plan_new.asp, website accessed April 23, 2012.

these factors during the planning phases of devolvement and include mitigation measures to reduce potential life safety and other consequences of these types of fires.

  - **Issues and Opportunities Section 6.2.10:** Require the use of automatic sprinkler systems in new and existing structures to control future demand for fire protection services, and to reduce fire losses. Continue annual fire inspections of all occupancies by the Fire Prevention Bureau to reduce the potential for fire code violations and to inspect sprinkler systems.
  - **Issues and Opportunities Section 6.2.13:** Emphasize planning, training, disaster drills and public education and awareness programs to prepare for emergency and disaster response.
  - **Issues and Opportunities Section 6.9.2:** The City has the ability to establish land use patterns that minimize the hazards associated with the use, storage and transport of hazardous materials. The Household Hazardous Waste Element and the Hazardous Waste Management Plan for the City of Moreno Valley contains programs on the reduction of hazardous waste and criteria for the siting of hazardous waste facilities. These plans should be updated from time to time to reflect changing conditions.

- **Land Use Element**
  - **Issues and Opportunities Section 2.8.2:** Fees will need to be collected in conjunction with new development to ensure that new development pays its fair share toward the future expansion of City facilities.

NOTE: The following changes have been made in response to Comment F-13-32 in Letter F-13 from Johnson & Sedlack on Behalf of Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.

- **Safety Element Goal**

Goal 6.1 To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property

Local Hazard Mitigation Plan. The City of Moreno Valley prepared a Local Hazard Mitigation Plan (LHMP) to develop an understanding of the natural and man-made hazards to the City and to determine ways to reduce those risks, prioritize and implement mitigation strategies.

4.8.3 Methodology

Evaluation of hazards and hazardous material impacts associated with the project included a focus on the use, generation, management, transport, and disposal of hazardous or potentially hazardous materials on the project site. Phase I ESAs were prepared to document existing site conditions involving the presence or absence of hazardous materials that may have been deposited through previous land uses. In addition, the City of Moreno Valley's LHMP was consulted to identify existing known hazards that may affect the project area. For airport hazards, the County of Riverside ALUC was consulted to determine if the WLC project would increase air hazards. In determining the level of significance, the analysis assumes that construction and operation of the project would be in compliance with relevant local, State, and Federal laws and regulations pertaining to the use, storage, and disposal of hazardous materials.

4.8.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines*, the WLC project would result in a significant adverse impact with regard to hazards if it were to:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment;
- For a project located within an airport land use plan or where such a plan has not been adopted within two miles of a public airport or public use airport, result in a safety hazard for people residing or working in the project area;
- For a project located within the vicinity of a private airstrip, result in a safety hazard for people working in the project area;
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation; and/or
- Result in the exposure of people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

4.8.5 Less than Significant Impacts

In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.

4.8.5.1 Within Two Miles of a Private Airport or Within an Airport Land Use Plan or Within Two Miles of a Public Airport

Threshold	For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area? Would the project be located within an airport land use plan or where such a plan has not been adopted within two miles of a public airport or public use airport, resulting in a safety hazard for people residing or working in the project area?

The nearest airport to the project area is MARB, approximately 7 miles to the southwest. The airfield is operated by two entities, March Air Reserve Base (military) and March Inland Port Airport Authority (quasi-governmental/private). In addition, Perris Valley Airport is located approximate 15 miles southwest of the project area. Perris Valley Airport is a private airport that is open to the public, and is utilized for skydiving and ballooning activities. The WLC project area is not located within the Airport Influence Area for either airport. Given the distance of the WLC project area to both airports in the vicinity, the development of the WLC project area as proposed would not result in private airport safety hazards for people working in the WLC project area. No impacts associated with this issue would occur and no mitigation is required.

4.8.5.2 Existing or Proposed School

Threshold	Would the project emit hazardous emissions or handle acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

There are no existing school facilities within one-quarter of a mile of the project area. The nearest existing school is Calvary Chapel Christian School which is located approximately 1.17 miles northwest of the project. There is one proposed elementary school site that is located within one-quarter mile of the WLC project area. The site for proposed Wilmot Elementary School is located on Bay Avenue at Wilmot Street, approximately 0.25 mile west of the project area. A PEA was prepared for the proposed elementary school in 2007; however, there has been no further discussion by the Moreno Valley Unified School District (MVUSD) since then.[1] The City does not have jurisdiction with respect to the location, design, or construction of school facilities. The City works with each school district concerning the design of roads and other public improvements in and around school sites. The City also notifies any school district of development proposals that might affect school facilities.[2]

The amount and type of materials that would be used during project construction (building and infrastructure) or stored in the high-cube logistics distribution center after construction is unknown at this time. The emission of air pollutants is discussed in the Air Quality Section of the EIR. While the warehouse facilities themselves are not expected to utilize acutely hazardous materials, the possibility exists that such materials could be stored or transported to and from the project site. For the purposes of this analysis, it is assumed that the project will handle substances that may be acutely hazardous. The handling of hazardous materials or emission of hazardous substances in accordance with the Hazardous Materials Business Emergency Plan (HMBEP) as required by applicable local, State, and Federal standards, ordinances, and regulations will ensure that impacts associated with environmental and health hazards related to an accidental release of hazardous materials or emissions of hazardous substance near existing or proposed schools are less than significant and no mitigation is required.

4.8.5.3 Routine Transport, Use, or Disposal of Hazardous Materials and Reasonable Foreseeable Upset and Accident Conditions

Threshold	Would the project create a significant hazard to the public through the routine transport, use, or disposal of hazardous materials? Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident?

The project area includes the development of 40.6 million square feet of high-cube logistics warehouse space. These warehouses would be used primarily for the storage and/or consolidation of manufactured goods, with minimal assembly and no manufacturing activities, prior to their distribution to secondary retail outlets.

Truck-Related Risks. Truck activities would frequently occur during off-peak hours. Deliveries to the project area would come from the Ports of Long Beach and Los Angeles as well as from other locations. Goods sorted for re-distribution would then be delivered via truck to both in and out of state locations. The exact tenants of the warehouse buildings are unknown at this time and will likely change over time so there is the potential that hazardous materials such as petroleum products, pesticides, fertilizer, and other household hazardous products such as paint products, solvents, and cleaning products may be stored and transported in conjunction with the proposed warehouse uses. These hazardous materials would only be stored and transported to and from the site. Manufacturing and other chemical processing

---

[1] Moreno Valley Unified School District, Minutes for Regular Meeting of the Board of Education, July 17, 2007.
[2] City of Moreno Valley General Plan, Land Use Element, Section 2.5.0.

will not be permitted under the provisions of the Specific Plan. Exposure to hazardous materials during the operation of the proposed on-site uses may result from (1) the improper handling or use of hazardous substances; (2) transportation accidents; or (3) an unforeseen event (e.g., fire, flood, or earthquake). The severity of any such exposure is dependent upon the type and amount of the hazardous material involved; the timing, location, and nature of the event; and the sensitivity of the individual or environment affected.

The City of Moreno Valley has no direct authority to regulate the transport of hazardous materials on State highways.[1] This activity is governed by the United States Department of Transportation (USDOT), as described in Title 49 of the Code of Federal Regulations[2] and by Title 13 of the California Code of Regulations. The State Office of Hazardous Materials Safety enforces regulations for the safe transportation of hazardous materials. It is possible that vendors may bring hazardous materials to and from the project site. Appropriate documentation for all hazardous waste that is transported in connection with project site activities would be provided as required by hazardous materials regulations. Hazardous waste produced on site is subject to requirements associated with accumulation time limits, proper storage locations and containers, and proper labeling. Additionally, for removal of hazardous waste from the site, hazardous waste generators are required to use a certified hazardous waste transportation company, which must ship hazardous waste to a permitted facility for treatment, storage, recycling, or disposal. Compliance with applicable regulations would reduce impacts associated with the use, transport, storage, and sale of hazardous materials. For example, the California Hazardous Materials Management Act requires that businesses handling or storing certain amounts of hazardous materials prepare a Hazardous Materials Business Emergency Plan, which includes an inventory of hazardous materials stored on site (above specified quantities), an emergency response plan, and an employee training program.

The enforcement of applicable local, State, and Federal standards, ordinances, and regulations will ensure that potential impacts associated with environmental and health hazards related to an accidental release of hazardous materials are less than significant and no mitigation is required.

Freeway Accident Risks. The following information is provided in response to NOP/Scoping comments regarding freeway accidents. According to the California Department of Transportation's Traffic Accident Surveillance and Analysis System (TASAS) report, there are approximately 105 accidents per year along a 3.75-mile stretch of SR-60 between Nason Street and Gilman Springs Road in the general vicinity of the project area. The data were derived for the three-year span of January 1, 2008, to December 31, 2010[3]. During this period, there were 316 accidents (average of 105 per year) along SR-60 (both westbound and eastbound). Of the 316 accidents, approximately 15.8 percent involved trucks (tractor/trailer). There were 127 eastbound accidents (19 or 15% involving trucks) and 189 westbound accidents (31 or 16.4% involving trucks). It is possible that congestion on the freeway might result in some WLCSP-related trucks exiting the freeway at off-ramps other than World Logistics Center Parkway~~Theodore Street~~, or attempting to enter the freeway at on-ramps if the drivers see or hear on their radios that the freeway is congested. In most instances, drivers will use the shortest route indicated on GPS system maps or the route(s) they have used previously, regardless of traffic conditions at the time. In addition, due to the type of uses planned within the WLCSP, much of the project-related traffic will be accessing the WLC site during off-peak times, so the changes of congestion or accidents occurring during the time they are accessing the site would be reduced. The accident database contains no information on whether the truck was the cause of a particular accident or the time of day, the vehicles involved, if hazmat spills occurred, if trucks or other vehicles detoured off the freeway, etc. Without these data, it is overly speculative to extrapolate any particular conclusions.

---

[1] Moreno Valley General Plan, Safety Element, 6.9.1

[2] Code of Federal Regulations, Title 49—Transportation, Pipeline and Hazardous Materials Safety Administration, Department of Transportation, http://ecfr.gpoaccess.gov/cgi/t/text/text idx?c=ecfr&tpl=/ecfrbrowse/Title49/49tab_02.tpl, site accessed April 23, 2012.

[3] California Department of Transportation, TSAR – Accident Summary 1/1/08-12/31/10.

Despite the lack of specific evidence regarding freeway accidents, it is reasonable to conclude that potential environmental impacts in this regard will be less than significant given the regulation of truck traffic on freeways according to State and Federal laws, and truck restrictions on local streets according to City municipal code (i.e., truck route enforcement) and no mitigation is necessary.

Land Use-Related Hazmat Risks. Both the Federal Government and the State of California require all businesses that handle more than a specified amount of hazardous materials or extremely hazardous materials, to submit an HMBEP to the local Certified Unified Program Agency (CUPA). The CUPA with responsibility for the City of Moreno Valley is the County of Riverside Community Health Agency, Department of Environmental Health.[1] The HMBEP must include an inventory of the hazardous materials used in the facility, and emergency response plans and procedures to be used in the event of a significant or threatened significant release of a hazardous material. The HMBEP must also include the Material Safety Data Sheet for each hazardous and potentially hazardous substance used. The Material Safety Data Sheets summarize the physical and chemical properties of the substances and their health impacts. The plan also requires immediate notification to all appropriate agencies and personnel of a release, identification of local emergency medical assistance appropriate for potential accident scenarios, contact information of all company emergency coordinators of the business, a listing and location of emergency equipment at the business, an evacuation plan, and a training program for business personnel.

HMBEPs are designed to be used by responding agencies, such as the Moreno Valley Fire Department, to allow for a quick and accurate evaluation of each situation for an appropriate response. HMBEPs are also used during a fire to quickly assess the types of chemical hazards that firefighting personnel may have to deal with, and to make decisions as to whether or not the surrounding areas need to be evacuated. Compliance with existing law will ensure that no significant impacts pertaining to the creation of hazards affecting the public will occur. The handling of hazardous materials in accordance with the HMBEP as required by applicable local, State, and Federal standards, ordinances, and regulations will ensure that impacts associated with environmental and health hazards related to an accidental release of hazardous materials are less than significant and no mitigation is required.

The Moreno Valley Fire Department will likely be first responders in the event of the release of hazard materials. The City of Moreno Valley contracts with the Riverside County Fire Department for fire services. The Riverside County Fire Department is administered and operated by the California Department of Forestry and Fire Protection (CalFire) per an agreement with the County of Riverside. The Fire Department has indicated it will need one or more fire stations in the area, and the project will mitigate impacts in this regard to less than significant levels (see Section 4.14, *Public Services and Facilities*).

Though the uses in the project area are not expected to utilize acutely hazardous materials in their daily operation, a potential for an accidental release of hazardous materials into the environment is present at the project site as it is at any commercial, retail, or industrial site. Compliance with the identified State and Federal transportation safety standards will govern the handling of hazardous materials during truck and freight transfer operations. These standards include procedures to contain, report, and remediate any accidental spill or release of hazardous materials. The handling of hazardous materials in accordance with all applicable local, State, and Federal standards, ordinances, and regulations will ensure that impacts associated with environmental and health hazards related to an accidental release of hazardous materials at the project site will be less than significant and no mitigation is required.

Hazardous On-site Facilities. The project site contains a regional natural gas compressor station operated by SDG&E. The Moreno Compressor Plant has been in operation for many years in the

---

[1] *CUPA Directory Search,* http://www.calepa.ca.gov/CUPA/Directory/default.aspx, website accessed April 24, 2012.

southeastern portion of the project area (see Section 4.16, *Utilities and Service Systems* and Section 4.5, *Biological Resources*). At present, the plant occupies a 19-acre site, surrounded by 174 acres of SDG&E-owned open space. There is additional open space around the plant, consisting of land owned by the CDFW as part of the SJWA. There are no plans to expand or otherwise modify the plant and/or its open space zone, which is considered adequate at this time to protect public health and safety, including users of the SJWA and new employees and users of the new warehouses associated with the WLCSP.

There will be sufficient setback from the plant to future warehouse uses (e.g., 1,000 feet). No development or change in operation has been announced for the property within the SJWA. Existing safety conditions will continue relative to the gas facility as it relates to the SJWA. Compliance with established safety laws and regulations regarding the natural gas facilities will reduce the potential impact to a less than significant level and no mitigation is required.

SCGC operates a natural gas metering station on a one-acre site located one-quarter mile north of the Moreno Compressor Plant. The land plan will provide 1,000 feet setback from the SCGC station as an additional setback between these uses. These setbacks appear sufficient to protect future uses/users within the WLCSP if upset conditions were to occur at this station. Compliance with established safety laws and regulations regarding natural gas plants is expected to reduce this potential impact to a less than significant level and no mitigation is required.

The site also contains two natural gas lines that cross the central and southern portions of the site in an east-west direction (Figure 3.17). They range in size from 16 to 36 inches in diameter and carry natural gas under medium and high pressure. The high pressure lines are managed by SDG&E while the moderate pressure lines are managed by SCGC. The utility companies that own and/or maintain these pipelines are responsible for the physical conditions of the pipelines. As development occurs in areas with buried natural gas lines, the project proponent will be required to negotiate with the involved utility provider as to whether these pipelines can be relocated or need to be protected in place. Future development is required to maintain clearance for pipelines depending on their contents and size, in consultation with the serving utility provider. As long as these design restrictions are implemented during the site design and construction process, no significant impacts are expected. However, if a catastrophic accident were to occur involving one or more natural gas lines on site, there could be property damage and loss of life. While the chance of occurrence is low, there are potential safety risks, mainly to project employees, if such an accident were to occur. Compliance with established safety laws and regulations regarding pipelines is expected to reduce this potential impact to a less than significant level and no mitigation is required.

Off-site Improvements. A number of off-site improvements will be needed to serve the project, including three reservoirs, various water, sewer, and drainage improvements within existing rights-of-way, and the SR-60/Theodore Street/ World Logistics Center Parkway interchange. None of these facilities is expected to create significant hazards or risks to public health or safety. These facilities will require standard improvement plan approvals through the City of Moreno Valley and/or County of Riverside. Based on these plan reviews, no significant hazard-related impacts are expected and no mitigation is required.

Hunting Accidents. Based on comments received during the NOP/Scoping period, this section explores the possible hazards or risks that could result from stray gunfire from hunters on the adjacent SJWA property as a result of the proposed change in land use from dry-land farming to high-cube logistics warehouses. Immediately south of the project area is the SJWA, where limited hunting is permitted. Hunting in the area is generally pheasant hunting, but also includes waterfowl (such as ducks) as well as jackrabbits, rabbits and quail. Hunting in these areas requires a hunting license issued by the State. The Fish and Game Code provides strict regulations on hunting, including limits on hours, time of year, quantity, and firearms. Hunting on State lands, such as the SJWA, can only be done with shotguns that are smaller in size (higher in gauge) than 10-gauge shotguns. In addition, Federal law allows no more than three shells in the chamber of the shotgun at any given time during hunting. The SJWA is patrolled by CDFW wardens to ensure that all hunting rules and regulations are followed. The private hunt clubs are also governed by similar rules and regulations to ensure the safety of their members and the general public.

Given the proximity of the project area to the nearby hunting areas, it is appropriate to consider the possibility of stray gunfire as a possible risk to future employees, visitors, and facilities on the project site. Accident conditions that could arise from the nearby hunting activities are expected to be less than significant for the following reasons: the most intensive operations at the high-cube logistics center would be during off-peak hours when there is no hunting; the hunting on the adjacent areas to the south of the WLC project area is in accordance with all applicable local, State, and Federal standards and regulations; and the range for the allowed firearms (shotguns smaller than 10-gauge) would be 60 yards or less providing a safe distance for development to occur in the WLC project area, which would be a safe distance from the actual hunting areas. It should also be noted that the Specific Plan provides for a minimum 250-foot setback along the southern boundary of the Specific Plan property, which is greater than the minimum safe distance described above.

Valley Fever. During processing of the Highland Fairview Corporate Park EIR, a local resident expressed concern regarding Valley Fever (*Coccidiomycosis*), a disease caused by fungus spores (*Coccidioides immitis*). Since the project site is adjacent to the Highland Fairview Corporate Park site, this issue will be addressed in this EIR as well. These fungal spores most typically lie dormant in relatively undisturbed soil with native vegetation cover in the Central Valley of California.

The likelihood of these spores to occur at this site is remote. The soil at the project site is not undisturbed and has little, if any, native vegetation cover. The site consists primarily of disturbed agricultural soils (i.e., regularly tilled and occasionally irrigated) and had virtually no native vegetative cover. The local soils will be extensively disturbed during grading and would be regularly watered to control dust. Erosion control measures will be implemented immediately following grading. Under these conditions, it is unlikely that *Coccidioides immitis* spores would survive in the soil. This potential impact appears minimal and no mitigation is required.

4.8.5.4 Located on a List of Hazardous Materials Sites

Threshold	Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

As detailed in the *Phase I Environmental Site Assessment Reports*, the project area is not listed in any of the searched regulatory databases provided by Environmental Data Resources (EDR). This included a review of Federal, State, and local environmental databases for information pertaining to documented and/or suspected contaminated sites, known handlers or generators of hazardous waste, waste disposal facilities, releases of regulated hazardous substances and/or petroleum products within specified search distances. Analysis of soil samples obtained during the limited site characterizations conducted as part of the Phase I ESAs, indicated there were trace concentrations of pesticides present in near surface soils at some of the sample locations. However, the pesticide concentrations were below the EPA’s Preliminary Remediation Goals, for residential properties. No further sampling was deemed necessary and unrestricted use of the property is warranted. Since neither the project site nor areas in the vicinity of the project site are listed on any of the hazardous materials sites as defined by Government Code Section 65962.5, there would be a less than significant impact and no mitigation is required.

4.8.5.5 Conflict with Emergency Response Plans

Threshold	Would the project impair the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation?

The City of Moreno Valley adopted its Local Hazard Mitigation Plan (LHMP) on October 4, 2011. This document identifies known hazards throughout the community and identifies strategies for which to prepare for and respond to these hazards if and when it is necessary. Figure 12-2 of the LHMP maps primary and alternative evacuations routes out of Moreno Valley. There are three (3) routes that either run through or along the project area that are identified as primary evacuation routes: Redlands Boulevard, World Logistics Center Parkway~~Theodore Street~~, and Alessandro Boulevard. The project will be designed, constructed, and maintained in accordance with applicable standards associated with vehicular access, ensuring that adequate emergency access and evacuation will be provided. Construction activities that may temporarily restrict vehicular traffic would be required to implement appropriate measures to facilitate the passage of persons and vehicles through/around any required road closures. Compliance with existing regulations for emergency access and evacuation will ensure that impacts related to this issue are less than significant and no mitigation is required.

4.8.5.6 Wildland Fire Risks

Threshold	Expose people or structures to a significant risk or loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

The City of Moreno Valley is subject to both wildland and urban fires. Wildfires in particular pose a threat to the northern and eastern portions of the City, near the WLC project area. Moreno Valley's LHMP documents that three wildland fires have occurred within the WLC project area since 2003. Although the project area is not within a mapped fire hazard area, the Badlands directly east of the project area are considered a High Fire Hazard Area.[1] Development of the eastern portion of the project could expose persons or property to wildland fire risks given the proximity of the project area adjacent to a High Fire Hazard Area. Regardless of this proximity, all new structures in the project area must be constructed in compliance with Title 24 of the California Code of Regulations to safeguard life and property from fire hazards, including the installation of automated fire suppression systems. Compliance with these standards would be enforced during building permit review and the construction inspection period. In addition, no development will be allowed within the San Jacinto Fault Zone, which runs parallel and just west of Gilman Springs Road; this area of limited development will provide a fuel or fire break to help protect future occupied uses within the WLCSP.

Six fire stations presently serve the City of Moreno Valley. Station No. 58, the Moreno Beach station, is the closest station to the project area (approximately a quarter of a mile directly west). Given the proximity of Station No. 58 and with all new structures constructed in compliance with Fire and Building Code regulations, the susceptibility and exposure of the project to wildland fires would be limited. **Mitigation Measures 4.14.2.6A** and **4.14.2.6B** in the Public Services and Facilities section will address potential impacts related to future fire protection services for this area. Implementation of these measures will help reduce potential wildland fire risks to a less than significant level, and no additional mitigation is required.

---

4.8.6 Significant Impacts

4.8.6.1 On-site Conditions Involving Hazardous Materials

Impact 4.8.6.1A: *Demolition of the existing on-site rural residential structures may involve hazardous materials (ACM and LBP) and possibly soil contamination from past agricultural chemical use.*

Impact 4.8.6.1B: *Demolition of the existing on-site rural residential structures may involve hazardous materials (LNG/CNG).*

Threshold	Would the project create a significant hazard to the public through the routine transport, use, or disposal of hazardous materials?

Due to the suspected age of the rural residential structures on the site, it is possible that demolition of these structures may involve asbestos-containing materials (ACMs) and/or lead-based paint (LBP). Demolition of these structures may need to be supervised or conducted by contractors certified to remove and dispose of ACMs and/or LBP.

During the comment period on the DEIR, several commenters suggested there may be soil contamination on the WLC site, and evidence from the State Department of Toxic Substances Control (DTSC) indicates organo-phosphate based herbicide and pesticide materials may have been applied on or near the 7 existing rural residences on the site. Prior to grading, soil testing should be performed to determine if in fact these areas contain any significant levels of agricultural chemicals in the soil, and, if so, they should be remediated by a licensed contractor.

In addition, the Specific Plan proposes a liquefied natural gas/compressed natural gas (LNG/CNG) fueling station to be constructed on approximately 3,000 square feet somewhere in the eastern portion of the Logistics Development (LD) land use area of the Specific Plan. This LNG/CNG facility is referred to as "logistics support" in the Specific Plan land uses. It would provide natural gas to fuel heavy and light-duty trucks serving the project.

Since this facility would store natural gas under liquefied and compressed conditions, there is a potential for fire and/or explosion involving natural gas. Therefore, this is a potentially significant hazards impact requiring mitigation.

~~*NOTE: The following changes were made based on the revised WLC Specific Plan.*~~

Project or Specific Design Features. It is anticipated that the LNG/CNG fueling facility proposed in the LD zone will be constructed in Planning Area 7, in the northeastern portion of the project area.

The Specific Plan does not provide any design specifications for this facility. Eventually, the seven existing rural residences are developed into some industrial use consistent with the LL designation. Until they are all converted, it is possible the construction of an alternative fueling station in Planning Area 7 could be proximate to one or more rural residences. This is a potentially significant impact requiring mitigation (see Mitigation Measure 4.8.6.1B).

~~*NOTE: The following mitigation measures have been revised in response to Comment F-7B-2 in letter F-7B from Lozeau Drury and Comment F-8-79 in Letter F-8 from Shute, Mihaly & Weinberger.*~~

Mitigation Measures. Implementation of the following measure will ensure there will be no significant impacts from demolition of on-site buildings as a result of hazardous materials:

4.8.6.1A Prior to demolition of any existing structures on the project site, a qualified contractor shall be retained to determine if asbestos-containing materials (ACMs) and/or lead-based paint

(LBP) are present. If asbestos-containing materials and/or lead-based paint are present, prior to commencement of demolition, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. In addition, onsite soils shall be tested for contamination by agricultural chemicals. If present, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any asbestos-containing materials, lead-based paint, or agricultural chemical residue in conformance with all applicable regulations.

The following measure is proposed to help ensure that the LNG/CNG natural gas fueling facility proposed in the "logistics support" area of the Specific Plan is constructed in a safe location to protect public health and safety:

4.8.6.1B Prior to the issuance of any discretionary permits associated with the proposed fueling facility ("logistic support" site in the LD zone), a risk assessment or safety study that identifies the potential public health and safety risks from accidents at the facility (e.g., fire, tank rupture, boiling liquid, or expanding vapor explosion) shall be submitted to the City for review and approval This study shall be prepared to industry standards and demonstrate that the facility will not create any significant public health or safety impacts or risks, to the satisfaction of the City Building and Safety Division and the Fire Prevention Bureau.

4.8.6.1C Prior to grading for any discretionary permits for development in Planning Areas 9-12 adjacent to the natural gas compressor plant, the applicant shall prepare a risk assessment report analyzing safety conditions relative to the existing compressor plant and planned development. The report must be based on appropriate industry standards and identify the potential hazards from the compressor plant (e.g., fire, explosion) and determine that the distance from the plant to the closest planned buildings in Planning Areas 9-12 is sufficient to protect the safety of workers from accidents that could occur (see Final EIR Volume 2 Figure 4.1.6B) at the compressor plant. This measure shall be implemented to the satisfaction of the City Building and Safety Division and the Fire Prevention Bureau.

4.8.6.1D Prior to the issuance of any grading permit, the developer shall inform the City of any existing solid waste materials within the development area. In conjunction with grading activities, all solid waste matter within the development area shall be removed by a licensed contractor and disposed of in an approved landfill. A record of the removal and disposal of any waste materials, in compliance with applicable laws and regulations, shall be submitted to the City prior to the issuance of any building permits.

Level of Impact After Mitigation. With implementation of **Mitigation Measures 4.8.6.1A** through **4.8.6.1D**, impacts associated with potential hazardous materials in existing rural residential structures or from the proposed natural gas fueling facility will be reduced to less than significant levels.

~~4.8.7 Cumulative Impacts~~

~~The cumulative impact analysis considers development of the proposed project in conjunction with other development in the City and this portion of Riverside County. Significant cumulative impacts associated with the routine transport, use, and disposal of hazardous materials would occur as the proposed project would increase the amount of truck traffic in the area as well as the number of trucks potentially transporting hazardous materials. The proposed project, in combination with other projects of a similar nature, has the potential to create a significant cumulative impact related to this issue. Some of these risks are site-specific and localized, such as businesses that handle hazardous materials within their facilities (i.e., on site); these types of hazmat impacts are generally limited to the project site. It is also possible there will be incrementally increased impacts by the transport and disposal of hazardous~~

~~materials related to warehouse operations on the project site. For example, the substantial increase in trucks in and around the WLC site would incrementally increase the risks of accidents involving truck-related fuels (e.g., fire or explosion).[1] However, the number of trucks containing hazardous materials on the road in a given area at any given time would be difficult if not impossible to calculate, and it would be likewise difficult to estimate the number and/or location of accidental spills and leaks, which, by their nature, are accidental or unplanned occurrences, it would be impossible to predict the specific occurrence of such events on the project site. Despite these uncertainties, it is reasonable to assume that with an increase in vehicles transporting hazardous materials would incrementally increase the potential for accidents on a regional basis.~~

~~As anticipated in the City's General Plan, demographic increases, and the availability of vacant property in the City would lead to the new industrial development in the City and surrounding area. While the project-specific hazardous material impacts of individual development projects will be addressed separately in future CEQA documents, anticipated future development will contribute, through increases in population and the number of outlets that transport, or dispose of hazardous materials, to a cumulative increase in risk for hazardous material incidents. Although each project has unique hazardous materials considerations, it is anticipated that future cumulative projects would comply with the local, State, and Federal regulations and requirements as these are required for all development projects. As a result, cumulative impacts associated with hazardous materials would be less than significant.~~

~~Cumulative impacts involving wildfires consists of future development adjacent to a High Fire Hazard Area. The risk to each future project is based on the location and interface between urbanized area and wildland areas. The risks associated with development in these area can only be reduced through conformance with Fire and Building Code regulations, it is anticipated that cumulative development within the project area would not create a significant and cumulative impact associated with wildland fire hazards.~~

~~4.9 HYDROLOGY AND WATER QUALITY: TABLE OF CONTENTS~~

~~FIGURES~~

~~TABLES~~

NOTE TO READERS. *The cumulative portion of Section 4.9 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.9 of this Revised Sections of the FEIR. All other portions of Section 4.9 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.9 means that the corresponding portion of Section 4.9 in the FEIR remains unchanged or has been deleted. The Hydrology/Water Quality Technical Memorandum is included in Appendix C.*~~*Various small revisions in this section have been made due to changes in the project description, related changes to the Draft Master Plan of Drainage Report, the Preliminary WQMP,[1] and in response to comments B-3-39 Letter B-3 from the California Department of Fish and Wildlife, and Comment B-6-5 from Letter B-6 from the Santa Ana Regional Water Quality Control Board.*~~

4.9 HYDROLOGY AND WATER QUALITY

This section describes the hydrologic conditions on and adjacent to the project site and evaluates potential impacts to surface and groundwater resources associated with the project.

For the reader's reference, this EIR has been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development.

~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

~~[1] FEIR Volume 2 Appendix J-1 and J-2).~~

The analysis contained in this section is based on the following technical studies prepared for the WLC project:

- *Draft Drainage Report for World Logistics Center Specific Plan and Environmental Impact Import,* CH2M HILL, September 2014 (Appendix J-1 of this EIR).
- *Preliminary Project Specific Water Quality Management Plan for World Logistics Center Specific Plan,* CH2M HILL, September 2014 (Appendix J-2 of this EIR).
- *Water Supply Assessment Report for the World Logistics Center Specific Plan in Moreno Valley,* Eastern Municipal Water District, March 21, 2012 (Appendix M-1 of this EIR).

In addition to these project-specific technical studies, the analysis contained in this section is also based on the following reference documents:

- 2012 Water Quality Management Plan – A Guidance Document for the Santa Ana Region of Riverside County.
- 2011 Design Handbook for Low Impact Development Best Management Practices.
- 2009 California Stormwater Quality Association [CASQA] Construction Best Management Practices (BMP) Handbook, effective July 1, 2010.

A detailed discussion of jurisdictional waters and riparian/wetland impacts as it relates to the WLC project is included in Section 4.4 (Biological Resources).

4.9.1 Existing Setting

The project site is located in Rancho Belago in the eastern portion of the City of Moreno Valley in Riverside County. Geologically, the project area is located in the Peninsular Ranges Geomorphic Province of southern California, which extends southeastward from the San Bernardino and San Gabriel Mountains to the tip of the Baja California peninsula and is composed of alluvial deposits resulting from the erosion of nearby granitic mountain ranges.

The project site is located in the Santa Ana River Basin, which includes the upper and lower Santa Ana River watersheds, the San Jacinto watershed, and several other small drainage areas. The Santa Ana region covers parts of southwestern San Bernardino County, western Riverside County, and northeastern Orange County. Of the approximately 2,610 acres within the project area, over 90 percent consists of dry-farmed agricultural fields.

NOTE: The following changes have been made in response to Comments B-3-38 in Letter B-3 from the California Department of Fish and Wildlife, B-6-5 in Letter B-6 from the Santa Ana Regional Water Quality Control Board, et al.

4.9.1.1 Drainage

The area is generally undeveloped with storm water runoff from the project area generally flowing in a southerly direction to the San Jacinto River. As illustrated in Figure 4.9.1, a topographic divide generally located west of World Logistics Center Parkway~~Theodore Street~~ separates storm water flows to the San Jacinto River in two directions. Runoff east of the divide flows through the San Jacinto Valley at a gradient ranging from 1 to 2 percent to the San Jacinto Wildlife Area (SJWA). Ultimately these flows drain to the Gilman Hot Springs Hydrologic Subarea (HSA). Runoff west of the divide flows to the Perris Valley Storm Drain at a gradient ranging from 1 to 2 percent. This runoff ultimately drains toward the Perris Valley HSA. Both the Gilman Hot Springs and Perris Valley HSAs eventually flow to the San Jacinto River, approximately 10 miles south of the project site. Flows are then conveyed through the

San Jacinto River, Canyon Lake, again to the San Jacinto River (Reach 1), and ultimately to Lake Elsinore. In the event Lake Elsinore is at or beyond capacity, flows would continue through Temescal Creek, the Santa Ana River (Reaches 1–3), and then to the Pacific Ocean.

As illustrated in Figure 4.9.1, off-site flows tributary to the project area originate from the upstream foothill area known as the Badlands as well as a small portion of moderately developed area and open space. Flows from the upstream watershed collect in natural drainage courses and flow southerly across SR-60 and Gilman Springs Road through existing drainage culverts and onto the project site. These natural drainage courses are tributary to six (6) sub watersheds, named Watershed “A,” Watershed “B,” Watershed “C,” Watershed “D,” Watershed “E,” and Watershed “F” as

Environmental Impact Report

Existing Drainage Subareas

I:\HFV1201\Reports\EIR\fig4-9-1_Exist_DrainSubareas.mxd (9/29/2014)

THIS PAGE INTENTIONALLY LEFT BLANK

shown on Figure 4.9.1. As identified in the hydrology and drainage report prepared for the project, the tributary drainage area includes the drainage area north of SR-60. The project site receives flow from SR-60 and culverts crossing the freeway. The project drainage plan takes into account this flow entering the project site and appropriate mitigation to downstream drainage facilities is provided. The existing capacity of the SR-60 culverts and drainage systems will not be affected by the project since the project is located downstream of these facilities. The following paragraphs describe the natural drainage courses and existing conditions of each sub watershed and capacities of the existing culverts at the SR-60 and Gilman Springs Road.

Watershed "A"

Watershed "A" is located within Riverside County Flood Control and Water Conservation District (RCFCWCD) Moreno Master Drainage Plan (MMDP) area. RCFCWCD is currently preparing a revised MMDP. The MMDP indicates that storm flows north of SR-60 will be routed to the proposed Sinclair Basin and Quincy Basin. Flows released from the proposed basins will pass under SR-60 and be conveyed to MMDP Line "F." Because it is unknown as to when these basins will be constructed, this study is prepared with the assumption that the basins are not in place prior to this project, and the offsite flows will be conveyed to MMDP Line "F" directly.

Downstream of SR-60 MMDP Line "F" is a 12-foot wide by 8-foot high reinforced concrete box (RCB) that conveys runoff from the existing culverts under SR-60: one triple 4-foot × 2-foot RCB, two double 48-inch corrugated metal pipe (CMP), one double 72-inch CMP, and one 42-inch reinforced concrete pipe (RCP) (with a 36-inch Riser). The capacity of the existing culverts are summarized in Table 4.9.A. Runoff north of SR-60, in excess of the capacities of the existing culverts, ponds north of SR-60 and flows towards the intersection of SR-60 and Redlands Boulevard. An existing 42-inch RCP conveys the runoff into the existing ditch along Redlands Boulevard. Since the 42-inch RCP does not have enough capacity to convey all of the offsite flows, the flows then sheet flow to the south. As a result, the interchange of SR-60 and Redlands Boulevard may be flooded. Ultimately the flows upstream of SR-60 will be less once RCFC&WCD constructs the master plan detention basins located north of SR-60.

Table 4.9.A: SR-60 Culverts

Culvert	Size/Material	Node	Capacity* (cfs)	100-year Flow (cfs)	Adequate to Convey 100-year flow
1	Triple 4' by 2' RCB	91	265	213	Yes
2	Double 48" CMP	76	250	715	No
3	Double 48" CMP	81	300	285	Yes
4	Double 72" CMP	81	805	557	Yes
5	42" RCP (36" Riser)		177	**	
Total			1797	1770	Yes

* Hydrology calculations based on a 100-year Water Surface Elevation of 1768.7 for all 5 culverts. ** Excess flows from Culvert 2 will pond at Culvert 2.

Source: Master Plan of Drainage Report, CH2MHILL, September 2014.

The outflow from Line "F" south of Eucalyptus Avenue sheet flows via a spreading area into the agricultural land downstream. Flows then sheet flow across the agricultural land to the southwest corner of the project at Alessandro Boulevard and Merwin Street. Flows leave the project boundary via a culvert under Alessandro Boulevard which outlets to an existing ditch, as shown on Figure 4.9.1.

The capacity of the existing ditch south of Alessandro Boulevard was evaluated and varies from 75 cubic feet per second (cfs) to 390 cfs. Just south of the culvert at Alessandro Blvd, the existing ditch is trapezoidal with a depth of approximately 4 feet and capacity of 390 cfs. The capacity of the ditch is 75 cfs about 70 feet south of the Alessandro culvert where the ditch is 2 feet deep. The ditch capacity remains at 75 cfs with a depth of 2 feet until after it crosses Cactus Avenue. About 160 feet downstream of the culvert, the ditch transitions to a v-ditch 3 feet deep with a capacity of 165 cfs. The v-ditch extends southwest for approximately 100 feet and crosses Redlands Blvd. Flows unable to be contained in the ditch will overtop the ditch into the agricultural area on the east and along Merwin Street on the west. Flows will flow south in Merwin Street and turn west into the residential area. Further downstream, the runoff flows to the Greenbelt Channel located south of Cactus Avenue. The Greenbelt channel ultimately drains to the Perris Valley Storm Drain.

Watershed "B"

Watershed "B" drains a total of 1,361 acres, of which 92 acres is offsite flow from north of SR-60 and 104 acres is offsite flow at the southerly end of the project. The total onsite area is 1,165 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into two sub areas by World Logistics Center Parkway~~Theodore Street~~. Flows to the west of World Logistics Center Parkway~~Theodore Street~~, consisting of 398 acres of onsite area and 104 acres of offsite area, drain to the ditch on the west side of World Logistics Center Parkway~~Theodore street~~. The 92 acres of offsite area flows to the ditch along the east side of World Logistics Center Parkway~~Theodore Street~~. Onsite flows on the east side of World Logistics Center Parkway~~Theodore Street~~ sheet flow in a southerly direction through the project area. The ditches are vegetated with bottom widths varying from 1 to 2 feet and depths varying from 1 to 3 feet. The existing capacity of the ditch at the project boundary is 55 cfs. Flows greater than 55 cfs will sheet flow through the project area and leave the project boundary in a sheet flow condition.

Watershed "C"

Watershed "C" drains a total of 1,061 acres, of which 658 acres is offsite flow from north of SR-60 and Gilman Springs Road. The total onsite area is 403 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into two watershed areas. The majority of the watershed, 944 acres, drains to a watercourse which exits the project area. A small portion of onsite flow, 117 acres, sheet flows offsite. The natural drainage course in Watershed "C" is vegetated, with an average bottom width of approximately 3 feet and a depth of approximately 2 feet. The existing capacity of the drainage course is 165 cfs. Flows greater than 165 cfs will sheet flow across the area. The drainage course drains southerly through the project boundary.

Watershed "D"

Watershed "D" drains a total of 965 acres, of which 627 acres is offsite flow from north of Gilman Springs Road. The total onsite area is 338 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into two sub watersheds. The majority of the watershed, 754 acres, drains to a watercourse which exits the project area. A portion of onsite flow, 211 acres, sheet flows offsite. The natural drainage course in Watershed "D" is also vegetated. Its bottom width varies from approximately 1 to 3 feet, and its depth varies from approximately 1 to 2 feet. The existing capacity of the drainage course is 65 cfs. Flows greater than 65 cfs will sheet flow across the area. The drainage course ends east of the existing gas facility. It is estimated that when significant storm events occur, the runoff ponds locally and eventually drains southwest.

Watershed "E"

Watershed "E" drains a total of 2,510 acres, of which 2,430 acres is offsite flow from north of Gilman Springs Road. The total onsite area is 80 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The natural drainage course in Watershed "E" has a bottom width varying from approximately 20 to 30 feet and depths varying from approximately 10 to 15 feet. The majority of this channel is vegetated, with a few locations of erosion. Approximately 1,500 feet north of the southerly project boundary, another natural drainage course confluences with the earthen channel forming a "V" shape junction. The junction is moderately eroded.

Watershed "F"

Watershed "F" drains a total of 445 acres, of which 288 acres is offsite flow from north of Gilman Springs Road. The total onsite area is 157 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into four sub areas. The first sub area, 99 acres consists entirely of onsite flow which sheet flows off site. The second sub area drains 121 acres, of which 72 acres is offsite area. The third subarea drains 151 acres, including 146 acres of offsite area. The last sub area drains 74 acres, of which 70 is offsite area. The flow from these sub areas will ultimately drain to the San Jacinto Wildlife Area. The main natural drainage course in Watershed "F" is located approximately 500 feet west of Gilman Springs Road. The drainage course is vegetated, with bottom widths varying from approximately 5 to 10 feet, and depths varying from approximately 1 to 3 feet. The capacity of the existing water course is 70 cfs. The remaining flow sheet flows offsite.

These natural drainage courses in Watersheds "B" through "F" drain into the San Jacinto Wildlife Area downstream. The majority of the project site sheet flows through the project's southerly boundary.

Existing Culverts along Gilman Springs Road

Within the project vicinity, there are ten (10) existing cross culverts located in Gilman Springs Road, as shown on Figure 4.9.2. Field visits by CH2M HILL staff found that most of the existing culverts were partially or completely blocked by sediment and debris allowing little flow from the culverts to enter the project site. In order to confirm if the existing culverts are sized appropriately to convey the offsite flow, the existing culvert capacities were analyzed using the inlet control capacity analysis chart. The results of the analysis are included in Appendix J of the DEIR, and summarized in Table 4.9.B. The analysis indicated that many of these culverts are undersized to convey the tributary 100-year flows even with proper maintenance, exclusive of culverts No. 2 and No. 7. Storm water unable to be conveyed by the culverts will flow to the existing ditches along the road, overtop the road and flow into the downstream natural drainage courses. The detailed flow patterns at these culverts were analyzed and summarized in Table 4.9.C and shown on Figure 4.9.2.

At Culvert No. 1, there is no existing ditch on either side of road. A total of 60 cfs offsite flow is tributary to the culvert, 20 cfs of the flow is conveyed through the 24-inch CMP, and 40 cfs overtops the road and flows to the natural drainage channel downstream. The impact to the downstream ditch is negligible due to the small amount of flow.

At Culvert No. 3, a total of 370 cfs flow is generated from offsite, 40 cfs is conveyed through the 36-inch CMP, and 330 cfs is conveyed along the existing ditch on the north side of the road, eventually flowing to Culvert No. 4.

At Culvert No. 4, a total of 170 cfs of flow comes from the offsite tributary area. One hundred (100) cfs is conveyed through the 48-inch CMP. The remaining 70 cfs combines with the 330 cfs of flow from Culvert No. 3 and 400 cfs overtops the road, draining to the natural channel downstream. The natural channel has a capacity of 365 cfs, therefore the flow will be spread beyond the top of bank.

At Culvert No. 5, a total of 1,370 cfs is generated from offsite, 370 cfs is conveyed through the 7-foot × 6-foot RCB, 52 cfs flow south within the existing ditch towards Culvert No. 6, and 938 cfs overtop the road draining to the natural channel downstream. The natural channel has a capacity of 330 cfs, the additional flow will overtop the channel at Alessandro Boulevard, and then sheet flow to the south.

Table 4.9.B: Gilman Springs Road Culvert Capacity Analysis

Culvert	Size/Material	Node	100-yr Flow (cfs)	Culvert Capacity * (cfs)	Adequate to Convey the 100-year flow?
1	24” CMP	341	60	20	No
2	36” CMP	351	15	50	Yes
3	36” CMP	51	370	40	No
4	48” CMP	52	170	100	No

FIGURE 4.9.2

World Logistics Center Specific Plan Project
Environmental Impact Report

Gilman Springs Road
Culvert Flow Pattern

SOURCE: HF, 2014.

THIS PAGE INTENTIONALLY LEFT BLANK

At Culvert No. 6, with a total of 650 cfs offsite flow, 130 cfs is conveyed through the 4-foot × 4-foot RCB, and 24 cfs is conveyed along the existing ditch along the road. The remaining flow combines with the flow of 52 cfs from Culvert No. 5 and 548 cfs overtop the road flowing to the downstream channel. Due to the large amount of offsite flow and small capacity of the existing channel, the flow will overtop the existing Alessandro Boulevard.

At Culvert No. 8, with a total of 55 cfs offsite flow, 45 cfs is conveyed through the 24-inch CMP, and 10 cfs overtop the road draining to the downstream natural channel. The downstream channel has a capacity of 75 cfs. Therefore the excess flow will be contained within the natural channel.

At Culvert No. 9, with a total of 140 cfs offsite flow, 20 cfs flow is conveyed through the 24-inch CMP, 112 cfs is conveyed along the existing ditch on the north side of the street, and 8 cfs overtop the road and drain to the existing natural channel downstream. The channel has a capacity of 1,600 cfs; therefore the impact of 8 cfs is considered negligible.

At Culvert No. 10, with a total of 70 cfs offsite flow, 20 cfs are conveyed through the 24-inch CMP, the remaining 50 cfs combine with the 112 cfs flow from the upstream ditch which overtop the road, 6 cfs drains to the existing ditch on the south side of the road, and the remaining flows to the natural drainage channel downstream, which has a capacity of 1,000 cfs. When larger storm events occur, Gilman Springs Road may be flooded. Even with proper maintenance to remove the existing sediment and debris to operate at full capacities, there will be excessive offsite flow overtopping the road and entering the project site in a 100-year storm.

4.9.1.2 Water Quality

The project area is within Region 8 (Santa Ana Region) of the Regional Water Quality Control Board (RWQCB), which encompasses the watersheds of the Santa Ana and San Jacinto Rivers. The 24-mile long San Jacinto River flows into southern Moreno Valley from the San Jacinto Mountains, across the San Jacinto Valley, through a portion of the City of Moreno Valley, to Railroad Canyon Reservoir, and finally to its terminus in Lake Elsinore, southwest of Moreno Valley. Table 4.9.D identifies receiving waters that receive urban storm water runoff from the project area.

NOTE: The following changes have been made to in response to Comment F-7A-59 in Letter F-7A from Lozeau Drury.

Table 4.9.D: Receiving Waters from the Project Site

Receiving Water	303(d) List Impairments	Designated Beneficial Use	Proximity to RARE Use* Designation
San Jacinto River Reach 3 (Hydrologic Units 802.11, 802.14 and 802.21)	None	Intermittent: MUN, AGR, GWR, REC1, REC2, WARM, WILD	Approximately 2 miles to RARE designated San Jacinto Wildlife Area
Canyon Lake (Railroad Canyon Reservoir), San Jacinto River Reach 2 (Hydrologic Unit 802.11)	Nutrients, Pathogens	MUN, AGR, GWR, REC1, REC2, WARM, WILD	Not Rare
San Jacinto River Reach 1 (Hydrologic Units 802.32 and 802.31)	None	Intermittent: MUN, AGR, GWR, REC1, REC2, WARM, WILD	Not Rare

Table 4.9.D: Receiving Waters from the Project Site

Receiving Water	303(d) List Impairments	Designated Beneficial Use	Proximity to RARE Use* Designation
Lake Elsinore (Hydrologic Unit 802.31)	Nutrients, Organic Enrichment/ Low Dissolved Oxygen, PCBs (polychlorinated biphenyls), sediment toxicity Unknown Toxicity	MUN, REC1, REC2, WARM, WILD	Not Rare

* Rare, Threatened or Endangered Species (RARE) waters support habitats necessary for the survival and successful maintenance of plant or animal species designated under State or Federal law as rare, threatened, or endangered.

Source: *Preliminary Project Specific Water Quality Management Plan for World Logistics Center Specific Plan*, CH2MHILL, September 2014.

According to the Santa Ana Region Basin Plan, water quality in the project area is affected by a number of factors including but not limited to consumptive use, importation of water high in dissolved solids, runoff from urban and agricultural areas, and the recycling of water within the basin. In general, water quality in the Santa Ana Region becomes progressively poorer as water moves along hydraulic flow-paths. The highest quality water is typically associated with tributaries flowing from surrounding mountains and groundwater recharged by these streams. As indicated in the Preliminary Water Quality Management Plan (WQMP)[1] prepared for the project, two receiving waters downstream of the project site are included in the most recent Federal Clean Water Act (CWA) Section 303(d) list of impaired water bodies. Canyon Lake is listed for pathogens and nutrients while Lake Elsinore is listed for nutrients, organic enrichment/low dissolved oxygen, polychlorinated biphenyls (PCBs), and unknown toxicity. As indicated in Table 4.9.D, each of the receiving waters has multiple designated beneficial uses. These designations provide a description of how the water is used and what beneficial purposes it serves. Table 4.9.E provides a description of each of these beneficial water uses.

Table 4.9.E: Beneficial Uses of Receiving Waters

Designated Beneficial Use	Description of Beneficial Use
Agricultural Supply (AGR)	Waters used for farming, horticulture, or ranching, including, but not limited to, irrigation, stock watering, and support of vegetation.
Groundwater Recharge (GWR)	Waters used for natural or artificial recharge of groundwater proposed for future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.
Municipal and Domestic Supply (MUN)	Waters used for community, military, or individual water supply systems including, but not limited to, drinking water supply.
(RARE)	Waters support habitats necessary for the survival and successful maintenance of plant or animal species designated under State or Federal law as rare, threatened, or endangered.
Water Contact Recreation (REC1)	Waters used for recreational activities involving body contact with water where ingestion of water is reasonably possible. Uses include, but are not limited to, swimming, water-skiing, whitewater activities, fishing, and use of natural hot springs.
Non-contact Water Recreation (REC2)	Waters used for recreational activities involving proximity to water, but not normally involving body contact with water where ingestion of water is reasonably possible. Uses include, but are not limited to, picnicking, sunbathing, hiking, camping, boating, hunting, sightseeing, and aesthetic enjoyment.

---

4.9.1.3 Water Sources

Water resources in the City and throughout Riverside County are sustained by substantial groundwater basins, which are used as reservoirs to store water during wet years. These underground reservoirs are tapped throughout the year according to the demand for water. Groundwater conditions in these basins are influenced by natural hydrologic conditions such as percolation of precipitation, groundwater seepage, and ephemeral stream flow within the watershed areas. The project site lies within the Perris North and San Jacinto Lower Pressure Management Zones of the West San Jacinto Groundwater Management Plan (Plan) area, which covers approximately 164,200 acres.[1] This Plan area is bounded by the San Jacinto Mountains on the east, the San Timoteo Badlands on the northeast, the Box Mountains on the north, the Santa Rosa Hills and Bell Mountain on the south, and unnamed hills on the west. Groundwater conditions in these basins are influenced by natural hydrologic conditions such as percolation of precipitation, groundwater seepage, and ephemeral stream flow within the watershed areas. Currently, the City does not identify any major groundwater recharge areas within the project site.[2]

4.9.1.4 Water Supply

The project area is located within the service boundary of the Eastern Municipal Water District (EMWD), which serves the eastern portion of the watershed in Riverside County. The EMWD has a 555-square mile service area that provides water for a population of about 630,000. Without easy access to an ocean outfall for effluent, the EMWD has developed into one of the State's largest reclaimed water providers, having a combined capacity from its five sewage treatment plants of more than 43 million gallons per day (mgd). Reclaimed water has become extremely important in managing local water resources, and helps extend potable supplies by substituting reclaimed water for potable water typically used by certain facilities (e.g., golf courses and landscape irrigation). The EMWD utilizes an aggressive program of developing local groundwater resources, including desalination, water harvesting, and additional storage of surplus imported and reclaimed water.

The EMWD adopted the West San Jacinto Groundwater Basin Management Plan (Plan) in June 1995. The Plan serves to protect the interests of existing groundwater producers and to provide a framework for new water supply projects within the 256-square mile Management Plan area. This plan encompasses more than 164,200 acres and includes the groundwater management zones, as well as essentially non-water bearing areas such as the Lakeview Mountains, the Bernasconi Hills around Lake Perris, the Double Butte area near Winchester, and areas in the extreme northern, western, and southern portions of the EMWD.[3]

---

[1] The West San Jacinto Groundwater Management Plan identifies groundwater areas as "management zones" which may not match the area or configuration of subbasins.

[2] *Section 5.7 Hydrology/Water Quality*, City of Moreno Valley General Plan Final Program EIR, City of Moreno Valley, July 2006.

[3] *West San Jacinto Groundwater Basin Management Plan 2010 Annual Report*, Eastern Municipal Water District, June 2011.

A Water Supply Assessment (WSA) was prepared for this project and approved by the EMWD on February 21, 2012, which indicated that water service to the project site will be provided by the EMWD and that the EMWD has the supplies available to provide water to the project.

The water supply available to the EMWD in 2010 totals approximately 154,700 acre-feet (AF).[1] Water sources for the EMWD include imported water purchased from the Metropolitan Water District of Southern California (Metropolitan), groundwater sources, desalted groundwater, and recycled water from the EMWD's five regional water reclamation facilities. Imported water from Metropolitan is delivered in three ways: as potable water, as raw water and treated at two local EMWD filtration plants, or as raw water for non-potable use.

EMWD has four (4) sources of water supply: imported water purchased from MWD, local potable groundwater, local desalted groundwater and recycled water. Imported water accounts for approximately 65 percent, local potable groundwater is approximately 11 percent, desalted groundwater is 3 percent, and recycled water is 21 percent of supply (page 5, project WSA).

In June 2011, the EMWD adopted its *2010 Urban Water Management Plan* (UWMP), which details the reliability of its current and future water supply. The document found that with all of its existing and planned supplies, the EMWD can meet 100 percent of projected supplemental demand through 2035, even with a repeat of a severe drought. In addition, the UWMP addresses conservation, local supplies and reliability of imported supplies. Table 4.16.A (q.v.) identifies EWMD's projected water supplies and demand.

The water supply demands of the project have been assessed in the WSA and a determination was made that there is adequate water to serve the WLC project. More information on this topic is provided in Section 4.16, *Utilities and Service Systems*, of the DEIR.

4.9.1.5 Storm Drain Infrastructure

The following revisions have been made in response to on Comment G-95-70 in Letter G-95 from Thomas Thornsley.

A portion of the project site is located within the Moreno Master Drainage Plan (MMDP) of the Riverside County Flood Control and Water Conservation District (RCFCWCD). The MMDP provides guidance for the construction of the master plan drainage system, and regional retention/detention basins. RCFCWCD is currently preparing a revised MMDP. The existing 12-foot wide by 8-foot high reinforced concrete box (RCB) east of Redlands Boulevard is owned by RCFCWCD and is designated as Line "F" in the MMDP. This facility conveys runoff from the existing culverts under SR-60 and through developed property to its current terminus immediately south of Eucalyptus Avenue. (Note: This RCB is located farther west than depicted on the MMDP to accommodate the existing logistics building south of SR-60.) The existing MMDP provides for storm flows north of SR-60 to be routed to the proposed Sinclair Detention Basin. Flows released from the proposed basin would pass under SR-60 through the existing culverts and be conveyed to the drainage systems identified as Line "F" in the MMDP.

4.9.1.6 NOP/Scoping Comments

A number of residents and representatives of local conservation groups expressed concerns regarding impacts the project might have on local drainage, especially historic localized flooding, groundwater quantity and quality, and water quality, especially related to the San Jacinto Wildlife Area immediately

---

[1] An acre-foot covers one acre to a depth of one foot. An acre foot is approximately 326,000 gallons, which is enough to meet the needs of two average southern California households a year.

south of the project site to serve as a transition area or buffer. Sections 4.9.5 and 4.9.6 of the DEIR thoroughly analyze these issues.

4.9.2 Existing Policies and Regulations

In the past, the effort to control the discharge of storm water has focused on managing the quantity of storm water (e.g., flood control) and only to a limited extent on managing the quality of storm water. In recent years, awareness of the need to improve water quality has increased. With this awareness, an extensive body of Federal, State, and local laws and regulatory programs has been established to pursue the goal of reducing pollutants contained in storm water discharges to waterways. The emphasis of these programs is to promote the concept and the practice of preventing pollution at the source, before it can cause environmental harm.

4.9.2.1 Federal Regulations

Clean Water Act. The CWA was amended in 1972 to prevent discharge of pollutants to waters of the United States from any point source unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 amendments to the CWA added Section 402(p), which establishes the NPDES, a permitting system for the regulation of discharges of any pollutant into waters of the United States. Regional Water Quality Control Boards (RWQCBs) administer this permitting program in California. In November 1990, the EPA published final regulations that establish application requirements for storm water permits. The regulations require NPDES permits for discharges of storm water from industrial/construction and Municipal Separate Storm Sewer Systems (MS4s). To comply with the permits, storm water pollution controls must be implemented for construction and industrial activity that discharges either directly to surface waters or indirectly through separate municipal storm drains. Pollution control is achieved by establishing engineering measures that have been designed, tested and successfully implemented throughout the past decades, such as detention basins and sediment traps, during both the construction period and the operational phases of a project.

Pursuant to the requirements of the State Water Resources Control Board (SWRCB), the NPDES General Permit No. CAS000002 applies to all construction activities that result in the disturbance of at least one acre of total land area, or activity which is part of a larger common plan of development of one acre or greater. General Permit No. CAS000002 is issued by the SWRCB as part of the Federal delegation responsibilities under this section of the CWA. The RWQCB regulates hydromodification[1] as well as surface and groundwater quality through adoption of water quality plans and standards, and issuance of water quality permits and waivers. The NPDES permit deals with both the construction phase and operational phase of development projects. For the construction phase of a project, the NPDES permit identifies the preparation of an SWPPP.

The implementation of NPDES permits ensures that the state's mandatory standards for the maintenance of clean water and the Federal minimum standards are met. Coverage under an NPDES permit regulates sedimentation and soil erosion through implementation of an SWPPP and periodic inspections by RWQCB staff. An SWPPP is a written document that describes the construction operator's activities to comply with the requirements in the NPDES permit. The SWPPP establishes a process whereby the operator evaluates potential pollutant sources at the site and implements Best Management Practices (BMPs) designed to prevent or control the discharge of pollutants in storm water runoff.

---

[1] Hydromodification is the alteration of the hydrologic characteristics of coastal and non-coastal waters, which, in turn, could cause degradation of water resources.

Storm water control measures during construction and grading will be outlined in the construction NPDES permit and SWPPP prepared for each proposed phase of the project. Examples of such BMP control measures include but are not limited to the following:

- Temporary detention basins for runoff and silt containment;
- Regular street-sweeping and truck washing prior to exiting construction areas;
- Covering of soil hauling trucks to minimize dust generation (and silt buildup on project roads;
- Dirt rockers at project exits to reduce soil transported out of construction areas;
- Monitoring of runoff and protection devices during storm events;
- Use of silt fencing, gravel bags, and/or straw bales to channel runoff to temporary basins; and
- Identification of emergency procedures in case of hazardous materials spills.

The project proponent will be required to obtain a construction NPDES permit prior to any site grading. In addition, the NPDES permit will require the identification of post-construction BMPs to be incorporated into the project WQMP and any subsequent site-specific WQMP. The WQMP identifies measures to control the post-construction entry of contaminants into storm flows.

In addition, pursuant to Section 404 of the CWA, the U.S. Army Corps of Engineers (USACE) regulates discharges of dredged or fill material into waters of the United States. These waters include wetlands and non-wetland bodies of water that meet specific criteria, including a direct or indirect connection to interstate commerce. The USACE regulatory jurisdiction pursuant to Section 404 of the CWA is founded on a connection, or nexus, between the water body in question and interstate commerce. This connection may be direct (through a tributary system linking a stream channel with traditional navigable waters used in interstate or foreign commerce) or may be indirect (through a nexus identified in the USACE regulations). The USACE typically regulates as non-wetland waters of the U.S. any body of water displaying an ordinary high water mark (OHWM). In order to be considered a jurisdictional wetland under Section 404, an area must possess three wetland characteristics: hydrophytic vegetation, hydric soils, and wetland hydrology. Each characteristic has a specific set of mandatory wetland criteria that must be satisfied in order for that particular wetland characteristic to be met. A project-specific discussion regarding Section 404 issues is provided in Section 4.4, *Biological Resources*, of this EIR.

National Flood Insurance Program. The National Flood Insurance Program (NFIP) is a relatively recent Federal program. The Federal government has been actively involved in flood control since 1927 following major floods on the Mississippi River. Beginning with the Flood Control Act of 1936, Congress assigned the USACE the responsibility for flood control engineering works and later for floodplain information services. Flood control was provided through the construction of dams and reservoirs. Despite these programs and rapidly rising Federal expenditures for flood control, flood losses continued to rise. In 1968, Congress passed the National Flood Insurance Act, which created the NFIP. The Flood Disaster Protection Act of 1973, which amended the 1968 Act, required the purchase of flood insurance by property owners who were located in special flood hazard areas and were being assisted by Federal programs, or by federally supervised, regulated, or insured agencies or institutions.

National Flood Insurance Program Reform Act of 1994. In 1994, the National Flood Insurance Program Reform Act went through its first major revision since its inception. Included in this revision were provisions that if a lender were to escrow an account and if the structure were in the floodplain, then the lender *must* escrow for flood insurance. The revised legislation also included increased flood insurance limits and the elimination of the 1962 buy-out program. However, the legislation did initiate the Hazard Mitigation Fund as part of the flood insurance policy. Also included in this legislation was the increase from a 5-day to a 30-day waiting period for a new policy to become effective. It also prohibits the waiver of flood insurance purchase requirements as a condition of receiving Federal disaster assistance. If the flood insurance policy were not maintained, in the event of another disaster, no disaster assistance would be made available for that structure.

Executive Order 11988, Floodplain Management. Executive Order 11988 requires the USACE to provide leadership and to take action to:

- Reduce the hazards and risk associated with floods;
- Minimize the impact of floods on human health, safety, and welfare; and
- Restore and preserve the natural and beneficial values of the current floodplain.

To comply with Executive Order 11988, the policy of the USACE is to develop projects that, to the extent possible, avoid or minimize adverse effects associated with use of the floodplain and that avoid development (or the inducement of development) in an existing floodplain unless there is no practicable alternative.

4.9.2.2 State Regulations

Porter-Cologne Water Quality Control Act. The California Water Code (CWC) is the principal state law regulating water quality in California. The CWC contains provisions regulating water and its use. This portion of the CWC, Division 7 (Porter-Cologne Act), establishes a program to protect water quality and beneficial uses of the State water resources and includes groundwater and surface water. The SWRCB is the principal State agency responsible for control of water quality. It establishes waste discharge requirements, water quality control planning and monitoring, enforcement of discharge permits, and ground and surface water quality objectives. It also prevents waste and unreasonable use of water, and adjudicates water rights.

Pursuant to requirements of the SWRCB, the NPDES Construction General Permit (CGP) No. CAS000002 applies to all construction activities that result in the disturbance of at least one acre of total land area, or activity which is part of a larger common plan of development of one acre or greater. The CGP is issued by the SWRCB as part of the Federal delegation responsibilities under Section 402 of the CWA. For all projects subject to the CGP, applicants are required to develop and implement an effective Storm Water Pollution Prevention Plan (SWPPP); to implement sediment, erosion, and pollution prevention control measures; and to obtain coverage under the CGP. The CGP separates projects into Risk Levels 1, 2, or 3. Risk Levels are determined during the planning and design phases, and are based on potential erosion and transport to receiving waters. Requirements apply according to the Risk Level determined.

The BMPs for this project contained in the Preliminary Water Quality Management Plan (PWQMP, see DEIR Appendix J) have been developed by the project engineers to address project-specific water quality impacts. See Section 4.9.2.3 for more information on the MS4 Permit System as it applies to the project. For additional information on the major BMPs recommended in the PWQMP prepared by CH2MHill for the project that are consistent with these regulations, see Section 4.9.6.2, *Construction-Related Water Quality Impacts*, and Section 4.9.6.3, *Operational Water Quality Impacts*. The BMPs for the project are described in Section 4.9.3.2 and 4.9.6.3 for treatment control BMPs, and in Section 4.9.6.2 for construction site BMPs.

California Fish and Game Code. The California Fish and Game Code has provisions to prevent unauthorized diversions of any surface water and discharge of any substance that may be deleterious to fish, plant, animal, or bird life. The California Department of Fish and Wildlife (CDFW), through provisions of the California Fish and Game Code (§1601 through §1603), is empowered to regulate any alteration of a river, stream, or lake where fish or wildlife resources may be adversely affected. The presence of a channel bed and banks, and at least an intermittent flow of water define streams (and rivers), is one of the most important factor in establishing CDFW jurisdiction. The CDFW regulates wetland areas only to the extent that those wetlands are part of a river, stream, or lake as defined by the CDFW. Discussion of jurisdictional waters and riparian/wetland resources is provided in Section 4.4, *Biological Resources*, of this EIR.

California Code of Regulations. The California Code of Regulations (CCR) contains administrative procedures for the State and the nine Regional Water Quality Control Boards (RWQCBs) in Title 23, and for water quality for domestic uses, wastewater reclamation, and hazardous waste management in Title 22.

Health and Safety Code. The Health and Safety Code provides for protection of ground and surface waters from hazardous waste and other toxic substances.

Groundwater Management Act (AB 3030) [Sections 10750–10756 of the California Water Code]. The availability of groundwater and issues involving the adequacy of recharge capability are regional in nature. The Groundwater Management Act[1] (AB 3030) provides a systematic procedure for an existing local agency to develop a groundwater management plan. AB 3030 allows a local agency whose service includes a groundwater basin that is not already subject to groundwater management pursuant to law or court order to adopt and implement a groundwater management plan and includes plans to mitigate overdraft conditions, control brackish water, and to monitor and replenish groundwater.

There are currently few domestic uses for groundwater in the project area as the City of Moreno Valley primarily relies upon imported water from the EMWD for domestic use. Water sources for the EMWD include imported water purchased from Metropolitan, groundwater sources, and recycled water from the EMWD’s five regional water reclamation facilities. Approximately two thirds of the EMWD’s water is imported from Metropolitan, with the remaining water supplied by groundwater wells.[2] Groundwater supplies are drawn from the EMWD wells located in the Hemet, San Jacinto, Moreno Valley, Perris Valley, and Murrieta areas.

Cobey-Alquist Flood Plain Management Act (California Water Code Section). This Act states that a large portion of land resources of the State of California is subject to recurrent flooding. The public interest necessitates sound development of land use, as land is a limited, valuable, and irreplaceable resource, and the floodplains of the State are a land resource to be developed in a manner that, in conjunction with economically justified structural measures for flood control, would result in prevention of loss of life and of economic loss caused by excessive flooding. The primary responsibility for planning, adoption, and enforcement of land use regulations to accomplish floodplain management rests with local levels of government. It is policy of the State of California to encourage local government to plan land use regulations to accomplish floodplain management and to provide state assistance and guidance. As part of its discretionary review process, the City must determine how the project will comply with this Act and not create flooding impacts on new occupied land uses.

---

[1] Sections 10750–10756 of the California Water Code.

[2] EMWD History and Mission, http://www.emwd.org, Eastern Municipal Water District, website accessed April 20, 2012.

California Toxics Rule. On May 18, 2000, the State Environmental Protection Agency (CalEPA) promulgated numeric water quality criteria for priority toxic pollutants and other provisions for water quality standards to be applied to waters in the State of California. The CalEPA promulgated this rule based on the Administrator's determination that the numeric criteria are necessary in California to protect human health and the environment. The rule fills a gap in California water quality standards that was created in 1994 when a State court overturned the State's water quality control plans containing water quality criteria for priority toxic pollutants. Thus, the State of California has been without numeric water quality criteria for many priority toxic pollutants as required by the CWA, necessitating this action by CalEPA. These Federal criteria are legally applicable in the State of California for inland surface waters, enclosed bays, and estuaries for all purposes and programs under the CWA.

4.9.2.3 Local Regulations

Municipal Separate Storm Sewer System (MS4) Permit System. The City of Moreno Valley is a co-permittee under the NPDES MS4 Permit No. CAS 618033, adopted on January 29, 2010. The NPDES MS4 permit is intended to regulate the discharge of urban runoff from the MS4 within Riverside County. Under the NPDES MS4 permit, the City is responsible for the management of storm drain systems within its jurisdiction. Cities are required to implement management programs, monitoring programs, implementation plans, and all BMPs outlined in the Riverside County Water Drainage Area Management Plan (DAMP) and Riverside County Water Quality Management Plan for Urban Runoff (WQMP). The current approved WQMP, dated October 22, 2012, addresses the 2010 MS4 NPDES permit.

Projects identified as a 'Priority Development Project' will be required to prepare a Project-Specific WQMP. The 2010 MS4 Permit mandates a Low Impact Development (LID) approach to storm water treatment and management of runoff discharges. The project site should be designed to minimize imperviousness, detain runoff, and infiltrate, reuse or evapotranspirate runoff where feasible. LID BMPs should be used to infiltrate, evapotranspirate, harvest and use, or treat runoff from impervious surfaces, in accordance with the Design Handbook for Low Impact Development Practices. The project must ensure that runoff does not create a hydrologic condition of concern. The RWQCB continuously updates impairments as studies are completed. The most current version of impairment data will be reviewed and implemented prior to the preparation of Preliminary and Final Project-Specific WQMPs for future phases of the project. As part of its discretionary review process, the City must ensure that each phase of the project complies with the MS4 requirements.

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The MSHCP is an element of the Riverside County Integrated Project (RCIP), which is an integration of land use, transportation, and conservation planning and implementation to develop a consensus for the future development of Riverside County. The MSHCP is designed to protect over 150 species and conserve over 500,000 acres of land in western Riverside County. The MSHCP was adopted in 2003 and is being implemented specifically to address the direct, indirect, cumulative, and growth-related effects on covered species resulting from build out of planned land use and infrastructure, including the project. The MSHCP involves efforts by the county, State, and Federal governments, the fourteen cities in western Riverside County, and private and public entities engaged in construction activities that potentially affect the species covered under the MSHCP. The plan specifies an obligation of local projects, both public and private, to mitigate their impacts on species. The MSHCP includes incentives for conservation or the purchase of properties from willing sellers and will eventually result in a Conservation Area in excess of 500,000 acres, focusing on conservation of 150 species. The MSHCP Conservation Area includes approximately 347,000 acres of existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. The MSHCP requires a proposed development project to evaluate any impacts to riparian or riverine resources on the project site, as well as what is referred to as the "urban/wildlands interface" when present. This analysis includes design features and measures related to drainage features, toxics, lighting, noise, invasive plants, barriers, and grading/land development.

The MSHCP requires new development to determine if a project site contains riparian or riverine resources/processes prior to development. If they are present, the MSHCP requires projects to protect these resources to the extent possible with creative project design, setbacks, etc. If such resources, or any other important resources identified in the MSHCP will be affected by development, the developer is required to submit a Determination of Biologically Equivalent or Superior Preservation (DBESP) report indicating how impacts to these resources will be mitigated or compensated for by the developer. For more information on the MSHCP and DBESP processes, see Section 4.4, *Biological Resources*.

4.9.2.4 City of Moreno Valley General Plan Policies

The following General Plan objectives, policies, and programs are applicable to the project:

Objectives, Policies, and Programs

Objective 6.2	Minimize the potential for loss of life and protect residents, workers, and visitors to the City from physical injury and property damage, and to minimize nuisances due to flooding.
Policy 5.5.11	Implement National Pollutant Discharge Elimination System Best Management Practices relating to construction of roadways to control runoff contamination from affecting water resources.
Objective 7.2	Maintain surface water quality and the supply and quality of groundwater.
Program 7-2	Advocate for natural drainage channels to the Riverside County Flood Control District, in order to assure the maximum recovery of local water, and to protect riparian habitats and wildlife.
Policy 7.4.3	Preserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels.

NOTE: The following changes have been made in response to Comment F-13-32 in Letter F-13 from Johnson & Sedlack on Behalf of Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.

Ultimate Goals

VII	Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards.

4.9.3 Methodology

Evaluation of hydrology and water quality impacts associated with the project includes the following:

- Determine the construction phase water quality impacts based on NPDES standards;
- Determine the construction impacts on drainage patterns and drainage capacity;
- Determine the operational water quality impacts based on NPDES standards;
- Determine the operational impacts on drainage patterns and drainage capacity; and
- Determine the impacts on local groundwater table levels.

A PWQMP (included as Appendix J-2 of this EIR) has been prepared for the project and evaluates impacts associated with operational activities. Drainage pattern and capacity impacts were evaluated by calculating existing and proposed flow condition rates using the rational method in accordance with the methods described in the Riverside County Flood Control and Water Conservation District Hydrology Manual. The peak 100-year storm runoff was utilized to preliminarily size storm drain pipes as indicated in the Draft Drainage Report conducted for this project (Appendix J-1 of this EIR).

Due to the land use change associated with the land development, a number of drainage systems are proposed to mitigate the changes of hydrologic characteristics of the watershed. The design guidelines for this project are in accordance with RCFCWCD requirements and City of Moreno Valley guidelines. The design guidelines and local flood protection requirements are summarized as the following:

- Drainage facilities shall be designed in accordance with the Riverside County Hydrology Manual and Design Manual Standard Drawings. The drainage systems shall be designed to provide 100-year level of flood protection through a combined hydraulic conveyance of the underground storm drains and detention basins;
- Proposed drainage systems, which are connecting to the existing downstream facilities, shall be designed properly so the proposed discharge does not exceed the existing discharge to the downstream facilities; and
- Provisions for maintenance and/or easement shall be incorporated in the proposed drainage systems.

4.9.3.1 Pollutants of Concern and Assessment Methodology

The pollutants of concern for the water quality analysis have been identified based on the previously described regulations and the pollutants identified by regulatory agencies that potentially could be generated by the project. The potential pollutants associated with the project are reflected in Table 4.9.F. Table 4.9.G describes these pollutants (bacterial indicators, metals, nutrients, pesticides, toxic organic compounds, sediments, trash & debris, and oil & grease) and their general impact on water quality and aquatic habitat.

The project's priority pollutants of concern are defined as the pollutants associated with the project that are also present in impaired receiving waters. Based on the WQMP prepared for the project, impaired receiving waters downstream from the project include Canyon Lake and Lake Elsinore. Canyon Lake is impaired for nutrients and pathogens, and Lake Elsinore is impaired for nutrients, organic enrichment/low dissolved oxygen, PCBs, and unknown toxicity. Therefore, the priority pollutants of concern for this project include pathogenic indicators, nutrients, pesticides, and toxic organic compounds.

THIS PAGE INTENTIONALLY LEFT BLANK

Table 4.9.F: Anticipated and Potential Pollutants Generated by Land Use Type

Priority Project Categories	General Pollutant Categories							
	Bacterial Indicators	Metals	Nutrients	Pesticides	Toxic Organic Compounds	Sediments	Trash & Debris	Oil & Grease
Commercial/Industrial Development	P[3]	P	P[1]	P[1]	P[5]	P[1]	P	P
Parking Lots (>5,000 ft^2)	P[6]	P	P[1]	P[1]	P[4]	P[1]	P	P
Retail Gasoline Outlets	N	P	N	N	P	N	P	P

P = Potential N= Not Potential

[1] A potential pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected.

[2] A potential pollutant if the project includes uncovered parking areas; otherwise not expected.

[3] A potential pollutant if land use involves animal waste.

[4] Specifically petroleum hydrocarbons.

[5] Specifically solvents.

[6] Bacterial indicators are routinely detected in pavement runoff

Table 4.9.G: Pollutants and General Water Quality Impacts

Pollutant	Water Quality Impact
Bacterial Indicators	May result in water body impairments, can exceed public health standards for water contact recreation, creating a harmful environment. Can alter the aquatic habitat and create a harmful environment for aquatic life.
Metals	Bio-available forms of trace metals are toxic to aquatic life, potential of groundwater contamination, bio-accumulation in aquatic life, affect beneficial uses of a water body.
Nutrients	Elevated nutrient levels in surface waters cause algal blooms, excessive vegetative growth, and dissolved oxygen levels, which is detrimental to aquatic life.
Pesticides	Elevated levels can indirectly or directly constitute a hazard to life or health. During cleaning activities, these compounds can be washed off into storm drains creating runoff containing toxic levels of the pesticides active component. Dirt, grease, and grime may adsorb concentrations that are harmful or hazardous to aquatic life.
Toxic Organic Compounds	May contain levels that are harmful or hazardous to aquatic life.
Sediments	Excessive sediment can be detrimental to aquatic life by interfering with photosynthesis, respiration, growth, and reproduction.
Trash and Debris	Detrimental effect on recreational value of a water body and aquatic habitat; interferes with aquatic life respiration and can be harmful or hazardous to aquatic animals that mistakenly ingest floating debris.
Oil and Grease	Can accumulate in aquatic life from contaminated water, sediments, and food and are toxic at low concentrations. Can persist in sediments for long periods of time and result in adverse impacts on the diversity and abundance of existing bio-communities and can affect the aesthetic value of a water body.

THIS PAGE INTENTIONALLY LEFT BLANK

4.9.3.2 Treatment Control BMPs and Assessment Methodology

The treatment control BMP strategy is to select Low Impact Development (LID) BMPs that promote infiltration and evapotranspiration, including infiltration basins, bioretention facilities, and extended detention basins. Generally infiltration BMPs have advantages over other types of BMPs, including reduction of the volume and rate of runoff, as well as full treatment of all potential pollutants potentially contained in the storm water runoff. It is recognized however that infiltration may not be feasible on sites with low infiltration rates, or located on compacted engineered fill. If the BMP is considered in a fill condition, and the infiltration surface of the BMP cannot extend down into native soils, or if the BMP is considered in a cut condition, and there is no practicable way to verify infiltration rates at the final BMP elevation, infiltration BMPs will not be used. Prior to final design of each phase of the project, infiltration tests shall be performed within the boundaries of the proposed infiltration BMP and at the bottom elevation (infiltration surface) of the proposed infiltration BMP to confirm the suitability of infiltration. In situations where infiltration BMPs are not appropriate, bioretention and/or biotreatment BMPs (including extended detention basins, bioswales, and constructed wetlands) that provide opportunity for evapotranspiration and incidental infiltration will be considered. Harvest and use BMPs will also be considered as a treatment control BMP to store runoff for later non-potable uses.

Proprietary BMPs combined with traditionally accepted BMPs may assist with the treatment of project pollutants. Proprietary BMPs combined with traditionally accepted BMPs may be employed on a site-specific basis as approved by the City of Moreno Valley. The appropriate BMP(s) for each phase of the project will be determined based on the size of the project area, the types of pollutants that would be found in the development runoff, and pollutants of concern. Table 4.9.H describes these BMPs (infiltration basins, biofilters, detention basins, water quality inlets, and hydrodynamic separators) and their general characteristics.

Table 4.9.H: BMP Characteristics

BMP	General Characteristics
Biofilters	Includes grass swales, grass strips, wetland vegetation swales, and bioretention. Pollutants are removed by bioretention or biofiltration, and provide opportunity for evapotranspiration and incidental infiltration.
Water Quality Inlet	Pollutants are removed through sedimentation and separation as the design flow passes through one or more chambers. Generally used for pretreatment before discharging into another type of BMP.
Extended Detention Basin	Basin sized to detain and slowly release the design volume of urban runoff, allowing particles and associated pollutants to settle out. Maintenance efforts would need to be directed toward vegetation management, vector control, and removal of debris accumulations.
Infiltration Basins	Basin sized to detain and infiltrate runoff, allowing particles and associated pollutants to settle out. Maintenance efforts would be directed toward vegetation management, vector control, and removal of debris accumulations. This BMP may require groundwater monitoring.
Hydrodynamic Separator System	Device treats storm water by creating a whirlpool of water within a concrete chamber in which solids fall to the bottom of the chamber while buoyant debris, oil, and grease rise to the surface, allowing water to pass through a flow control opening.

4.9.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts to hydrology and water quality are based on *CEQA Guidelines* (2012). A project would have a significant impact on surface hydrology, water quality, and/or groundwater if it would:

- Result in violations of any water quality standards or waste discharge requirements of the City of Moreno Valley or the Regional Water Quality Control Board;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion, siltation on site or off site;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff which would result in on-site or off-site flooding;
- Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff;
- Otherwise substantially degrade water quality;
- Place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows;
- Expose people or structures to a significant risk of loss injury or death involving flooding, including flooding as a result of the failure of a levee or dam; and/or
- Expose people or structures to inundation by seiche, tsunami, or mudflow.

4.9.5 No Impacts/Less than Significant Impacts

The following potential impacts were determined to be less than significant. In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.

4.9.5.1 Seismic Flooding-Related Impacts

Threshold	Would the project expose people or structure to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?

The project site and the off-site improvement areas are not identified as being located within the City's mapped inundation area;[1] therefore, the project would not result in the exposure of people or structures to risk of loss, injury, or death involving flooding as a result of failure of either the Poorman Reservoir (Pigeon Pass Dam) or Lake Perris Dam. Impacts related to this issue would be less than significant, and no mitigation is required.

4.9.5.2 Seismic-Related Impacts

Threshold	Would the project expose people or structure to a significant risk of loss, injury, or death involving inundation by seiche, tsunami, or mudflow?

---

[1] *Figure 5.5-2 Floodplains and Fire Hazard Areas*, City of Moreno Valley General Plan Final Program EIR. July 2006.

A tsunami is a series of waves generated in a body of water by a pulsating or abrupt disturbance that vertically displaces water. Seiches are oscillations in enclosed bodies of water that are caused by a number of factors, most often wind or seismic activity. Lakes in seismically active areas such as Lake Perris are at risk from seiches. A mudslide (also known as a mudflow) occurs when there is fast-moving water and a great volume of sediment and debris that surges down a slope, stream, canyon, arroyo, or gulch. Mudslides are similar to flash floods and can occur suddenly without time for adequate warning. Mudflows can ruin substantial improvements with the force of the flow itself and the burying or erosion of improvements by mud and debris.

The project area is not at risk of inundation by a tsunami as it is located approximately 56 miles from the Pacific Ocean. The project area is located approximately 2.5 miles northeast of Lake Perris. Lake Perris is an enclosed body of water and could be subject to a seiche during a seismic event. However, a seiche event would not affect the project area because water levels in the lake are not high enough to overtop the Perris Dam in the event of a seiche.[1] The Perris Dam has been designed to prevent seiche phenomena due to the region’s high seismicity. In addition, the topography between the Specific Plan area and Lake Perris has multiple hills and valleys. Given these factors, impacts associated with seiche events are less than significant for the WLC project.

Except for the far southwest corner, the project site is located in a gently sloping area where landslides and mudslides would not occur. No development is proposed on the steep slopes of Mount Russell in the southwesterly portion of the property, which is included in the 74.3 acres of open space designated within the WLCSP other than the eastern extension of Cactus Avenue. Therefore, a less than significant impact associated with landslides, rockfalls, or mudslides would occur, and no mitigation is required.

4.9.5.3 Groundwater

Threshold	Would the WLC project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level?

Based on the WSA prepared for the project by the EMWD, water demand for the proposed on-site uses would total approximately 1,991.25 acre-feet per year (AFY).[2] The EMWD considers this a worst-case estimate based on the total acres and amount of square footage of high cube logistics uses proposed by the project. This estimate does not take into account the project landscaping design with xeriscape drought-tolerant landscaping and on-site collection of runoff and channeling it to landscaped areas to minimize irrigation on the interior of the project site. Thus, the water demand analysis conducted by the EMWD and in this EIR is somewhat conservative in its estimate of the actual water usage of the project as it builds out. For the purposes of analysis in this EIR, the EMWD’s estimate of 1,991 AFY figure will be used relative to water consumption.

As identified in Section 4.16, *Utilities and Service Systems*, of this EIR, the project will obtain water service from the EMWD. It is anticipated that the project would primarily utilize imported water purchased from Metropolitan. In the event that the supply of imported water is reduced, it would be supplemented with new local supply projects during multiple dry years, if needed.

The WSA prepared for the project indicates that development of the project will not include groundwater for water supply. Rather, this project, as well as other new developments in the EMWD’s service area,

---

[1] The existing earthen wall is approximately 128 feet high with the highest elevation at 1,628 feet. Normal operating water levels for Lake Perris are at 1,588 feet (leaving 40 feet of excess height between the water level and the top of the dam). Restricted operating water levels for Lake Perris are at 1,563 feet (leaving 65 feet of excess height between the water level and the top of the dam).

[2] *Water Supply Assessment Report for the World Logistics Center Specific Plan in Moreno Valley,* Eastern Municipal Water District, March 21, 2012.

will be supplied exclusively with imported water provided by MWD. The imported water may be treated by MWD, provided by Metropolitan as untreated water and subsequently treated by the EMWD, or recharged into the basin for later withdrawal.

NOTE: The following changes were made in Responses to Comments F-5-10 and F-5-23 in Letter F-5 from the Inland Empire Waterkeeper.

The project will not substantially interfere with groundwater recharge due to the project implementation of bioretention areas and detention basins with infiltration capacity that mitigates the impact of reduced pervious areas. Bioretention areas and detention basins will be implemented in addition to the remaining impervious areas. The only use of groundwater may be to support continued agriculture on portions of the WLCSP property that have not yet been developed. The EMWD developed the West San Jacinto Groundwater Basin Management Plan to help ensure that local groundwater resources are conserved and groundwater overdraft does not occur, based on projections of future growth and expected water supply conditions. The Plan projects the water consumption demands of existing and future development based on rates of growth assumed by regional planning organizations (i.e., SCAG and WRCOG) and estimates water demand versus available supply under different water supply scenarios (e.g., multiple dry years).

The Specific Plan requires future development to minimize water use by installing drought-tolerant landscaping (Specific Plan Section 4.2, Offsite Landscaping, and Section 5.4, Onsite Landscaping), by designing buildings and hardscape areas to capture and reuse water on-site for landscape irrigation (Specific Plan Section 5.4, *On-Site Landscaping*), and installing water-conserving building fixtures such as sinks, toilets, etc. (Specific Plan Section 6.0, *Sustainability*).

State Water Supply Reliability. Based on the Water Allocation analysis released by the California Department of Water Resources (DWR) on March 22, 2010, export restriction could reduce Metropolitan deliveries by 150 to 200 thousand acre-feet (TAF) under mean hydrologic conditions, and operations could remain restricted until a long-term solution is found to improve the stability of the Bay-Delta region.

The State Water Project (SWP) and Central Valley Project (CVP) are the responsible partners for operation of the DWR and Bureau of Reclamation (Reclamation), respectively. In November 1986, DWR and Reclamation signed the Coordinated Operations Agreement (COA). The COA was subsequently authorized and approved by the California State Legislature and Congress. Under COA, DWR and Reclamation agree to operate the SWP and CVP in a balanced manner to coordinate releases from upstream reservoirs and unregulated flows to meet Sacramento Valley in-basin and in-Delta uses, including water quality standards established by the SWRCB.

Reclamation, as a Federal agency is required to consult with National Marine Fisheries Service (NMFS) and U.S. Fish and Wildlife Service (USFWS) under Section 7 of the Federal Endangered Species Act (FESA) to determine if a Federal action that they authorize, fund, or implement could jeopardize the continued existence of a listed species in the wild, or destroy or modify the species' critical habitat. Because the SWP and CVP are operated in a balanced manner, the findings under Section 7 of the FESA affect operations of both the SWP and CVP.

The initial biological opinions related to long-term operations of the SWP and CVP were issued in 1993 by NMFS for protection of the winter-run Chinook salmon and by USFWS for protection of delta smelt. Operations of the SWP and CVP were modified to reduce potential adverse impacts to these species primarily through:

1) Increased storage volumes of water in upstream reservoirs to provide adequate flows with appropriate temperatures for the winter-run Chinook salmon and adequate flows in the Delta for both species;
2) Flows released from upstream reservoirs to provide adequate in-Delta flows and Delta outflows for these species; and
3) Modification of periods of time when water can be diverted at the SWP and CVP south Delta intakes to reduce the potential for reverse flows, reduce the potential for high salinity in the south Delta, and reduce the potential for entrainment and entrapment of fish in the SWP and CVP south Delta intake facilities.

The biological opinions were modified as DWR and Reclamation modified operations of the SWP and CVP and new information related to aquatic resources became available. During this period, NMFS redesignated the Sacramento River winter-run Chinook salmon as “endangered” and designated two species as “threatened” (i.e., Central Valley spring-run Chinook salmon and Central Valley steelhead). Therefore, the consultations under Section 7 of the FESA were modified and new biological opinions were issued between 2000 and 2004. In 2005, the Department of the Interior was sued with respect to the 2004 biological opinion issued by USFWS. Subsequently, USFWS re-issued the biological opinion in 2005; however, the Department of the Interior was sued in 2005 with respect to the reissued biological opinion. The 2005 USFWS biological opinion was invalidated and the United States District Court for the Eastern District of California (the Court) ordered a new biological opinion and issued interim operations orders to protect delta smelt until a new biological opinion could be issued in 2008. The interim operations criteria included limitations for operation of the SWP and CVP south Delta intakes to protect delta smelt.

In response to these actions, Reclamation requested consultation with USFWS and NMFS in August 2008 with respect to the coordinated long-term operation of the SWP and CVP. In December 2008, the USFWS issued a new biological opinion on the coordinated long-term operation of the SWP and CVP on the effects to delta smelt. In June 2009, the NMFS issued a new biological opinion on the coordinated long-term operation of the SWP and CVP on the effects to currently listed species (e.g., Central Valley spring-run Chinook salmon, Central Valley steelhead, Southern District Population Segment of North American green sturgeon, and Southern Resident killer whale). Reclamation provisionally accepted and then implemented the Reasonable and Prudent Alternatives included in these biological opinions. The operational criteria included in the Reasonable and Prudent Alternatives resulted in changes to operations of upstream reservoirs, stream flows, Delta outflow, and SWP and CVP south Delta intakes.

Several lawsuits were filed in the Court related to various aspects of the USFWS and NMFS biological opinions, and to the acceptance and implementation of the associated Reasonable and Prudent Alternatives by Reclamation. Between 2009 and 2010, the Court ruled that Reclamation failed to conduct an environmental analysis under the National Environmental Policy Act (NEPA) of potential impacts to the human environment before provisionally accepting and implementing the Biological Opinion Reasonable and Prudent Alternatives. In 2010, the Court found certain portions of the USFWS biological opinion to be arbitrary and capricious, and remanded those portions of the biological opinion to the USFWS. The Court ordered Reclamation to review the biological opinion and Reasonable and Prudent Alternative in accordance with NEPA. In 2011, the Court remanded the biological opinion to the NMFS.

Reclamation has continued the consultation with USFWS and NMFS for modification of the biological opinions, and has initiated the NEPA process through publication of the Notice of Intent on March 28, 2012. The Court order required completion by Reclamation of the Environmental Impact Statement (EIS) and the USFWS biological opinion related to delta smelt by December 1, 2013. The Court order also required completion by Reclamation of the EIS and the NMFS biological opinion related to Central Valley spring-run Chinook salmon, Central Valley steelhead, Southern District Population Segment of

North American green sturgeon, and Southern Resident killer whale by February 1, 2016. The Court did not vacate the biological opinions, and therefore, SWP and CVP operations are analyzed each year with respect to the Reasonable and Prudent Alternatives.

The most recent Metropolitan Regional Urban Water Management Plan (RUWMP) (Metropolitan November 2010, page 1-18) indicates that operational constraints similar to the most recent biological opinions and associated Reasonable and Prudent Alternatives would likely be continued until future long-term plans, such as the Bay Delta Conservation Plan (BDCP), would be implemented. A similar discussion was included in the EMWD Urban Water Management Plan (UWMP) (2010, page 38).

To address potential constraints on the SWP, Metropolitan has developed near and long-term action plans to increase water supply reliability. Metropolitan is also working with stakeholders throughout the state to develop and implement long term solution to the problem in the Bay Delta. The BDCP developed by State and Federal resource agencies, aimed at addressing ecosystem needs and securing long-term operating permits for the SWP. A working draft of the BDCP was released in November of 2010 and reflects significant progress toward consensus on a plan to restoring the Bay-Delta ecosystem and associated sensitive species and provides for improved water supply and reliability.

Conclusion. Based on this analysis, the WLC project is not expected to interfere with groundwater recharge activities or groundwater supplies. Impacts associated with this issue are less than significant, and no mitigation is required.

4.9.5.4 100-Year Flooding-Related Impacts

Threshold	Would the project place within a 100-year flood hazard area structures that would impede or redirect flood flows? Would the WLC project place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

The Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs) identify areas subject to flooding during the 100-year storm.[1] Based on these FIRM maps, the project site does not fall within a 100-year flood zone.[2] Because the project site does not lie within a 100-year floodplain, impacts related to this issue are less than significant. No further discussion or mitigation is required.

4.9.6 Significant Impacts

4.9.6.1 Drainage Pattern and Capacity-Related Impacts

Impact 4.9.6.1: *The project may significantly increase off-site runoff.*

Threshold	Would the WLC project substantially alter the existing local drainage patterns of the site and substantially increase the rate or amount of surface runoff in a manner which would result in substantial erosion, siltation, or flooding on site or off site?

---

[1] The term “100-year” is a measure of the size of the flood, not how often it occurs. The “100-year flood” is a flooding event that has a one percent chance of occurring in any given year.

[2] FEMA DFIRM Data, 2008.

Would the WLC project create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?

In general, runoff from the western portion of the site flows west toward the Perris Valley Storm Drain, while runoff from the eastern portion of the WLC site flows south into Mystic Lake, and (during times of high storm flow), reaches the San Jacinto River south of the San Jacinto Wildlife Area. As previously illustrated in Figure 4.9.1, the Specific Plan area is divided into six off-site and on-site HSAs. In general, existing storm water flows coming onto the Specific Plan area from the Badlands (Drainage Subarea A) are conveyed through a 12 foot by 8 foot reinforced concrete box (RCB). The RCB drains to the south through the existing Highland Fairview Corporate Park site (a 36-inch and 42-inch storm drain underlying Eucalyptus Avenue outlets to the RCB). Flows from the RCB sheet flow into a spreading area south of Eucalyptus Avenue and is dispersed onto the downstream agricultural land in its historical pattern. Further south, flows coming from the adjacent agricultural land are routed to an existing RCFCWCD earthen channel, identified as Line “F” in the MMDP, located along Redlands Boulevard and ultimately routed to the Perris Valley Storm Drain.

For the eastern portion of the Specific Plan Area (Drainage Subareas B, C, D, E, and F), there currently is no master plan of drainage. Open ditches and drainage culverts along World Logistics Center Parkway~~Theodore Street~~ and Gilman Springs Road convey off-site runoff from adjacent areas to the north and east. The drainage culverts along Gilman Springs Road drain into the San Jacinto Wildlife Area. The land uses and roadway facilities proposed under the Specific Plan would require modifications to the existing hydrologic patterns within the project vicinity to accommodate and manage these flows.

As part of the Specific Plan, a Master Plan of Drainage for the project area was developed (see Drainage Report). Table 4.9.I provides a summary of each of the proposed drainage subareas. Figure 4.9.3 outlines the drainage areas identified in this Master Plan of Drainage and indicates that, with implementation of the project, the Specific Plan area would be divided into six drainage subareas.

As identified in Table 4.9.I, the majority of the existing Line “E” will remain as is; with four exceptions:

1) Where Line “E” crosses the proposed Alessandro Boulevard, a bridge or culvert will be provided at the crossing;
2) Where the proposed Lateral E-1 will connect with Line E.
3) Removal of the concrete at Alessandro Boulevard and lowering the grade above to match the downstream portion.
4) Installation of energy dissipating devices to slow water flow in order to reduce erosion and increase available moisture.

Storm water flows from the westerly portion of the project will be routed to Line “F” of the RCFCWCD MMDP similar to existing drainage patterns in the project area. Line “F” flows in a southwesterly direction and joins the Kitching Street Channel near Iris Avenue and Lasselle Street. Kitching Street Channel flows in a southerly direction and joins the Perris Valley Storm Drain south of Krameria Avenue. Once the storm water flows reach the Perris Valley Storm Drain, they will travel approximately 5.4 miles until joining Reach 3 of the San Jacinto River. This river travels 5.6 miles to Canyon Lake (Reach 2) and another 7.1 miles through Canyon Lake to Lake Elsinore (Reach 1). Lake Elsinore is essentially the terminus for the San Jacinto River and the San Jacinto Watershed. Although Temescal Creek and the Santa Ana River were included in the ultimate flow path from the project site, flows that reach Lake Elsinore rarely spill into Temescal Creek or into the Santa Ana River due to local topography.

Table 4.9.I: Summary of Drainage Areas

Watershed	Area (acres)		HSA	Description
	Without Project	With Project		
A	2,657	2,746	Perris Valley	Storm water runoff coming from north of SR-60 would be routed to the proposed Sinclair Detention Basin. Since the proposed Sinclair Detention Basin is not expected to be constructed prior to the WLC project, the existing 12-foot by 8-foot RCB will need to be extended southerly as proposed Line “F” (referred as Line “F” in MMDP) to convey the off-site flow. The project also proposes one on-site detention basin to mitigate on-site flows and then outlet to Line “F.” Ultimately, Line “F” would flow to the discharge point Node 4 at Redlands Boulevard and eventually drain to the RCFCWCD regional facility.
B	1,361	1,147	Gilman Hot Springs	Storm water runoff coming from north of SR-60 would be conveyed to the proposed Line “B” along World Logistics Center Parkway~~Theodore Street~~. The WLCSP proposes three (3) detention basins to mitigate the on-site flows. The outflow from the basins will be conveyed to Line “B” and routed to the proposed spreading area.
C	1,061	1,149	Gilman Hot Springs	Storm water runoff coming from north of SR-60 and north of Gilman Springs Road would be conveyed to the proposed Line “C” and routed to the proposed spreading area. The project proposes two (2) detention basins to mitigate the on-site flows. The outflow from the detention basin along with the off-site flow will sheet flow through the spreading area and then exit the project boundary.
D	965	1,013	Gilman Hot Springs	Off-site storm water runoff from north of Gilman Springs Road would be conveyed to the proposed Line “D.” The WLCSP proposes two detention basins to mitigate the on-site flows. The outflow from the basins will be conveyed to Line “D” and the spreading area.
E	2,510	2,545	Gilman Hot Springs	Off-site runoff from north of SR-60 would be routed to the existing earthen channel Line “E.” The majority of Line “E” will be protected in place. Easement on either side of the channel is provided for the floodplain. Where Line “E” crosses the proposed Street C a bridge or culvert will be provided. Line “E-1” conveys flows to and from one (1) detention basin. Line “E-1” within proposed Street C, will connect to Line “E”. The concrete portion of Alessandro Boulevard will be removed and grades lowered to match downstream, and energy dissipating devices will be installed. The runoff exits the project southerly boundary at discharge point Node 73.
F	445	399	Gilman Hot Springs	Off-site runoff from north of Gilman Springs Road would be conveyed to the proposed Line “F.” The WLCSP proposes two (2) detention basins to mitigate the on-site flows. The outflow from the basins will be conveyed to Line “F” and exit the project southerly boundary at discharge point Node 3.

THIS PAGE INTENTIONALLY LEFT BLANK

The Perris Valley Storm Drain Master Plan identifies future improvement needs of the channel based on future growth, including development of the WLCSP area. The backbone of the regional storm drainage system south of the City is the 250-foot wide earthen Perris Valley Storm Channel (PVSC). The PVSC is the primary collector of storm water in the northern part of Perris and the southern end of Moreno Valley. The PVSC was built and is currently owned and maintained by the RCFCWCD. The PVSC collects runoff from this area and transports the flows through Perris Valley and to the San Jacinto River. The 24-mile long San Jacinto River enters southern Perris from the east, at approximately the intersection of I-215 and Ellis Avenue, and runs approximately six miles to the extreme southwesterly boundary of the City. The PVSC is a major part of the Master Drainage Plan adopted as part of the Perris Valley Commerce Center Specific Plan.

The PVSC is part of the regional flood control system intended to convey regional flood flows from the upper watershed in Moreno Valley to the confluence with the San Jacinto River in the southern portion of the City. The Perris Valley Storm Channel Specific Plan (PVSCSP) Master Drainage Plan reduces the 100-year floodplain and accommodates 100-year flood events in the area. The PVSC regional system consists of several miles of open channel, several bridge crossings, and a number of retention basins to help capture storm water during seasonal and peak storm events. Historically, flooding in this part of the Perris Valley has been a longstanding issue. To manage seasonal, peak, and 100-year flooding events, in the late 1980s and early 1990s, Riverside County and the RCFCWCD adopted several Master Drainage Plans that were periodically refined. However, these Master Drainage Plans were adopted during the time period in which the land areas covered by the Master Drainage Plans were utilized primarily for agricultural uses. In the late 1990s, increasing urban development occurred in these areas and it became evident that variations to the precise Master Drainage Plans adopted by the County and RCFCWCD would be required to facilitate the construction of needed infrastructure. The adoption of the PVSCSP in 2012 by the City of Perris included refinements to the facilities necessary to control flooding in the PVSCSP planning area.

Engineering of these ultimate PVSC improvements has been designed to handle storm water flows from 100-year storm events. Within the City of Perris, the majority of the PVSC flood control system is not constructed to the ultimate condition envisioned by the PVSCSP. As a result, the reduced capacity within the existing channel causes regional flood flows to exceed the banks of the channel and flood the surrounding area. With the construction of the ultimate system, the 100-year storm floodplain will be reduced by several hundred acres, and the surrounding properties and roadways will be protected from flooding.

Although the PVSC has not yet been widened to its ultimate width, expected runoff from the WLC project will not exceed current levels because on site detention and infiltration basins will be provided to mitigate and control runoff and drainage patterns to pre-project levels in accordance with **Mitigation Measure 4.9.6.1A**. Flow characteristics and locations of the detention and infiltration basins are outlined in the project hydrology study prepared by CH2MHill (see Appendix J). See Table 4.9.I and Figure 4.9.4. These proposed basins will be located and designed such that the existing sub-watersheds and the existing drainage pattern and flows leaving the project boundary mimic existing conditions. Therefore, development of the WLC project will not have significant impacts on regional flood control, even prior to ultimate buildout of the PVSC.

The development of this project will include the construction of buildings, parking areas, sidewalks, roads and other infrastructure such as storm water, water, and sewer facilities. Because the development of the project will substantially increase the amount of impervious surfaces, the post-development flow volumes that will be generated on site are anticipated to be substantially higher than the pre-development flows.

Conditions resulting from this change will include increased runoff volumes and velocity; reduced infiltration; increased flow frequency, duration, and peak; shorter time to reach peak flow; and

degradation in water quality. The project site currently has a low runoff coefficient, meaning that runoff during storms represents a relatively small portion of the total rainfall. The majority of the precipitation, particularly in smaller storms, infiltrates into the subsurface. The development of the Specific Plan area with impervious surfaces (such as roadways, parking lots, and buildings) would result in a condition in which nearly all rainfall becomes runoff.

NOTE: The following changes have been made in response to Comment B-3-39 in Letter B-3 from the California Department of Fish and Wildlife and Comment B-6-5 from Letter B-6 from the Santa Ana Regional Water Quality Control Board.

A significant impact would be deemed to have occurred in the event that post-development storm water flows, volumes or velocities are greater than pre-development storm water flows leaving the site. However, flows, volumes, and velocities will not increase because volume is stored in the basins and infiltrated or released at a controlled rate after the storms (CH2MHill 2014). Each detention basin has 2 feet of dead storage so that flows will infiltrate in the ground. Table 4.9.J presents the sizes of each of the basins. Figures 4.9.5 and 4.9.6 show typical sections for the basins. Two separate analyses were performed for the detention and infiltration basins. The first analysis was part of the drainage system analysis to size the basins to mitigate the flow from the 100-year 3 and 24-hour storms. In this analysis the bottom 2 feet of the basins (identified as Basin Infiltration Depth in Table 4.9.J) is infiltration storage and assumed to be full prior to the storm. The second analysis was performed to analyze the pre and post project infiltration for the project. This is a water balance model analysis of historical daily runoff.

The project hydrology study used local hydrographs and flood routing models to simulate the proposed condition. Based on the modeling results, the 100-year, 3-hour storm provides the highest peak flows, and the 100-year, 24-hour storm provides the highest flow volumes. The 100-year, 3-hour peak flows are used to preliminarily size the proposed drainage systems. Table 4.9.K provides the modeled peak flows for the 100-year, 3-hour storm scenario.

Flows at Project Boundary. Flows exiting the project's boundary in the proposed condition will mimic existing conditions. There are six watershed areas and drainage courses that deliver flow through the project area. These are identified as watershed areas "A" through "F" on Figure 4.9.3. The existing capacity of these drainage courses at the project boundary was determined. Flows in excess of this capacity would flow overland and sheet flow across the project boundary in the existing condition. Detention Basins and spreading area facilities are proposed to reduce the proposed conditions flow to pre-project conditions at the project boundary. Table 4.9.L identifies the existing and proposed 100-year flow, the drainage course capacity, and the sheet flow at the project boundary.

Flow Velocities at Project Boundary. This project proposes a number of open space, detention basins and spreading areas to mitigate the increased runoff, volumes and flow velocities. As a result, the flow velocities at the project boundary for the proposed condition are less than the existing condition, as illustrated in Table 4.9.M. For the watersheds "A" and "E" in the proposed condition, the runoff will flow to the existing Green Belt Channel and existing earth channel, respectively. Therefore, sheet flow would not occur at the project boundary. The flow velocities in the watersheds "B," "C," "D," and "F" for the proposed and existing conditions were analyzed. For the proposed condition, the runoff will flow to the basins and spreading areas, then weir flow over a level curb, and eventually flow to the existing channels downstream of the project's boundary. Flows in excess of channel capacity would flow overland and sheet flow across the project's boundary. For the existing condition, the runoff would flow in to the existing drainage channels, and the flow in excess of channel capacity would flow overland and sheet flow across the project's boundary.

Runoff and Infiltration Volumes Comparison. An analysis and comparison of the volume of runoff and infiltration for the pre and post project conditions was performed. A total of three scenarios were analyzed, baseline plus the following two project scenarios:

- Baseline or Pre Project conditions, where most of the land use is agricultural and the crop is considered to be dry wheat.
- Scenarios of Post Project Conditions, where the development of the site will happen and the impervious area will increase. Two scenarios were considered under the Post development conditions, those are:

Scenario 1) Detention Basins and bioretention areas with 0.15 in/hr infiltration rate. This scenario considers the use of detention basins not only for storm peak attenuation but also for infiltration. The lower end of the minimum infiltration rate for soil type B is considered. The detention basins are assumed to take 3 days to empty and total dead storage currently assumed at 212 acre-feet (AF). In reality the amount of dead storage needed will be a function of the measured infiltration rate at the site. The bioretention areas are areas where the runoff is directed to prior to the detention basins. The bioretention areas consist of landscaped areas that provide treatment and infiltration.

Scenario 2) Detention Basins and bioretention areas with 0.3 in/hr infiltration rate. This scenario considers the use of detention basins not only for storm peak attenuation but also for infiltration. The higher end of the minimum infiltration rate for soil type B is considered. The detention basins are assumed to take 3 days to empty and dead storage is assumed at 212 acre-feet.

The results are summarized in Table 4.9.N

Table 4.9.N: Model Results for Runoff and Infiltration and the Percentage Change from Baseline Conditions

Scenario	Runoff		Infiltration	
	1990-2012 Average(AF/yr)	Percent Change from Baseline	1990-2012 Average(AF/yr)	Percent Change from Baseline
Baseline	59	—	1,649	—
Scenario 1	125	110%	1,850	12%
Scenario 2	40	-33%	1,945	18%

Source: Master Plan of Drainage Report, CH2MHILL, September 2014.

The project's impacts will be mitigated with the implementation of Scenario 2. The volume of runoff after the project is constructed will be less than the existing volume of runoff and the amount of infiltration will increase. Infiltration tests to refine Scenarios 1 and 2 will be performed in final design so runoff and infiltration will mimic existing conditions.

To the degree possible, the project will site basins in areas of cut that do not require over excavation, this should result in acceptable infiltration rates. In the event the soil at a basin site does not meet the required infiltration rate, dry wells, hybrid bioretention/dry wells or infiltration trenches will be used to achieve the target infiltration rate. All three of these BMP's will reach past impervious clay or compacted fill area to deeper more pervious soils. Dry wells are considered Class V wells and require submission of an "Inventory Form" to the EPA. Infiltration tests will be done prior to design of basins so that the proper BMP's can be incorporated into the basins. It should also be noted that groundwater levels in the project area are in excess of 100 feet below ground surface (DEIR Section 4.6.5.4, Geology and Soils).

Due to the construction of impervious surfaces on the project site, post-development flows will be higher than the pre-development flows. To avoid a significant impact to the existing drainage capacity, the post-development flows, volumes, and velocities coming from the project site must be managed to be equal to or less than pre-development flows, volumes, and velocities.[1] As required by **Mitigation Measure 4.9.6.1A**, flows will be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. The existing storm water runoff discharge rate for the undeveloped project site is 7,720 cubic feet per second (cfs). With the installation of the on-site detention basins, culverts, and energy dissipaters included in the project, expected discharges would be at a rate of 6,835 cfs, which is less than the existing condition. With the installation of the storm drain system facilities outlined in *C*H2M Hill's hydrology reports (see Appendix J) and implementation of the recommended mitigation measures, the buildout of the project will convey storm flows safely through the region in accordance with Riverside County Flood Control requirements and will not result in flooding or additional erosion within the project area or any downstream areas, including the Perris Valley Storm Drain Channel.

For additional analysis regarding anticipated construction and operational pollutants, please refer to Section 4.9.6.2, *Construction-Related Water Quality Impacts,* and Section 4.9.6.3, *Operational-Related Water Quality Impacts*.

Development of the WLC project site will increase impervious surfaces on the project site due to the construction of the project's buildings, roadways, and associated improvements. While the resultant increase in impervious surfaces would contribute to a greater volume and higher velocities of storm flow, **Mitigation Measure 4.9.6.1A** requires the WLC project site's drainage system be designed to accept and accommodate runoff that would result from the project construction at or better than historic, or pre-development, conditions, as outlined in the project's Master Plan of Drainage shown in previously referenced Figure 4.9.4. **Mitigation Measure 4.9.6.1B** provides for the operation and maintenance of these facilities to ensure that they will be maintained.

Ultimately, for the proposed condition, the peak flows at downstream discharge points where the flows exiting the southerly project boundary, will not exceed the peak flows for the existing condition. As the WLC project develops and regional drainage improvements are installed as anticipated (e.g., Perris Valley Storm Drain Master Plan), there should be no long-term significant impacts related to storm drainage or flood control. Overall, current experiences with flooding in the general project vicinity should decrease as on-site drainage is contained or controlled in planned improvements and detention basins. Section 4.16, *Utilities and Service Systems,* provides additional analysis of on-site drainage capacity relative to planned storm drain improvements.

NOTE: The following changes have been made in response to Comment F-1-77 in Letter F-1 from Center for Biological Diversity/San Bernardino Valley Audubon Society and Comment F-11-44 in Letter F-11 from the Sierra Club.

Project or Specific Plan Design Features. The Drainage Master Plan (DMP) and creation and maintenance of the proposed combined detention and infiltration basins in the southern portion of the project according to the DMP will help ensure that there will be no significant off-site impacts related to runoff from the project. These facilities will be designed based on the most up–to-date hydrology based on the latest rainfall to runoff patterns in compliance with local, state, and federal regulations. The design of the drainage facilities include a factor of safety in the form of freeboard to account for uncertainties due to climate change, rainfall patterns, friction factors and other uncertainties. One foot of freeboard was included in the detention basins and drainage facilities to account for these

---

[1] As part of the MS4 Permit issuance requirements, projects must identify any Hydrologic Conditions of Concern and demonstrate that changes to hydrology are minimized to ensure that post-development runoff rates and velocities from a site do not adversely impact downstream erosion, sedimentation or stream habitat.

uncertainties. At the time of final design the amount of freeboard to account for these uncertainties will be finalized. The facilities are being designed to provide both detention and infiltration to mitigate increases in runoff volume, velocity and peak discharge as outlined in the following mitigation measure.

The changes to the following mitigation measures have been made in response to Comment B-3-39 in Letter B-3 from the California Department of Fish and Wildlife, Comment F-1-77 in Letter F-1 from Center for Biological Diversity/San Bernardino Valley Audubon Society, Comments F-5-13 and –F-5-23 in Letter F-5 from the Inland Empire Waterkeeper, Comment F-11-41 in Letter F-11 from the Sierra Club et al, and other related comments.

Mitigation Measures. The following measure is proposed to help ensure that runoff from the project site does not have significant impacts on downstream off-site properties, including the SJWA:

4.9.6.1A Prior to issuance of any building permit within the Specific Plan area, the developer shall construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term “construct” shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow such that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

4.9.6.1B The bioretention areas and detention/infiltration basins shall be designed to assure infiltrations rates. The monitoring plan will follow the guidelines presented by the California Storm Water Quality Association (CASQA) in the California Storm Water Best Management Program (BMP) Handbook, Municipal, January 2003 Section 4, Treatment Control Best Management Programs Fact Sheets TC-11 Infiltration Basin and TC-30 Vegetated Swale).

For the Bioretention areas, as needed maintenance activities shall be conducted to remove accumulated sediment that may obstruct flow through the swale. Bioretention areas shall be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. The maintenance activities should occur when sediment on channels and culverts builds up to more than 3 inches (CASQA 2003). The swales will need to be cultivated or rototilled if drawdown takes more than 72 hours.

For the detention/infiltration basins, a 3-5 year maintenance program shall be implemented mainly to keep infiltration rates close to original values since sediment accumulation could reduce original infiltration rate by 25-50%. Infiltration rates in detention basins will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. If cumulative infiltration rates of all detention basins drops below the minimum required rates, then the detention basins will be reconditioned to improve infiltration capacity by scraping the bottom of the detention basin, seed or sod to restore groundcover, aerate bottom and dethatch basin bottom (CASQA 2003).

Level of Significance after Mitigation. Implementation of the Master Drainage Plan of the Specific Plan and **Mitigation Measures 4.9.6.1A** and **4.9.6.1B** will reduce potential impacts associated with runoff from the project site to less than significant levels.

4.9.6.2 Construction-Related Water Quality Impacts

Impact 4.9.6.2: *The project may cause surface water pollution during construction.*

Threshold	Would the project violate any water quality standards or waste discharge requirements during construction phases of the project in form of increased soil erosion, sedimentation, or storm water discharges?

The grading phases of any portion of the project will require temporary disturbance of surface soils and removal of vegetative cover, which could potentially result in erosion and sedimentation, major visible water quality impacts attributable to construction activities. Stockpiles and excavated areas would be susceptible to high rates of erosion from wind and rain and, if not managed properly, could result in increased sedimentation in local watercourses.

By volume, sediment is the principal component in most storm runoff. The delivery, handling, and storage of construction materials and wastes, as well as the use of on-site construction equipment will also introduce a risk for storm water contamination. Spills and leaks could occur from the use of construction equipment and could originate from construction staging areas. Once released, substances such as fuels, oils, paints, and solvents can be transported to nearby surface waterways and/or to groundwater in storm water runoff, wash water, and dust control water, potentially reducing the quality of the receiving waters. The anticipated and potential pollutants in storm water or urban runoff for various land uses are reflected in previously referenced Table 4.9.F.

Short-term storm water pollutant discharges from each development site within the project will be mitigated through compliance with the required NPDES permits, resulting in a less than significant impact. The NPDES permit program was established under Section 402 of the CWA, which prohibits the unauthorized discharge of pollutants, including municipal, commercial, and industrial wastewater discharges, from point sources to U.S. waters. Permittees must verify compliance with permit requirements by monitoring their effluent, maintaining records, and filing periodic reports. An NPDES permit specifies an acceptable level of a pollutant or pollutant parameter in a discharge (for example, a certain level of bacteria) and the permittee selects an appropriate process or technology to achieve that level. Some permits, however, do contain certain generic BMPs. Table 4.9.O lists possible construction site BMPs for runoff control, sediment control, erosion control, and housekeeping that may be used during the construction phases of the WLC project. These construction site BMPs are only examples of what should be considered and should not preclude new or innovative approaches currently available or being developed.

The implementation of NPDES permits, including the General Construction permit, ensures that the Federal and State standards for clean water are met. Enforcement of required NPDES permit requirements will prevent sedimentation and soil erosion through implementation of an SWPPP and periodic inspections by RWQCB staff. An SWPPP is a written document that describes the construction operator's activities to comply with the requirements in the NPDES General Construction permit. Required elements of an SWPPP include (1) site description addressing the elements and characteristics specific to the project site; (2) descriptions of BMPs for erosion and sediment controls; (3) BMPs for construction waste handling and disposal; (4) implementation of approved local plans; and (5) proposed post-construction controls, including a description of local post-construction erosion and sediment control requirements. The SWPPP establishes a plan whereby the operator evaluates potential pollutant sources at the site and selects and implements BMPs designed specifically to prevent or control the discharge of the identified pollutants into storm water runoff.

Table 4.9.O: General Construction Site Best Management Practices

Runoff Control	Sediment Control	Erosion Control	Good Housekeeping
• Minimize clearing • Preserve natural vegetation • Stabilize drainage ways • Install check dams • Install diversion dikes	• Install perimeter controls (e.g., silt fences) • Install sediment trapping devices (e.g. straw wattles, hay bales, gravel bags) • Inlet protection (e.g. check dams) • Install fiber rolls	• Stabilize exposed soils (e.g., hydroseed, soil binders) • Protect steep slopes(e.g., geotextiles, compost blankets) • Cover stockpiles with blankets • Complete construction in phases	• Create waste collection area • Put lids on containers • Clean up spills immediately

Source: National Pollutant Discharge Elimination System, *Construction Site Storm Water Runoff Control*, http://cfpub.epa.gov/npdes/stormwater/menuofbmps/index.cfm, site accessed April 20, 2012.

Project or Specific Plan Design Features. The Specific Plan itself does not contain any features that address water quality issues related to construction, but the WQMP (see Appendix J), the DMP, and the landscaping plan will help reduce long-term water consumption and water quality impacts within the project. However, additional information has been added to the *Hydrology and Water Quality Master Plan of Drainage Report* (FEIR Volume 2 Appendix J) to provide specific and detailed plans for the drainage systems to include the size, capacity, design, function and maintenance requirements of the detention basins. The detention basins have been modified to combine detention and infiltration. Additional analysis has been performed to detail the infiltration capacity of the basins and indicates that runoff leaving the project site will be less than or equal to the existing condition. Infiltration after the project will be greater than the existing condition. Additional details on the spreading areas and mitigation of flow volumes and velocities at the project boundary have been added to the *Master Plan of Drainage Report* and are summarized in the Response to Comment B-3-37 from the CDFW to address similar comments regarding drainage and water quality impacts of the project.

Mitigation Measures. Although adherence to NPDES requirements is required of all development within the City, the incorporation of these requirements as **Mitigation Measures 4.9.6.2A** and **4.9.6.2B** are designed to ensure that any future development within the WLC Specific Plan area obtains coverage under the NPDES General Construction permit, and to track compliance with these requirements as part of the Mitigation Monitoring and Reporting Plan or Program (MMRP):

4.9.6.2A Prior to issuance of any grading permit for development in the World Logistics Center Specific Plan, the project developer shall file a Notice of Intent (NOI) with the Santa Ana Regional Water Quality Control Board to be covered under the National Pollutant

Discharge Elimination System (NPDES) General Construction Permit for discharge of storm water associated with construction activities. The project developer shall submit to the City the Waste Discharge Identification Number issued by the State Water Quality Control Board (SWQCB) as proof that the project's Notice of Intent is to be covered by the General Construction Permit has been filed with the State Water Quality Control Board. This measure shall be implemented to the satisfaction of the City Engineer.

4.9.6.2B Prior to issuance of any grading permit for development in the World Logistics Center Specific Plan, the project developer shall submit to the State Water Quality Control Board (SWQCB) a project-specific Storm Water Pollution Prevention Plan (SWPPP). The Storm Water Pollution Prevention Plan shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. In addition, the Storm Water Pollution Prevention Plan shall emphasize structural and nonstructural best management practices (BMPs) to control sediment and non-visible discharges from the site. Best Management Practices to be implemented may include (but shall not be limited to) the following:

(a) Sediment discharges from the site may be controlled by the following: sandbags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the Best Management Practices are to be periodically inspected by the Regional Water Quality Control Board during construction, and repairs would be made as required.

(b) Materials that have the potential to contribute non-visible pollutants to storm water must not be placed in drainage ways and must be placed in temporary storage containment areas.

(c) All loose soil, silt, clay, sand, debris, and other earthen material shall be controlled to eliminate discharge from the site. Temporary soil stabilization measures to be considered include: covering disturbed areas with mulch, temporary seeding, soil stabilizing binders, fiber rolls or blankets, temporary vegetation, and permanent seeding. Stockpiles shall be surrounded by silt fences and covered with plastic tarps.

(d) The Storm Water Pollution Prevention Plan shall include inspection forms for routine monitoring of the site during the construction phase.

(e) Additional required Best Management Practices and erosion control measures shall be documented in the Storm Water Pollution Prevention Plan.

(f) The Storm Water Pollution Prevention Plan would be kept on site for the duration of project construction and shall be available to the local Regional Water Quality Control Board for inspection at any time.

The developer and/or construction contractor for each development area shall be responsible for performing and documenting the application of Best Management Practices identified in the project-specific Storm Water Pollution Prevention Plan. Regular inspections shall be performed on sediment control measures called for in the Storm Water Pollution Prevention Plan. Monthly reports shall be maintained and available for City inspection. An inspection log shall be maintained for the project and shall be available at the site for review by the City of Moreno Valley and the Regional Water Quality Control Board.

Level of Significance after Mitigation. While on-site grading and development activities will increase the potential for the erosion of soils, adherence to the BMPs mandated by **Mitigation Measures 4.9.6.2A** and **4.9.6.2B** will reduce impacts associated with short-term (construction) storm water discharges during project construction to a less than significant level.

4.9.6.3 Operational-Related Water Quality Impacts

Impact 4.9.6.3: *The project may result in surface water pollution during operation.*

Threshold	Would the project violate any water quality standards or waste discharge requirements during the operational phases of the project in the form of increased soil erosion, sedimentation, or urban runoff?

During the operational phase of any urban use, the major source of pollution in storm water runoff will be contaminants that have accumulated on the land surface over which runoff passes. Storm runoff from the roadways, parking lots, and commercial and industrial buildings can carry a variety of pollutants such as sediment, petroleum products, commonly utilized construction materials, landscaping chemicals, and (to a lesser extent) trace metals such as zinc, copper, lead, cadmium, and iron, which may lead to the degradation of storm water in downstream channels. Runoff from landscaped areas may contain elevated levels of phosphorus, nitrogen, and suspended solids. Oil and other hydrocarbons from vehicles are also expected in storm water runoff.

Pollutant concentrations in urban runoff are variable depending on storm intensity, land use, elapsed time since previous storms, and the volume of runoff generated in a given area that reaches receiving waters. Pollutant concentrations are typically highest during the first major rainfall event after the dry season, known as the “first-flush.” The WQMP prepared for the project identifies pollutants and hydrologic conditions of concern that may be associated with the implementation of the project. Table 4.9.P identifies the receiving waters for post-development runoff from the site and states if the receiving water is listed as impaired or has a total maximum daily load (TMDL) adopted for a certain type of pollutant. Table 4.9.Q provides a summary of pollutants associated with proposed land uses within the Specific Plan area.

Table 4.9.P: Pollutant Stressors in Receiving Waters

Receiving Waters	Receiving Water Classification	303(d) Listing		Adopted TMDL Pollutants
	Proximate	Listed?	Pollutant Causing Impairment	
San Jacinto River	Yes	No	None	None
Canyon Lake (Railroad Canyon Reservoir)	No	Yes	Nutrients, Pathogens	Phosphorus, Nitrogen
Lake Elsinore	No	Yes	Nutrients, Organic Enrichment/Low Dissolved Oxygen, PCBs, Sediment Toxicity, Unknown Toxicity	Phosphorus, Nitrogen, Dissolved Oxygen

Source: *Preliminary Water Quality Management Plan for World Logistics Center Specific Plan*, CH2MHILL, September 2014.

As identified in Table 4.9.Q, pollutants associated with the operations of the proposed logistics land uses include sediments, nutrients, toxic organic compounds, trash and debris, bacterial indicators, oil and grease, pesticides, and metals. Based on the WQMP, all downstream receiving waters to which a project directly or indirectly discharges have been identified. The selection of treatment controls for the project shall be based primarily on the potential pollutants associated with the project that are also present in impaired receiving waters.

As specific developments within the project are developed, updates to the Master WQMP for the World Logistics Center Specific Plan will be required to ensure that water quality treatment is being maintained per City requirements.

Table 4.9.Q: WLC Specific Plan Potential Pollutants

Pollutants	Specific Plan Land Use	Is/Does the Pollutant? Have a Potential to Occur?	Is/Does the Pollutant? Impaired in Receiving Waters?
Sediments	Landscape/Open Areas	Yes	No
Nutrients	Industrial/Commercial Areas	Yes	Yes
Toxic Organic Compounds	Industrial/Commercial Areas	Yes	Yes
Trash and Debris	Industrial/Commercial Areas	Yes	No
Bacterial Indicators	Industrial/Commercial Areas	Yes	Yes
Oil and Grease	Industrial/Commercial Areas	Yes	No
Pesticides	Industrial/Commercial Areas	Yes	Yes
Metals	Industrial/Commercial Areas	Yes	No

Source: *Preliminary Water Quality Management Plan for World Logistics Center Specific Plan*, CH2MHILL, September 2014.

The WQMP prepared for the project (Appendix J) identifies the following BMPs to be implemented that will minimize the project's effects on site hydrology, urban runoff flow rates, and pollutant loads. This comprehensive water quality approach will be implemented throughout the project and will establish a three-tier program for achieving water quality goals through the enforcement of site design, source control, and treatment control BMPs. These project-specific site design, source control, and treatment control BMPs are listed below.

Site Design BMPs. Site design BMPs are implemented to create a hydrologically-functional project design that attempts to mimic the natural hydrologic regime. In accordance with the Riverside County WQMP, projects shall implement site design concepts that achieve each of the following:

1. Minimize Urban Runoff
   a. Maximize the permeable area.
   b. Incorporate landscaped buffer areas between sidewalks and streets.
   c. Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
   d. Use natural drainage systems.
   e. Where soil conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.
   f. Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.
2. Minimize Impervious Footprint
   a. Maximize the permeable area.
   b. Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walk able environment for pedestrians are not compromised.
   c. Reduce widths of street where off-street parking is available.
   d. Minimize the use of impervious surfaces such as decorative concrete, in the landscape design.
3. Conserve Natural Areas

   a. Conserve natural areas.
   b. Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
   c. Use natural drainage systems.

4. Minimize Directly Connected Impervious Areas (DCIAs)
   a. Runoff from impervious areas will sheet flow or be directed to treatment control BMPs.
   b. Streets, sidewalks, and parking lots will sheet flow to landscaping/bioretention areas.

Source Control BMPs. Source control BMPs are implemented to eliminate the presence of pollutants through prevention. Such measures can be both non-structural and structural.

1. Non-structural operational source control BMPs include:
   a. Education for property owners, operator, tenants, occupants, or employees;
   b. Activity restrictions;
   c. Irrigation system and landscape maintenance;
   d. Common area litter control;
   e. Street sweeping private streets and parking lots; and
   f. Drainage facility inspection and maintenance.
2. Structural source control BMPs include:
   a. MS4 stenciling and signage;
   b. Landscape and irrigation system design;
   c. Protect slopes and channels; and
   d. Properly design fueling areas, refuse areas, loading docks, and outdoor material storage areas.

Treatment Control BMPs. Treatment control BMPs supplement the pollution prevention and source control measures by treating the water to remove pollutants before it is released from the project site. The treatment control BMP strategy for the project is to select LID BMPs that promote infiltration and evapotranspiration, including the construction of infiltration basins, bioretention facilities, and extended detention basins. Where infiltration BMPs are not appropriate, bioretention, and/or biotreatment BMPs (including extended detention basins, bioswales, and constructed wetlands) that provide opportunity for evapotranspiration and incidental infiltration may be utilized. Harvest and use BMPs (i.e., storage pods) may be used as a treatment control BMP to store runoff for later non-potable uses.

NOTE: The following changes have been made in response to Comment F-1-78 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society and F-11-44 in Letter F-11 from the Sierra Club.

Site-specific WQMPs have not been prepared at this time as no site-specific development project has been submitted to the City for approval. When specific projects within the project are developed, BMPs will be implemented consistent with the goals contained in the master WQMP. All development within the project will be required to incorporate on-site water quality features to meet or exceed the approved Master WQMP's water quality requirements identified previously. This would include the design based on the appropriate pollutant loads for the project from all sources including climate change.

The project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of Low Impact Development (LID) BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by **Mitigation Measure 4.9.6.1A**, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the San Jacinto Wildlife Area.

The Water Quality Management Plan Guidance Document for the Santa Ana Region of Riverside County discusses water quality impacts and the use of LID BMPs:

> "LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted TMDLs in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives."

The project will comply with the Nutrient TMDL for Lake Elsinore and Canyon Lake by implementing LID-based BMPs. According to the *Comprehensive Nutrient Reduction Plan for Lake Elsinore and Canyon Lake* (prepared for Riverside County Flood Control and Water Conservation District by CDM Smith, January 28, 2013 in compliance with Order No. R8-2010-0033, NPDES Permit No. CAS618033), "Post construction LID based BMPs required for new development and significant redevelopment projects are the only structural watershed based BMPs currently included in the CNRP. The newly developed WQMP requirements ensure that a portion of the wet weather runoff will be contained onsite for all future development projects subject to WQMP requirements. Implementation of WQMP requirements over time coupled with the in lake remediation projects are expected to provide sufficient mitigation of nutrients."

Specific Plan Design Features. Long-term water quality design is addressed in Section 5.4, *On-site Landscaping*, of the Specific Plan and encourages (a) minimization of urban runoff; (b) minimization of impervious footprint of development; (c) conservation of natural areas; and (d) minimization of directly connected impervious areas. The previous section outlined the BMPs from the Specific Plan that include the following:

1. Maximize the permeable area;
2. Incorporate landscaped buffer areas between sidewalks and streets;
3. Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs;
4. Use natural drainage systems;
5. Where soils conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration;
6. Construct ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives;
7. Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design;
8. Sites must be designed to contain and infiltrate roof runoff, or direct roof runoff to vegetative swales or buffer areas, where feasible;

9. Where landscaping is proposed, drain impervious sidewalks, walkways, trails, and patios into adjacent landscaping;
10. Increase the use of vegetated drainage swales in lieu of underground piping or imperviously lined swales;
11. Parking areas may be paved with a permeable surface, or designed to drain into landscaping prior to discharging to the MS4; and
12. Where landscaping is proposed in parking areas, incorporate landscape areas into the drainage design.

Figure 4.9.7 summarizes how protection of water quality is incorporated into the project design.

NOTE: The changes to the following mitigation measures have been made in response to Comment B-6-3 in Letter B-6 from the Santa Ana Regional Water Quality Control Board.

Mitigation Measures. To address potential impacts to water quality during the project's long-term operations, the following measures have been identified:

4.9.6.3A Prior to discretionary permit approval for individual plot plans, a site-specific Water Quality Management Plan (WQMP) shall be submitted to the City Land Development Division for review and approval. The Water Quality Management Plan shall specifically identify site design, source control, and treatment control Best Management Practices that shall be used on site to control pollutant runoff and to reduce impacts to water quality to the maximum extent practicable. The Water Quality Management Plan shall be consistent with the Water Quality Management Plan approved for the overall World Logistics Center Specific Plan project. At a minimum, the site developer shall implement the following site design, source control, and treatment control Best Management Practices as appropriate:

Site Design Best Management Practices

(a) Minimize urban runoff.
(b) Maximize the permeable area.
(c) Incorporate landscaped buffer areas between sidewalks and streets.
(d) Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
(e) Use natural drainage systems.
(f) Where soil conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.
(g) Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.

I:\HFV1201\Reports\EIR\fig4-9-7_WaterQualDesign.cdr (01/31/14)

THIS PAGE INTENTIONALLY LEFT BLANK

(i) Minimize impervious footprint.
(j) Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.
(k) Reduce widths of street where off-street parking is available.
(l) Minimize the use of impervious surfaces such as decorative concrete, in the landscape design.
(m) Conserve natural areas.
(n) Minimize Directly Connected Impervious Areas (DCIAs).
(o) Runoff from impervious areas will sheet flow or be directed to treatment control Best Management Practices.
(p) Streets, sidewalks, and parking lots will sheet flow to landscaping/bioretention areas that are planted with native or drought tolerant trees and large shrubs.

Source Control Best Management Practices

Source control Best Management Practices are implemented to eliminate the presence of pollutants through prevention. Such measures can be both non-structural and structural:

Non-structural source control Best Management Practices include:

(a) Education for property owners, operator, tenants, occupants, or employees;
(b) Activity restrictions;
(c) Irrigation system and landscape maintenance;
(d) Common area litter control;
(e) Street sweeping private streets and parking lots; and
(f) Drainage facility inspection and maintenance.

Structural source control Best Management Practices include:

(g) MS4 stenciling and signage;
(h) Landscape and irrigation system design;
(i) Protect slopes and channels; and
(j) Properly design fueling areas, trash storage areas, loading docks, and outdoor material storage areas.

Treatment Control Best Management Practices

Treatment control Best Management Practices supplement the pollution prevention and source control measures by treating the water to remove pollutants before it is released from the project site. The treatment control Best Management Practice strategy for the project is to select Low Impact Development (LID) Best Management Practices that promote infiltration and evapotranspiration, including the construction of infiltration basins, bioretention facilities, and extended detention basins. Where infiltration Best Management Practices are not appropriate, bioretention and/or biotreatment Best Management Practices (including extended detention basins, bioswales, and constructed wetlands) that provide opportunity for evapotranspiration and incidental infiltration may be utilized. Harvest and Reuse Best Management Practice will be used to store runoff for later non-potable uses.

Site-specific Water Quality Management Plans have not been prepared at this time as no site-specific development project has been submitted to the City for approval. When specific projects within the project are developed, Best Management Practices will be implemented consistent with the goals contained in the Master Water Quality Management Plan. All development within the project will be required to incorporate on-site water quality features to meet or exceed the approved Master Water Quality Management Plan’s water quality requirements identified previously.

4.9.6.3B The Property Owners Association (POA) and all property owners shall be responsible to maintain all onsite water quality basins according to requirements in the guidance Water Quality Management Plan and/or subsequent site-specific Water Quality Management Plans, and established guidelines of the Regional Water Quality Control Board. Failure to properly maintain such basins shall be grounds for suspension or revocation of discretionary operating permits, and/or referral to the Regional Water Quality Control Board for review and possible action. This measure shall be implemented to the satisfaction of the City Land Development Division, in consultation with the City Engineer, and Regional Water Quality Control Board.

The changes to the following mitigation measure has been made in response to Comment B-3-39 in Letter B-3 from the California Department of Fish and Wildlife, Comment B-6-3 in Letter B-6 from the Santa Ana Regional Water Quality Control Board, and other similar comments.

4.9.6.3C Prior to issuance of future discretionary permits for any development along the southern boundary of the World Logistics Center Specific Plan (WLCSP), the project developer of such sites, in cooperation with the Property Owners Association (POA), shall establish and annually fund a Water Quality Mitigation Monitoring Plan (WQMMP) to confirm that project runoff will not have deleterious effects on the adjacent San Jacinto Wildlife Area (SJWA). This program shall include at least quarterly sampling along the southern boundary of the site (i.e., at the identified outlet structures of the project detention basins) during wet season flows and/or when water is present, as well as sampling of any dry-season flows that are observed entering the San Jacinto Wildlife Area property from the project property, including Drainage 9, which is planned to convey only clean off-site flows from north of the World Logistics Center Specific Plan site across Gilman Springs Road. The program shall also include at least twice yearly sampling after completion of construction, and a pre-construction survey must be completed to determine general water quality baseline conditions prior to and during development of the southern portion of the World Logistics Center Specific Plan. This sampling shall be consistent with and/or comply with the requirements of applicable Storm Water Pollution Prevention Plans (SWPPPs) for the development site.

The project developer of sites along the southern border of the World Logistics Center Specific Plan shall be responsible for preventing or eliminating any toxic pollutant (not including sediment) found to exceed applicable established public health standards. In addition, the discharge from the project shall not cause or contribute to an exceedance of Receiving Water Quality Objectives for the potential pollutants associated with the project as identified in Table 4.9.J. Once development is complete, the developer shall retain qualified personnel to conduct regular (i.e., at least quarterly) water sampling/testing of any basins and their outfalls to ensure the San Jacinto Wildlife Area will not be affected by water pollution from the project site. This measure shall be implemented to the satisfaction of the City Land Development Division Manager based on consultation with the project developer, Eastern Municipal Water District, the Regional Water Quality Control Board-Santa Ana Region, and the Mystic Lake Manager.

Level of Significance After Mitigation. The project incorporates on-site drainage control structures and programs sufficient to meet the applicable Federal, State, and local water quality requirements. Through the use of site design BMPs, source control BMPs (e.g., street and parking lot sweeping and vacuuming), and treatment control BMPs (e.g., infiltration basins, bioretention areas, and pervious pavement), the resulting pollutant loads coming from the project will be reduced, thereby reducing pollutants discharged from urban storm water runoff to surface water bodies. Compliance with the requirements of the NPDES permit, which include implementation of the BMPs outlined in the WQMP, will be enforced by the City during the ongoing operation of the project. Implementation of **Mitigation**

Measures 4.9.6.3A through **4.9.6.3C** will help to reduce potential water quality impacts resulting from storm water and urban runoff to less than significant levels.

~~4.9.7 Cumulative Impacts~~

~~Cumulatively, development within the watershed will result in an increase in impervious surfaces in addition to changes in land use and associated pollutant runoff characteristics. Increased impervious surfaces are likely to alter existing hydrology and increase potential pollutant loads. However, all future development in the City and throughout the Santa Ana RWQCB will be required to comply with the requirements of the NPDES permit program. Continued growth is anticipated to occur in the City and surrounding areas and all new development and significant redevelopment will be required to minimize its individual impacts to water quality and pollutant transport through implementation of BMPs. Therefore, since all new developments will be required to mitigate for impacts to water quality, a less than significant cumulative impact to water quality will occur.~~

~~Cumulatively, continued development within the West San Jacinto Groundwater Management Plan area will result in an increase in demand on water sources, including both surface and groundwater supplies. Since the majority of the projects within the Plan area obtain water service from the EMWD, most of the cumulative development will rely on imported water purchased from Metropolitan with supplements from local groundwater sources. As stated in the previous Section 4.9.5.3, there has been a shift in the water demand patterns in the last 15 years, as a residential market has replaced an agricultural market, with a resulting incremental increase in urban-related surface and groundwater pollution. The proposed project will make an incremental contribution to production of urban pollutants, but the site-specific water quality Best Management Practices will help ensure that these contributions will not make a significant contribution to any cumulatively considerable regional water quality impacts.~~

~~The EMWD's Urban Water Management Plan (UWMP) concludes that the EMWD has sufficient supplies of local groundwater and imported surface water to accommodate existing and planned development, including the proposed project, as documented in the project's Water Supply Assessment (see Appendix M). For these reasons, the proposed project will not make a significant contribution to any cumulatively considerable surface water or groundwater supply impacts.~~

~~The drainage system for the proposed project will be designed so that peak flows from post-development runoff are equal to or less than historic conditions at any given off-site discharge location and no additional mitigation measures are proposed for cumulative impacts. This same requirement will be placed on all other development in the vicinity of the project site by the City of Moreno Valley. The proposed project, including implementation of its master drainage plan, will not make a significant contribution to any cumulatively considerable impacts related to drainage or water quality on a local or regional basis.~~

THIS PAGE INTENTIONALLY LEFT BLANK

~~4.10 LAND USE AND PLANNING: TABLE OF CONTENTS~~

~~FIGURES~~

~~TABLES~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~***NOTE TO READERS.*** *Although there were numerous questions about potential impacts to the City Housing Element, no major revisions have been made to this section based on the response to comments in Final Programmatic EIR Volume 1.*~~

4.10 LAND USE AND PLANNING

This section of the EIR addresses the land use impacts that will result from the change from the existing on-site land uses to the proposed land uses. In addition, this section analyzes the consistency of the WLC project with the goals and policies of the City of Moreno Valley General Plan, applicable community plans, and the Zoning Code, and compatibility within local and regional plans. This section also identifies and evaluates the compatibility of the WLC project with existing land uses and the potential land use impacts that may result during or subsequent to development of the proposed on-site uses.

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

~~For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the~~ The project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements~~. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The following technical study was prepared to support the analysis of potential impacts in this section:

- David Taussig and Associates, Inc. (DTAA). *Fiscal and Economic Impact Study*, Draft dated March 13, 2012, revised report dated September 2014.

The analysis contained in this section is also based on the following reference documents:

- *City of Moreno Valley General Plan*, City of Moreno Valley, 2006;

- *Updated and Certified City of Moreno Valley Housing Element,* 2011;
- *Municipal Code*, City of Moreno Valley, codified through February 12, 2012;

4.10.1 Existing Setting

~~The project area includes two adjacent areas, the WLC Specific Plan Area and the General Plan Amendment Area. The two areas combined make up most of the older Moreno Highlands Specific Plan.~~

4.10.1.1 Project Location

The WLC project area is located in the northwestern Riverside County, within the eastern portion of the City of Moreno Valley. The WLC project is situated generally south of SR-60, between Redlands Boulevard and Gilman Springs Road (the easterly City limit), extending to the southerly City limit. Previously referenced Figure 1.2 in Section 1.0, *Executive Summary*, depicts the WLC project boundary on the applicable U.S. Geological Survey (USGS) Quad sheets.

4.10.1.2 Existing On-site Land Uses

The WLC project area is largely undeveloped land and Figure 4.10.1 shows an aerial view of existing land uses. Presently, there are ~~seven~~ six single-family homes in various locations on the property along with associated ranch/farm buildings. Most of the site has been used for dry farming at one time or another since the early 1900s, and much of the site continues to be used for dry farming at the present time. San Diego Gas & Electric (SDG&E) operates a natural gas compressor station, known as the Moreno Compressor Station, on 18 acres in the southern portion of the site. Southern California Gas Company (SCGC) operates a valving, metering, and pipe cleaning station on a one-acre parcel in the south-central portion of the site.

4.10.1.3 Existing Roadways

The major roadways that currently provide access to the WLC project area are SR-60 (the Moreno Valley Freeway), Redlands Boulevard, Alessandro Boulevard, Gilman Springs Road, and ~~Theodore Street~~World Logistics Center Parkway. Redlands Boulevard and ~~Theodore Street~~World Logistics

Center Parkway are north-south collector roadways that intersect

THIS PAGE INTENTIONALLY LEFT BLANK

with SR-60. Alessandro Boulevard is an east-west thoroughfare that runs through Moreno Valley from Interstate 215 (I-215) on the west to Gilman Springs Road on the east. Gilman Springs Road runs in a northwesterly-southeasterly direction connecting SR-60 to the Hemet-San Jacinto area and State Route 79 (SR-79).

4.10.1.4 General Surrounding Land Uses

To the west of the WLC project area are more developed portions of the City of Moreno Valley. Near the southern and western boundaries of the project are existing residential neighborhoods along the west sides of Redlands Boulevard and Merwin Street; a small market and a Post Office are also located near Redlands and Alessandro Boulevards. A new industrial warehouse project (Westridge) was recently approved just west of Redlands Boulevard and south of SR-60 but it has been challenged in court. Another large warehouse project (ProLogis Eucalyptus Industrial Park) is currently being processed by the City just west of the Westridge project and is due to be considered by the City Council in December 2014. Farther to the west, there is a variety of commercial and auto sales uses along Moreno Beach Drive.

Highland Fairview Corporate Park (HFCP), located north and west of the project area between Redlands Boulevard and Theodore Street, is currently under development and the first phase was completed in late 2011 (Skechers). The area north of SR-60 is largely undeveloped with clusters of low-density residential development within the Moreno Valley city limits.

There is little development adjacent to the east and south boundaries of the project area. The area easterly of the project, commonly referred to as the Badlands, is a rugged area that separates the City of Moreno Valley from San Timoteo Canyon and the City of Beaumont. Most of the Badlands area north of SR-60 is incorporated into the Norton Younglove Reserve. Due to its reserve status, steep slopes and canyons, the Badlands area has experienced little development; however, there are scattered single-family homes in the area east of Gilman Springs Road. The Badlands Sanitary Landfill, operated by the County of Riverside Waste Management Department, is located approximately 1.5 miles northeasterly of the project area in the Badlands.

The area south of the project site is the San Jacinto Wildlife Area (SJWA), which includes an Upland Game Hunting Area and is adjacent to the Lake Perris State Recreation Area. These lands are State-owned and access to these areas is restricted. The SJWA is owned and operated by the California Department of Fish and Wildlife (CDFW) and contains approximately 9,000 acres of restored wetland and ponds. The Lake Perris State Recreation Area is owned and operated by the California State Parks Department and contains approximately 6,000 acres of open space land, which is used both for recreation and preservation of the natural southern California landscape.

In 1981–82, the State Wildlife Conservation Board initially purchased 15,000 acres of the Mystic Lake area as mitigation for habitat impacts associated with the construction of the State Water Project. This area was designated as the SJWA. In 1995, the Board acquired an additional 921 acres of upland farmland within the southern portion of the Moreno Highlands Specific Plan (MHSP) property to incorporate into the SJWA. ~~In 2001, the Board acquired an additional 274 acres in this same area. This land was purchased to provide a buffer between the land surrounding Mystic Lake and the planned urban development within Moreno Valley.~~ The Board action on this purchase indicated the land was to "facilitate restoration of historic water flows back into the lake bed and allow for reversion back to wetlands during wet years, and areas of low vegetation cover during dry years, all providing significant habitat for species using the SJWA, including a number of state and federally listed species."[1]

~~Most of the State-owned land south of the project area is referred to as the SJWA. However, the land purchased out of the Moreno Highlands Specific Plan is referred to in this EIR as the CDFW~~

---

[1] Wildlife Conservation Board minutes from May 18, 2001.

~~Conservation Buffer Area to denote the reason for its original purchase. The 1,195 acres acquired by the Wildlife Board during the past 20 years was intended to serve as an effective buffer between the SJWA and the development expected to occur north of the SJWA area (the present mixed-use Moreno Highlands Specific Plan). Currently, this acreage provides not only a buffer area, but also provides open space for raptor and bird foraging habitat, and is actively farmed under CDFW contract. The proposed project will permanently designate this CDFW Conservation Buffer Area as Open Space under the City General Plan. It is anticipated the State would maintain its function as a buffer and also as foraging habitat for raptors as long as it is regularly tilled. There are no plans to alter the current agricultural use of the property.~~

There are two future commercial areas located immediately north of the project area. The first is located at the northwest corner of ~~Theodore Street~~World Logistics Center Parkway and Eucalyptus Avenue (proposed 80,000 square feet) and the second is at the northeast corner of Redlands Boulevard and Eucalyptus Avenue (proposed 120,000 square feet). The nearest large-scale commercial development is located on the south side of SR-60 at Moreno Beach Drive approximately 1.25 miles to the west of the WLC project; this shopping complex includes Walmart and Target along with restaurants and ancillary commercial and service uses, as well as the Moreno Valley Auto Center. The central core of Moreno Valley, which includes residential neighborhoods and commercial activity, is located approximately three miles west of the project area.

March Air Reserve Base (MARB) is located approximately seven miles southwesterly of the WLC planning area. The MARB is under the authority of the March Joint Powers Authority, which acts as the land use authority, the Redevelopment Agency and Airport Authority (the March Inland Port Airport Authority) for reuse of the former March Air Force Base.

4.10.1.5 Existing General Plan, Specific Plan, and Zoning Land Use Designations Applicable to the WLC Project Site

The World Logistics Center site currently has a General Plan designation of Business Park/Light Industrial and zoning land use designations of WLSP-LD (World Logistics Center Specific Plan – Logistics Development) and WLCSP – LL (World Logistics Center Specific Plan – Light Logistics). The zoning land use designations are shown on Figure 4.10.3 in the FEIR. Development of the site is controlled by the World Logistics Center Specific Plan which authorizes the construction and operation of 40,600,000 square feet of logistics facilities and associated infrastructure, The land use plan in the Specific Plan is show on Figure 4.10.4 and in Section 3.0 of the Revised Sections of the FEIR. ~~The Community Development Element of the City's General Plan currently designates the project area as a mix of residential and associated uses, commercial, business park, and open space land uses. In 1992, the City approved the 3,038-acre Moreno Highland Specific Plan (MHSP) as a master planned, mixed-use community, consisting of up to 7,763 residential dwelling units and associated uses (on approximately 2,435 acres) and approximately 603 acres of business, retail, institutional, and other uses. The Moreno Highland Specific Plan is incorporated into the City's General Plan (Table 4.10.A).~~

~~Table 4.10.A: Moreno Highlands Specific Plan (Current Land Use Designations)~~

~~Community Commercial~~	~~16.0~~
~~Parks and Open Space~~	~~77.9~~
~~Public Facilities~~	~~67.4~~
~~Project Total~~	**~~3,038~~**

~~Adopted by City Council March 17, 1992~~

~~The MHSP called for the development of an approximately 7,300 new residential units in the City of Moreno Valley. However, as discussed below, the City of Moreno Valley already has a very low jobs-to-housing ratio, meaning that the City has a surplus of housing as compared to jobs. This reduces the demand for new housing in the area, and implementation of the MHSP would further lower the jobs/housing ratio. In addition, the 2008–2009 recession resulted in a substantial reduction of housing prices in the Inland Empire, the State of California, and throughout most of the U.S. As is well documented in the press, foreclosure rates became very high, and the demand for newly constructed housing has been greatly reduced. Therefore, the current demand for housing development on the site is greatly limited. As such, none of the MHSP has been implemented.~~

~~In February 2011, the City adopted an updated Housing Element that identified the MHSP project area as a potential location for future jobs-producing land uses, rather than residential uses. In April 2011, the City adopted its Economic Development Action Plan, which identified eastern Moreno Valley as a potential area for major job-producing land uses. The proposed WLC Specific Plan project is consistent with this planning prerogative, and seeks to comprehensively plan the project area for jobs-producing land uses.~~

4.10.1.6 Surrounding Land Uses

South of SR-60/East of Redlands Boulevard. The HFCP project is currently under development. Phase 1 (Skechers North American Operational Headquarters) was completed in late 2011. HFCP is located immediately north and west of the project area, on the north side of Eucalyptus Avenue between Redlands Boulevard and ~~Theodore Street~~World Logistics Center Parkway. The HFCP project was approved by the City of Moreno Valley in 2009. The City General Plan land use designation for the site is Commercial (C) and Business Park/Light Industrial (BP/LI).

North of SR-60. The land located on the north side of SR-60 and westerly of Theodore Street is within the City of Moreno Valley and has a land use designation of Office (O) and Residential (R1-density of one dwelling unit per acre). The area easterly of ~~Theodore Street~~World Logistics Center Parkway is unincorporated within the County of Riverside with land use designations of Scenic Highway Commercial (C-P-S) and Controlled Development Area (W-2). The W-2 area allows single-family residential and light agriculture (the suffix indicates a 2-acre minimum parcel size); and the C-P-S district allows certain wholesale and retail commercial uses. This County territory is within the City's Sphere of Influence; the City land use designation for the area is Rural Residential (RR) and Residential (R1).

East of Gilman Springs Road. The Badlands area, easterly of Gilman Springs Road, is unincorporated within the jurisdiction of the County of Riverside and has a land use designation of Controlled Development Area (W-2, W-2-1, and W-2-20); allowed uses include single-family residential and light agriculture (the suffix indicates minimum parcel size in acres). This County territory is also within the City's Sphere of Influence and the City land use designation for the area is Rural Residential (RR).

Southern Boundary. The land area to the south of the project is within the SJWA and the Lake Perris State Recreation Area. Portions of these facilities are within the City limits and have a City General Plan land use designation of Open Space (OS).

West of Redlands Boulevard. The City land use designations for the residential areas west of Redlands Boulevard are Residential R2 and R3 (maximum density of 2 and 3 dwelling units per acre, respectively). Residential areas southerly of the site along Alessandro Boulevard are subject to City land use designations of R2 and R5 (maximum density of 2 and 5 dwelling units per acre).

4.10.1.7 Project Components

The WLC project components are described in detail in Section 3.4, *Project Characteristics*. The City of Moreno Valley is the Lead Agency for the WLC project. The only land use approvals currently needed for the development of the World Logistics Center site are subdivision maps, and Local Agency Formation Commission (LAFCO) action to transfer 85 acres from unincorporated Riverside County to the City of Moreno Valley and into the City' Community Services District. The entitlements necessary for the WLC project include approval of the following:

- ~~General Plan Amendment(s) for the former MHSP site to Business Park/Light Industrial (BP/LI);~~
- ~~World Logistics Center Specific Plan with Logistics Development (LD) and Light Logistics (LL) zones;~~
- ~~Corresponding Zone Change to Specific Plan for the WLCSP and redesignate the CDFW Conservation Buffer Area as Open Space and the natural gas facilities as Public Facilities~~
- ~~Development Agreement for parcels owned by the project applicant;~~
- Tentative Parcel Map (for financing purposes only); and
- Annexation of an 85-acre parcel along Gilman Springs Road.

In addition, the WLC project will require other associated actions and approvals by other public entities in order to construct and operate the WLC project.

~~**General Plan Amendment.** The General Plan Amendment proposes a revision to the City General Plan land use designations for the entire MHSP area, including the project area as set forth in the proposed WLC Specific Plan. The General Plan Amendment also includes amendments to the following elements: (a) Community Development; (b) Parks, Recreation and Open Space; (c) Circulation; (d) Environmental Safety; and (e) Conservation. With these amendments, these elements will be modified to authorize the World Logistics Center Specific Plan and designate the WLC property for Business Park/Light Industrial (BP/LI) land uses.~~

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

~~**Specific Plan.** The proposed WLC project includes the 2,610-acre World Logistics Specific Plan to implement the logistics and industrial portion of the General Plan Amendment and to set forth comprehensive land use regulations governing the proposed WLC project. The World Logistics Center Specific Plan is a master plan for the development of approximately 40.6 million square feet of modern high-cube logistics warehouse distribution facilities and up to 200,000 square feet of light logistics uses.~~

~~The Specific Plan establishes the master plan of development for the project area, including development standards and use regulations, a master plan for circulation and infrastructure, architectural, landscape and design guidelines and sustainability goals, all of which will be applicable to all development within the developable project area.~~

~~Within the Specific Plan, the primary land use category will be Logistics Development. This use will provide for high-cube logistics warehouse space consisting of buildings of 500,000 square feet or greater, with ceiling heights of approximately 60–80 feet. Warehousing and logistics activities consistent with the storage and processing of manufactured goods and materials prior to their distribution to other facilities and retail outlets will be permitted within this category. Ancillary office and maintenance space will be permitted, along with the outdoor storage of trucks, trailers, and shipping containers.~~

~~**Change of Zone.** The Change of Zone will establish the World Logistics Center Specific Plan, which will replace most of the Moreno Highlands Specific Plan and rezone several other properties. It will also redesignate the CDFW Conservation Buffer Area as Open Space and the natural gas facilities as Public Facilities. The WLCSP property will have two new land use zones, Logistics Development (LD) and Light Logistics (LL).~~

Annexation. The WLC project includes the annexation by the City of an 85-acre parcel located on the north side of Alessandro Boulevard at Gilman Springs Road. This parcel is already within the City's Sphere of Influence. The City has requested annexation of the 85 acres. ~~proposed project includes pre-annexation General Plan land use designations and zoning for this parcel, and the~~The EIR will be the environmental documentation used by the Local Agency Formation Commission (LAFCO) to complete the annexation process. The County's land use designation currently applicable to this parcel is W-2-2½. The W-2 area allows single-family residential and light agriculture (the suffix indicates minimum parcel size in acres). ~~and the~~The City's current General Plan land use designation for the 85 acres ~~site~~ is Business Park (BP) and is subject to the WLC Specific Plan. ~~This project proposes to incorporate this property into the World Logistics Center Specific Plan.~~

4.10.1.8 General Plan and Zoning Designations

Table 4.10.B compares the existing and proposed land uses in the project vicinity.

West	Residential/ Undeveloped	Residential	No Change

4.10.2 Applicable Regulations

The following goals, objectives, and policies of the City of Moreno Valley General Plan are applicable to the WLC project:

Section 9.2.2 Community Development

Goal 2.1 A pattern of land uses which organizes future growth, minimizes conflicts between land uses, and which promotes the rational utilization of presently underdeveloped and undeveloped parcels.

Goal 2.2 An organized, well-designed, high quality, and functional balance of urban and rural land uses that will meet the needs of a diverse population, and promote the optimum degree of health, safety, well-being, and beauty for all areas of the community, while maintaining a sound economic base.

Goal 2.3 Achieves an overall design statement that will establish a visually unique image throughout the City.

Objective 2.1 Balance the provision of urban and rural lands within Moreno Valley by providing adequate land for present and future urban and economic development needs, while retaining the significant natural features and the rural character and lifestyle of the northeastern portion of the community.

Objective 2.5 Promote a mix of industrial uses which provide a sound and diversified economic base and ample employment opportunities for the citizens of Moreno Valley with the establishment of industrial activities that have good access to the regional transportation system, accommodate the personal needs of workers and business visitors; and which meets the service needs of local businesses.

Policy 2.5.1 The primary purpose of areas designated Business Park/Industrial is to provide for manufacturing, research and development, warehousing and distribution, as well as office and support commercial activities. The zoning regulations shall identify the particular uses permitted on each parcel of land. Development intensity should not exceed a Floor Area Ratio of 1.00 and the average floor area ratio should be significantly less.

Policy 2.5.2 Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses.

Policy 2.5.3 Screen manufacturing and industrial uses where necessary to reduce glare, noise, dust, vibrations and unsightly views.

Policy 2.5.4 Design industrial development to discourage access through residential areas.

Section 9.6.2 Safety Element

Objective 6.6 Promote land use patterns that reduce daily automotive trips and reduce trip distance for work, shopping, school, and recreation.

4.10.3 Methodology

The focus of the land use analysis is on land use impacts that would result from implementation of the WLC project. Land use conflicts are identified and evaluated based on existing land uses, land uses ~~proposed~~ as part of the project, land use designations, and standards and policies related to land use. Land use compatibility is based on the intensity and patterns of land use to determine whether a project would result in incompatible uses or nuisance impacts to sensitive receptors (e.g., residences, medical facilities, or schools).

An evaluation of the potential land use impacts associated with implementation of the WLC project is based on review of the Moreno Valley General Plan and associated Final EIR, the Moreno Valley Municipal Code, SCAG Regional Comprehensive Plan, SCAG Regional Transportation Plan, SCAG Compass Growth Vision, SCAQMD Air Quality Management Plan, Santa Ana Water Quality Control Plan, Riverside County Drainage Area Management Plan, and the EMWD Urban Water Management Plan. Compatibility of the WLC project with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is discussed in Section 4.4, *Biological Resources*.

4.10.4 Thresholds of Significance

Appendix G of the *CEQA Guidelines* recognizes the following significance thresholds related to land use. Based on these significance thresholds, potential impacts to land use could be considered significant if the WLC project would result in the following:

- Physically divide an established community;
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the General Plan, Specific Plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; and/or
- Conflict with any applicable habitat conservation plan or natural community conservation plan.

4.10.5 Less than Significant Impacts

The following potential impacts were determined to be less than significant. In each of the following issues, either no impact would occur (therefore, no mitigation would be required) or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level.

4.10.5.1 Conflict with Any Applicable Habitat or Natural Community Conservation Plan

Threshold	Would the WLC project conflict with any applicable habitat conservation plan or natural community conservation plan?

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The WLC project site is located within the MSHCP area, Mead Valley and Reche Canyon/Badlands Plan Area.[1] The MSHCP is a comprehensive, multi-jurisdictional effort that includes Riverside County and fourteen cities to provide a regional approach to conservation planning. Portions of the project area occur in 14 criteria cells of the MSHCP. The project site is not located within any special linkage areas identified by the MSHCP. The project applicant, the City, and the County[2] are required to use the Joint Project Review (JPR) process established in the MSHCP to identify and acquire habitat as part of the development review process. The JPR process involves negotiations between a landowner and the

---

[1] *Multiple Species Habitat Conservation Plan Compliance Report*, Michael Brandman Associates. September 20, 2014.
[2] Western Riverside County Regional Conservation Authority (RCA)

Western Riverside County Regional Conservation Authority (RCA) so the County can acquire land with important habitat or other biological resources while providing fair compensation and/or reasonable development opportunities on the remaining land for the landowner.

The WLC project site is located within areas requiring burrowing owl surveys, within the MSHCP Criteria Area Species Survey Area (CASSA), and Narrow Endemic Plant Species Survey Area (NEPSSA).

Because the WLC project site is within an MSHCP CASSA and is considered to be a covered activity, the project is subject to provisions of the MSHCP. In particular, the project proponent will be required to provide payment of mitigation fees and adhere to the BMPs found in Appendix C of the MSHCP. Pursuant to agreements with the U.S. Fish and Wildlife Service (USFWS) and the CDFW, the payment of the mitigation fees and compliance provisions of the MSHCP provides full mitigation under CEQA, the Federal Endangered Species Act (FESA), and the California Endangered Species Act (CESA) for impacts to the species and habitats covered by the MSHCP. Since the City has adopted the MSHCP and its requirements and provisions, and since the project is within Moreno Valley, the WLC project would be required to adhere to applicable MSHCP requirements and fees. Therefore, the WLC project was determined to be consistent with the MSHCP WLC project (see Section 4.4, *Biological Resources*).

4.10.5.2 Conflict with Applicable Land Use Plans, Policies, or Regulations (Regional)

Threshold	Conflict with any applicable regional land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the General Plan, Specific Plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Section 15125 (d) of the *CEQA Guidelines* requires EIRs to “discuss any inconsistencies between the proposed project and applicable general plans and regional plans.” The objective of such a discussion is to find ways to modify a project, if warranted, to eliminate any identified inconsistencies with relevant plans and policies, and thereby avoid creating an impact to the environment that consistency with the plan would otherwise mitigate. Pursuant to *CEQA Guidelines* Section 15125 (d), this EIR section includes an evaluation of the consistency of the WLC project with pertinent goals and policies of relevant adopted local and regional plans. Because certain plans are more specifically tailored to other issue areas, such as air quality, transportation, biology, hazards, water quality, and water supply, the local and regional plans identified below are addressed in detail in other sections of this EIR. The following analysis evaluates the project against all the applicable regional planning documents and processes, while the following Section 4.10.6.1 evaluates the project relative to the City of Moreno Valley General Plan.

Airport Regulations. **March Air Force Base (**MARB) is a joint-use airport, used for military and civilian purposes, located seven miles west of the WLC project site. The project area is outside of any Federal or State regulation related to MARB. The project is also outside of any areas regulated by the Riverside County Airport Land Use Plan (ALUP). Therefore, the project does not have a conflict with the ALUP and no impact will occur.

SCAG Applicable Regional Plans. On April 4, 2012, the SCAG approved the year 2012 Regional Transportation Plan (RTP)/Sustainable Communities Plan (SCS). This section evaluates consistency with both the SCAG 2008 RTP and the SCAG 2012 RTP.

SCAG 2008 Regional Comprehensive Plan (RCP), Regional Transportation Plan (RTP), and Compass Growth Vision (Compass): The SCAG (the designated Metropolitan Planning Organization

[MPO] for the Counties of Ventura, Orange, San Bernardino, Riverside, Imperial, and Los Angeles) is federally mandated to develop plans for transportation, growth management, hazardous waste management, and air quality. With its members and other regional planning entities, the SCAG prepared the 2008 RCP to serve as a framework to guide decision-making with respect to the growth and changes that can be anticipated in the region for the 2008–2012 timeframe. The RCP is a major advisory plan prepared by the SCAG that addresses important regional issues like housing, traffic/transportation, water, and air quality. The RCP serves as an advisory document to local agencies in the Southern California region for their information and voluntary use for preparing local plans and handling local issues of regional significance.

The RCP identifies voluntary best practices to approach growth and infrastructure challenges in an integrated and comprehensive way. It also includes goals and outcomes to measure progress toward a more sustainable region. The RCP includes nine chapters, each based on specific areas of planning or resource management. Each of the nine chapters contains goals, policies, implementation, and strategies to achieve the SCAG's overall goals of improving the standard of living for all; improving the quality of life for all; and enhancing equity and access to government. Local governments are required to use the RCP as the basis for their own plans and are required to discuss the consistency of projects of "regional significance" with the RCP.

Regional Comprehensive Plan: The RCP's overall goal is to reinvigorate the region's economy, avoid social and economic inequities and the geographical dislocation of communities, and to maintain the region's quality of life. The document is described as a regional policy framework for future land use decisions in the SCAG area that respects the need for strong local control, but that also recognizes the importance of regional comprehensive planning for issues of regional significance. The RCP is laid out much like a General Plan and organizes recommended policies into nine chapters. The highlight of each chapter is the regional strategy that addresses the RCP's vision for that resource area. As such, each chapter includes three levels of recommendations for the region:

- *Goals.* Each goal will help define how sustainability is defined for that resource area.
- *Outcomes.* These focus on quantitative targets that define progress toward meeting the RCP's Goals. Where possible, they are clearly defined (e.g., a 20% reduction in greenhouse gas emissions from 2007 levels), capable of being monitored with existing or reasonably foreseeable resources, and have a strong link to sustainability goals.
- *Action Plan.* This critical part of the RCP lays out a comprehensive implementation strategy that recommends how the region can systematically move to meet the RCP's quantitative Outcomes and achieve its Goals, Guiding Principles, and Vision. Each Action Plan contains:
    - *Constrained Policies.* This includes a series of recommended near-term, feasible policies that stakeholders should consider for implementation. For example, the RCP calls on the SCAG to adopt policies that reflect its role as a planning agency, council of governments, and metropolitan planning organization. The RCP also recommends voluntary policies for consideration by local governments and other key stakeholders.
    - *Strategic Initiatives.* This encompasses longer-term strategies that require significant effort to implement but are necessary to achieve the RCP's desired Goals and Outcomes. For example, identifying technological breakthroughs that can reduce air pollution from the transportation sector requires both commitment and time. Most of these initiatives are not constrained and will require political will, enabling legislation, new funding sources, and other key developments to become a reality. In most cases, this tier of strategies is the key to achieving the region's sustainability Goals and Outcomes.

Other policies contained within the 2008 RCP were either not applicable to the WLC project or are directed at the SCAG and actions that the SCAG would undertake at the regional level that would not pertain directly to the WLC project. Policies within the 2008 RCP that are applicable to the WLC project were identified and are discussed below.

Land Use and Housing Chapter

Goal *Focusing growth in existing and emerging centers and along major transportation corridors.*

Consistent. The WLC project site is currently either underdeveloped or used for agriculture. Regional access to the City and project area is provided from SR-60, which runs east-west just north of the project site. SR-60 provides direct access to the site via interchanges at Redlands Boulevard, ~~Theodore Street~~World Logistics Center Parkway, and Gilman Springs Road.

According to the City's "Rancho Belago Development Strategy" adopted in 2011, the WLC project would occur in an area acknowledged by the City as appropriate for this type of development. The existing roadway system and infrastructure surrounding the project site will be utilized to the maximum extent possible, and the WLC project will install improvements and/or pay necessary fees to facilitate the continuation of satisfactory operation. The WLC project is consistent with this SCAG policy in that it exists along a major transportation corridor of the City and will be connecting to the existing utilities underlying the arterial roadways.

Goal *Targeting growth in housing, employment, and commercial development within walking distance of existing and planned transit stations.*

Consistent. The WLC project would comply with all City development policies, standards, and programs pertaining to supporting alternative modes of transportation included in the General Plan Circulation Element. In addition, the WLC project is located within an urbanizing area of the City. As provided in the discussion on cumulative projects (Section 4.10.7), the approved and planned development in the project area includes residential, commercial, and industrial uses. As such, the project site is in an area that is developing with projects that have already been approved and constructed, or are in the various stages of the planning process.

Transit service in Moreno Valley is provided by the Riverside Transit Authority (RTA), which provides two routes in the vicinity of the development:

- Route 35, which runs along Eucalyptus Street, Moreno Beach Boulevard, and SR-60; while this route does not directly serve the project site, it could be readily rerouted through the site.
- Route 20, which runs along the southerly portion of Moreno Beach Boulevard, approximately one mile west of the site.

Because the WLC project site is located in close proximity existing RTA routes,[1] the WLC project could be accessible to existing transit systems. As the project site is located adjacent to an area where commercial, residential, and industrial uses are planned or approved, and because the project site is readily accessible from SR-60 and from existing RTA bus routes, the WLC project would be consistent with this SCAG Policy.

Goal *Inject new life into underused areas by creating vibrant new business districts, redeveloping old buildings, and building new businesses and housing on vacant lots.*

Consistent. The WLC project site is currently used for agriculture. The WLC project would introduce new high-cube logistics warehouse uses on vacant lots.

---

[1] Riverside Transit Agency, http://www.riversidetransit.com, website accessed April 15, 2012.

Outcome *Significantly increase the number and percentage of new housing units and jobs created within the Compass Blueprint 2% Strategy Opportunity Areas by 2012 and improve the regional jobs-housing balance. (Tracking the number of new units will measure the region's progress in accommodating forecast growth. The percentage of housing and jobs developed within the Opportunity Areas will indicate the locational efficiency of growth.)*

Consistent. The project is designed to address the City of Moreno Valley jobs/housing imbalance; the City has a scarcity of jobs compared to the number of residents.

Direct population increases are generally associated with residential developments and as there are no residential uses proposed for the WLC project, there would be no direct increase in population. As most of the new employment opportunities are anticipated to be filled by existing local area residents, a large influx of new residents to the City would not occur. The City's current population per the 2010 Census is 195,216 and the SCAG projects the City's population will grow by 59,984 persons by the year 2035 (+31%). A City or sub-region with a jobs-to-housing ratio lower than the overall standard would be considered a "jobs poor" area, indicating that many of the residents must commute to places of employment outside the sub-area. The 2011 estimated jobs-to-housing ratios for the City, County, and SCAG region are 0.45, 0.69, and 1.14, respectively. These ratios indicate that both Western Riverside County and the City of Moreno Valley are "jobs poor" because the jobs-to-housing ratios are below that of the Southern California region (as defined by SCAG).

It is anticipated that any new employment opportunities created by the development of the WLC project would be filled by persons already residing in the local area. The WLC project would serve the existing and continuing growth in the City and would not result in any direct increase to the population or households not previously anticipated in the City of Moreno Valley. In fact, it would result in a decrease in projected population in favor of an increase in anticipated job growth. As such, the WLC project would be within the SCAG and Western Riverside Council of Governments (WRCOG) growth projection forecasts and would be consistent with this SCAG policy.

Outcome *Reduce total regional vehicle miles traveled (VMT) to 1990 levels by 2020. (The Land Use and Housing Action Plan can be expected to result in a 10% reduction in VMT in 2035 when compared to current trends. VMT serves as a proxy for jobs/housing balance, urban design, transit accessibility, and other urban form issues. VMT per household will decrease with Compass Blueprint implementation.)*

Consistent. As previously identified, the WLC project would comply with all City development policies, standards, and programs pertaining to supporting alternative modes of transportation included in the General Plan Circulation Element. In addition, the WLC project would result in the development of employment opportunities in fairly close proximity to existing residential development. The type of uses proposed and their proximity to each other allow for increased pedestrian and bicycle activity, limiting the need for vehicle travel. Because the project site is located adjacent to existing RTA Route 35[1] the WLC project would be accessible to existing transit systems. Through consultation with the RTA, the project applicant will coordinate and facilitate the use of public transit to access the project site. The provision of additional employment options in proximity to existing residential development has the potential to reduce VMT; therefore, the WLC project is consistent with this policy.

Section 4.15 of the EIR, *Traffic and Transportation*, indicates that Moreno Valley currently has a jobs/housing imbalance resulting in long westbound commutes for thousands of City residents every workday. The WLC Specific Plan would eventually create approximately 25,000 new jobs, nearly

---

[1] Riverside Transit Agency, http://www.riversidetransit.com, website accessed April 15, 2012.

doubling the number of jobs in Moreno Valley. This would have several effects on commute patterns over the long-term:

- Many existing and future residents of Moreno Valley would be able to work locally with very short commute trips.
- Residents of neighboring cities who work within the WLC Specific Plan area would have short commutes and be able to access the site using the local arterial road network rather than the freeway. This is consistent with the policies of the WRCOG and the Riverside County Transportation Commission (RCTC) to promote use of the arterial road network as an alternative to freeways. The traffic study indicates that nearly half of auto traffic associated with the project would be on surface streets (i.e., not on freeways).
- Workers coming from more distant residences would, in most cases, be traveling on freeways in the off-peak direction; i.e. commuters traveling to the project from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to take advantage of the existing unused off-peak capacity of facilities that were sized for flows in the peak direction. The traffic study determined that, although the project would increase freeway auto traffic eastbound in the morning, it would decrease the traffic in the more congested westbound direction (Figure 40, TIA 2014). In the evening, this pattern would reverse, with the project relieving traffic in the congested eastbound direction (Figure 41, TIA 2014). Therefore, it appears the project will have a net beneficial impact on the regional freeway auto traffic. This is consistent with the policies of the SCAG, WRCOG, and other regional bodies to encourage better jobs/housing balances as a way to reduce peak flow on the freeway system. It will also help the project and City comply with the requirements of SB 375 regarding long-term land use patterns to achieve a better regional balance of jobs/housing, which in turn will help reduce traffic congestion on regional freeways.

It should also be noted that ~~this~~ the WLC project will help reduce VMT within the City of Moreno Valley over the long term since it will add thousands of new jobs to the local workforce instead of new housing, thus improving the City's jobs to housing ratio.

Policy LU-6.2 *Developers and local governments should integrate green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program.*

Consistent. According to Section 1.3.2 of the WLC Specific Plan, the project will be in conformance with California's CALGreen building regulations. The Specific Plan states that 1) these are "the most stringent, environmentally friendly building codes in the U.S.;" and 2) "CALGreen is a comprehensive, far-reaching set of regulations which mandate environmentally advanced building practices and regulations designed to conserve natural resources and reduce greenhouse gas emissions, energy use, and water use."

In addition to compliance with the CALGreen building regulations, WLCSP Section 1.3.2, *Green Building – Sustainable Development*, indicates the project proposes to incorporate the following sustainable design features to further reduce its environmental footprint, including:

- Allow the installation of solar photovoltaic panels on each building (i.e., Mitigation Measure 4.16.4.6.1C requires that the project install solar panels to provide electricity for the office demands.) to help offset each building's annual electrical demand;
- The project would require LEED certification for buildings and would require buildings to exceed Title 24 by 10 percent;
- Channelizing street runoff into landscape areas instead of storm drains;

- Use of recycled and/or locally sourced building materials to the extent feasible;
- Reduction in the use of impervious surfaces throughout the project;
- The WLCSP provides for an alternative fueling station on the site;
- Provide for site access via existing transit systems (WLCSP Section 3.3.4, Mass Transit Circulation); and
- Provide for internal circulation via bicycles and walking (WLCSP Section 3.4, Non-Vehicular Circulation).

Therefore, the WLC project is consistent with this SCAG policy.

Open Space and Habitat Chapter

Policy OSC-8 *Local governments should encourage patterns of urban development and land use, which reduce costs of infrastructure and make better use of existing facilities.*

Consistent. The WLC project is adjacent to existing developed in areas that are presently served by various existing water, sewer, storm drainage, electrical, natural gas, and transportation services. During the construction of the project and as needed throughout the process, necessary utility and roadway improvements will be installed or extended to the project site from adjacent existing facilities. The supply of electricity and natural gas is demand-responsive and the project proponent would be required to meet the service requirements of these utility providers. By maximizing the use of existing facilities, the costs of expanding infrastructure would be minimized. Because the WLC project would be located in close proximity to existing industrial, commercial, and residential structures requiring a similar type of infrastructure, it is consistent with this growth management policy.

Policy OSC-12 *Developers and local governments should promote water-efficient land use and development.*

Consistent. As identified in Section 4.17 of this EIR, pursuant to Assembly Bill 325 (AB 325), the City of Moreno Valley implements landscape and irrigation design standards (Chapter 9.17 of the City's Municipal Code), which establishes water conservation requirements for new or rehabilitated landscapes.[1] The WLC project is subject to this ordinance and will be required to implement water-efficient landscaping design (i.e., drought-tolerant landscaping) within the project site. In addition, a major design concept of the Specific Plan is water conservation through the careful selection and maintenance of drought-tolerant native plants. For example, Section 1.3.1 of the Specific Plan indicates a major goal of the project will be to minimize water consumption as outlined in Specific Plan Section 5.2.3 *Sustainable Design*, Section 5.4, *Onsite Landscaping,* and Section 6.0, *Sustainability*. All of these sections call for the project to minimize water use through installation of drought-tolerant landscaping and irrigating with runoff from building roofs and ground-level hardscape areas. Therefore, the WLC project would be consistent with this SCAG policy.

Water Chapter

Policy WA-11 *Developers and local governments should encourage urban development and land uses to make greater use of existing and upgraded facilities prior to incurring new infrastructure costs.*

Consistent. Existing warehousing development is located in the immediate vicinity of the WLC project site where infrastructure for water, sewer, storm drainage, electrical, natural gas, and transportation facilities currently exist. During the construction of the project and as needed throughout the process, necessary utility and roadway improvements will be installed or extended to the project site from adjacent existing facilities. The utility and roadway improvements will facilitate future growth in the

---

[1] *City of Moreno Valley Municipal Code.*

surrounding area. The availability of this infrastructure would reduce the cost to public agencies that would provide services to the project area. The WLC project would be developed in an area where such infrastructure is accessible. Furthermore, the project applicant would pay all applicable development fees for the necessary infrastructure and public service improvements, including those associated with water, sewer, drainage, roadways, fire, and police; therefore, the WLC project is consistent with this policy.

Policy WA-12 *Developers and local governments should reduce exterior uses of water in public areas, and should promote reduced use in private homes and businesses by shifting to drought-tolerant native landscape plants (xeriscaping), using weather-based irrigation systems, educating other public agencies about water use, and installing related water pricing incentives.*

Consistent. As identified in earlier in this section, pursuant to Assembly Bill 325 (AB 325), the City of Moreno Valley implements landscape and irrigation design standards (Chapter 9.17 of the City's Municipal Code), which establishes water conservation requirements for new or rehabilitated landscapes.[1] The WLC project is subject to this ordinance and will be required to implement water-efficient landscaping design (i.e., drought-tolerant landscaping) within the project site. Therefore, the WLC project would be consistent with this SCAG policy.

Energy Chapter

Policy EN-10 *Developers and local governments should integrate green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. Energy-saving measures that should be explored for new and remodeled buildings include:*

- *Using energy-efficient materials in building design, construction, rehabilitation, and retrofit.*
- *Encouraging new development to exceed Title 24 energy efficiency requirements.*
- *Developing Cool Communities measures including tree planting and light-colored roofs. These measures focus on reducing ambient heat, which reduces energy consumption related to air conditioning and other cooling equipment.*
- *Utilizing efficient commercial/residential space and water heaters. This could include the advertisement of existing and/or development of additional incentives for energy-efficient appliance purchases to reduce excess energy use and save money. Federal tax incentives are provided online at http://www.energystar.gov/index.cfm?c=Products.pr_tax_credits.*
- *Encouraging landscaping that requires no additional irrigation; utilizing native, drought-tolerant plants can reduce water usage up to 60 percent compared to traditional lawns.*
- *Encouraging combined heating and cooling (CHC), also known as cogeneration, in all buildings.*
- *Encouraging neighborhood energy systems, which allow communities to generate their own electricity.*
- *Orienting streets and buildings for best solar access.*

---

[1] *City of Moreno Valley Municipal Code*.

- *Encouraging buildings to obtain at least 20 percent of their electric load from renewable energy.*

Consistent. According to Section 5.2.3 of the WLC Specific Plan (Sustainable Design), the project will be in conformance with California's "CALGreen" building regulations which are considered the most stringent, environmentally friendly building codes in the U.S. In addition to compliance with the CALGreen building regulations, the project proposes to incorporate the following additional sustainable design features to further reduce its environmental footprint, including:

- The project would require LEED certification for buildings and would require buildings to exceed Title 24 by 10 percent;
- Allow the future installation of solar photovoltaic panels on each building (i.e., Mitigation Measure 4.16.4.6.1C requires that the project install solar panels to provide electricity with a minimum capacity equal to office electrical demand.) to help offset annual electrical energy consumption;
- Substantially reduced water use for landscape irrigation;
- Channelizing street runoff into landscape areas instead of storm drains;
- Use of recycled and/or locally sourced building;
- Reduction in the use of impervious surfaces throughout the project;
- The WLCSP provides for an alternative fueling station on the site;
- Provide for site access via existing transit systems (WLCSP Section 3.3.4, Mass Transit Circulation); and
- Provide for internal circulation via bicycles and walking (WLCSP Section 3.4, Non-Vehicular Circulation).

In addition, the strategies listed in Section 4.7, *Greenhouse Gases and Global Climate Change*, of this EIR are considered to be greenhouse gas emission reduction strategies, which include green building measures. These strategies are either part of the WLC project, required mitigation measures, or requirements under local or State ordinances. Since the project would implement these strategies into project design and operation, the project would be consistent with this SCAG policy.

Solid Waste Chapter

Policy SW-14 *Developers and local governments should integrate green building measures into project design and zoning including, but not limited to, those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. Construction reduction measures to be explored for new and remodeled buildings include:*

- *Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities.*
- *An ordinance that requires the inclusion of a waste management plan that promotes maximum C&D diversion.*
- *Source reduction through (1) use of building materials that are more durable and easier to repair and maintain, (2) design to generate less scrap material through dimensional planning, (3) increased recycled content, (4) use of reclaimed building materials, and (5) use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings).*
- *Reuse of existing building structure and shell in renovation projects.*

Building lifetime waste reduction measures that should be explored for new and remodeled buildings include:

- *Development of indoor recycling program and space;*
- *Design for deconstruction; and*
- *Design for flexibility through use of moveable walls, raised floors, modular furniture, moveable task lighting, and other reusable components.*

Consistent. As noted above, according to Section 5.2.3 of the WLC Specific Plan, *Sustainable Design*, the project will be in conformance with California's "CALGreen" building regulations. In addition to compliance with the CALGreen building regulations, the project proposes to incorporate the following additional sustainable design features to further reduce its environmental footprint, including:

- Substantially reduced water use for landscape irrigation;
- Channelizing street runoff into landscape areas instead of storm drains;
- Use of recycled and/or locally sourced building materials to the extent feasible;
- Reduction in the use of impervious surfaces throughout the project;
- Provide for site access via existing transit systems; and
- Provide for internal circulation via bicycles and walking.

The strategies listed in Section 4.7 *Greenhouse Gases and Global Climate Change* of this EIR are considered to be greenhouse gas emission reduction strategies, which include green building measures. These strategies are either part of the WLC project, required mitigation measures, or requirements under local or State ordinances. With implementation of these strategies/measures, the project would be consistent with this SCAG policy.

Transportation Chapter

Goal *A more efficient transportation system that reduces and better manages vehicle activity.*

Consistent. The WLC project would result in the development of employment opportunities in close proximity to housing. In addition, the project proposes sidewalks, bicycle routes, and landscaping treatments to provide for pedestrian and bicycle access throughout the project site. The type of uses proposed and their proximity to each other allow for increased pedestrian and bicycle activity, limiting the need for vehicle travel. At present, Moreno Valley has a jobs/housing imbalance that results in long westbound commutes for thousands of city residents every workday. The WLC would create approximately 24,000[1] permanent new jobs within the City (20,307 direct jobs and 3,693 indirect jobs); nearly doubling the number of jobs in Moreno Valley. This would have several effects on commute patterns:

- Many existing and future residents of Moreno Valley would be able to work locally with very short commute trips.
- Residents of neighboring cities who work at the WLC would have short commutes and, importantly, be able to access the site using the arterial road network. This is consistent with the policies of the WRCOG and the RCTC to promote use of the arterial road network as an alternative to freeways. Tests with the Riverside County Traffic Analysis Model (RivTAM) model suggest that nearly half of auto traffic associated with the WLC would be on surface streets (i.e., not on freeways).

---

[1] *Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California, David Taussig & Associates, Inc., original dated January 2012, updated September, 2014.*

- Workers coming from more distant residences would, in most cases, be traveling on freeways in the off-peak direction; i.e. commuters traveling to the WLC from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to take advantage of the existing unused off-peak capacity of facilities that were sized for flows in the peak direction. Although the project would increase freeway auto traffic eastbound in the morning, it would decrease the traffic in the more congested westbound direction. In the evening, the pattern would reverse, with the project relieving traffic in the congested eastbound direction. Therefore the WLC project will have a net beneficial impact on the regional freeway auto traffic. This is consistent with the policies of SCAG, WRCOG, and other regional bodies to encourage better jobs/housing balances as a way to reduce peak flow on the freeway system.

Therefore, ~~this~~ the WLC project is consistent with this transportation goal.

Security and Emergency Preparedness Chapter

Goal *Ensure transportation safety, security, and reliability for all people and goods in the region.*

Consistent. The WLC project is consistent with this goal in that the WLC project would be required to adhere to the City of Moreno Valley's General Plan. The General Plan contains goals and policies that aim to provide adequate and reliable transportation facilities. The goals and policies identified in the City's General Plan resemble those of the RCP that address mobility, traffic safety, environmental concerns, and land use consistency as the major traffic study factors to identify existing traffic conditions and to assess the future effects on area traffic patterns/flow.

Economy Chapter

Goal *Enable business to be profitable and competitive (locally, regionally, nationally, and internationally).*

Consistent. The WLC project would add to the City's portfolio of industrial and logistics services. Through the addition of the WLC project, the City would also expand its economic competitiveness with other areas in the region. Therefore, the WLC project is consistent with this policy.

Goal *Promote sustained economic health through diversifying the region's economy, strengthening local self-reliance and expanding competitiveness.*

Consistent. As previously stated, the WLC project would add to the City's portfolio of industrial and logistic services, which would enable the City to be more self-reliant through the provision of goods and services to residents within the City. Through the addition of the WLC project, the City would also expand its economic competitiveness with other areas in the region. Therefore, the WLC project is consistent with this policy.

Goal *Ensure a healthy, flourishing economy that provides sufficient employment opportunities to decrease poverty and meet the basic needs of all the people who participate in our economy by promoting education and workforce training policies that give residents an opportunity to compete for the full range of jobs available with good wages and benefits.*

Consistent. The WLC project would provide additional employment opportunities in a community with a low jobs/housing ratio. In addition, the WLC project would meet the basic needs of those who participate in the economy through the use of training in the workforce. Therefore, the WLC project is consistent with this policy.

Outcome *Increase job growth to add three million jobs to the regional economy by 2035.*

Consistent. The WLC project would result in additional jobs in the City and indirect jobs in the County and City, which would contribute to job growth in the regional economy. Therefore, the WLC project is consistent with this policy.

Outcome *Increase the region's economic vitality and attractiveness by focusing housing and job additions in urban centers, employment centers, and transportation corridors, such that there will be a minimum of 35 percent of the region's household growth and 32 percent of employment growth in these areas from their levels in 2005 by 2035.*

Consistent. Development of the on-site uses would increase the number of jobs in the City by approximately 24,000 at full development. The 2011 estimated jobs-to-housing ratios for the City, sub-region, and region are 0.45, 0.69, and 1.14, respectively. The 2035 future jobs-to-housing ratios for the City, sub-region, and region are 0.88, 1.14, and 1.29, respectively. These ratios indicate that both western Riverside County and the City of Moreno Valley are "jobs poor" because the jobs-to-housing ratios are below the Southern California region (as defined by SCAG). A city or sub-region with a jobs-to-housing ratio lower than the overall standard would be considered a "jobs poor" area, indicating that many of the residents must commute to places of employment outside the sub-area. Since the WLC project would add jobs to a "jobs poor" region, the WLC project would increase the region's economic vitality and attractiveness by job additions in urban centers and along transportation corridors. Therefore, the WLC project is consistent with this SCAG policy.

2008 Regional Transportation Plan: The 2008 RTP adopted by the SCAG in May 2008 contains a set of existing socioeconomic projections used as the basis for the SCAG's transportation planning efforts. They include projections of population, housing, and employment at the regional, county, sub-regional, jurisdictional, Census tract, and transportation analysis zone levels. The RTP includes policies and regulations set forth to ensure development within the SCAG regional area is within planned and forecast socioeconomic projections. Goals established within the RTP include the following:

- Maximize mobility and accessibility for all people and goods in the region (discussed in Section 4.15, *Traffic and Circulation*);
- Ensure travel safety and reliability for all people and goods in the region (discussed in Section 4.15, *Traffic and Circulation*);
- Preserve and ensure a sustainable regional transportation system (discussed in Section 4.15, *Traffic and Circulation*);
- Maximize the productivity of our transportation system (discussed in Section 4.15, *Traffic and Circulation*);
- Protect the environment, improve air quality, and promote energy efficiency (discussed in Section 4.3, *Air Quality*);
- Encourage land use and growth patterns that complement our transportation investments and improve the cost-effectiveness of expenditures (discussed in Section 4.15, *Traffic and Circulation*); and
- Maximize the security of our transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies (discussed in Section 4.15, *Traffic and Circulation*).

The WLC project is consistent with the RTP in that it would be required to adhere to the City of Moreno Valley's General Plan. The General Plan contains goals and policies that aim to minimize traffic congestion, provide adequate transportation facilities, and require development to pay its share of costs. The goals and policies identified in the City's General Plan resemble those of the RTP that address mobility, traffic safety, environmental concerns, and land use consistency as the major traffic study factors to identify existing traffic conditions and to assess the future effects on area traffic patterns/flow.

Compass Growth Vision: The Compass Growth Vision plan provides a framework for local and regional decision-making regarding growth, transportation, land use, and economic development. The framework includes principles and a specific set of strategies intended to achieve and improve a quality of life that promotes and sustains for future generations the region's mobility, livability, and prosperity. The main objective of the Compass Growth Vision is to manage the forecast growth while improving future living conditions for all people within the SCAG area, including live, work, and play activities.

The following discussion includes the principles within the Compass Growth Vision plan and their association to the WLC project.

- ***Principle 1:*** Improve mobility for all residents.
- ***Principle 2:*** Foster livability in all communities.
- ***Principle 3:*** Enable prosperity for all people.
- ***Principle 4:*** Promote sustainability for future generations.

The WLC project is consistent with the four principles identified above. The nature of the WLC project allows the transport of commodities from a single area rather than multiple areas, minimizing vehicle trip generation. The WLC project supports the prosperity for all people by providing employment opportunities close to existing housing within the City of Moreno Valley. The WLC project is located in an area that is already developing with urban uses and where existing infrastructure (freeway, sewer, electrical, water, etc.) is accessible. During the construction of the project and as needed throughout the process, necessary utility and roadway improvements will be installed or extended to the project site from adjacent existing facilities. The utility and roadway improvements will facilitate future growth in the surrounding area. The development of the WLC project is consistent with the land use vision for the site and will augment existing services available in the City and region.

SCAG 2012 Regional Transportation Plan and Sustainable Communities Plan. As part of the adoption of the 2012 RTP, SCAG developed an SCS, which was required as part of SB 375. According to SB 375, each metropolitan planning organization shall prepare a sustainable communities strategy, including the requirement utilizing the most recent planning assumptions considering local general plans and other factors. The Sustainable Communities Strategy shall:

1. Identify the general location of uses, residential densities, and building intensities within the region;
2. Identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth;
3. Identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region;
4. Identify a transportation network to service the transportation needs of the region;
5. Gather and consider the best practically available scientific information regarding resource areas and farmland in the region;
6. Consider the State housing goals specified in Sections 65580 and 65581;
7. Set forth a forecast development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse

gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the State Board; and

8. Allow the regional transportation plan to comply with the Federal Clean Air Act.

The SCS and the 2012 RTP contain new regional growth projections for each city in the Southern California region. Table 4.10.C contains the population and employment forecasts for the City of Moreno Valley.

Table 4.10.C: SCAG Population and Employment Projections, 2008–2035

Population			Employment			Increase 2008–2035	
2008 per Census	2020 Projection	2035 Projection	2008 per Census	2020 Projection	2035 Projection	Population	Employment
187,400	213,700	255,200	32,300	48,000	64,400	36%	99%

Source: SCAG 2012 RTP

The 2012–2035 RTP/SCS contains a number of "Outcome and Performance Measures/Indicators"[1] that are used to evaluate various regional land use plan alternatives, with the objective being an improvement over the No Project (i.e., no SCS) baseline. These measures are applied on a regional basis, and are not necessarily applicable to individual projects like the World Logistics Center. However, the following general discussion of consistency with the relevant measures shown in Table 4.10.D can be provided.

Table 4.10.D: Discussion of RTP Outcomes and Performance Measures/Indicators

Performance Measure/Indicator	Definition	Consistency of WLC project
Share of growth in High Quality Transit Areas (HQTAs)	Increase share of the region's growth in households and employment in HQTAs	**Consistent.** The WLC project is not currently located in an SCAG-defined HQTA. However, the project is located adjacent to existing transit routes and makes provisions for future bus service through the relocation of existing routes. By developing a focused employment center, the project can attract more frequent transit service to the area. Given the potential for readily providing transit service to the site, the project is generally consistent with this goal.
Land consumption	Reduce additional land needed for development that has not previously been developed or otherwise affected, including agricultural land, forest land, desert land, and other virgin sites.	**Consistent.** The SCAG plan calls for reducing the amount of virgin land converted to development, as compared to the "No Project" condition. The WLC project would develop land long planned for suburban level development, ~~but would replace the approved mixed-use residential project~~ with a logistics warehousing project that would add employment instead of housing to the City which has long been considered by SCAG to be "housing rich." The EIR does note that the WLC project would convert agricultural land to other uses.

---

[1] http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_PerformanceMeasures.pdf, Table 2.

Table 4.10.D: Discussion of RTP Outcomes and Performance Measures/Indicators

Performance Measure/Indicator	Definition	Consistency of WLC project
Average distance for work or non-work trips	Decrease the average distance traveled for work or non-work trips separately.	**Consistent.** The City of Moreno Valley is "jobs-poor," which forces many Moreno Valley residents to commute long distances from their homes to work. By providing employment opportunities closer to existing population centers, the WLC project should reduce the length of work related trips.*
Percentage of work trips less than 3 miles.	Increase the share of total work trips that are fewer than 3 miles.	**Consistent.** As noted above, the City of Moreno Valley needs additional jobs for its residents. The project will increase the ability of Moreno Valley residents to find work closer to home and thereby reduce travel times. Approximately 50% of the City of Moreno Valley is within three miles of the project site. To the extent that Moreno Valley residents are employed at the project site, the share of work-related trips less than three miles should increase.
Work trip length distribution.	Reduce the statistical distribution of work trip length in the region.	**Consistent.** In addition to the discussion above, the project traffic study indicates that nearly half of auto traffic associated with the WLC project would be on surface streets (i.e., not on freeways). The traffic study determined that, although the project would increase freeway auto traffic eastbound in the morning, it would decrease the traffic in the more congested westbound direction. In the evening, this pattern would reverse, with the project relieving traffic in the congested eastbound direction. Therefore, it appears the project will have a net beneficial impact on the regional freeway auto traffic.
Criteria pollutants and greenhouse gas emissions.	Reduce CO, NO_X, $PM_{2.5}$, PM_{10}, VOC, and per capita greenhouse gas emissions (CO_2).	**Consistent.** To the extent that total work-related trip lengths are reduced, the WLC project would reduce such emissions.
Annual household transportation cost.	Reduce annual household spending on transportation costs of vehicle ownership, operation, and maintenance, and public transportation.	**Consistent.** To the extent that total work-related trip lengths are reduced, the WLC project would reduce such costs.
Percentage of jobs within 15 minutes' walk of transit.	Increase the number of jobs within 15 minutes' walk of public transportation.	**Consistent.** Assuming the bus service revisions as described above, all of the WLCSP site would be within 15 minutes' walk of public transportation.

* Market conditions at the time that employers move into the site will determine the actual match of jobs within the project to the then current employment needs of Moreno Valley residents.

Source: http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_PerformanceMeasures.pdf

As Table 4.10.D shows, the project is generally consistent with the SCAG RTP/SCS Performance measures. It should be noted that the WLCSP project will significantly improve the jobs/housing ratio for the City, which will assist SCAG in achieving its regional RTP growth goals, as well as a number of RTP performance standards regarding sub-regional jobs/housing ratios (i.e., regional goal is to add housing in jobs rich areas and add jobs in housing rich areas like Moreno Valley). Additional information and analysis in this regard is provided in Section 4.13, *Population, Housing, and Employment.*

Santa Ana Water Quality Control Plan (Basin Plan). The Santa Ana Basin Plan, which is implemented by the Santa Ana RWQCB, specifically (1) designates beneficial uses for surface and ground waters, (2) sets qualitative and quantitative objectives that must be attained and maintained at that level in order to protect the designated beneficial uses and conform to the State's anti-degradation policy, and (3) describes implementation policies and programs to protect all waters in the region. In cases where the Basin Plan does not contain a standard for a particular pollutant, other criteria are used to establish a standard. Storm water runoff from approximately the western half of the project drains toward the west, into the Perris Valley Storm Drain, then flows into the San Jacinto River and eventually into Canyon Lake and Lake Elsinore. The eastern half of the project drains south into Mystic Lake when flows are high, and runoff eventually makes its way to the San Jacinto River. Because the WLC project is required to comply with all applicable water quality standards and requirements established by the RWQCB, and is therefore in compliance with the NPDES permitting system, the WLC project would be consistent with the Basin Plan.

Riverside County Drainage Area Management Plan (DAMP). Like the Basin Plan, the Drainage Area Management Plan deals primarily with the Santa Ana Region. The DAMP describes a wide range of continuing and enhanced Best Management Practices (BMPs) and control techniques for development projects within a municipality and are being implemented during the five-year terms of the third-term MS4 permits. In essence, the DAMP describes the overall urban runoff management strategies planned by the permittees in the Santa Ana Region. The WLC project is required to comply with all applicable drainage standards and requirements designed to protect water resources and enhance water quality and would therefore, be consistent with the DAMP.

Eastern Municipal Water District Urban Water Management Plan (EMWD UWMP). A UWMP is required of every urban water supplier in order to be in compliance with the Urban Water Management Plan Act. The UWMP includes assessment of current and projected water supplies, evaluation of water demand, customer types, and reliability of water supplies, description of conservation measures, a response plan for water shortage, and a comparison of demand and supply projections. The WLC project is required to comply with all applicable standards and requirements designed to conserve water supplies and ensure water source reliability for future years prior to the approval of the project. As such, the WLC project would be consistent with the EMWD UWMP. A comprehensive Water Supply Assessment (WSA) was prepared for this project by the EMWD that determined there were sufficient water supplies, including during multiple drought years, to supply the WLCSP project.

Summary of Impact 4.10.5.2: Conflict with Applicable Regional Land Use Plans, Policies, or Regulations. The preceding analysis demonstrates that the WLC project is generally consistent with the goals of SCAG's Regional Comprehensive Plan, Compass Plan and Regional Transportation Plan in that it seeks to add employment in an area that has historically been "jobs poor," which will help reduce worker commute trips from Moreno Valley over the long term. The WLCSP project ~~is generally consistent with these plans because the WLCSP will generate fewer emissions than the currently approved Moreno Highland Specific Plan, and it~~ will provide for a better balance of jobs versus housing in Moreno Valley, which will incrementally improve regional commuting directions and distances by providing almost 24,000 new jobs in an area currently planned for housing.

4.10.5.3 Conflict with Applicable Land Use Plans, Policies, or Regulations (Local)

Threshold	Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the General Plan, Specific

Plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Section 15125 (d) of the *CEQA Guidelines* requires EIRs to “discuss any inconsistencies between the proposed project and applicable general plans and regional plans.” The objective of such a discussion is to find ways to modify a project, if warranted, to eliminate any identified inconsistencies with relevant plans and policies, and thereby avoid creating an impact to the environmental that consistency with the plan would otherwise mitigate. Pursuant to *CEQA Guidelines* Section 15125 (d), this EIR section includes an evaluation of the consistency of the project with pertinent goals and policies of the adopted City of Moreno Valley General Plan (see Figure 4.10.2).

~~The project proposes to amend the existing City of Moreno Valley General Plan Land Use Plan for the project area. By definition, the project is inconsistent with the existing General Plan and approval of the project would correct the inconsistency by amending the General Plan Land Use and other Elements to be consistent with the WLC project and Specific Plan. Figures 4.10.2 and 4.10.3 show the existing General Plan land uses and the proposed land uses. Table 4.10.E compares the land uses allowed under the current General Plan with those allowed under the proposed amended General Plan.~~

Table 4.10.E: City of Moreno Valley General Plan Consistency Analysis

Goals, Policies and Objectives	Project Consistency Analysis
Ultimate Goal IV: Enjoys a healthy economic climate that benefits both residents and businesses.	**Consistent:** The City has determined that its low jobs/ housing ratio limits the job opportunities for local residents, and creates economic challenges for the City. By increasing employment opportunities and potentially increasing the jobs/housing ratio, the WLC project will enhance the economic climate for both businesses and residents.
Ultimate Goal VI: Enjoys a circulation system that fosters traffic safety and the efficient movement of motor vehicles, bicycles, and pedestrians.	**Consistent:** The WLCSP circulation will be designed to modern safety standards, and provide for efficient movement and motor vehicles, both on the local streets and freeway. To the extent that the WLC project increases job opportunities for local residents, it should decrease the length of employment trips, increasing the efficiency of the local transportation system. However, it will result in substantial additional traffic, including trucks, on SR-60 and Gilman Springs Road. The project will make various roadway and intersection improvements, and pay ~~make fair share contributions to local Development Impact Fee (DIF) and~~ regional Transportation Uniform Mitigation Fee (TUMF) traffic mitigation programs.
Community Development Goal 2.1: Develop a pattern of land uses, which organizes future growth, minimizes conflicts between land uses, and which promotes the rational utilization of presently underdeveloped and undeveloped parcels.	**Consistent:** The WLC project proposes a major industrial/logistics center on agricultural land in the eastern end of the City. With proposed mitigation, these land uses will have adequate setbacks or be buffered from adjacent residential land uses. ~~The property was planned for a mixed use residential master planned community (i.e. Moreno Highlands Specific Plan) and so the proposed WLCSP project will require a General Plan Amendment.~~ In addition, ~~although this is a fundamental change from previous planned land uses,~~ it will provide a substantial amount of new employment consistent with the City's Economic Development Strategy and the 2011 Housing Element. Therefore, the WLC project is considered to be consistent with the General Plan in this regard.
Objective 2.1: Balance the provision of urban and rural lands within Moreno Valley by providing adequate land for present and future urban and economic development needs, while retaining the significant natural features and the rural character and lifestyle of the northeastern portion of the community.	**Consistent:** The proposed WLCSP will provide logistics-related employment to help balance out the historical abundance of housing developed in the City. It would not affect the northeastern portion of the City (i.e., north of SR-60).
Community Development Objective 2.5: Promote a mix of industrial uses that provides a sound and diversified economic base and ample employment opportunities for the citizens of Moreno Valley with the establishment of industrial activities that have good access to the regional transportation system, accommodate the personal needs of workers and business visitors; and which meets the service needs of local businesses.	~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~ **Consistent:** The WLC project will provide 40.6 million square feet of logistics-related warehousing and supporting office space. This development will enhance the economic base and provide increased employment opportunities for the citizens of Moreno Valley in a limited number of worker categories. The project site has direct access to two interchanges on SR-60, along with arterial access to the balance of Moreno Valley, and access to the San Jacinto/Hemet Valley via Gilman Springs Road. It is therefore consistent with the General Plan.

Table 4.10.E: City of Moreno Valley General Plan Consistency Analysis

Goals, Policies and Objectives	Project Consistency Analysis
Community Development Policy 2.5.1: The primary purpose of areas designated Business Park/Industrial is to provide for manufacturing, research and development, warehousing and distribution, as well as office and support commercial activities. The zoning regulations shall identify the particular uses permitted on each parcel of land. Development intensity should not exceed a Floor Area Ratio of 1.00 and the average floor area ratio should be significantly less.	**Consistent**: The WLC project is consistent with policies applicable to the Business Park/Industrial designation. The project will primarily provide opportunities for warehousing/logistics distribution, along with additional opportunities for manufacturing and research and development, along with associated office space. The Specific Plan ~~will become~~provides the zoning regulations for the site, and designates the land uses allowed on each parcel. The net Floor Area Ratio is estimated to be 0.5, which is considered significantly less that the General Plan maximum of 1.0.
Community Development Policy 2.5.2: Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses.	**Consistent:** The WLC project proposes to locate logistics warehouses in the far eastern portion of the City, and residential uses are adjacent to the southwest portion of the project site. The Specific Plan addresses these adjacency impacts with setbacks and landscaping, berms, walls, etc. so the project will be compatible with surrounding uses.
Community Development Policy 2.5.3: Screen manufacturing and industrial uses where necessary to reduce glare, noise, dust, vibrations and unsightly views.	**Consistent:** The WLC Specific Plan will provide visual and physical screening where planned uses are adjacent to existing residential uses.
Community Development Policy 2.5.4: Design industrial developments to discourage access through residential areas.	**Consistent:** The proposed circulations network provides primary project access directly from SR-60, and does not rely on residential streets. Trucks will generally access the WLC site off SR-60 by using the ~~Theodore Street~~WLC Pkwy Interchange. Truck access along the Cactus Avenue Extension to Cactus Avenue and along Redlands Boulevard south of Eucalyptus Avenue will be prohibited.
Community Development Objective 2.10: Ensure that all development within the City of Moreno Valley is of high quality, yields a pleasant living and working environment for existing and future residents, and attracts business as the result of consistent exemplary design.	**Consistent:** The WLC Specific Plan includes contemporary design standards, which will provide a pleasant working environment.
Community Development Policy 2.10.1: Encourage a design theme for each new development that is compatible with surrounding existing and planned developments.	**Consistent:** Section 5.0 of the WLC Specific Plan provides the architectural theme for the development.
Community Development Policy 2.10.12: Screen parking areas from streets to the extent consistent with surveillance needs (e.g., mounding, landscaping, low profile walls, and/or grade separations).	**Consistent:** Section 6.0 of the WLC Specific Plan provides for mounding and screening of parking lots.

~~While the project would amend the General Plan Land Use Map, the project also needs to be assessed against the Goals, Policies, and Objectives of the adopted General Plan, as contained in Section 9 of the General Plan. The potentially relevant policies have been extracted in Table 4.10.E, and the project's consistency with said policies is assessed.~~

~~With the implementation of the General Plan amendment that is part of the project approvals being sought, the project will be consistent with the City's General Plan.~~

In summary, the project is consistent with the goals, objectives, and policies of the City of Moreno Valley General Plan, except Objective 2.1 and Community Development Policy 2.5.2. ~~As proposed, the Specific Plan represents a fundamental land use change for the Rancho Belago area, the eastern portion of Moreno Valley. The land is currently planned for a mixed-use residential community, but the~~The WLC project will introduce 40.6 million square feet of logistics warehousing onto existing agricultural land that is adjacent to existing residential uses to the west and the San Jacinto Wildlife Area to the south.

~~NOTE: The following changes have been made due to revision to the Specific Plan project size.~~

Moreno Valley. ~~The land is currently planned for a mixed-use residential community, but the~~The WLC project will introduce 40.6 million square feet of logistics warehousing onto existing agricultural land that is adjacent to existing residential uses to the west and the San Jacinto Wildlife Area to the south.

~~Housing Element.~~ ~~During the NOP period, several group representatives expressed concern that the WLCSP would eliminate 7,700 housing units in the Moreno Highlands Specific Plan that would have to be replaced elsewhere in the City. The City adopted an updated Housing Element in February 2011 identifying the Moreno Highlands area as a potential location for future jobs-producing land uses rather than housing (affordable or otherwise).The 2011 Housing Element update indicated the Moreno Highlands area would likely be rezoned to support employment-generating uses rather than housing. It also stated that "pursuing any land use changes with the Moreno Highlands Specific Plan area will not hinder the City's ability to meet its RHNA obligations." The term RHNA refers to the Regional Housing Needs Allocation (affordable housing allocations) from the SCAG. The State Department of Housing and Community Development (HCD) certified the City's Housing Element on May 31, 2011.~~

~~In April 2011, the City adopted its Economic Development Action Plan, which also identified the eastern part of the City as a potential area for major job-producing land uses. The~~ *~~Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California~~* ~~("Study") prepared by David Taussig & Associates, Inc., in 2014 concluded that the proposed WLC project would generate 24,000 jobs/employees to the area, which includes the creation of direct, indirect, and induced jobs/employees to the City.~~

~~The City's 2006 Housing Element identified the Moreno Highlands Specific Plan as a potential source of vacant land that could accommodate possible future residential growth in the City. However, in 2011 the City updated its Housing Element and (i) anticipated possible land use changes from mixed use and residential to jobs producing warehouses in the eastern part of the City, and (ii) concluded that redesignating the entire land east of Redlands to the eastern City border for warehouse uses would not impede the City's Housing Element Objectives. As stated in the City's Housing Element:~~

> *~~The City will likely consider undertaking future planning efforts to achieve an improved jobs-housing balance. These future planning efforts could include the consideration of future proposals to re-designate areas south of SR 60 and east of Redlands Boulevard to the City's eastern border to jobs-producing commercial and/or industrial-type uses.~~*
>
> *~~The Moreno Highlands Specific Plan is an older, mixed use residential and industrial land use plan originally conceived and approved nearly twenty years ago and therefore may not be representative of the current economic environment and may not be viable. The plan does not specify unit types, thus allowing the City and the developer to tailor the unit mix to the community's needs at the time the project is actually developed.~~*
>
> *~~Moreno Highlands does make provisions for the phasing of the residential units. The plan does not specifically address the phasing of the affordable units, but merely notes the total number of units that will be developed in each of the three phases.~~*

~~As noted above, the current economic recession has severely and negatively affected the residents of the City. Unemployment in the City is extraordinarily high, and many City residents have expressed a desire that the City consider job-producing land uses that create an improved jobs-housing balance.~~

~~As shown in Table 8-19.5, even with the elimination of all residential uses from the land area approximately south of SR 60 and east of Redlands Boulevard and extending to the City's eastern and southern boundaries, the City is still fully capable of and is expected to achieve its RHNA obligations for the 2008-2014 planning period.~~

~~Table 8-19.5~~

~~AFTER removing sites south of SR 60 and east of Redlands, the Amended Inventory accommodates:~~

~~4,100 Low and Very Low Income units which is 1.3 times the RHNA number (3,045) (deleting sites south of SR 60 and east of Redlands has no effect on low and very low income housing opportunities)~~

~~2,600 Moderate Income units which is 2.1 times the RHNA number (1,239)~~

~~7,828 Above Moderate Income units which is 2.5 times the RHNA number (3,068)~~

~~14,528 total identified units which is 1.94 times the total RHNA number (7,474)~~

~~The HCD certified the City's Housing Element as compliant with State law on May 31, 2011. This means that approval of the proposed project will not impede the City's housing goals as set forth in its Housing Element, and no mitigation is required.~~

4.10.6 Significant Impacts

4.10.6.1 Physically Divide an Established Community

Impact 4.10.6.1: *The project may adversely affect existing rural residences on the project site.*

Threshold	Would the WLC project physically divide an established community?

The adjacent properties surrounding the WLC project are residential, light industrial, open space and undeveloped. Essentially, the project site is located along the eastern urban boundary of the City of Moreno Valley with development only adjacent to the western boundary and northwest corner of the site. As it is located at the edge of the community, its development could not physically divide the community and no impact would occur relative to residences near the southwest corner of the site.

At present, there are ~~seven~~ six rural residences on the project site. These properties vary in size from 0.5 to 5 acres and are located on the east side of Redlands Boulevard and ~~Theodore Street~~World Logistics Center Parkway. The WLC Specific Plan designates these properties as "Light Logistics" and allows various logistics-related uses but not actual development of logistics warehousing since none of the properties are large enough to support a warehouse building of 500,000 square feet or more. It is believed these properties are currently occupied. It is possible that, as development of the project site occurs according to the WLCSP, large warehouse buildings may eventually be located in close proximity to existing residences. It would be ineffective and inefficient to try to incorporate these residences into the WLCSP land plan of large logistics warehouses to accommodate these residences. In addition, logistics operations would cause air pollutant, noise, lighting, and health risk impacts on residents living in these units if they were adjacent to operating warehouses. This is a significant land use impact.

Specific Plan Design Features. The WLCSP currently shows a 250-foot buffer or setback along the western boundary of the site to separate existing residences from the warehouse buildings. However, it would be similarly ineffective and inefficient to try incorporate residences with similar buffers or setbacks into the WLCSP land plan.

Mitigation Measures. Installation of solid block walls around the warehouse building or the existing residences would help reduce noise and lighting impacts, but they would not help reduce air pollutant or health risk impacts. Therefore, there is no effective mitigation available to protect or separate these existing residences from future warehousing buildings and operations.

Level of Impact After Mitigation. Since there is no effective means of mitigating these onsite residences from the planned logistics warehouses, this land use impact is significant and unavoidable.

~~4.10.7 Cumulative Impacts~~

~~As discussed in this section, the WLC project would not have significant project-related impacts related to conflicts with applicable land use plans, policies, or regulations with approval of the proposed GPA, or conflict with an approved habitat conservation plan. While the project would represent a shift in land use policy for the eastern portion of the City, this policy shift does not represent a significant cumulative land use impact under CEQA. Section 4.10.6 determined the proposed project would have significant land use impacts on existing rural residences ("dividing an established community"), but this conflict does not rise to the level of a cumulative impact since the potential land use impacts to all adjacent residences will be less than significant, as discussed in Section 4.10.5.~~

THIS PAGE INTENTIONALLY LEFT BLANK

~~4.11 MINERAL RESOURCES: TABLE OF CONTENTS~~

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

NOTE TO READERS. *The cumulative portion of Section 4.11 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.11 of this Revised Sections of the FEIR. All other portions of Section 4.11 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.11 means that the corresponding portion of Section 4.11 in the FEIR remains unchanged or has been deleted.*~~*No major revisions have been made to this section in response to comments.*~~

4.11 MINERAL RESOURCES

This chapter evaluates potential impacts related to known mineral resources that may result from the project.

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

For the reader's reference, this EIR has been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development.

~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

This chapter is based in part on the following document, which is incorporated by reference:

- *City of Moreno Valley General Plan*, City of Moreno Valley, adopted July 2006.

4.11.1 Existing Setting

There are no lands within the City of Moreno Valley designated by the California Department of Conservation as known significant resource areas, defined by the State as Mineral Resources Zone 2 areas. As identified in the City's General Plan, lands within the City of Moreno Valley and its Sphere of Influence are designated MRZ-3 and MRZ-4, which are not defined as significant mineral resource areas.

4.11.1.1 NOP/Scoping Comments

No comments were received from public agencies or the public regarding mineral resources.

4.11.2 Policies and Regulations

4.11.2.1 State Regulations

Surface Mining and Reclamation Act. The Surface Mining and Reclamation Act of 1975 (SMARA) requires classification of land into mineral resource zones (MRZs) according to the known or inferred mineral potential of the area. Construction aggregate resources (sand and gravel) deposits were the first commodity selected for classification by the State Mining and Geology Board. Once mapped, the State Mining and Geology Board is required to designate for future use those areas that contain aggregate deposits that are of prime importance in meeting the region's future need for construction-quality aggregates. There are three key objectives of SMARA regulations:

- Adverse environmental effects are prevented or minimized, and mined lands are reclaimed to a usable condition that is readily adaptable for alternative uses;
- The production and conservation of minerals are encouraged, while consideration is given to values relating to recreation, watershed, wildlife, range and forage, and aesthetic enjoyment; and
- Residual hazards to the public health and safety are eliminated.

The primary objective of the SMARA is for each jurisdiction to develop policies that will conserve important mineral resources, where feasible, that might otherwise be unavailable when needed. The SMARA requires that once policies are adopted, local agency land use decisions must be in accordance with its mineral resource management policies. These decisions must also balance the mineral value of the resource to the market region as a whole, not just their importance to the local jurisdiction. Under SMARA, areas are categorized into four MRZs as follows:

MRZ-1	Areas where adequate information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their production.
MRZ-2	Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.
MRZ-3	Areas containing mineral deposits, the significance of which cannot be evaluated from available data.
MRZ-4	Areas where available information is inadequate for assignment to any other MRZ zone.

4.11.2.2 City of Moreno Valley General Plan Policies

No policies related to mineral resources are identified within the City's General Plan.

4.11.3 Methodology

The California Geological Survey (CGS) provides objective geologic information about California's diverse non-fuel mineral resources. Maps, reports, and other data products developed by CGS were used to locate mineral extraction areas in the project area. In addition, the City of Moreno Valley's General Plan was used to determine the location of possible mineral extraction areas in the project area.

4.11.4 Thresholds of Significance

Appendix G of the *State CEQA Guidelines* recognizes the following thresholds related to mineral resources. Based on these significance thresholds, potential impacts to mineral resources could be considered significant if the proposed project:

- Resulted in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State;
- Resulted in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plans.

4.11.5 Less than Significant Impacts

The following potential impacts were determined to be less than significant. In both of the following issues, either no impact would occur or adherence to established regulations, standards, and policies would reduce potential impacts to a less than significant level. In both instances, no mitigation is required.

4.11.5.1 Loss of Statewide, Regional, or Locally Important Mineral Resources

Thresholds	Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State? Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plans?

Lands within the City of Moreno Valley and its Sphere of Influence are designated MRZ-3 and MRZ-4, which are not defined as significant mineral resource areas. No sites have been designated as locally-important mineral resource recovery sites on any local plan.[1] In addition, Figure OS-5 of the Riverside County General Plan shows that the project area is also located within MRZ-3. The development of the project site would not result in the loss of identified regional or local mineral resources, conversion of an identified mineral resource use, or conflict with existing mineral resource extraction activities. Therefore, the development of the project site would not result in a loss of statewide, regional, or locally important mineral resources. No impacts associated with this issue would occur and no mitigation is required.

---

[1] *Section 6.10 Mineral Resources, Section 6.0 Issues Found Not To Be Significant*, Draft Environmental Impact Report for City of Moreno Valley General Plan 2030, State Clearinghouse #2004031135, City of Moreno Valley, October 2004.

4.11.6 Significant Impacts

Based on the analysis in Section 4.11.5, the project will have no significant impacts related to mineral resources, and no mitigation is required.

~~4.11.7 Cumulative Impacts~~

~~CEQA requires that an EIR discuss the project's incremental effects to determine if they are cumulatively considerable. The discussion of cumulative impacts must reflect the severity of the impacts and the likelihood of their occurrence; however, the discussion need not be as detailed as the discussion of environmental impacts attributable to the project alone. The discussion must demonstrate practicality and reasonableness.~~

~~The cumulative area for mineral resources is the City of Moreno Valley and this part of western Riverside County. As population levels increase in the region, greater demand for aggregate and other mineral materials will be placed on mineral resources, especially sand and gravel. Similarly, development pressures in areas where these materials are known or expected to occur would result in the loss of availability of these mineral resources. However, because the project site is not identified as a significant source of sand/gravel deposits and development subsequent to the adoption of the proposed land use actions on any of the sites would not decrease the local or regional availability of mineral resources, potential future development of any of the sites would have no significant cumulative mineral resources impact.~~

~~4.12 NOISE: TABLE OF CONTENTS~~

~~FIGURES~~

~~TABLES~~

~~***NOTE TO READERS.*** *This section has been revised due to the following changes from the project characteristics analyzed in the original DEIR:*~~

- ~~*Loss of 100 acres from the Specific Plan (in the southwest corner);*~~
- ~~*Changes to the Traffic Impact Assessment (TIA, see Section 4.15); and*~~

~~*Change in project*~~ **NOTE TO READERS:** This portion of the Revised Sections of the FEIR replaces portions of Section 4.12 of the FEIR. Tables and figures included herein are numbered sequentially as they appear for ease of reading and do not account for any tables or figures included in the unchanged portions of Section 4.12 of the FEIR. The cumulative portion of Section 4.12 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.12 of this Revised Sections of the FEIR. The absence of reference to a portion of Section 4.12 means that the corresponding portion of Section 4.12 in the FEIR remains unchanged or has been deleted.

4.12 NOISE

The Superior Court ruling requires the follow actions with regards to Noise:

- “The FEIR must provide an analysis of construction ~~*phasing (from 10 to 15 years).*~~

~~*These changes also resulted in updates to*~~ noise over ambient levels; provide adequate analysis on construction noise impacts on nearby homes; address the ~~*traffic impact assessment and proposed*~~ inadequacy of mitigation measures~~*. In addition, this section has been revised in response*~~, which fail to include performance standards or ways to ~~*public comments received on the Programmatic DEIR.*~~

~~The original DEIR determined that 14 road or freeway segments would result in a significant noise increase attributable to the project, resulting in a significant cumulative impact requiring mitigation. These 14 segments were included in the original noise study, and all other impacts identified in the original~~reduce construction noise~~ study are unchanged except as noted below.~~.”

~~*Revisions have been made to this section to address changes in the Specific Plan, revisions to the project noise study (assessment tables), and in responses to comments mainly regarding mitigation.*~~[1] ~~*Three street names have changed (Street C, D, and E) and may still be referenced in the section. For correct street names see Circulation Master Plan Figure 3.10. Due to a reduction in size of the Specific Plan, some impacts in this section have been reduced to less than significant levels.*~~

~~4.12 NOISE~~

~~*Changes from January 24, 2013, Noise Analysis*~~

~~*The Noise Assessment report included in the Programmatic Draft EIR was issued in January 2013. Comments have been received from various public and private groups and individuals. The Noise Assessment report has been modified in response to these comments and to clarify the description of the analysis. In addition, the Traffic Impact Analysis contained in the Draft EIR has been revised to reflect a downsizing of the project and other factors, resulting in a reduction in associated traffic volumes for the “with project scenarios.” The updated traffic volumes were used in the revised Noise Assessment report. The noise analysis procedures and significance thresholds have not been changed from the January 2013 noise assessment.*~~

---

[1] ~~*Mainly Comments C-4-2 and F-13-9 and F-13-84.*~~

~~*In the Noise Assessment report included in the Draft EIR, 33 roadway segments were identified where a significant noise impact would occur for at least one of the impact scenarios. In the revised Noise Assessment report for the Final EIR, 21 roadway segments have been identified as having a significant noise impact. The reduction in noise impact areas is a direct result of the revised traffic analysis which reflects a downsizing of the project and associated traffic volumes for the "plus project" traffic scenarios.*~~

~~*The roadway links that were previously identified as being impacted in the January 2013 noise analysis contained in the Draft EIR and are not directly affected in the revised noise analysis for the Final EIR are listed below:*~~

- ~~*Day Street between Cottonwood Avenue and Alessandro Boulevard (#109);*~~
- ~~*Fir Avenue between Quincy Drive and Redlands Boulevard (#62);*~~
- ~~*Moreno Beach Drive between Locust Avenue and Ironwood Avenue (#56);*~~
- ~~*Perris Boulevard between John F. Kennedy Drive and Iris Avenue (#303);*~~
- ~~*Placentia Avenue from El Nido Avenue to Evans Road and on to Water Avenue (#431, #432);*~~
- ~~*Quincy Drive from Cactus Avenue to Alessandro Boulevard and to Cottonwood Avenue (#502, #503);*~~
- ~~*Reche Canyon Road from Keissel Road to Reche Vista Drive and on to High Country Drive (#205, #206);*~~
- ~~*Redlands Boulevard from Eucalyptus Avenue to Dracaea Avenue (#12); and*~~
- ~~*State Route 60 from Perris Boulevard to Nason Street (#31).*~~

~~*There are five roadway segments that were previously identified in the January 2013 noise analysis contained in the Draft EIR that had a direct and cumulative impact. In the revised noise analysis for the Final EIR, these five roadway segments do not have a direct impact but have a cumulative impact only. These roadways are as follows:*~~

- ~~*Fir Avenue between Quincy Drive and Redlands Boulevard (#62);*~~
- ~~*Gilman Springs Road between Eucalyptus Avenue and Street C (#31); and between Jack Rabbit Trail and Bridge Street (#191);*~~
- ~~*Moreno Beach Drive between Locust Avenue and Ironwood Avenue (#56); and*~~
- ~~*State Route 60 from Perris Boulevard to Nason Street (#31).*~~

~~*The roadway link that was previously identified in the January 2013 noise analysis contained in the Draft EIR as being impacted and mitigation was considered infeasible is mitigated below a level of significance with feasible mitigation as shown in the revised noise analysis for the Final EIR:*~~

- ~~*Cactus Avenue west of Redlands Boulevard.*~~

The Noise technical report is included in Appendix D.

This section of the ~~EIR~~Revised Sections of the FEIR is intended to satisfy the City's requirements for a project-specific noise impact analysis by examining ~~the short-term and long-term noise~~ construction impacts of the ~~proposed~~ project on sensitive land uses adjacent to the ~~proposed~~World Logistics Center project area, noise generated by project-related traffic, and by evaluating the effectiveness of mitigation measures. This analysis includes the potential for the ~~proposed~~ project to result in impacts associated with a substantial temporary and/or permanent increase in ambient noise levels in the vicinity of the project area; and exposure of people to ~~excessive~~ noise levels~~, groundborne vibration, or groundborne~~ exceeding noise ~~levels~~standards.

~~CEQA requires an analysis of the proposed project's impacts on the existing environment; not an analysis on the existing environment's impacts on the proposed project. The occasional blow downs that occur at the Southern California Gas Company (SCGC) are part of the existing conditions and have been part of the existing conditions for years. Thus, for purposes of clarity, it should be noted that the impact analysis below goes beyond the requirements of CEQA and provided as part of an analysis to ensure worker safety. All mitigation measures imposed in this analysis are the responsibility of future developers and not SCGC.~~

~~*Note: The following changes have been made due to revision to the Specific Plan project size.*~~

~~For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 29 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.~~

The analysis contained in this section is based on the following technical study prepared for the ~~proposed~~ project:

- *Noise Assessment for the World Logistic Center Specific Plan,* ~~Mestre Greve~~ESA Associates, ~~original~~ dated ~~January 24, 2013, revised dated September 2014~~July 2018 (Appendix ~~K~~D of this Revised ~~DEIR~~Sections of the FEIR).

In addition to these project-specific technical studies, the analysis contained in this section is also based on the following reference documents:

- *California Noise Insulation Standards,* California Code of Regulations, Title 24, Part 2, §3501;
- *Highway Traffic Noise Prediction Model (FHWA-RD-77-108)*, Federal Highway Administration (FHWA);
- *City of Moreno Valley General Plan*, City of Moreno Valley, July 2006;

- *Moreno Valley Municipal Code,* City of Moreno Valley, current through Ordinance 836 and the February 2012 code supplement; and
- *State of California General Plan Guidelines*, Governor's Office of Planning and Research, October 2003, pages 249 and 250.
- *Traffic Impact Analysis Report for The World Logistics Center,* WSP USA Inc., dated June 2018 (Appendix F of this Revised FEIR).

4.12.1 Existing Setting

4.12.1.1 Background

Characteristics of Noise. To the human ear, sound is technically described in terms of its loudness (amplitude) and pitch (frequency). Pitch is generally an annoyance, while loudness can affect our ability to hear. Noise is usually defined as unwanted sound; it consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

Measurement of Noise. The standard unit of measurement of the loudness of sound is the decibel (dB). Decibels are based on a logarithmic scale. The logarithmic scale compresses the wide range in sound levels resulting in a more usable range of sound level values, similar to the Richter scale used to measure earthquakes. To humans, a sound 10 dB higher than another is considered to be twice as loud; a sound 20 dB higher than another is considered four times as loud; etc. Typical daily sounds in the environmental range from 30 dB (very quiet) to 100 dB (very loud).

Since the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel (dBA) scale performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear. Community noise levels are measured in terms of the dBA. Figure 4.12~~.~~-1 shows examples of various noises sources and their typical dBA noise level.

There are two categories of noise that are measured to characterize noise conditions: single event noise and community or cumulative noise. Single event measurements describe the noise levels from an individual event such as a passing airplane or a heavy-duty truck. Cumulative measurements average the total noise in a community over a specific time period, which is typically 1 or 24 hours.

The noise impact analysis performed for this Revised Final EIR is based on assessment of both single event noise and community or cumulative noise. Several rating scales have been developed for measurement of community noise. These account for: (1) the parameters of noise that have been shown to contribute to the effects of noise on humans; (2) the variety of noises found in the environment; (3) the variations in noise levels that occur as a person moves through the environment; and (4) the variations associated with the time of day. They are designed to account for the known health effects of noise on people described previously. Based on these effects, the observation has been made that the potential for a noise to affect people is dependent on the total acoustical energy content of the noise. A number of noise scales have been developed to account for this observation. Two of the predominant noise scales are the Equivalent Noise Level (L_{eq}) and the Community Noise Equivalent Level (CNEL). L_{eq} is the sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. L_{eq} is the "energy" average noise level during the time period of the sample. L_{eq} can be measured for any time period, but is typically measured for 1 hour. This 1-hour noise level can also be referred to as the Hourly Noise Level (HNL). It is the energy sum of all the events and background noise levels that occur during that time period.

CNEL is the predominant rating scale now in use in California for land use noise compatibility assessment. The CNEL scale represents a time weighted 24-hour average noise level based on the dBA. Time weighted refers to the inclusion of penalties for noise that occurs during certain noise-sensitive time periods. The evening time period (7 p.m. to 10 p.m.) penalizes noises by 5 dBA, while nighttime (10 p.m. to 7 a.m.) noises are penalized by 10 dBA, reflecting people's increased sensitivity to noise during these time periods. A CNEL noise level may be reported as a CNEL of 60 dBA, 60 dBA CNEL, or simply 60 CNEL.

L(%) is a statistical method of describing noise which accounts for variance in noise levels throughout a given measurement period. L(%) is a way of expressing the noise level exceeded for a percentage of time in a given measurement period. For example, since 5 minutes is 25 percent of 20 minutes, L(25) is the noise level that is equal to or exceeded for five minutes in a twenty-minute measurement period. It is L(%) that is used for most Noise Ordinance standards. For example, most daytime County, State and City noise ordinances use a standard of 55 dBA for 30 minutes per hour, or an L(50) level of 55 dBA. In other words, the noise ordinance may state that no noise level should exceed 55 dBA for more than fifty percent of a given period.

World Logistics Center Project

Figure 4.12-1

Typical A-weighted Noise Levels

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

The maximum noise level (L_{max}) is the highest exponential time averaged sound level that occurs during a stated time period. The noise levels discussed in this analysis for short-term noise impacts are specified in terms of maximum levels denoted by L_{max}, which reflects peak noise conditions and addresses the annoying aspects of intermittent noise. It is often used together with another noise scale, or noise standards in terms of percentile noise levels, in noise ordinances for enforcement purposes. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

~~**Fundamentals of Groundborne Vibration.** Vibration refers to groundborne noise and perceptible motion of the earth. Similar to noise, vibration is transmitted in noise-like waves through the earth and solid objects.~~

~~There are several ways to categorize vibration sources. One way is to divide vibration into natural sources (e.g., earthquakes, volcanic eruptions, sea waves, and landslides) and human sources (e.g., explosions, machinery, traffic, trains, and construction equipment). Similar to noise sources, vibration sources can also be described as continuous (e.g., operating factory machinery) or transient (e.g., explosions).~~
~~As with noise, ground vibrations can be described by amplitude and frequency. Vibration amplitude is characterized by its displacement, velocity, and acceleration. Displacement is the distance that soil particles travel from their original location as a result of vibration, as measured in inches or millimeters. Velocity is the speed of the soil particles measured in inches per second or millimeters per second. Acceleration is the acceleration of the soil particles measured in inches per second per second or millimeters per second per second. Particle velocity is the most commonly used vibration attribute used to describe vibration. Table 4.12.A presents the human reaction to various levels of peak particle velocity. Vibrations also vary in frequency. Traffic vibrations generally range in frequencies from 10 to 30 hertz (Hz), and tend to average around 15 Hz. As a point of reference, city buses often generate frequencies around 3 Hz at high vehicle speeds, due to their suspension systems.~~

~~**Table 4.12.A: Human Reaction to Typical Vibration Levels**~~

~~**Vibration Level Peak Particle Velocity (inches/second)**~~	~~**Human Reaction**~~
~~0.0059–0.0188~~	~~Threshold of perception, possibility of intrusion.~~
~~0.0787~~	~~Vibrations readily perceptible.~~
~~0.0984~~	~~Level at which continuous vibrations begin to annoy people.~~
~~0.1968~~	~~Vibrations annoying to people in buildings.~~
~~0.3937–0.5905~~	~~**Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges.**~~

~~Source: Caltrans 1992.~~

~~Groundborne vibration is almost exclusively a concern inside buildings and is rarely perceived as a problem outdoors, where the motion may be discernable. However, without the effects associated with the shaking of a building, there is less adverse reaction. Building vibration may be perceived by the occupants as motion of building surfaces, rattling of items on shelves or hanging on walls, or as a low-frequency rumbling noise. Building damage is not a factor for normal projects, with the occasional exception of blasting and pile driving during construction or mining. Annoyance from vibration often occurs when the vibration exceeds the threshold of perception by up to 10 decibels. This is an order of magnitude below the damage threshold for normal buildings.~~

~~Typical sources of groundborne vibration are construction activities (e.g., blasting, pile driving, and operating heavy-duty earthmoving equipment), steel-wheeled trains, and occasional traffic on rough roads. Problems with groundborne vibration and noise from these sources are usually localized to within about 100 feet of the vibration source, although there are examples of groundborne vibration causing interference out to distances greater than 200 feet, as described in the FTA Transit Noise and Vibration Impact Assessment (FTA, May 2006). When roadways are smooth, vibration from traffic, even heavy trucks, is rarely perceptible.~~

~~Factors that influence groundborne vibration and noise include the following:~~

- ~~*Vibration Source:* Vehicle suspension, wheel types and condition, track/roadway surface, track support system, speed, transit structure, and depth of vibration source.~~
- ~~*Vibration Path:* Soil type, rock layers, soil layering, depth to water table, and frost depth.~~
- ~~*Vibration Receiver:* Foundation type, building construction, and acoustical absorption.~~

~~Among the factors listed above, there are significant differences in the vibration characteristics when the source is underground versus at ground surface. In addition, soil conditions are known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil and the depth to bedrock. Vibration propagation is more efficient in stiff clay soils than in loose sandy soils, and shallow rock seems to concentrate the vibration energy close to the surface and can result in groundborne vibration problems at a great distance from the track. Factors such as layering of the soil and depth to water table can have significant effects on the propagation of groundborne vibration. Soft, loose, sandy soils tend to attenuate more vibration energy than hard, rocky materials. Vibration propagation through groundwater is more efficient than through sandy soils.~~

4.12.1.2 Sensitive Land Uses in the Project Vicinity

Certain land uses are considered more sensitive to noise than others. Examples include residential areas, educational facilities, hospitals, childcare facilities, and senior housing. The World Logistics Center project vicinity and ~~Specific Plan area~~World Logistics Center site are characterized by a mix of developed and undeveloped properties. Developed properties in the vicinity include an industrial/warehouse building in Moreno Valley to the northwest (Skechers~~) and~~), several residential neighborhoods along Redlands Boulevard along the western boundary of the project site~~.~~, and scattered residential uses along Gilman Springs Road to the east of the project site. An area of the City known as "Old Moreno" is situated near the southwest portion of the project site, around the intersection of Redlands and Alessandro Boulevards. The homes along Merwin Street, east of Redlands Boulevard, constitute the closest sensitive receptors to the project site (i.e., they are adjacent to the property). Additionally, there are currently six occupied residential uses located within the northwestern portion of the World Logistics Center site.

4.12.1.3 Existing Noise Measurements

Existing noise levels in the vicinity of the ~~proposed~~World Logistics Center project are used to establish baseline noise levels in key areas. Noise measurements within the project site and in the surrounding area were ~~taken~~conducted. The noise measurement locations were selected to provide coverage of the project's potential noise impact area. The noise measurement locations are shown Figure 4.12~~.~~-2.

~~Noise measurements were taken at sixteen sites in the project vicinity during the daytime hours (between 7 a.m. and 10 p.m.) and during nighttime hours (between 10 p.m. and 7 a.m.). For each measurement site and time period, noise levels were measured for 15 minutes and calibrated to ensure~~

~~that the measured sound level readings were accurate. The measurements were used to calculate existing L_{eq}, L_{min}, L_{max}, $L_{1.7}$, $L_{8.3}$, L_{25} and L_{50} values for the measurement locations. Table 4.12.B shows the results for the daytime measurements, and Table 4.12.C shows the nighttime measurements.~~

Noise measurements were conducted at 14 sites in the World Logistics Center project vicinity. Long-term (24-hour) measurements were conducted at locations R1 and R3 through R5, a 13-hour measurement was conducted at location R2, and short-term (15-minute) noise measurements were conducted at locations R6 through R14. Short-term ambient noise measurements were conducted between 8:00 A.M. to 12:00 P.M. on Thursday, March 15, 2018, and long-term ambient noise measurements were conducted from Thursday, March 15 through Friday, March 16, 2018 to characterize the existing noise environment in the project vicinity. Long-term measurements (typically 24 hours a day for several days) are used to characterize the diurnal traffic noise pattern at selected locations in the project area. This data can be used to identify the worst noise hour and to develop relationships between non-worst-hour and worst-hour noise levels. Long-term noise measurement locations were selected to represent the existing 24-hour noise environment at residential uses adjacent to the western boundary of the project site and short-term measurement locations were selected to represent each major developed area within the World Logistics Center site and serve as representative modeling locations. This information can be used to estimate worst-hour noise levels from levels measured during non-worst hour times. A summary of the noise measurements collected is provided in Table 4.12-1.

Table 4.12-1: Existing Ambient Noise Measurements (dBA L_{eq})

Site	Date	Start Time/ Measurement Period	Daytime (7 a.m. to 10 p.m.) Hourly L_{eq}	Daytime Average Hourly Leq	Nighttime (10 P.M. to 7 A.M.) Hourly Leq	Nighttime Average Hourly Leq	dBA CNEL

R14	3-15-18	10:54 a.m. / 15 minutes	50.7	N/A	N/A	N/A	N/A

4.12.1.4 Existing Traffic Noise Environment

The primary existing noise sources in the World Logistics Center project area are transportation facilities. Traffic on SR-60, Redlands Boulevard, Theodore Street, World Logistics Center Parkway, Gilman Springs Road, and other local streets is the dominant source contributing to the ambient noise levels in the project vicinity. Noise from motor vehicles is generated by engine vibrations, the interaction between the tires and the road, and the exhaust system. Table 4.12~~.D~~-2 identifies the existing (~~2012~~2018) traffic noise levels adjacent to roadway segments in the project vicinity without consideration of existing noise barriers.

~~4.12.1.5 Existing SDG&E and SCGC Facilities~~

~~The proposed World Logistics Center Specific Plan area is currently occupied by one San Diego Gas and Electric Company (SDG&E) compressor station and two Southern California Gas Company (SCGC) facilities. These facilities are located within the boundaries of the Specific Plan as shown in previously referenced Figure 4.12.2. The SDG&E compressor station recompresses natural gas received from interstate gas pipelines and delivers the gas to Southern California via transmission pipelines. The two SCGC facilities contain flow valve and metering equipment facilities. The southern SCGC facility contains a maintenance functions as well. All of these facilities contain gas pipeline blow-down equipment. This equipment includes exhaust stacks that vent the high pressure gas into the atmosphere occur during emergencies, scheduled maintenance, and annual testing of the blow-down systems.~~

~~The SDG&E and SCGC facilities produce noise from three different sources that could affect future development within the proposed project: 1) the operation of the compressor station; 2) blow-down events at the compressor station; and 3) blow-down events at the SCGC facilities. The blow-down events generate infrequent high noise levels for relatively short periods. The compressor station generates a relatively constant noise level, although noise levels vary slightly when the compressors are turned on and off when the gas is conveyed to the transmission pipelines.~~

~~The SDG&E compressors are the primary source of operational noise generated by the compressor station. The facility contains two sets of three reciprocating natural gas combustion engines and one set of four natural gas-fired turbines, for a total of ten compressors with power ranging from 995 to 3,400 horsepower. The compressors are located within noise attenuation structures and are equipped with intake and exhaust silencers. The facility routinely operates at maximum capacity 24 hours per day. It is anticipated that demand on the compressor station will increase in the future to the point where the facility operates 24 hours a day, year round.~~

~~The CNEL levels for the SDG&E compressor station presented in Figure 4.12.3 are based on a worst-case assumption that the compressor station is in full operation 24 hours a day. Figure 4.12.4 presents the average (L_{eq}) noise levels generated by the compressor station during full operation. Both the CNEL and L_{eq} metrics are used to assess the noise impacts from the facility.~~

~~There are several blow-down points within the SDG&E compressor station. As stated previously, these blow-down points allow for the release of pressurized gas during emergencies, scheduled maintenance, and annual testing. Blow-down events at the compressor station vent gas and last between 30 and 90 seconds. The maximum sound levels (L_{max} dBA) generated by the blow-down events is presented in Figure 4.12.5.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.12.5: Existing L_{max} Noise Levels for the SDG&E Blow-Down Event~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~There are blow-down points in the SCGC facilities. Blow-down events at the SCGC facilities vent gas from miles of pipeline and are much longer than those at the compressor station, and can last up to 90 minutes. Approximately four blow-down events occur annually at the SCGC facilities. L_{max} noise levels (dBA) are shown in in Figure 4.12.6. The noise level will be at or near the L_{max} level during the entire blow-down event. It should also be noted that blow-down events generate ground vibrations and natural gas odors in the vicinity in the surrounding area when events occur. Again, it must be noted that these blow-down events are part of the existing conditions of the project site, and any impacts caused by development of new warehousing near these facilities, and any mitigation necessary, are not the responsibility of SCGC or SDG&E.~~

4.12.2 Existing Policies and Regulations

The applicable noise standards governing the ~~project~~World Logistics Center site are the criteria in the City of Moreno Valley General Plan Safety Element (Environmental Safety, Noise) and Municipal Code (Noise Ordinance). The City's Safety Element of the General Plan does not contain specific noise standards or significance thresholds. However, the General Plan does cite applicable State standards including the California Administrative Code, Section 1092 of Title 25, Chapter 1, Subchapter 1, Article 4 and Section 5014 of Title 21, Subchapter 6, Article 2. In addition, other applicable standards identified in the California Code of Regulations, Title 24, Part 2, Section 3501, the *California Noise Insulation Standards*~~[1]~~ and the *State of California Vehicular Code*~~[2] are included below.~~ (Governor's Office of Planning and Research, 2003). The following sections list the City of Moreno Valley General Plan policies, City of Moreno Valley Municipal Code, and State standards relevant to noise for the ~~proposed~~ project. Construction- and traffic-related noise could potentially impact uses in neighboring jurisdictions. Therefore, General Plan goals and policies and Noise Ordinance standards for the City of Perris, City of Riverside, and County of Riverside have also been included herein.

4.12.2.1 City of Moreno Valley General Plan Policies

Chapter 9 of the *City of Moreno Valley General Plan*~~[3]~~ (COMV, 2006g) defines goals, objectives, policies, and action items related to noise conditions in the City. The specific policies related to noise that are relevant to the ~~proposed~~ project are as follows:

Objective 6.3	Provide noise compatible land use relationships by establishing noise standards utilized for design and siting purposes.
Policy 6.3.5	Enforce the California Administrative Code, Title 24 noise insulation standards for new multi-family housing developments, motels and hotels.
Policy 6.3.6	Building shall be limited in areas of sensitive receptors.
Objective 6.4	Review noise issues during the planning process and require noise attenuation measures to minimize acoustic impacts to existing and future surrounding land uses.
Policy 6.4.1	Site, landscape and architectural design features shall be encouraged to mitigate noise impacts for new developments, with a preference for noise barriers that avoid freeway sound barrier walls.
Objective 6.5	Minimize noise impacts from significant noise generators such as, but not limited to, motor vehicles, trains, aircraft, commercial, industrial, construction, and other activities.
Policy 6.5.1	New commercial and industrial activities (including the placement of mechanical equipment) shall be evaluated and designed to mitigate noise impacts on adjacent uses.
Policy 6.5.2	Construction activities shall be operated in a manner that limits noise impacts on surrounding uses.

~~[1] California Code of Regulations, Title 24, Part 2, §3501, *California Noise Insulation Standards*.~~

4.12.2.2 City of Moreno Valley Municipal Code

The *Moreno Valley Municipal Code*~~[1]~~ (COMV, 2018) establishes a Noise Ordinance that describes the noise standards within the City. Chapter 11.80.030 (Title 11) lists specific prohibited acts.

~~The City's residential site development standards, as identified in Chapter 9.03.040 of the City's Planning and Zoning Code, state that in all residential districts, air conditioners, heating, cooling, and ventilating equipment and all other mechanical lighting or electrical devices shall be operated so that noise levels do not exceed 60 dBA (L_{dn}) at the property line.~~

The City's Municipal Code, Section 6.04.030.J states that "to create, allow or maintain any loud or unusual noise or operate or maintain any device, instrument, vehicle, or machinery in such a manner as to create loud or unusual noise, cause vibrations, or unreasonable light spillage or glare which causes discomfort or annoyance to reasonable persons of normal sensitivity, or which endangers the comfort, repose, health or peace of the public or of any person using or occupying other property in the vicinity" is prohibited.

The City's Municipal Code, Section 9.10.140, specifies that all commercial and industrial uses shall be operated so that noise created by any loudspeaker, bells, gongs, buzzers, or other noise attenuation or attracting devices shall not exceed 55 dBA at any one time beyond the boundaries of the property.

Chapter 11.80.030 of the City's Municipal Code also states:

> *Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 and Table 1-A specify sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the sound levels are being exceeded. No sound shall be permitted within the City which exceeds the parameters set forth in Table 11.80.030-1* [Table 4.12~~.E~~-3] *and 11.80.030-~~1-A~~1A* [Table 4.12~~.F~~-4] *of this chapter.*
>
> *No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimpulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2* [Table 4.12~~.F~~-5] *when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.*
>
> *The following uses and activities shall be exempt from the sound level regulations except the maximum sound levels provided in Tables 11.80.030-1* [Table 4.12~~.E~~-3] *and 11.80.030-1A* [Table 4.12~~.F~~-4]*:*
>
> 1. *Sounds resulting from any authorized emergency vehicle when responding to an emergency call or acting in time of an emergency.*
> 2. *Sounds resulting from emergency work as defined in Section 11.80.020.*
> 3. *Any aircraft operated in conformity with, or pursuant to, federal law, federal air regulations and air traffic control instruction used pursuant to and within the duly adopted federal air regulations; and any aircraft operating under technical difficulties in any kind of distress, under emergency orders or air traffic control, or being operated pursuant to and subsequent to the declaration of an emergency under federal air regulations.*

~~[1] *Moreno Valley Municipal Code*, City of Moreno Valley, current through Ordinance 836 and the November 2012 code supplement.~~

4. *All sounds coming from the normal operations of interstate motor and rail carriers, to the extent that local regulation of sound levels of such vehicles has been preempted by the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.) or other applicable federal laws or regulations.*
5. *Sounds from the operation of motor vehicles, to the extent they are regulated by the California Vehicle Code.*
6. *Any constitutionally protected noncommercial speech or expression conducted within or upon any public right-of-way, public space or other publicly owned property constituting an open or a designated public forum in compliance with any applicable reasonable time, place and manner restriction on such speech or expression or otherwise pursuant to legal authority.*
7. *Sounds produced at otherwise lawful and permitted city-sponsored events, organized sporting events, school assemblies, school playground activities, by permitted fireworks, and by permitted parades on public right-of-way, public space, or other publicly owned property.*
8. *An event for which a temporary use permit or special event permit has been issued under other provisions of this code, where the provision of Section 11.80.010 are met, the permit granted expressly grants an exemption from specific standards contained in this chapter, and the permittee and all persons under the permittee's reasonable control actually comply with all conditions of such permit. Violation of any condition of such permit related to sound or sound equipment shall be in violation of this chapter and punishable as such.*

Table 4.12~~.E~~-3 and Table 4.12~~.F~~-4 show the maximum sound levels that are permitted in the City for continuous and impulsive sounds, respectively.

Table 4.12~~.E:~~-3: Maximum Continuous Sound Levels*

Duration Per Day Continuous Hours	Sound Level (dBA)
8	90
6	92
4	95
3	97
2	100
1.5	102
1	105
0.5	110
0.25	115

* When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percentage of allowed period of sound exposure at each level exceeds 100 percent.

~~Source: Chapter 11.80.030 Table 11.80.030-1, City of Moreno Valley Municipal Code, City of Moreno Valley.~~Source: COMV, 2018.

Table 4.12~~.F:~~-4: Maximum Impulsive Sound Levels

Number of Repetitions Per 24-Hour Period	Sound Level (dBA)
1	145
10	135
100	125

Source: Chapter 11.80.030 Table 11.80.030-1A, City of Moreno Valley Municipal Code, City of Moreno Valley.

The City also restricts the sound levels for non-impulsive sound on lands designated for residential and commercial land uses during the daytime and nighttime time periods. These levels are shown in Table

4.12~~.G~~-5. Section 11.80.050 (3) clearly identifies the measurement as an “average” noise level, and therefore, the noise limits shown in Table 4.12~~.G~~-5 are interpreted as the L_{eq} noise level.

Table 4.12~~.G:~~-5: Maximum Non-Impulsive Sound Levels (in dBA) ~~for Source Land Uses~~

Residential		Commercial	
Daytime (8:00 a.m. – 10:00 p.m.)	**Nighttime (10:01 p.m. – 7:59 a.m.)**	**Daytime (8:00 a.m. – 10:00 p.m.)**	**Nighttime (10:01 p.m. – 7:59 a.m.)**
60	55	65	60

~~Source: Chapter 11.80.030 Table 11.80.030-2, City of Moreno Valley Municipal Code, City of Moreno Valley.~~Source: COMV, 2018.

~~The~~Should a noise disturbance occur during construction, the City prohibits all construction and demolition activities between the hours of 8:00 p.m. and 7:00 a.m. the day following ~~a~~the noise disturbance; with the exception of emergency work by public service utilities or for other work approved by the city manager or designee. A noise disturbance is defined as any sound which that disturbs a reasonable person of normal sensitivities, exceeds the sound level limits set forth in the Noise Ordinance, or is plainly audible. A noise disturbance is defined as plainly audible measured at a distance of 200 feet from the real property line of the source of the sound if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property.

4.12.2.~~3 State~~5 City of ~~California Vehicle Code~~Perris General Plan Policies

~~Recent studies have shown that the most objectionable feature of traffic noise is the sound produced by vehicles equipped with illegal or faulty exhaust systems. In addition, such vehicles are often operated in a manner that causes tire squeal and excessively loud exhaust noise. A number of California State vehicle noise regulations can be enforced by local authorities as well as the California Highway Patrol. These include § 27150 (mufflers) of the California Vehicle Code (CVC), as well as excessive speed laws, which may be applied to curtail traffic noise. The California Highway Patrol and the Department of Health Services (through local health departments) are available to aid local authorities in code enforcement and training pursuant to proper vehicle sound level measurements.~~

~~4.12.2.4 State of California Noise Compatibility Guidelines~~

~~The State of California Noise Compatibility Guidelines, published by the Department of Health, Services provides guidance for use when siting~~The Noise Element of the *City of Perris General Plan* (COP, 2016) defines goals, policies, and implementation measures related to noise conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

Goal II Roadway improvements compatible with existing noise-sensitive land uses. ~~The compatibility guidelines are shown in Figure 4.12.7. The guidelines will be used~~

Policy II.A Appropriate measures shall be taken in the design phase of future roadway widening projects to ~~evaluate the compatibility of the proposed~~ minimize impacts on existing sensitive noise receptors.

Goal V Future non-residential land uses compatible with ~~the~~ noise ~~environment. The guidelines show compatibility of various~~sensitive land uses ~~with different noise environments. The guidelines show that~~ .

Policy V.A New large scale commercial or industrial facilities located within 160 feet of sensitive and uses ~~are normally~~shall mitigate noise impacts to attain an acceptable ~~in~~ level as required by the State of California Noise/Land use Compatibility Criteria.

4.12.2.6 City of Riverside General Plan Policies

The Noise Element of the *City of Riverside General Plan* (COR, 2018) defines objectives and policies related to noise ~~environments up to 75 CNEL.~~conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

Objective N-1 Minimize noise levels from point sources throughout the community and, wherever possible, mitigate the effects of noise to provide a safe and healthful environment.

Policy N-1.5 Avoid locating noise-sensitive land uses in existing and anticipated noise-impacted areas.

Policy N-1.7 Evaluate noise impacts from roadway improvement projects by using the City's Acoustical Assessment Procedure.

Policy N-1.8 Continue to consider noise concerns in evaluating all proposed development decisions and roadway projects.

Objective N-4 Minimize ground transportation-related noise impacts.

Policy N-4.1 Ensure that noise impacts generated by vehicular sources are minimized through the use of noise reduction features (e.g., earthen berms, landscaped walls, lowered streets, improved technology).

Policy N-4.2 Investigate and pursue innovative approaches to reducing noise from railroad sources.

Policy N-4.3 Identify and aggressively pursue funding sources to provide grade separations and sound walls along train routes as noise reduction measures.

Policy N-4.5 Use speed limit controls on local streets as appropriate to minimize vehicle traffic noise.

4.12.2.7 County of Riverside General Plan Policies

The Noise Element of the *County of Riverside General Plan* (COR, 2015) defines policies related to noise conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

N.1.1 Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas. If the noise-producing land use cannot be relocated, then noise buffers such as setbacks, landscaping, or block walls shall be used.

N.1.2 Guide noise-tolerant land uses into areas irrevocably committed to land uses that are noise-producing, such as transportation corridors or within the projected noise contours of any adjacent airports.

N.1.4 Determine if existing land uses will present noise compatibility issues with projects by undertaking site surveys.

N.1.5 Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Riverside County.

N.1.6 Minimize noise spillover or encroachment from commercial and industrial land uses into adjoining residential neighborhoods or noise-sensitive uses.

N.1.8 Limit the maximum permitted noise levels that cross property lines and impact adjacent land uses, except when dealing with noise emissions from wind turbines.

N.2.3 Mitigate exterior and interior noises to the levels listed in Table 4.12-6 below to the extent feasible.

Table 4.12-6: Stationary Source Land Use Standards

Land Use	Interior Standards	Exterior Standards
Residential		
10:00 p.m. to 7:00 a.m.	40 L_{eq} (10 minute)	45 L_{eq} (10 minute)
7:00 a.m. to 10:00 p.m.	55 L_{eq} (10 minute)	65 L_{eq} (10 minute)

Source: COR, 2015.

N.3.3 Ensure compatibility between industrial development and adjacent land uses. To achieve compatibility, industrial development projects may be required to include noise mitigation measures to avoid or minimize project impacts on adjacent uses.

N.3.5 Require that a noise analysis be conducted by an acoustical specialist for all proposed projects that are noise producers. Include recommendations for design mitigation if the project is to be located either within proximity of a noise-sensitive land use, or land designated for noise-sensitive land uses.

N.3.6 Discourage projects that are incapable of successfully mitigating excessive noise.

N.3.7 Encourage noise-tolerant land uses such as commercial or industrial, to locate in areas already committed to land uses that are noise-producing.

N.4.1 Prohibit facility-related noise received by any sensitive use from exceeding the following worst-case noise levels:

a. 45 dBA-10-minute Leq between 10:00 p.m. and 7:00 a.m.

b. 65 dBA-10-minute Leq between 7:00 a.m. and 10:00 p.m.

N.4.3 Ensure any use determined to be a potential generator of significant stationary noise impacts be properly analyzed and ensure that the recommended mitigation measures are implemented.

N.4.4 Require that detailed and independent acoustical studies be conducted for any new or renovated land uses or structures determined to be potential major stationary noise sources.

N.4.5 Encourage major stationary noise-generating sources throughout the County of Riverside to install additional noise buffering or reduction mechanisms within their facilities to reduce noise generation levels to the lowest extent practicable prior to the renewal of conditional use permits or business licenses or prior to the approval and/or issuance of new conditional use permits for said facilities.

N.4.8 Require that the parking structures, terminals, and loading docks of commercial or industrial land uses be designed to minimize the potential noise impacts of vehicles on the site as well as on adjacent land uses.

N.6.3 Require commercial or industrial truck delivery hours be limited when adjacent to noise-sensitive land uses unless there is no feasible alternative or there are overriding transportation benefits.

N.9.2 Ensure the inclusion of noise mitigation measures in the design of new roadway projects in the county.

N.9.3 Require development that generates increased traffic and subsequent increases in the ambient noise level adjacent to noise-sensitive land uses to provide for appropriate mitigation measures.

N.9.4 Require that the loading and shipping facilities of commercial and industrial land uses, which abut residential parcels be located and designed to minimize the potential noise impacts upon residential parcels.

N.9.5 Employ noise mitigation practices when designing all future streets and highways, and when improvements occur along existing highway segments. These mitigation measures will emphasize the establishment of natural buffers or setbacks between the arterial roadways and adjoining noise-sensitive areas.

N.12.1 Utilize natural barriers such as hills, berms, boulders, and dense vegetation to assist in noise reduction.

N.12.2 Utilize dense landscaping to effectively reduce noise. However, when there is a long initial period where the immaturity of new landscaping makes this approach only marginally effective, utilize a large number of highly dense species planted in a fairly mature state, at close intervals, in conjunction with earthen berms, setbacks, or block walls.

N.13.1 Minimize the impacts of construction noise on adjacent uses within acceptable practices.

N.13.2 Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

N.13.4 Require that all construction equipment utilizes noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

4.12.3 Methodology

Evaluation of noise impacts associated with the ~~proposed~~ project includes the following:

- Determination of the short-term construction noise impacts on on-site and off-site noise-sensitive uses;
- Determination of the long-term noise impacts, ~~including~~of vehicular traffic~~ and stationary noise sources~~, on on-site and off-site noise-sensitive uses; and
- Determination of the required mitigation measures to reduce ~~long-term~~construction and traffic noise ~~impacts from all sources~~.

Because of the location of noise-sensitive receptors, the noise analysis evaluates the noise effects of the industrial development on the existing residential development (sensitive receptors) near the ~~southwest portion of the proposed~~ project area.

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.12.7: California Noise Compatibility Guidelines~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~There are no Federal Highway Administration (FHWA), State, or local standards for vibration. According to the FHWA, highway traffic and construction vibrations pose no threat to buildings and structures; and annoyance to people is not considered any worse than other discomforts experienced from living near highways. However, a substantial amount of research has been completed to compare vibrations from single events such as dynamite blasts with architectural and structural damage. The U.S. Bureau of Mines has set a safe limit of 0.5 inch per second peak particle velocity to avoid structure damage in residential structures (U.S. Bureau of Mines 1980). Below this level, there is virtually no risk of building damage.~~

Analysis of the project's temporary construction noise effects is based on estimates of construction equipment units and duration of use consistent with the air quality analysis. The analyses accounted for attenuation of noise levels due to distances that would be between the construction activity and the nearest sensitive land uses. Construction noise levels at nearby sensitive land uses were estimated using the FHWA's Roadway Construction Noise Model (FHWA, 2006a) assuming two of the loudest pieces of construction equipment would operate at the closest location point to the nearest sensitive receptor. Modeled construction noise levels at nearby sensitive receptors were compared to the City of Moreno Valley noise ordinance and to ambient noise levels.

The City of Moreno Valley prohibits construction from occurring outside of the hours of 8:00 p.m. to 7:00 a.m. that creates a noise disturbance. The project is anticipated to require limited nighttime construction activity, subject to the City's approval. Therefore, for this analysis, residences that are exposed to noise levels exceeding those identified in Chapter 11.80.030, Table 11.80.030-2 of the City of Moreno Valley Municipal Code (see Table 4.12-5) during project construction (60 dBA L_{eq} between 8:00 a.m. and 10:00 p.m. and 55 dBA L_{eq} between 10:01 p.m. and 7:59 a.m.) would result in violation of the City's noise ordinance.

Construction noise impacts are also assessed relative to the increase in noise levels that could result from the operation of specified construction equipment compared to existing noise level conditions. The City of Moreno Valley General Plan and noise ordinance does not specify an incremental increase threshold for construction. For this analysis, substantial temporary or periodic increases in ambient noise would occur and it would be considered a significant impact in cases where sensitive land uses are exposed to construction noise levels that increase ambient noise levels by 10 dB. A 10 dB increase in noise is considered a doubling of loudness to the average person (Caltrans, 2013).

Roadway noise impacts were evaluated using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM) method (FHWA 2006b) based on the roadway traffic volume data provided in the Traffic Study prepared for the project and included in Appendix D of this Revised Final EIR. This method allows for the definition of roadway configurations, barrier information (if any), and receiver locations. Roadway noise attributable to Project development was calculated and compared to baseline noise levels that would occur under the "Without Project" condition.

4.12.4 Thresholds of Significance

A project would have a significant effect on the environment related to noise if it would substantially increase the ambient noise levels for adjoining areas or if it would conflict with adopted environmental plans and goals of the community in which it is located.

The applicable noise standards and guidelines governing the project are those specified previously in ~~Sections~~Section 4.12.2.~~1 through 4.12.2.4.~~ In summary, these criteria are contained within the Safety Element of the General Plan, the Municipal Code, the California Vehicle Code, and the State Noise Compatibility Guidelines.

For the purpose of this ~~project~~Revised Sections of the FEIR, a noise impact is considered significant if the project would result in:

- ~~Exposure of~~ Construction noise would expose persons to ~~or generation of~~ noise levels in excess of standards established in the *City of Moreno Valley General Plan*, City of *Moreno Valley Municipal Code*, or applicable standards of other agencies; and/or
- ~~Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;~~
- A substantial temporary, periodic, and/or permanent increase in ambient noise levels in the project vicinity above levels existing without the project~~;~~.
- ~~For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels; and/or~~
- ~~For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.~~

The standards within the *City of Moreno Valley General Plan* and City of *Moreno Valley Municipal Code* determine the acceptable noise environment for ~~proposed~~ project and its vicinity. The standards are as follows:

- ~~To the extent feasible, ensure through the design review process that exterior noise levels at commercial and industrial areas do not exceed 75 dBA CNEL.~~
- Consider the following uses noise-sensitive and discourage them in areas where exterior noise levels exceed 65 dBA CNEL unless measures are implemented that reduce the noise exposure below this level: single-family and multiple-family residential uses, group homes, hospitals, schools and other learning institutions, and parks and open space areas where quiet is a basis for use.
- Noise from construction and demolition activities exceeding those identified in Chapter 11.80.030, Table 11.80.030-2 of the City of Moreno Valley Municipal Code (60 dBA L_{eq} between 8:00 a.m. and 10:00 p.m. and 55 dBA L_{eq} between 10:01 p.m. and 7:59 a.m.) at sensitive uses during project construction would result in violation of the City's noise ordinance (see Table 4.12-5).
- Construction activity that would increase ambient noise levels at sensitive land uses by 10 dB or more would result in substantial temporary or periodic increases in ambient noise and be considered significant.

Long-term impacts from the project's traffic noise that affect existing sensitive land uses are considered to be substantial and, therefore, constitute a significant noise impact if the project would:

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

~~The project's incremental contribution to a cumulative noise increase would be considered cumulatively considerable and significant when ambient noise levels affect noise-sensitive land uses and when the project increases noise levels by 1 dB or more over pre-project conditions and the predicted future cumulative with project noise levels cause the following cumulative increases:~~

- ~~Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;~~
- ~~Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or~~

- ~~Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.~~

4.12.5 No Impact/Less than Significant Impacts

~~The following impacts were identified as having a less than significant impact or no impact on the environment with implementation of the proposed project.~~

~~4.12.5.1 Groundborne Vibration Impacts~~

~~Threshold~~	~~Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?~~

~~Roadways in the vicinity of the project area are either paved or would be paved as the area develops, and would not result in project traffic driving over rough or dirt roads. Well maintained roads typically do not result in substantial vibration levels. Even roads with irregularities typically only generate substantial levels of vibration very near, less than 50 feet from the irregularity. Construction activities that would occur within the WLCSP area are not anticipated to require blasting or pile driving. Roadway vibrations are typically not perceptible more than 50 feet from the roadway except in very unusual circumstances. Generally, the interface between the soft tire of a truck or automobile will not generate significant vibration unless the road is in poor shape (e.g., potholes or pavement joints) Therefore, impacts associated with this issue are anticipated to be less than significant, and no mitigation is required.~~

~~4.12.5.2 Airport Noise Impacts~~

~~Threshold~~	~~For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, results in exposure of people residing or working in the project area to excessive noise levels.~~
	~~For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.~~

~~The project area is located approximately 5.5 miles northeast of the March Airfield (MAF) and is not located within two miles of a private airstrip. The MAF is a joint-use airport, used for both military and civilian purposes. The March Air Reserve Base (MARB) is the military operator of the MAF and March Inland Port (MIP) is the civilian operator of the airport. This facility is anticipated to play an increasingly important role in the transportation of goods and cargo for the Southern California region. Existing flight patterns affect a large portion of the City of Moreno Valley, along a path that affects the western portion of the City in a northwest/southeast alignment. Aircraft operations from the airport currently contribute intermittent single-event noise.~~

~~There is potential for single-event noise exposure levels from MAF activity to affect the proposed project. The exposure levels will vary dependent upon the type of aircraft and flight track flown for each operation at MAF. However, the proposed project is not identified as being within the noise or safety contours delineated for the MARB Airport.[1] In addition, the proposed project is not considered to contain sensitive receivers and, therefore, the impacts from these single-event noise levels are considered to be below the level of significance. The City's exterior noise standard for industrial uses is 70 dBA CNEL. MAF noise levels are less than 60 dB CNEL within the project area. Therefore, the proposed project would not have the potential to expose people to excessive noise levels from airport operations.~~

~~[1] *Figure 5.4-1 March Reserve Air Base Noise Impact Area*, City of Moreno Valley General Plan EIR, July 2006.~~

~~Therefore, no significant noise impacts would occur regarding these issues from implementation of the proposed project, and no mitigation is required.~~

Section 4.12.5 of the 2015 FEIR remains unchanged.

4.12.6 Significant Impacts

4.12.6.1 Short-Term Construction Noise Impacts

Impact 4.12.6.1A: *The project could expose persons to noise levels in excess of standards established in the City of Moreno Valley General Plan, City of Moreno Valley Municipal Code, or applicable standards of other agencies.*

Threshold	Would the project result in ~~a substantial temporary, periodic, ~~the exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley General Plan, City of Moreno Valley Municipal Code, or applicable standards of other agencies?

Construction noise levels in and~~/or permanent increase in ~~ around the project area would fluctuate depending on the type, number, and duration of use of various pieces of construction equipment. Construction-related material haul trips would raise ambient noise levels ~~in the project vicinity above levels existing without the project?~~along haul routes, depending on the number of haul trips made and types of vehicles used. In addition, certain types of construction equipment generate impulsive noises (such as pile driving or blasting), which can be particularly disruptive. Pile driving and blasting, however, is not proposed during project construction. Table 4.12-7 shows typical noise levels produced by the types of construction equipment that would likely be used during project construction.

Table 4.12-7: Reference Construction Equipment Noise Levels

Type of Equipment	L_{max}, dBA (50 Feet from Source)	Hourly L_{eq}, dBA/percent Use[1] (50 Feet from Source)
Bore/Drill Rigs	85	78/20
Cement and Mortar Mixers	85	81/40
Cranes	85	77/16
Excavators	85	81/40
Forklifts	85	78/20
Graders	85	81/40
Pavers	85	82/50
Pumps	77	74/50
Rollers	85	78/20
Dozers	85	81/40
Scrapers	85	81/40
Skid Steer Loaders	85	81/40
Tractors	84	80/40
Loaders	80	76/40
Backhoes	80	76/40
Trenchers	85	78/20

NOTES:

1. Percent used during the given time period (usually an hour – hourly L_{eq}) were obtained from the FHWA Roadway Construction Noise Model User's Guide.

SOURCE: FHWA, 2006a.

As ~~Short-term noise would occur during the construction of the WLCSP. First, construction crew commutes and the transport of construction equipment and materials to the site for the proposed WLC project would incrementally increase noise levels on access roads in the WLC planning area. In addition, noise would be generated during excavation, grading, and building construction on various portions of the Specific Plan site. Construction is completed in discrete steps, each of which has its own mix of equipment, and consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. The site preparation phase, which includes excavation and grading of the site, tends to generate the highest noise levels, because the noisiest construction equipment is earthmoving equipment, which includes excavating machinery such as backfillers, bulldozers, draglines, and front loaders. Earthmoving and compacting equipment includes compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Implementation of the Specific Plan would result in construction activities that would require the use of scrapers, bulldozers, and water and pickup trucks within the WLCSP area.~~

~~Figure 4.12.8 presents construction noise levels measured at 50 feet. The peak noise level for the majority of the equipment that~~ previously discussed in the *Methodology* discussion in Section 4.12.3, the City of Moreno Valley Noise Ordinance prohibits construction from occurring outside of the hours of 8:00 p.m. to 7:00 a.m. that creates a noise disturbance. Construction occurring within the allowable hours of 7:00 a.m. and 8:00 p.m. would not result in the violation of the City's Noise Ordinance. For this analysis, residences that are exposed to noise levels exceeding those identified in Table 4.12-5 during daytime or nighttime project construction would result in violation of the City's Noise Ordinance.

Construction operations would occur in two general areas; on-site and off-site. The on-site construction activities will be ~~used during construction of the proposed project will range from 70 to 95 dBA. Based on the fact that noise levels dissipate with increases in distance from the noise source due to noise divergence, noise levels at greater distances are less than those presented in Figure 4.12.8. Noise measurements made by Mestre Greve Associates demonstrate that the noise levels generated by commonly used grading equipment (e.g., loaders, graders, and trucks) generate noise levels that typically do not exceed the middle of the range shown in Figure 4.12.8.[1] However, the noise levels shown in Figure 4.12.8 have been used as the basis for the noise analysis estimates presented in this EIR.~~

~~[1] *Noise Assessment for the World Logistic Center Specific Plan*, page 27, Mestre Greve Associates, Division of Landrum & Brown, September 2014.~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Figure 4.12.8: Typical Construction Equipment Noise Levels~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

~~Construction activities that are associated with the proposed WLCSP project would occur in two general areas: on-site and off-site.~~ more intense. Some phases of the on-site construction ~~would~~ are expected to occur for 24~~-~~-hours a day~~ for~~, 7~~-~~-days ~~a~~per week. ~~It is~~ For the purpose of this analysis, construction is anticipated ~~that on-site construction would occur~~ to begin in 2020, periodically~~ over a nine-year period with~~ , for a ~~potential start year of 2015 and ending in 2030.~~total of 16-years. Off-site construction ~~(which~~ would ~~involve~~be much less intense and consist of minor grading, drainage, interchange, utility~~,~~ and roadway improvements~~) is anticipated to~~ . Off-site construction activities would be of shorter duration and would only occur on weekdays during ~~the~~ daytime ~~weekday~~ hours. Both on-site and ~~would have a shorter~~off-site construction ~~duration~~are discussed in more detail below.

~~**On-site Construction.** Sensitive receptors that would be potentially affected by on-site construction activities would include residences located within and adjacent to the WLCSP area as well as residences located on the north side of SR-60. For residences on the opposite side of SR-60, existing daytime and nighttime freeway noise is anticipated to be greater than the noise generated by the construction activities that would occur within the WLCSP area. Although certain conditions at night, such as low inversions and very calm conditions, can increase the ability of construction noise to travel to the residences north of the freeway, these same conditions would also amplify the noise generated on the freeway. Since freeway noise would continue to be the dominant noise source in the area for these residences along SR-60, construction noise impacts on the residents north of the freeway will be less than significant and no mitigation is required.~~

~~Existing residences within the WLCSP area or adjacent to the Specific Plan area may be located within 50 feet or less from areas where intense construction (24 hours a day, 7 days a week) would occur. Although residential properties located within the WLCSP would be rezoned as Light Logistics, the existing residences are considered to be noise-sensitive uses that would be affected by intense construction activities. Similarly, residences located adjacent to the project site (i.e., along Redlands Boulevard, Merwin Street, Bay Avenue, Cactus Avenue, and Gilman Springs Road) would also be affected by intense construction activities. Based on a 50-foot noise attenuation distance, these residences may experience worst-case unmitigated peak construction noise levels (L_{max}) up to 97 dBA. The average noise levels are typically 5 to 15 dB lower than the peak noise levels. Average noise levels (L_{eq}) at 50 feet could easily be in the range of 82 to 92 dBA during most phases of construction.~~

~~The City of Moreno Valley Municipal Code does not include any exemptions for construction noise. Therefore, construction would be subject the limitations of 60 dBA during daytime and 55 dBA at nighttime measured at residential areas. According to Section 3.4.14, *Project Description*, WLC project construction may occur 24 hours a day, 7 days a week for certain activities. Significant noise impacts would be expected, especially if work with high noise levels occurs between 8:00 p.m. and 6:00 a.m.~~

On-site construction activities are expected to occur outside of the allowed construction hours specified in the City of Moreno Valley Noise Ordinance. The operation of each piece of off-road equipment within the on-site construction areas (i.e., Plots 1 through 22) would not be constant throughout the day, as equipment would be turned off when not in use. Most of the time over a typical work day, the equipment would be operating at different locations within the various plots of the project site and would not likely be operating concurrently. However, for a more conservative approximation of construction noise levels to which the nearest sensitive receptor would be exposed, it is assumed that two of the loudest pieces of construction equipment would be operating at the same time and located within the project plots nearest to a sensitive receptor. The nearest sensitive receptors are the existing on-site residences, which would be located approximately 25 feet from construction activity of various Plots. As a worst case scenario, it has been assumed that all existing on-site residences will remain onsite throughout construction.

Based on the list of the construction equipment that would be used at each of the plots, it was assumed that the two loudest pieces of off-road equipment (a paver and scraper) would have a combined noise level of 85 dBA L_{eq} from a distance of 50 feet (FHWA, 2006a). Using this reference noise level and a

7.5 dB per doubling of distance attenuation rate, the noise exposure level at representative locations around the project site were calculated and presented in Table 4.12-8. The location of the modeled receptor locations is presented in Figure 4.12-3. As shown in Figure 4.12-3 and Table 4.12-8, noise generated during construction of the plots, in some cases construction of various plots occurring concurrently, would expose sensitive receptors to noise levels that would exceed the City's 60 dBA L_{eq} daytime and 55 dBA L_{eq} nighttime exterior noise standard. Specifically, impacts would occur at existing residences located within and to the west of the project area. Affected receptors are all located within City of Moreno Valley boundaries.

Based on these projections, anticipated worst-case construction noise levels would regularly be exceeded ~~during daytime and nighttime hours~~ at residences within and near the ~~Specific Plan~~project area. Based on an L_{eq} noise level of ~~90~~85 dBA L_{eq} at 50 feet and an attenuation rate of 7.5 dB per doubling of distance, an observer would need to be ~~1,580~~at a distance of 500 feet from ~~the~~ an active project construction area to experience a noise level of 60 dBA ~~(~~L_{eq}~~),~~, or ~~2,~~800 feet for a noise level of 55 dBA ~~(~~L_{eq}~~).~~. Therefore, ~~a residence within 1,580 feet during active~~ the on-site construction ~~during~~of the ~~daytime~~project would ~~be affected. Similarly, a residence within 2,800 feet during~~result in the ~~nighttime~~exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley Noise Ordinance would ~~be affected by construction noise~~result in a significant impact.

~~As set forth in Section 3.4.14 and as stated by the project applicant, construction could occur 24 hours per day, 7 days per week for these construction activities. Therefore, noise levels at the nearest residences would exceed the City's exterior noise standard of the 60 dBA[1] CNEL daytime standard and 55 dBA CNEL nighttime standard for residential uses. This is a significant impact requiring mitigation.~~

~~**Off-site Construction.** Construction activities associated with off-site construction include road improvements along Cactus Avenue and Redlands Boulevard, water and utility improvements, construction of a detention basin, debris basins, and interchange improvements. Roadway and interchange improvements are planned along Cactus Avenue, Redlands Boulevard, State Route 60, and Gilman Springs Road. Often the loudest pieces of equipment associated with this type of construction are the graders/scraper equipment. Peak noise levels at 50 feet can reach 96 dBA, with average noise levels (~~L_{eq}~~) in the 85 dBA range. Noise levels of 60 dBA (~~L_{eq}~~) could be exceeded for up to 900 feet from the construction area. Existing residences are located within 900 feet of the off-site construction areas and would be exposed to noise levels that would exceed of the Moreno Valley noise criteria for residential uses.~~

~~Other off-site construction improvements such as drainage, sewer, water, and utility features would also generate noise in close proximity to existing sensitive uses. However, these activities typically utilize less construction equipment, which results in lower noise levels. These construction activities may commonly employ a backhoe as the loudest piece of equipment. A backhoe may have a peak noise level that exceeds 90 dBA at 50 feet, but has an average noise level around 80 dBA (~~L_{eq}~~) at 50 feet. However, at this noise level one would need to be more than 500 feet away to experience a noise level (~~L_{eq}~~) of less than 60 dBA. This noise level would exceed the City's daytime criteria at the nearest existing residences and mitigation measures would be required.~~

~~**Specific Plan Design Features.** The WLCSP does not contain any design features that specifically address noise. Other features, such as perimeter setback requirements, will have the effect of reducing noise to certain residential areas.~~

~~[1] *Chapter 11.80.030 Table 11.80.030-2, City of Moreno Valley Municipal Code,* City of Moreno Valley.~~

Off-site construction activities would occur within the allowed construction hours identified in the City's Noise Ordinance and would be consistent with the City's code. The nearest sensitive receptors are located at approximately 25 feet from off-site construction areas. Based on the operation of the two loudest pieces of equipment simultaneously at 25 feet, off-site construction could expose sensitive receptors to a noise level of 93 dBA L_{eq}, which would exceed the City's allowable daytime exterior noise level of 60 dBA L_{eq}. Therefore, the off-site construction activities would result in the exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley Noise Ordinance would result in a significant impact.

Notes:
Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.
1. Construction noise levels were modeled assuming two of the loudest construction equipment running at the same time and place nearest to a sensitive receptor. A distance of 25 feet was assumed between construction equipment and nearby receptors where plot boundaries abutted residential property boundaries. Construction noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.

2. Mitigation assumed a 10 dB reduction from a temporary noise barrier and equipment exhaust mufflers.

Source: ESA, 2018; FHWA, 2006a

Specific Plan Design Features. ~~*Note: The following changes to the mitigation measures were made as a result of the revised project noise assessment (Appendix K in FEIR Volume 2) and in responses to Comments C-4-2 in Letter C-4 from Sempra Energy and Comments F-13-9 and F-13-84 in Letter F-13 from Johnson & Sedlack on behalf of the Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.*~~

The WLCSP does not contain any design features that specifically address noise. Other features, such as perimeter setback requirements, will have the effect of reducing noise to certain residential areas.

Mitigation Measures. Construction of the ~~proposed~~World Logistics Center project would result in noise levels at the closest residences exceeding the maximum noise level allowed under the City's Municipal Code. The following measures~~[1]~~ would reduce short-term construction-related noise impacts associated with the proposed WLC project:

4.12.6.1A Prior to issuance of any discretionary project approvals, a Noise Reduction Compliance Plan (NRCP) shall be submitted to and approved by the City. ~~The Noise Reduction Compliance Plan shall show the limits of nighttime construction in relation to any then-occupied residential dwellings and shall be in conformance with City standards. Conditions shall be added to any discretionary projects requiring that the limits of nighttime grading be shown on the Noise Reduction Compliance Plan and all grading plans submitted to the City (per Noise Study MM N-2, pg. 51).~~The NRCP shall be prepared by a qualified acoustical consultant describing how noise reduction measures shall be implemented to reduce the noise exposure on sensitive receptors adjacent to onsite and offsite construction areas. The noise reduction measures shall be implemented so that construction activities do not exceed the City's daytime and nighttime average hourly noise standard of 60 dBA L_{eq} and 55 dBA L_{eq}, respectively. The construction noise reduction measures shall include, but not be limited to, the following measures:

- ~~**4.12.6.1B**~~ All construction equipment, fixed or mobile, shall be equipped with operating and maintained mufflers consistent with manufacturers' standards.
- ~~**4.12.6.1C**~~ Construction vehicles shall be prohibited from using Redlands Boulevard south of Eucalyptus Avenue to access on-site construction for all phases of development of the ~~Specific Plan (per Noise Study MM N-1, pg. 51).~~project.
- ~~**4.12.6.1D**~~ No ~~grading~~construction activity shall occur within ~~2,~~800 feet of residences ~~south of State Route 60~~ between 8 p.m. and ~~6~~7 a.m. on weekdays and ~~between 8 p.m. and 7 a.m. on~~ weekends. ~~These restrictions shall be included as part of the Noise Reduction Compliance Plan per Mitigation Measure 4.12.6.1A (per Noise Study MM N-2, pg. 51)~~
- ~~**4.12.6.1E**~~ ~~As an alternative to Mitigation Measure 4.12.6.1D, a~~A 12-foot tall temporary construction sound barrier ~~may be installed for residences~~blocking the line-of-sight of construction activity to any residential receptor located within ~~1,580~~800 feet of active ~~nighttime~~ construction areas~~.~~ shall be installed prior to commencement of any construction activity. The temporary sound barrier shall be constructed of plywood with a total thickness of ~~15~~1.5 inches, or a sound blanket wall may be used. If sound blankets are used, they must have a Sound Transmission Class (STC) rating of 27 or greater. ~~This shall be included as part of the Noise Reduction Compliance Plan required in Mitigation Measure 4.12.6.1A, which shall be reviewed and approved by the City prior to implementation (per Noise Study MM N-2 and N-3, pg. 51 and pg. 52).~~

~~**4.12.6.1F** As an alternative to Mitigation Measure 4.12.6.1D and 4.12.6.1E, on-site noise measurements of construction areas may be taken by qualified personnel and specific~~

~~[1] Measures 4.12.6.1B-F corresponds to the noise study measures N-1 through N-5.~~

~~buffer distances between construction activities and existing residences may be proposed based on actual noise levels. These measurements will be incorporated into the Noise Reduction Compliance Plan required in Mitigation Measure 4.12.6.1A, which shall be reviewed and approved by the City prior to implementation (per Noise Study MM N-2, pg. 51).~~

~~**4.12.6.1G** Any discretionary approvals for development that proposes grading within 1,580 feet of occupied residential units shall require that all grading equipment be equipped with residential grade mufflers (or better). All stationary construction equipment shall be placed so that emitted noise is directed away from noise-sensitive receptors nearest the site. Additionally, stationary construction equipment shall have all standard acoustic covers in place during operation (per Noise Study MM N-4, pg. 52).~~

~~**4.12.6.1H** All material stockpiles in connection with any grading operations shall be located at least 1,200 feet from existing residences (per Noise Study MM N-5, pg. 52).~~

~~**4.12.6.1I** All project-related off-site construction shall be limited to 6 a.m. and 8 p.m. on weekdays only. Construction during weekends and City holidays shall not be permitted (per Noise Study MM N-6, pg. 53) to the satisfaction of the Land Development Division/Public Works.~~

~~**4.12.6.1J** Prior to issuance/approval of any grading permits, off-site construction activities adjacent to residential uses shall provide for installation of 12-foot temporary sound barriers for construction activities lasting more than one month. The sound barrier will reduce noise levels by approximately 10 dB. The temporary sound barrier may be constructed of plywood with a total thickness of 1.5 inches, or a sound blanket wall may be used. If sound blankets are used, the curtains must have a Sound Transmission Class (STC) rating of 27 or greater. No off-site construction is permitted during weekday nighttime hours (8 p.m. to 6 a.m.) or during weekends and City holidays except for emergencies (per Noise Study MM N-7, pg. 53).~~

~~**Level of Significance after Mitigation.** *On-site Construction*. Elimination of nighttime construction within 2,800 feet of residences would lower the noise levels to 55 dBA (L_{eq}) at the closest residences. The noise levels would just meet the 55 dBA (L_{eq}) nighttime criteria contained in the Moreno Valley Noise Ordinance resulting in a less than significant impact. With the implementation of **Mitigation Measures 4.12.6.1A** through **4.12.6.1J**, the loudest noise level that would be experienced at any developed residential parcel would be less than the 55 dBA (L_{eq}) nighttime threshold and would be consistent with the limits established in the City's Noise Ordinance resulting in a less than significant impact. In addition, implementation of **Mitigation Measure 4.12.6.1H**, would reduce the noise experienced at existing residences, resulting in a less than significant impact.~~

~~As previously stated, construction within 1,580 feet of residential areas south of the freeway has the potential to exceed the daytime Moreno Valley Noise Ordinance criteria of 60 dBA (L_{eq}). With implementation of **Mitigation Measure 4.12.6.1E**, any existing residences within 1,580 feet of a construction area would be shielded from construction noise with a 12-foot temporary sound barrier. A sound barrier will reduce the noise levels by about 10 dB resulting in a reduction of noise below City thresholds at residences 500 feet or further from the construction area. Although the installation of the temporary sound barrier would reduce noise levels experienced at the closest residences, those residences that are located within 500 feet of a construction area would still be exposed to noise levels greater than 60 dBA (L_{eq}). Therefore, impacts associated with this issue would remain significant and unavoidable.~~

~~*Off-site Construction*. With the implementation of **Mitigation Measure 4.12.6.1I**, off-site construction activities would be limited to daytime hours while **Mitigation Measure 4.12.6.1J** would require the installation of a temporary sound barrier. With these mitigation measures in place, residences adjacent to construction activities (depending on the loudness of the construction equipment) could experience~~

~~noise levels greater than 60 dBA (L_{eq}) for off-site construction projects lasting less than one month. These impacts would only occur during weekday daytime hours. However, even with implementation of these mitigation measures, noise levels experienced at these residences would be above the City's threshold. Therefore, impacts would remain significant and unavoidable.~~

- Distribute to the potentially affected residences and other sensitive receptors within 500 feet of project construction boundary a "hotline" telephone number, which shall be attended during active construction working hours, for use by the public to register complaints. The distribution shall identify a noise disturbance coordinator who would be responsible for responding to any local complaints about construction noise. The disturbance coordinator would determine the cause of the noise complaints and institute feasible actions warranted to correct the problem. All complaints shall be logged noting date, time, complainant's name, nature of complaint, and any corrective action taken. The distribution shall also notify residents adjacent to the project site of the construction schedule. Records of any complaints and corrective action shall be stored at the site and available to the City upon request.

Level of Significance after Mitigation. Implementation of Mitigation Measure 4.12.6.1A would reduce construction noise levels at nearby sensitive receptors through implementation of a NRCP, which is expected to attenuate construction noise levels by a minimum of 10 dB. Table 4.12-8 shows mitigated construction noise levels at sensitive receptors in the vicinity of on-site construction areas. In addition, Mitigation Measure 4.12.6.1A prohibits construction activity within 800 feet of any sensitive receptor outside of the allowable hours of 7:00 a.m. to 8:00 p.m. As shown in Table 4.12-8, at distances greater than 800 feet, construction noise would not exceed the City's nighttime exterior noise standard of 55 dBA L_{eq}. Therefore, impacts would be less than significant with mitigation incorporated for nighttime construction. With regard to daytime construction, sensitive receptors located within and to the west of the project would continue to be exposed to construction noise levels that would exceed the City's daytime exterior noise standard of 60 dBA L_{eq} even with implementation of mitigation. Additionally, with a 10 dB reduction, off-site construction activity would continue to expose the sensitive receptors at 25 feet to noise levels up to 83 dBA L_{eq}. Therefore, this would result in a significant and unavoidable impact with mitigation.

Impact 4.12.6.1B: The project could result in a substantial temporary and/or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

Threshold	Would the project result in a substantial temporary and/or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

The project has the potential of exposing sensitive receptors within the vicinity of on- and off-site construction areas to noise levels that could temporarily elevate the existing ambient noise level above the applied 10 dB substantial temporary increase threshold. As previously discussed in the *Methodology* discussion in Section 4.12.3, the City of Moreno Valley noise ordinance and general plan does not contain an incremental increase threshold for construction. Therefore, for purposes of this analysis, it would be considered a significant impact in cases where sensitive receptors are exposed to construction noise levels that increase ambient noise levels by 10 dB.

Construction crew commutes and the transport of construction equipment and materials to the site for the project would incrementally increase noise levels on access roads in the planning area. Using algorithms from the FHWA's TNM Technical Manual and the estimated work, vendor and haul truck volumes, project peak hour construction traffic noise levels were estimated for anticipated construction years and compared to measured daytime ambient noise levels along Redlands Boulevard and World Logistics Center Parkway, South of SR 60. The results of the modeling are shown in Table 4.12-9. As shown in Table 4.12-9, project construction traffic would not elevate existing ambient noise levels above the applied substantial temporary increase threshold of 10 dB.

As previously discussed, two of the loudest pieces of construction equipment running at the same time and place was used to model project-related construction noise levels at sensitive receptors nearest to on- and off-site construction areas. The modeled receptor locations for on- and off-site construction areas are shown in Figure 4.12-3 and Figure 4.12-4, respectively. These modeled construction noise levels were compared to ambient noise measurements conducted by ESA in March 2018 to evaluate whether project-related construction activities could elevate the existing ambient noise level above the applied 10 dB substantial temporary increase threshold. Table 4.12-8 and Table 4.12-10 compares the highest on-site and off-site, respectively, project construction-related L_{eq} noise levels to which sensitive receptors could be exposed against the applicable temporary substantial increase in ambient noise threshold.

As shown in Table 4.12-8, construction activities within the project area (i.e., plots 1 through 22) would elevate existing ambient noise levels by as much as 50 dB. The existing sensitive receptors that would be most affected by on-site construction activities are located within, to the west, and to the southwest of the project area. The project-related construction activities could also have the potential to expose wildlife located within the undeveloped land located south of the project area to construction noise levels that would elevate the existing ambient to above the applied 10 dB substantial temporary increase threshold. Transient construction noise consisting of worker trips and construction equipment and materials delivery would not occur along the southern boundary of the site, adjacent to the wildlife corridor. Therefore, noise generated during onsite construction activities would not result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project and would result in a significant impact.

Notes:

Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.

1. Construction noise levels were modeled assuming two of the loudest construction equipment running at the same time and place nearest to a sensitive receptor. A distance of 25 feet was assumed between construction equipment and nearby receptors where plot boundaries abutted residential property boundaries. Construction noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.
2. Mitigation assumed a 10 dB reduction from a temporary noise barrier and equipment exhaust mufflers.

Source: ESA, 2018; FHWA, 2006a

As shown in Table 4.12-10, off-site construction (e.g., roadway improvements, drainage improvements, etc.) in some areas, would elevate ambient noise levels by as much as 45 dB over existing ambient noise levels. The existing sensitive receptors located adjacent to Redlands Boulevard, Cactus Avenue and near the intersections of World Logistics Center Parkway, South of SR 60/Highway 60 and Redlands Boulevard/Highway 60 would be most affected by offsite construction activities. Therefore, noise generated during off-site construction activities would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project and would result in a significant impact.

Specific Plan Design Features. The WLCSP does not contain any design features that specifically address noise. Other features, such as perimeter setback requirements, will have the effect of reducing noise to certain residential areas.

Mitigation Measures. Construction activities occurring on- and off-site would expose nearby sensitive receptors to noise levels that would exceed the applied 10 dB substantial temporary increase threshold. Mitigation Measure 4.12.6.1A would reduce short-term construction-related noise impacts associated with the proposed WLC project.

Level of Significance after Mitigation. Implementation of Mitigation Measure 4.12.6.1A would reduce construction noise levels at nearby sensitive receptors through implementation of a NRCP, which is expected to attenuate construction noise levels by 10 dB and prohibit construction activities within 800 feet of residences during nighttime hours. As shown in Table 4.12-8 and Table 4.12-10, even with implementation of Mitigation Measure 4.12.6.1A, sensitive receptors located near on-site and off-site construction areas would be exposed to construction noise levels that would elevate the existing ambient noise levels above the applied 10 dB substantial temporary increase threshold. Therefore, this would result in a significant and unavoidable impact with mitigation.

4.12.6.2 Long-Term Traffic Noise Impacts

Impact 4.12.6.2: *The project could result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project.*

Threshold	Would the project result in a substantial ~~temporary, periodic, and/or~~ permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

~~The January 2013 noise analysis contained in the Draft EIR identified 33 roadway segments where a significant noise impact would occur for at least one of the impact scenarios. In the revised noise analysis for the Final EIR, 21 roadway segments have been identified as having a significant noise impact. The reduction in noise impact areas is a direct result of the revised traffic analysis which reflects a downsizing of the project and associated traffic volumes for the "plus project" traffic scenarios. The roadway links that were previously identified as being impacted in the January 2013 noise analysis contained in the Draft EIR and are not impacted in the revised noise analysis for the Final EIR are listed below:~~

- ~~Day Street between Cottonwood Avenue and Alessandro Boulevard (#109);~~
- ~~Fir Avenue between Quincy Drive and Redlands Boulevard (#62);~~
- ~~Moreno Beach Drive between Locust Avenue and Ironwood Avenue (#56);~~
- ~~Perris Boulevard between John F. Kennedy Drive and Iris Avenue (#303);~~
- ~~Placentia Avenue from El Nido Avenue to Evans Road and on to Water Avenue (#431, #432);~~

- ~~Quincy Drive from Cactus Avenue to Alessandro Boulevard and to Cottonwood Avenue (#502, #503);~~
- ~~Reche Canyon Road from Keissel Road to Reche Vista Drive and on to High Country Drive (#205, #206);~~
- ~~Redlands Boulevard from Eucalyptus Avenue to Dracaea Avenue (#12); and~~
- ~~State Route 60 from Perris Boulevard to Nason Street (#31).~~

~~The noise analysis for the proposed~~The noise analysis for the World Logistics Center project is based on the traffic volume data contained in the revised Traffic Impact Analysis (TIA) prepared for the project (contained in its entirety as ~~EIR~~Revised Sections of the FEIR Appendix ~~L~~D). The TIA addressed the intersections of surface streets in Moreno Valley of a collector or higher classification street with another collector or higher classification street, at which the ~~proposed~~ project will add 50 or more peak hour trips. The study area also included the main travel routes between the project and the neighboring cities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area extended west to the nearest ramps on SR-91 and as far south as the I-215 ramps at Redlands Avenue in Perris. The study area for freeways was selected to ~~cover~~encompass the freeway routes radiating from the project site to the north, south, east, and west. The traffic analysis covered SR-60 from ~~SR-62~~I-10 in the east to SR-71 in the west, SR-91/I-215 from I-~~215~~210 in the east to I-15 in the west, ~~and~~ I-215 from ~~SR-210~~Redlands Avenue in the north to the Scott Road interchange in the south, and I-10 from SR-62 in the east to SR-60 in the west.

Three hundred and thirty~~-~~-nine (339) roadway links and eighty~~-~~-nine (89) freeway segments were analyzed in the noise analysis. The change in noise level was calculated for all 428 roadway and freeway links with and without the World Logistics Center project for the existing case (~~2012), 2022~~2018), 2025, and ~~2035 time horizons. Links~~2040 buildout scenarios. Segments with noise increases less than 1.5 dB would not have a substantial noise increase and were not presented in the main body of the noise report (i.e., the tables~~ and figures~~). Similarly, any ~~links~~segments that do not have sensitive receptors (e.g., residential uses or schools) were also not presented in the main body of the noise report. Based on this filtering process, of the 428 ~~links~~segments analyzed, ~~44 links~~21 segments have sensitive receptors and an increase of 1.5 dB for at least one ~~time horizon~~buildout scenario and were therefore addressed in the analysis.

The projected future ~~daily~~ traffic volumes (~~Parsons Brinckerhoff, Inc., September 2014~~WSP USA, June 2018) for roadway segments in the World Logistics Center project vicinity were used in the ~~traffic noise impact analysis~~TIA. Modeled noise levels represent the worst-case scenario, which assumes that no shielding is provided between the traffic and the location where the noise contours are drawn. As previously identified, long-term impacts from the ~~threshold for~~project's traffic noise ~~is 65 dBA CNEL for~~that affect existing sensitive ~~receptors.~~land uses are considered to be substantial and, therefore, constitute a significant noise impact if the project would:

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

Operation of development that could occur within the ~~proposed~~World Logistics Center project area would generate traffic along roadways in the project vicinity. Table 4.12~~.H~~-11 identifies existing ~~with project~~With Project roadway traffic noise levels~~ with the project.~~

~~*Note: Table 4.12.H has been replaced in its entirety. Please refer to Final EIR Volume IV for the original Table 4.12.H, which can be found in section 4.12.6.2*~~.

As identified in Table 4.12~~.H~~-11, build out of the proposed WLC project under 2018 conditions would result in ~~relatively minor changes~~ substantial increases in traffic noise levels in the Existing plus Project Build Out scenario case. The largest project-related increase in traffic noise would be along ~~Streets D, E, and~~Cactus Avenue Extension and Street F where increases of greater than 65 dBA are predicted. ~~The increase~~However, the increases associated with these roadway segments is attributable in part to ~~Streets D, E and~~Cactus Avenue Extension and Street F being new roads that will be constructed by the ~~proposed~~ project. A total of ~~18~~13 road or freeway segments would result in a ~~significant~~substantial noise increase attributable to the project, resulting in a significant ~~project direct~~ impact requiring mitigation.

Year ~~2022~~2025 (Phase I) ~~with~~With and ~~without~~Without World Logistics Center project scenarios projected ~~daily~~ traffic volumes on roadway segments in the project vicinity were used to conduct the traffic noise modeling. The projected ~~daily~~ traffic volumes in the area were taken from the TIA prepared for the ~~proposed~~ project. Table 4.12~~.I~~-12 identifies year ~~2022 without project~~2025 Without Project and ~~with project~~With Project traffic noise levels.

~~*Note: Table 4.12.I has been replaced in its entirety. Please refer to Final EIR Volume IV for the original Table 4.12.I, which can be found in section 4.12.6.2.*~~

Source: ~~Mestre Greve Associates, September 2014.~~ESA, 2018

~~Increases in noise levels associated with Buildout Year (2035) traffic conditions on area roadways range from 0.1 to 68.0 dBA. As identified in the Table 4.12.J, the greatest increase in noise levels would be along Street D (Street E to Cactus Avenue), Street E (north of Alessandro Boulevard), and Street F west (of Street A), where increases of greater than 65 dBA are predicted for the Buildout Year 2035 With Project scenario over the Buildout Year 2035 Without Project scenario. The increase associated with these roadway segments is attributable in part to Streets D, E, and F being new roads that will be constructed by the proposed project.~~

~~Note: A total of 14 road or freeway segments would result in a significant noise increase attributable to the project, resulting in a significant cumulative impact requiring mitigation. These 14 segments were included in the original noise study, and all other impacts identified in the original noise study are unchanged except as noted below.~~

Tables 4.12.~~H~~-11 through 4.12.~~J~~-13 identify the noise increases directly caused by the ~~proposed~~ project. These numbers represent the distance from the centerline of the road to the contour value shown. Note that the values given in Tables 4.12.~~H~~-11 through 4.12.~~J~~-13 do not take into account the effect of any existing noise attenuation in the form of barriers, soundwalls, or topography that may affect ambient noise levels.

~~For the reader's convenience, the significance threshold for a project-specific roadway noise impact as defined previously is:~~

- ~~Project induced increase in noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;~~
- ~~Project induced increase in noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or~~
- ~~Project induced increase in noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.~~

~~For the reader's convenience, the significance threshold for a project's incremental contribution to a cumulative noise increase as defined previously is:~~

- ~~A project increase of the ambient (cumulative without project) noise level by 1 dB or more, and the predicted future cumulative with project noise levels cause the following cumulative increases:~~
    - ~~Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;~~
    - ~~Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or~~
    - ~~Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.~~

It should be noted that the same noise increase occurs at all locations along a roadway link. In addition, the noise contours for the With Project scenarios cover a wider area around the local roadways than ~~does the~~what was evaluated for existing ~~condition~~conditions. State Route 60, however, continues to be the dominant noise source in the area.

In general, the World Logistics Center project proposes logistics uses and will not be affected by these noise increases. However, there are a few scattered residences within the project area and adjacent to the ~~WLCSP area~~World Logistics Center site that would be affected by the proposed logistics uses.

Within the ~~Specific Plan Area.~~ ~~Existing~~**World Logistics Center Site.** Six occupied noise-sensitive uses within the ~~WLCSP area~~World Logistics Center site include ~~three groups of~~ residences that may remain with the implementation of the ~~proposed~~ project. The Specific Plan would rezone the properties as Light Logistics, but it is anticipated that the residences may remain for some time. The Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain, must be considered sensitive land uses.

- ~~*Redlands Boulevard (north of Brodiaea Avenue).* The first group of homes is located east of Redlands Boulevard north of the intersection with Brodiaea Avenue. The traffic on Redlands Boulevard will not increase significantly as a result of the project. Future Street E is proposed to be constructed west of these existing residences. However, as stated in the Noise Study conducted for the Specific Plan, it is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways. Therefore, impacts are anticipated to be less than significant and no mitigation is required.~~
- *Street A/~~Theodore Street~~ World Logistics Center* Parkway, South of SR 60 *(Street B/Eucalyptus Avenue to Street F).* ~~The second group of~~ Three residences ~~within the Specific Plan area is~~are located ~~on the east side of~~ along Street A (~~Theodore Street) midway~~World Logistics Center Parkway, South of SR 60) between the future Street B and Street F. ~~There are currently two residences in this area.~~ These residences are anticipated to experience noise increases up to ~~16~~18.5 dB due to the implementation of the ~~Specific Plan~~project. As a result, existing noise levels at these ~~two~~ residences will be changed significantly. ~~The exact alignment of the roadway is yet to be determined, but the homes may be roughly 100 feet from the centerline on the roadway. As identified in Table 4.12.J, at this distance, the noise level by future year (2035) could be as high as 73.1 CNEL. This level of noise~~ Therefore, this would be ~~above the 65 CNEL threshold and would result in a greater than 1.5 dB noise increase when compared to without project conditions. This is~~ a significant impact requiring mitigation.
- *Street F/Dracaea Avenue (east of ~~Theodore Street).~~* ~~The third area is a~~ *Street A/* World Logistics Center Parkway, South of SR 60*). A* single residence is located east of ~~Theodore Street~~World Logistics Center Parkway, South of SR 60 along what is currently Dracaea Avenue (future Street F). Existing conditions identify low levels of traffic noise on Dracaea Avenue. With build out of the project~~, noise levels would reach as high as 68.1 CNEL. This level of noise would be above the 65 CNEL threshold and result in a greater than 1.5 dB noise increase when compared to without project conditions.~~ in year 2040, this residence would experience noise increases up to 69.2 dB during the 2018 buildout year. Therefore, this ~~is~~would be a significant impact requiring mitigation.

- *Street E/Dracaea Avenue (east of Redlands Boulevard).* Two residences are located along Dracaea Avenue east of Redlands Boulevard. These residences would be most affected by traffic along Redlands Boulevard between Eucalyptus Avenue and Cottonwood Avenue, where no significant noise increase has been identified. Additionally, although the alignment of future Street E is not yet known, it is not anticipated that the future Street E centerline would be located less than 100 feet from these residences. Therefore, impacts would be less than significant and no mitigation is required.

Off-Site Areas Adjacent to the ~~Specific Plan Area.~~World Logistics Center Site. For areas adjacent to the ~~Specific Plan area, 18~~World Logistics Center site, 13 segments would experience a noise increase that would be greater than significance criteria specified previously. These~~ seven~~ areas are described below.

- ~~*Cactus Avenue (Redlands Boulevard to Street D).* This area is occupied by a small group of single-family homes along Cactus Avenue between the future Street D and Redlands Boulevard. A significant noise increase is projected for all time horizons. Currently, there is no soundwall along these homes. Therefore, this is a significant impact requiring mitigation.~~

- ~~*Cactus Avenue (west of Redlands Boulevard).* As identified in the noise study, this area shows noise increases ranging from 0.7 dB to 4.2 dB depending on the time horizon. Only the 2035 case results in a significant noise increase.~~

  ~~Existing residences are located along Redlands Boulevard with rear yards facing Cactus Avenue. Existing 6-foot high soundwalls are located along the residences and rear yard areas are approximately 60 feet from the centerline of the roadway. In buildout year (2035), the noise levels projected for the yard area including the effects of the soundwall are projected to be 66.2 CNEL. This is above the City criteria of 65 CNEL, resulting in a significant impact and mitigation is required.~~

- ~~*Gilman Springs Road (between Eucalyptus Avenue and Street C, between Jack Rabbit Trail and Bridge Street, and between Bridge Street and SR-79 SB Ramps).* There are three single-family homes scattered along these roadway segments. All of the houses are set back from the roadway, but none has soundwalls. A significant noise increase is projected for at least one of these segments in all time horizons. Therefore, this is a significant impact requiring mitigation.~~

- ~~*Ironwood Avenue (between Redlands Boulevard and Highland Boulevard).* There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. A significant noise increase is projected for 2012 with full project build out. Therefore, this is a significant impact requiring mitigation.~~

- ~~*John F. Kennedy Drive (south of Cactus Avenue).* The residences along John F. Kennedy Drive south of Cactus Avenue will experience significant noise increases in all four time horizons. Similar to the area along Cactus Avenue, this noise increase will be due to cars and light vehicles, and not heavy trucks. The residences along the west side of the roadway are generally depressed with respect to the road and have existing 6-foot soundwalls. Due to the presence of the existing soundwalls and slope conditions, noise levels would be reduced by 6 to 10 dB. This would result in noise levels being below the City threshold of 65 CNEL for residential uses. Therefore, residences on the west side of the street will not be affected. Impacts are considered to be less than significant and no mitigation is required.~~

- ~~The residences on the east side of the roadway are elevated with respect to the roadway and do not have soundwalls. Rear yards areas on both sides of the street are approximately 60 to 90 feet from the centerline of the roadway and are bordered by wrought iron fencing. As identified in Tables 4.12.H through 4.12.J, the greatest noise levels that would be experienced at these residences would range up to 67.5 CNEL, which is above the City threshold of 65 CNEL. This is a significant impact requiring mitigation.~~

- ~~*Locust Avenue (between Moreno Beach Drive and Smiley Boulevard).* There are three single-family homes along this roadway and they front onto the roadway. The 2035 time horizon results in a significant noise increase for this area. In 2035, the project will increase noise levels by 1.5 dB, bringing the noise level to 66.9 CNEL. This is a significant impact requiring mitigation.~~

- ~~*Redlands Boulevard (from Eucalyptus Avenue to State Route 60).* There are scattered homes in this area that either face Redlands Boulevard (or Shubert Street) or are on Redlands Boulevard. The 2012 and 2035 time horizons result in a significant noise increase for this area. This is a significant impact requiring mitigation.~~

- ~~*Redlands Boulevard (from Ironwood Avenue to State Route 60 and Ironwood Avenue to San Timoteo Canyon Road).* There are approximately 28 homes along this roadway that would be affected. The single-family homes are scattered and generally front the roadway. All time horizons result in a significant noise increase for this area. The increases in noise are around 2 dB with a resultant noise level in the 70 to 71 CNEL range. This is a significant impact requiring mitigation.~~

- ~~*San Timoteo Canyon Road (from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard).* There are about four scattered residences along this roadway that would be affected. The existing baseline plus project time horizon results in a significant noise increase for this area. The noise increases by up to 3.1 dB with resultant noise levels in the 65 to 66 CNEL range. This is a significant impact requiring mitigation.~~

- ~~*Theodore Street (State Route 60 to Highland Boulevard).* There are four existing homes on Theodore Street that front onto the roadway. Implementation of the Specific Plan would result in a 7.1 dB increase over baseline conditions (2012), and a 3.1 dB increase in Opening Year (2022). By Buildout Year (2035), the noise increase associated with the proposed project is anticipated to be 1.2 dB, which would not be significant. These existing residences could experience noise levels of 65.0 CNEL in the baseline and 66.3 CNEL in the Year 2035 time horizons which is above the City threshold of 65 CNEL. This is a significant impact requiring mitigation.~~

- ~~*Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19).* There are three groups of homes that may remain within the project area. The analysis shows significant noise increases for all four cases. The proposed Specific Plan designates these properties for Light Logistics uses, but the residences may remain indefinitely. The future Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain as a non-conforming use, must be considered as a sensitive land use. The first group of homes is east of Redlands Boulevard north of the intersection with Brodiaea Avenue. Street E will be constructed west of these homes. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways.~~

  ~~The second group of homes is on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are two homes in this area. Their noise environment will be changed significantly. The exact alignment of the roadway is to be determined, but noise levels could exceed 70 CNEL at the residences. The noise levels at these homes would be unacceptable to the residents, and a significant impact would occur.~~

  ~~The third area is a single home and lies east of Street A and along Street F. Currently there is essentially no traffic on this street. There is one residence in this area. Depending on the alignment for the street noise levels could exceed 70 CNEL. Since this home will experience a substantial noise increase, this is considered a significant impact.~~

  ~~It should be noted these homes were evaluated in the original DEIR and their impacts were disclosed on DEIR page 4.12-47.~~

- *Street D/Cactus Avenue Extension (~~from Street E~~Alessandro Boulevard to Cactus Avenue).* Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the World Logistics Center project parallel to Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. ~~There would be limited or no heavy trucks using this roadway. The 65 CNEL contour will lie 114 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than 114 feet to the residences, then a significant impact would occur. Outdoor living spaces for homes along Merwin Street would experience noise levels greater than 65 CNEL, and this would not be consistent with City criteria. This is a significant impact requiring mitigation.~~These homes would experience noise level increases of up to 66.8 dB during the 2040 buildout year. Therefore, this would be a significant impact requiring mitigation.

- *Redlands Boulevard (from Eucalyptus Avenue to* State Route 60*).* There are homes located at the northwestern corner of Redlands Boulevard and Eucalyptus Avenue. The 2018 buildout scenario results in a significant noise increase of 2.8 dB. Therefore, this would be a significant impact requiring mitigation.
- *Cactus Avenue (west of Redlands Boulevard).* Existing residences are located along Cactus Avenue with rear yards facing Cactus Avenue with soundwalls located long the rear yards of the residences. The 2018 and 2040 buildout scenarios result in significant noise increases of 2.1 dB and 3.9 dB, respectively. Therefore, this would be a significant impact requiring mitigation.
- *Ironwood Avenue (between Redlands Boulevard and Highland Boulevard).* There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. A significant noise increase of 5.5 dB is projected for 2018 with full project build out. Therefore, this would be a significant impact requiring mitigation.
- *Cactus Avenue (Redlands Boulevard to Cactus Avenue Extension).* This area is occupied by a small group of single-family homes along Cactus Avenue between the future Street D/Cactus Avenue Extension and Redlands Boulevard. A significant noise increase is projected for all buildout scenarios. Currently, there is no soundwall along these homes. Therefore, this would be a significant impact requiring mitigation.
- *Locust Avenue (between Moreno Beach Drive and Smiley Boulevard).* There are three single-family homes along this roadway and they front onto the roadway. The 2018 buildout scenario results in a significant noise increase for this area. In 2018, the project will increase noise levels by 5.1 dB. Therefore, this would be a significant impact requiring mitigation.
- *Locust Avenue (between Moreno Beach Drive and Redlands Boulevard).* There are single-family homes along this roadway with front, rear, and side yards facing Locust Avenue. With project buildout in 2018, the project will increase noise levels by 5.7 dB. Therefore, this would be a significant impact requiring mitigation.
- *Kitching Street (between Krameria Avenue and Lurin Avenue).* There are single-family homes along this roadway with rear yards facing Kitching Street. Existing 6-foot high soundwalls are located along the residences and rear yard areas. Under the 2018 buildout scenario, the noise level is projected to increase by 3.2 dB. Therefore, this would be a significant impact requiring mitigation.
- *State Route 60 eastbound ramps (between SR-60 and Central Avenue).* Single-family homes are located south of SR-60 eastbound ramps. Under the project buildout scenario in year 2018, a noise level increase of 7.6 dB is anticipated. Therefore, this would be a significant impact requiring mitigation.
- *State Route 60 (from ~~Pigeon Pass Road to~~ Perris Boulevard to Nason Street).* All residential areas along this stretch of freeway have soundwalls in place. The ~~2012 time horizon~~2018 buildout scenario results in a significant noise increase ~~for this area. The noise levels are projected to increase by~~of 1.5 ~~to 1.7~~ dB ~~in this area with resultant noise levels in the 66.9 to 68.0 CNEL range. This is~~. Therefore, this would be a significant impact requiring mitigation.
- *State Route 60 (from Moreno Beach Drive to Redlands Boulevard).* There are soundwalls in place for all residences in this area. The existing ~~2012 and 2035 time horizons result~~2018 buildout scenario results in a significant noise increase ~~for~~of 2.4 dB. Therefore, this ~~area, reaching 67.1 CNEL by 2035. This is~~would be a significant impact requiring mitigation.
- *State Route ~~60~~215 (from ~~Redlands Boulevard to Theodore~~Mill Street~~). No~~ to 2nd Street).* There are four residential uses located to the west of SR-215 south of 2nd Street with no soundwalls ~~are present in this area.~~. The residential ~~area is~~uses are set back from the freeway and ~~is clustered along Redlands Boulevard north of~~ are located at a lower grade than the freeway. The ~~existing~~

~~2012 time horizon~~2040 buildout scenario results in a significant noise increase ~~for~~ of 1.9 dB. Therefore, this would be a significant impact requiring mitigation.

- *State Route 215 (from Baseline Road to Highland Avenue/SR-210).* There are residential uses on the west and east sides of SR-215. There are soundwalls in place along this ~~area.~~segment of the SR-215 alignment. The ~~resultant~~2040 buildout scenario results in a significant noise ~~level will be 63.5 CNEL with an~~ increase ~~due to the project~~ of ~~3.4~~1.7 dB. ~~This is~~Therefore, this would be a significant impact requiring mitigation.

Specific Plan Design Features. The WLCSP indicates there will be a 250-foot setback from existing housing along Redlands Boulevard. No additional design features to attenuate noise impacts are planned as part of the WLCSP.

~~*Note: Due to changes in the Specific Plan, Project Traffic Impact Assessment, Project Noise Study, and in response to comments in Letter C-4-2 and F-13-9 and F-13-84, the following mitigation measures have been revised.*~~

Mitigation Measures. Construction of the proposed WLC project would result in noise levels at the closest residences within and adjacent to the WLCSP area exceeding the maximum noise level allowed under the City's Municipal Code. The following measures would reduce long-term traffic related noise impacts associated with the ~~proposed~~ project:

4.12.6.2A When processing future individual buildings under the World Logistics Center Specific Plan, as part of the City's approval process, the City shall require the Applicant to take the following three actions for each building prior to approval of discretionary permits for individual plot plans for the requested development:

Action 1: Perform a building-specific noise study to ensure that the assumptions set forth in the Revised Sections of the FEIR ~~prepared for the programmatic level entitlement~~ remain valid. These ~~procedure~~procedures used to conduct these noise analyses shall be consistent with the noise analysis conducted in the ~~programmatic~~Revised Sections of the FEIR and shall be used to impose building-specific mitigation on the individually-proposed buildings.

Action 2: If the building-specific analyses identify that the proposed development triggers the need for mitigation from the proposed building, including all preceding developments in the ~~specific plan area~~World Logistics Center site, the Applicant shall implement the appropriate level of mitigation, identified in the ~~WLC~~Revised Sections of the FEIR~~.~~ to reduce the identified impacts to comply with the Moreno Valley Municipal Code, which sets maximum sound levels reaching residential uses at 60 dBA Leq during the daytime hours (8:00 a.m. – 10:00 p.m.) and 55 dBA Leq during nighttime hours (10:01 p.m. – 7:59 a.m.). Prior to implementing the mitigation, the Applicant shall send letters by registered mail to all property owners and non-owner occupants of properties that would benefit from the proposed mitigation asking them to provide a position either in favor of or in opposition to the proposed noise abatement mitigation within 45 days. Each property shall be entitled to one vote on behalf of owners and one vote per dwelling on behalf of non-owner occupants.

If more than 50% of the votes from responding benefited receptors oppose the abatement, the abatement will not be considered reasonable. Additionally, for noise abatement to be located on private property, 100% of owners of property upon which the abatement is to be placed must support the proposed abatement. In the case of proposed noise abatement on private property, no response from a property owner, after three attempts by registered mail, is considered a *no* vote.

At the completion of the vote at the end of the 45~~-~~-day period, the Applicant shall provide the tentative results of the vote to all property owners by registered mail. During the next

15 calendar days following the date of the mailing, property owners may change their vote. Following the 15-day period, the results of the vote will be finalized and made public.

Action 3: Upon consent from benefited receptors and property owners, the Applicant shall post a bond for the cost of the construction of the necessary mitigation as estimated by the City Engineer to ensure completion of the mitigation. The certificate of occupancy permits shall be issued upon posting of the bond or demonstration that 50% of the votes from responding benefited receptors oppose the abatement or, if the abatement is located on private property, any property owners oppose the abatement~~ (per Noise Study MM N-8, pg.53).~~.

4.12.6.2B Prior to issuance/approval of any building permits, the centerline of Cactus Avenue Extension will be located no closer than ~~114~~49 feet to the residential property lines along Merwin Street. An alternative is to locate the roadway closer to the residences and provide a soundwall along Cactus Avenue Extension. The soundwall location and height should be determined by a Registered Engineer, and the soundwall shall be designed to reduce noise levels to less than 65 CNEL at the residences. The Engineer shall provide calculations and supporting information in a report that will be required to be submitted to and approved by the City prior to issuing permits to construct the road~~ (per Noise Study, pg. 51, Cactus Avenue Extension, ID #50).~~.

4.12.6.2C Prior to the approval of any discretionary permits, cumulative impact areas shown in the WLC EIR Noise Study shall be included in the soundwall mitigation program outlined in Mitigation Measures 4.12.6.2A and 4.12.6.2D~~ (per Noise Study MM N-9, pg. 62).~~.

4.12.6.2D Prior to issuance of a building permit, the applicant shall demonstrate that the development maintains a ~~buffer~~setback with soundwall for noise attenuation at residential/warehousing interface (i.e., western and southwestern boundaries of the project site). To keep the noise levels at nearby residential areas less than typical ambient conditions, the warehousing property line shall be located a minimum of 250 feet from the residential zone boundary~~-~~, and a 12-foot noise barrier shall be located along the perimeter of the property that faces any residential areas. The 12~~-~~-foot noise barrier may be a soundwall, berm, or combination of the two. The height shall be measured relative to the pad of the warehouse. This requirement shall be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (Leq) will not be exceeded at the residential zone. This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, “All manufacturing and industrial uses adjacent to residential land uses shall include a ~~buffer~~setback zone and/or noise attenuation wall to reduce outside noise levels~~" (per Noise Study MM N-10, pg.62).~~”.

Level of Significance after Mitigation. *Within the WLC ~~Specific Plan Area.~~Site.* For areas within the ~~WLCSP area, three groups of~~World Logistics Center site, noise levels at on-site residences may exceed the noise standard with the implementation of the ~~proposed ~~project. The level of significance after mitigation is provided for each of the two areas for which a significant impact has been identified.

- ~~*Redlands Boulevard (north of Brodiaea Avenue).* A group of homes is located east of Redlands Boulevard north of the intersection with Brodiaea Avenue. The traffic on Redlands Boulevard will not increase significantly as a result of the project. Future ~~*Street* ~~E is proposed to be constructed west of these existing~~*A/* World Logistics Center Parkway *(Street B/Eucalyptus Avenue to Street F).* Three residences~~. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways. Therefore, impacts are anticipated to be less than significant and no mitigation is required.~~

- ~~*Theodore Street/*~~ are located along Street A (World Logistics Center Parkway) between the future Street B ~~*to*~~and Street F~~*)*. There are two residences in this area~~. These residences are anticipated to experience noise increases up to ~~16~~18.5 dB due to the implementation of the ~~Specific~~

~~Plan~~project. As a result, existing noise levels at these ~~two~~ residences will be changed significantly. The exact alignment of the roadway is to be determined, but the homes may be roughly 100 feet from the centerline on the roadway. ~~One residence fronts~~Two residences front onto Street A (~~Theodore Street~~World Logistics Center Parkway), and the driveway access would make a soundwall ineffective. The other residence is on ~~to~~ Street A~~. It~~ (World Logistics Center Parkway) and it is difficult to determine where an outdoor living area is for this residence. However, since it is a single residence, a soundwall would have a limited effectiveness. Since mitigation is not feasible, impacts remain significant and unavoidable.

- *Street F/Dracaea Avenue~~/Street F~~ (east of ~~Theodore~~ Street A/ World Logistics Center Parkway).* There is one residence in this area fronting onto the future alignment of Street F (currently Dracaea Avenue). Existing conditions identify low levels of traffic noise on Dracaea Avenue. The 65 CNEL contour is projected to lie ~~84~~114 feet from the centerline of Street F and it is likely that the one residence would lie within this zone. With build out of the project, noise levels would reach as high as 68.~~1~~3 CNEL, which exceeds the City's 65 CNEL threshold. Installation of a soundwall would not be effective in reducing noise levels due to the opening for the driveway. Since mitigation is not feasible, impacts remain significant and unavoidable.

Off-Site Areas Adjacent to the ~~Specific Plan Area.~~World Logistics Center Site. For areas adjacent to the ~~WLCSP area, seven~~World Logistics Center site, two areas would experience noise increases that would be mitigated to a less than significant level with implementation of **Mitigation Measures 4.12.6.2A** ~~and~~through **4.12.6.2D**. These areas are as follows:

- ~~Cactus Avenue west of Redlands Boulevard;~~
- Cactus Avenue from Redlands Boulevard to ~~Street D;~~
- ~~John F. Kennedy Drive, south of Cactus Avenue;~~
- ~~Moreno Beach Drive between Locust Avenue and Ironwood Avenue (15 of 18 homes);~~
- ~~State Route 60 from Redlands Boulevard to Theodore Street;~~
- ~~Iris Avenue from Nason Street to Oliver Street; and~~
- ~~Street D from Street E to Cactus Avenue (8).~~

- ~~For the remaining noise impact locations adjacent to the WLCSP area for which significant noise impacts have been identified, mitigation measures are not feasible or will not fully reduce the impact to less than significant levels. Each location that will remain significant and unavoidable with *Gilman Springs Road (between Eucalyptus Avenue and Street C, and between Jack Rabbit Trail and Bridge Street).* There are three single-family homes scattered along these roadway segments. All of the houses are set back from the roadway, but none has soundwalls. A significant noise increase is projected for at least one of these segments in three of the four case years. Homes that are widely separated from other homes cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~

- ~~*Ironwood Avenue (between Redlands Boulevard and Highland Boulevard).* There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. A significant noise increase is projected for the 2012 time horizon. In 2035, the project is projected to increase noise levels by2.1 dB, bringing the noise level to 60.8 CNEL. Land uses that are widely separated from one another cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~

- ~~*Locust Avenue (between Moreno Beach Drive and Smiley Boulevard).* There are three single-family homes along this roadway and they front onto the roadway. The 2035 time horizon results in a significant noise increase for this area. In 2035, the project will increase noise levels by 1.5 dB, bringing the noise level to 66.9 CNEL. As discussed above, homes that are scattered and front~~

~~onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~

- ~~*Redlands Boulevard (Eucalyptus Avenue to State Route 60).* There are scattered homes in this area that either face Redlands Boulevard (or Shubert Street) or are on Redlands Boulevard. The 2012 and 2035 time horizons result in a significant noise increase for this area. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~
- ~~*Redlands Boulevard (State Route 60 to San Timoteo Canyon Road).* There are approximately 28 homes along this roadway that would be affected. The single-family homes are scattered and generally front the roadway. The 2012, 2022, and 2035 time horizons result in a significant noise increase for this area. The increases in noise are around 2 dB with a resultant noise level in the 70 to 71 CNEL range. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~
- ~~*San Timoteo Canyon Road (from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard).* There are approximately four scattered residences along this roadway that would be affected. The existing baseline plus project time horizon results in a significant noise increase for this area. The noise increases by a little over 3.0 dB with resultant noise levels in the 65 to 66 CNEL range. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~
- ~~*Theodore Street (State Route 60 to Highland Boulevard).* The noise analysis indicates that the project will cause a 1.2 dB increase in the year 2035 with a resulting noise level of 66.3 CNEL. There are four existing homes on Theodore Street that front onto the roadway. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, the significant impact cannot be feasibly mitigated and it will remain significant and unavoidable.~~
- ~~*Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19).* There are three groups of homes that may remain within the project area. The analysis shows significant noise increases for all four cases. The project would rezone these residences as Light Logistics, but the residences may remain for some time. The Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain, must be considered as a sensitive land use. The first homes are east of Redlands Boulevard north of the intersection with Brodiaea Avenue. Street E will be constructed west of these homes. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways.~~

  ~~The second group of homes is on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are two homes in this area. Their noise environment will be changed significantly. The exact alignment of the roadway is to be determined. The noise levels at these homes would be unacceptable to the residents, and a significant impact would occur. As discussed above homes, that front onto a street or scattered homes cannot be effectively mitigated with a soundwall. Therefore, there is no feasible mitigation and this impact would remain significant and unavoidable.~~

  ~~The third area is a single home and lies east of Street A and along Street F. Currently there is essentially no traffic on this street. There is one residence in this area. Since this home will experience a substantial noise increase, this is considered a significant impact. All of these homes will either front onto the roadway or are scattered. As discussed above homes, that front onto a street or scattered homes cannot be effectively mitigated with a soundwall. Therefore, there is no feasible mitigation and this impact would remain significant and unavoidable.~~

- Cactus Avenue Extension ~~(Street D)~~; and

- Cactus Avenue Extension from ~~*Street E*~~Alessandro Boulevard to Cactus Avenue.

Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the ~~project~~World Logistics Center site parallel to Merwin Street and roughly 1,250 feet from Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. ~~There would be essentially no heavy trucks using this roadway.~~ There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. The noise forecast for buildout year 2040 shows that the 65 CNEL contour will lie ~~114~~49 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than ~~114~~49 feet to the residences, then a significant impact would occur. Outdoor living spaces for homes along Merwin Street would experience noise levels greater than 65 CNEL, and this would not be consistent with City criteria. Due to the distance ~~from the~~ currently envisioned between Merwin Street and Cactus Avenue Extension, it is most likely that no soundwall will be needed. If a soundwall ~~was~~is needed, a preliminary estimate indicates that the soundwall along Cactus Avenue Extension would need to be roughly 2,000 feet long. The soundwall shall reduce traffic noise to 65 dBA CNEL measured at the boundary of residences along Merwin Street.

~~4.12.6.3 Long-Term Operational Noise Impacts~~

~~Threshold~~	~~Would the project cause exposure of persons to or generation of~~ For the remaining noise ~~levels in excess of standards established in the *City of Moreno Valley General Plan, Moreno Valley Municipal Code*, or applicable standards of other agencies?~~

~~Potential long-term stationary noise impacts would primarily be associated with operations at logistics facilities within the WLCSP area. Logistics facility uses would generate noise from truck delivery, loading/unloading activities at the loading areas, heating, ventilation, and air-conditioning (HVAC) equipment and other noise-producing activities within the parking lot (e.g., doors slamming, vehicle engine start-ups, and conversing in the parking lot). These activities are potential point sources of noise that could affect noise-sensitive receptors~~impact locations adjacent to the ~~loading areas and parking lots. As noise spreads from a source, it loses energy; therefore, the farther away the noise receiver is from the noise source, the lower the perceived noise level would be.~~

~~Noise levels were measured at similar facilities to determine representative noise levels that might be generated by this type of activity. Noise measurements were made at two facilities; specifically, Lowes Distribution Center (3984 Indian Avenue, Perris, CA) and Ross Distribution Center (3404 Indian Avenue, Perris, CA). Based on these representative noise measurements, Table 4.12.K provides the noise levels for various distances from the warehouse property line with no noise barrier in place and with an assumed 12-foot noise barrier.~~

~~Table 4.12.K: Representative Noise Levels for Warehousing Activities~~

~~Distance from Facility (feet)~~	~~Noise Level (dBA L_{eq})~~	
	~~No Barrier~~	~~With 12-foot barrier~~
~~50~~	~~56.9~~	~~48.6~~
~~100~~	~~54.9~~	~~47.8~~
~~250~~	~~50.8~~	~~44.7~~
~~500~~	~~46.6~~	~~40.9~~

~~Source: Mestre Greve Associates, September 2014.~~

~~The City of Moreno Valley Noise Ordinance requires that noise levels remain below 55 dBA (L_{eq}) during nighttime hours. To achieve this noise level, the warehouse property line would only need to be 100 feet from the nearest residential property and no soundwall would need to be present.~~

~~Another consideration is whether the proposed activity levels will be substantially higher than current ambient conditions. No matter what is developed in the Specific Plan area, ambient conditions would be higher in future years due to higher levels of traffic and activity. Ambient noise levels were measured at seven sites that could border the~~ World Logistics Center ~~(i.e., Measurement Sites 3 through 9). The nighttime ambient noise levels (L_{eq}) ranged from 35.8 to 61.8 dBA with an average for the sites of 46.6 dBA. To keep the noise levels at nearby residential areas less than typical ambient conditions, the logistics property line should be located a minimum distance of 250 feet and a 12-foot soundwall should be located along the perimeter of the property that faces any residential areas. This would keep the logistic use noise to less than 45 dBA (L_{eq}) at the residences. The implementation of this buffer between logistics uses and noise sensitive uses has been included as **Mitigation Measure 4.1.6.1A**.~~

site for which ~~**Specific Plan Design Features.** The WLCSP indicates there will be a 250-foot building setback from residentially zoned property along Redlands Boulevard, Bay Avenue, and Merwin Street.~~

~~**Level of Significance after Mitigation.** Implementation of **Mitigation Measure 4.1.6.1A** would eliminate any noise impacts on residential areas due to the operation of logistic activities. Through the provision of a 250-foot buffer, berms, and/or soundwalls, noise levels at the nearest residences would be reduced to below the City's thresholds. Therefore, with adherence to the identified mitigation measure, impacts associated with this issue would be less than~~ significant~~.~~

~~4.12.6.4 Long-Term Utility Noise Impacts~~

~~Threshold~~	~~Would the project cause exposure of persons to or generation of noise levels in excess of standards established in the *City of Moreno Valley General Plan, Moreno Valley Municipal Code*, or applicable standards of other agencies?~~

~~As illustrated in previously referenced Figure 4.12.3 and Figure 4.12.6, there is one existing SDG&E compressor station and two existing SCGC facilities located within the WLC Specific Plan area.~~

~~Based on preliminary calculations as illustrated in Figure 4.12.3, the worst-case compressor station operational characteristics will result in a maximum noise level just above 65 CNEL within the project area proposed for development (i.e., not open space). Typical commercial construction results in buildings that achieve at least a 20 dB reduction of outdoor noise levels. Therefore, an office use exposed to the highest noise level from the compressor station will be just above 45 CNEL and below the 50 CNEL limit prescribed by the City's General Plan, resulting in a less than significant impact and no mitigation is required.~~

~~As illustrated in previously referenced Figure 4.12.4, the L_{eq} noise level generated by the compressor station does not exceed 60 dBA L_{eq} beyond the property lines of the facility. Therefore, the compressor station is not considered a noise disturbance based on City criteria. Operation of the compressor station would not result in any interior noise levels exceeding the limits established by the City in the General Plan. Therefore, noise impacts associated with the operation of the compressor station would be less than significant and no mitigation is required.~~

~~As identified in previously referenced Figure 4.12.5, the maximum noise level from a blow-down at the SDG&E compressor station within the WLCSP area proposed for development (i.e., the Logistics Development land use) is 100 dBA. A person would need to be exposed to this level for more than two~~

~~hours in a day before permanent hearing loss would be expected. As discussed above, blow-down events at the SDG&E compressor station typically do not last longer than 90 seconds. Therefore, the SDG&E blow-down events will not result in a significant impact to the uses proposed within the WLCSP area, and no mitigation is required.~~

~~For SCGC blow-down events, noise generated could reach as high as 130 dBA just outside the fence line of the southern facility and in excess of 135 dB just outside the fence line of the northern facility. People within approximately 250 feet of the blow-down points would be exposed to noise levels greater than 115 dBA, which would likely cause permanent hearing damage regardless of the exposure time. The SCGC blow-downs could last as long as 90 minutes. It is anticipated that people exposed to noise levels greater than 102 dBA, within approximately 1,300 feet from the blow-down point could experience permanent hearing loss based on this event duration. Noise generated by SCGC blow-down events has the potential to cause permanent hearing loss in persons in the developed area of the project. This is a significant impact and mitigation is required.~~

~~SCGC blow-down events also~~ noise impacts have ~~the potential to produce groundborne vibration. However, the effect of the blow-down groundborne vibration would be limited to within 100 feet of the equipment and would not be perceived beyond the facility fenceline, resulting in a less than significant impact and no mitigation is required.~~

~~**Specific Plan Design Features.** The WLCSP provides a setback of open space and a street between the SCGC facility and planned warehouse buildings in the WLCSP. However, the separation may not be sufficient to prevent significant noise impacts during blow-down events. According to the project noise assessment, a 40 dB reduction in existing noise levels from the blow-down facilities would be needed to ensure there would be no significant noise impacts on workers or other persons within 1,300 feet of the blow-down facilities (FEIR Volume 2 Appendix K).~~

~~*Note: The changes to the following mitigation measure have been made in response to Comment C-4-2 in Letter C-4 from Semper Energy, and the revised noise study.*~~

~~**Mitigation Measures.** Operation of the proposed WLC project could result in exposure of people to noise levels as high as 130 dBA or greater during SCGC blow-down events. The following measure would reduce long-term utility related noise impacts associated with the proposed WLC project:~~

~~**4.12.6.4A** Prior to the issuance of building permits for projects within 1,300 feet of the Southern California Gas Company (SCGC) and San Diego Gas and Electric (SDG&E) blow-down facilities, documentation shall be submitted to the City confirming that sound attenuation devices and/or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events are available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund all sound attenuation improvements to the blow-down facilities required by this measure. It shall also be the responsibility of the developer to coordinate with San Diego Gas and Electric and/or Southern California Gas Company regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the San Diego Gas and Electric compressor station or the Southern California Gas Company pipelines. This measure shall be implemented to the satisfaction of the City Land Management Division (per Noise Study MM N-11, pg.65).~~

~~**Level of Significance after Mitigation.** The SCGC blow-down equipment does not currently include a permanent silencer system. A review of the literature of a leading manufacturer of specialty silencer~~

~~systems (Industrial Acoustics Company) determined that a specialty silencer system added to the blow-down equipment could reduce noise levels by about 40 dB. With a silencer system providing 40 dB of noise reduction, blow-down noise levels would be less than 102 dBA approximately 30 feet from the blow-down point, which is within the property line of these facilities. 102 dBA is the noise level that could be experienced for up to 90 minutes without causing permanent hearing loss. Therefore, while occupants within the WLCSP in close proximity to the SCGC facilities would be subject to high noise levels during these infrequent noise events, they would not be subject to any permanent hearing damage. With implementation of **Mitigation Measure 4.12.6.4A**, SCGC blow-down events would not result in noise levels that could cause permanent hearing loss and the project would not be significantly affected by noise from the SCGC facilities, resulting in a less than significant impact.~~

~~4.12.7 Cumulative Impacts~~

~~The cumulative area for noise impacts is the City of Moreno Valley. Implementation of the Specific Plan would result in the introduction of new noise sources and levels from on-site activities and from increased traffic volumes on vicinity roadway and freeways.~~

~~Construction crew commutes and the transport of construction equipment, and materials to the WLCSP area would incrementally increase noise levels on access roads leading to the site. Secondary sources of noise would include noise generated during excavation, grading, and building erection on the project site. The net increase in project site noise levels generated by these activities and other sources has been quantitatively estimated and compared to the applicable noise standards and thresholds of significance. Although it is not possible to predict if contiguous properties may be constructed at the same time and create cumulative noise impacts that would be greater than if developed at separate times, it is unlikely that adjacent properties will be developed at the same time as the Specific Plan area. However, in the unlikely event that adjacent properties are developed at the same time as the proposed WLC project, adherence to the City's Municipal Code provisions that regulate construction activities and other development standards would render the cumulative impacts of the proposed project to less than significant levels.~~

~~The noise analysis contained in this section also provides an assessment of on-site operational noise level impacts on adjacent sensitive uses, both existing and future. Additionally, on-site operational noises are individual noise occurrences and are not typically additive in nature. It is extremely unlikely that adjacent properties will generate noises that would be additive in nature because of two important reasons. First, the noise sources would have to be adjacent or in close proximity to one another in order for the noises to intermingle. Second, the sensitive receptor or receptors would also have to be adjacent to or in close proximity to the noise generators. Although it is not possible to predict if contiguous or proximate properties may generate noise at the same time that would be additive in nature and thus create a significant cumulative noise impact at sensitive receptors, adherence to the City's Municipal Code provisions that regulate nuisance noise from land uses and other development standards would render the cumulative impacts of the proposed project to less than significant levels.~~

~~Cumulative traffic volumes contained in the TIA were developed for the Future Year 2022 and Buildout 2035 analysis time horizons. Traffic volumes for each time horizon were developed utilizing a combination of various future traffic growth methods as follows. For Future Year 2022, traffic volumes were developed by interpolating year 2035 traffic volume projections from the Riverside County Transportation and Analysis Model (RivTAM) to year 2022 plus traffic from a list of past, present, and reasonably foreseeable projects. For Buildout Year 2035, traffic volumes were developed by utilizing the year 2035 traffic volume projections from the RivTAM plus traffic from a list of past, present, and reasonably foreseeable projects.~~

~~Cumulative noise impacts associated with roadway noise have been addressed based on the cumulative traffic volumes. Previously referenced Table 4.12.J provides a comparison of Buildout Year~~

~~(2035) without and with project noise levels, and if a significant impact (project-specific or cumulatively significant) occurs.~~

~~The project calls for improvements to several of the roadways around the project area in order to accommodate the projected increase in project traffic volumes. There are no new noise-sensitive land uses proposed to be constructed within the area of analysis. However the presence of residential uses occurs within the WLCSP project and nearby area. These roadway segments are analyzed against the thresholds for determining significant impacts defined previously in Section 4.12.6.2. As described previously in Section 4.12.4, the project's incremental contribution to a cumulative noise increase would be considered cumulatively considerable and significant when ambient noise levels affect noise-sensitive land uses and when the proposed project increases noise levels by 1 dB or more over pre-project conditions and the predicted future cumulative with project noise levels cause the following cumulative increases:~~

- ~~Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;~~
- ~~Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or~~
- ~~Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.~~

~~Cumulative noise impacts associated with roadway noise have been addressed based on the 2022 and 2035 time horizons analyses contained in Section 4.12.6.2. As identified in the preceding analysis, Table 4.12.J shows the Buildout Year 2035 CNEL values without and with the proposed project and if a significant impact would be produced based on the project-specific significance criteria identified in Section 4.12.4 and the cumulatively significant significance criteria identified in Section 4.12.4 and repeated above. Traffic noise level increases from the existing baseline condition and the future (2022 and 2035) time horizons are attributable to the intermingled effects of both the cumulative (i.e., past, present, and reasonably foreseeable projects) development projects in the project vicinity and region as well as the proposed project. As indicated in Section 4.12.6.2, roadway noise impacts have been identified and **Mitigation Measures 4.12.6.2A** and **4.12.62D** have been presented to reduce roadway noise impacts to the greatest extent feasible. As disclosed in Section 4.12.6.2, there are numerous instances in which there is no feasible means to reduce roadway noise impacts because of the existing developed nature of the affected roadway segment and/or the scattered nature of the sensitive receptors (i.e., residences), which prohibits the effectiveness of a soundwall. Therefore, no significant cumulative noise impacts would occur after implementation of the proposed~~been identified, mitigation measures~~. For those segments at which there is a cumulatively considerable impact and there is no~~ are not feasible ~~means to provide mitigation,~~or will not fully reduce the impact to less than significant ~~cumulative impact~~levels. Each location that will remain significant and unavoidable is discussed below.

- *Redlands Boulevard (Eucalyptus Avenue to State Route 60).* There are scattered homes in this area that either face Redlands Boulevard (or Shubert Street) or are on Redlands Boulevard. The 2018 buildout scenario results in a significant noise increase for this area. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Cactus Avenue (west of Redlands Boulevard).* Existing residential uses are located along Redlands Boulevard with rear yards facing Cactus Avenue. Existing 6-foot high soundwalls are located along the rear yard areas. Soundwalls are already present on the west side of the roadway. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Ironwood Avenue (between Redlands Boulevard and Highland Boulevard).* There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. Land uses that are widely separated from one another cannot be effectively mitigated with a soundwall. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Locust Avenue (between Moreno Beach Drive and Smiley Boulevard).* There are three single-family homes along this roadway and they front onto the roadway. ~~.~~Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Locust Avenue (between Moreno Beach Drive and Redlands Boulevard).* There are single-family homes along this roadway with front, rear, and side yards facing Locust Avenue. The homes located on the north side of Locust Avenue mostly front onto the roadway, making erecting a soundwall infeasible. A majority of the homes on the south side of the street either already have soundwalls in place or front onto Locust Avenue. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Kitching Street (between Krameria Avenue and Lurin Avenue).* There are single-family homes along this roadway with rear yards facing Kitching Street. Existing soundwalls are located along the rear years. Soundwalls are already present on the west side of the roadway. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 60 eastbound ramps (between SR-60 and Central Avenue).* Single-family homes are located south of SR-60 eastbound ramps. Although Mitigation Measure 4.12.6.2A could mitigate impacts related to increases in ambient noise, the construction of mitigation on private property not controlled by the project would be controlled by the property owner and not be guaranteed. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 60 (from Perris Boulevard to Nason Street).* Residential uses along this stretch of the freeway have soundwalls in place. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 60 (from Moreno Beach Drive to Redlands Boulevard).* Residential uses along this stretch of the freeway do not have soundwalls in place. Although Mitigation Measure 4.12.6.2A could mitigate impacts related to increases in ambient noise, the construction of mitigation on private property not controlled by the project would be controlled by the property owner and not be guaranteed. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 215 (from Mill Street to 2nd Street).* Residential uses along this stretch of the freeway do not have soundwalls in place. Although Mitigation Measure 4.12.6.2A could mitigate impacts related to increases in ambient noise, the construction of mitigation on private property not controlled by the project would be controlled by the property owner and not be guaranteed. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 215 (from Baseline Road to Highland Avenue/SR-210).* The freeway has soundwalls in place. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

~~4.13 POPULATION, HOUSING, AND EMPLOYMENT: TABLE OF CONTENTS~~

~~TABLES~~

~~THIS PAGE INTENTIONALLY LEFT BLANK~~

Note to Reader: *The cumulative portion of Section 4.13 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.13 of this Revised Sections of the FEIR. All other portions of Section 4.13 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.13 means that the corresponding portion of Section 4.13 in the FEIR remains unchanged or has been deleted.*~~*The following Section 4.13 has been revised based on revisions to the Specific Plan project size. The section has also been revised to provide clarification in response to comments made about data consistency.*[1]~~

4.13 POPULATION, HOUSING, AND EMPLOYMENT

This section identifies population and housing conditions within the City of Moreno Valley and addresses potential impacts that may result from the construction and operation of the WLC project. The analysis is based in part on population and housing projections identified by the California Department of Finance (DOF), Southern California Association of Governments (SCAG), as well as information contained in the City's General Plan.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

For the reader's reference, this EIR has been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development. ~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~[1] Mainly *Letter G-95 from Thomas Thornsley.*~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

The analysis contained in this section is based in part on the following reference documents:

- *City of Moreno Valley Draft Housing Element 2008 – 2014,* City of Moreno Valley, February 2011.
- *Economic Impacts the World Logistics Center, PowerPoint presentation to the City Council,* Beacon Economics, January 2013.

4.13.1 Existing Setting

4.13.1.1 Population Characteristics

The U.S. Census as reported by the DOF estimates the City's current (2011) population at 194,451 persons.[1] SCAG projections estimate the population of the City, Riverside County, and southern California (SCAG) regions will continue to grow. The SCAG projects the City's population will grow to 213,700 persons by the year 2020 and 255,200 persons by the year 2035 (Table 4.13.A).

Table 4.13.A: Population, Housing, and Employment Forecasts

	2011	2020	2035
Population [2]			
City of Moreno Valley	194,451	213,700	255,200
Riverside County	2,205,731	2,592,000	3,324,000
SCAG	18,163,664	19,663,000	22,091,000
Housing Units [2]			
City of Moreno Valley	55,635	60,000	72,800
Riverside County	804,913	834,000	1,092,000
SCAG	6,348,741	6,458,000	7,325,000
Employment[1]			
City of Moreno Valley	25,120	48,000	64,400
Riverside County	551,492	939,000	1,243,000
SCAG	7,224,670	8,414,000	9,441,000

4.13.1.2 Housing Characteristics

The number of housing units in the City has increased to accommodate the City's growing population (Table 4.13.B). Currently, the DOF identifies that over three-quarters of the existing housing units in the City are single-family detached units (Table 4.13.C). Multiple-unit dwellings comprise approximately 15 percent of the City's current housing stock.

Table 4.13.B: City of Moreno Valley Housing Units, 1990, 2000, and 2010

Year	Housing Units	Increase (%)
1990	37,945[1]	—
2000	41,462[2]	9.3
2010	55,559[3]	25.4

4.13.1.3 Employment Characteristics

As identified in Table 4.13.A, approximately 25,120 jobs were located within the City in 2011. Based on available data from 2012 (SCAG 2013), the largest share of Moreno Valley's jobs were in the education sector (41.5%). The top four employment sectors, education (41.5%), retail trade (17.8%), leisure/hospitality (10.8%), and professional and management (6.0%) accounted for three-fourths of jobs in the City. Table 4.13.D provides a breakdown of the percentage by job type for the most recent available data (2013). The Husing Report presented to the City Council in January 2012 also indicated that medical services and logistics were two of the few employment categories to show significant growth during the economic downturn starting in 2008 (Husing 2012).

NOTE: This table had been updated based upon the updated Profile of the City of Moreno Valley, by the Southern California Association of Governments 2013.

Table 4.13.D: City of Moreno Valley 2012 Employment Percentage by Sector

Job Sector	Percentage of Employees
Education	41.5%
Retail Trade	17.8%
Leisure/Hospitality	10.8%
Professional and Management	6.0%

Table 4.13.D: City of Moreno Valley 2012 Employment Percentage by Sector

Job Sector	Percentage of Employees
Public Administration	5.0%
Manufacturing	3.7%
Finance/Insurance/Real Estate	3.2%
Other Services	3.6%
Construction	3.1%
Transportation/Warehousing/Utilities	2.7%
Wholesale	1.6%
Information	0.8%
Agriculture	0.3%
TOTAL	100%

Source: *Profile of the City of Moreno Valley,* Southern California Association of Governments, *http://www.scag.ca.gov/Documents/MorenoValley.pdf,* date accessed February 7, 2014.

The jobs-to-housing ratio measures the extent to which job opportunities in a given geographic area are sufficient to meet the employment needs of area residents. This ratio identifies the number of jobs available in a given region compared to the number of housing units in the same region. For example, a region with a jobs-to-housing factor of 1.5 would indicate that 1.5 jobs exist for every housing unit within that region. The standard used for comparison is the jobs-to-housing ratio of the SCAG region, is currently 1.24 jobs for every household. This standard is used because most residents of the region are employed somewhere in the SCAG region. A City or sub-region with a jobs-to-housing ratio lower than the overall standard would be considered a “jobs poor” area, indicating that many of the residents must commute to places of employment outside the sub-area. Table 4.13.E shows the current and potential jobs/housing ratios for the City, Riverside County, and SCAG.

Table 4.13.E: Existing and Future Jobs/Housing Ratios1

	2011 Jobs/Housing Ratio	2035 Jobs/Housing Ratio
City	0.45	0.88
Riverside County	0.69	1.14
SCAG	1.14	1.29

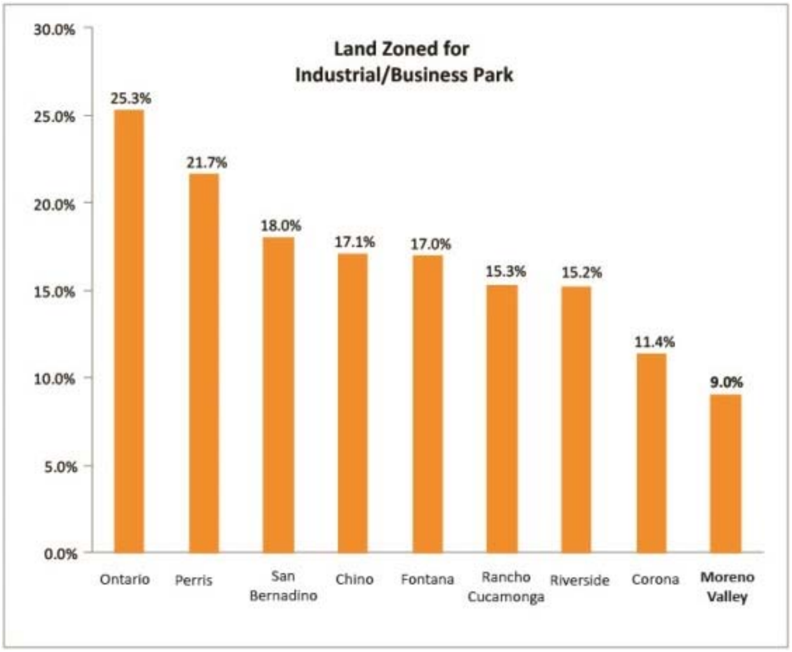
[1] Ratios calculated from values listed in Table 4.13.A

The 2011 estimated jobs-to-housing ratios for the City, County, and SCAG region are 0.45, 0.69, and 1.14, respectively. The 2035 future jobs-to-housing ratios for the City, County, and SCAG region are 0.88, 1.14, and 1.29, respectively. These ratios indicate that both Riverside County and the City of Moreno Valley are “jobs poor” because the jobs-to-housing ratios are below the Southern California region (as defined by SCAG). The Husing Report presented to the City Council in January 2012 indicated that the jobs to housing ratio for Southern California had actually declined from 1.25 to 1.04 from 2007 to 2010 as a result of the economic downturn (Slide 7, Husing 2012).

A low jobs/housing ratio results in longer distances that residents of Moreno Valley must drive to and from work. This factor may contribute to the City’s property values which are currently about half of the regional average (Source: *Profile of the City of Moreno Valley*, SCAG, May 2013). For example, the median home sales price in Moreno Valley in 2010 was $155,000 compared to the regional average of $291,000. One result of a jobs/housing imbalance is a weaker or lower tax base with which to support public services. The City also experiences a large “leakage” of potential sales tax revenue due to the resident workers’ absence during workdays, as well as the lack of business and industry taxes compared to other jurisdictions of similar size.

4.13.1.4 City Economic Conditions

Moreno Valley is Riverside County's second largest city with a population of nearly 200,000 people (2012) and a land area of more than 50 square miles. The City incorporated in 1984. The majority of the land in the City was designated for residential development. Over the years, the plan for Moreno Valley has remained overwhelmingly residential in character. Little of the City's area (approximately 9%) is allocated for job producing land uses today. More than 90 percent of the City is designated for non-commercial land uses such as residential, open space and parks[1]see figure below:



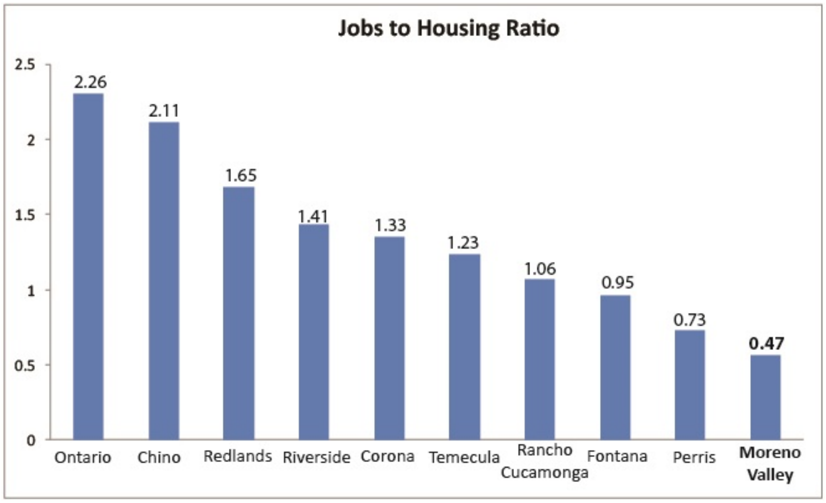
Comparison of Land Zoned for Industrial/Business Park
(Moreno Valley Economic Development Action Plan, 2011)

Moreno Valley has less than one job for every two homes (0.47), which is about one-third of Riverside's rate and about one-fifth of Ontario's, see figure below:[2]

---

[1] City of Moreno Valley Economic Development Action Plan, 2011

[2] SCAG City Profiles, May 2013; Fiscal and Economic Impact Study, David Taussig & Associates, September 2014



Comparison of Jobs to Housing Ratios *(SCAG City Profiles, May 2013; Fiscal and Economic Impact Study, David Taussig & Associates, 2014)*

This has created a significant jobs-housing imbalance which resulted in chronically difficult economic and social conditions. As a result, a large majority of Moreno Valley's workforce commutes to jobs outside the City, with an average daily commute of 76 minutes.[1] The City has a very limited tax base from which to generate tax dollars to fund expensive residential services. In 1996, the City enacted a utility tax to offset operational deficits resulting from the slowdown in residential development and the development fees which they provided.

> "The city became burdened with too much residential development, which does not generate enough property tax revenue to pay for the city services such development demands. Every new home constructed drained the city's coffers over time, and the city needed the more lucrative tax base of commerce and industry—which hasn't developed—to make up the difference." *Los Angeles Times*, October 28, 1996

Average household income in Moreno Valley is $56,000, well below the Riverside County average. Nearly one person in five or 20 percent of Moreno Valley is living below the poverty level.[2] Fifty percent of the population has a high-school education or less and Moreno Valley has one of the highest high-school drop-out rate in the county.

Unemployment in Moreno Valley remains the highest in the region at 9.7 percent[3] and median house prices are among the lowest in the Inland Empire at $158,000.[4] See figures below:

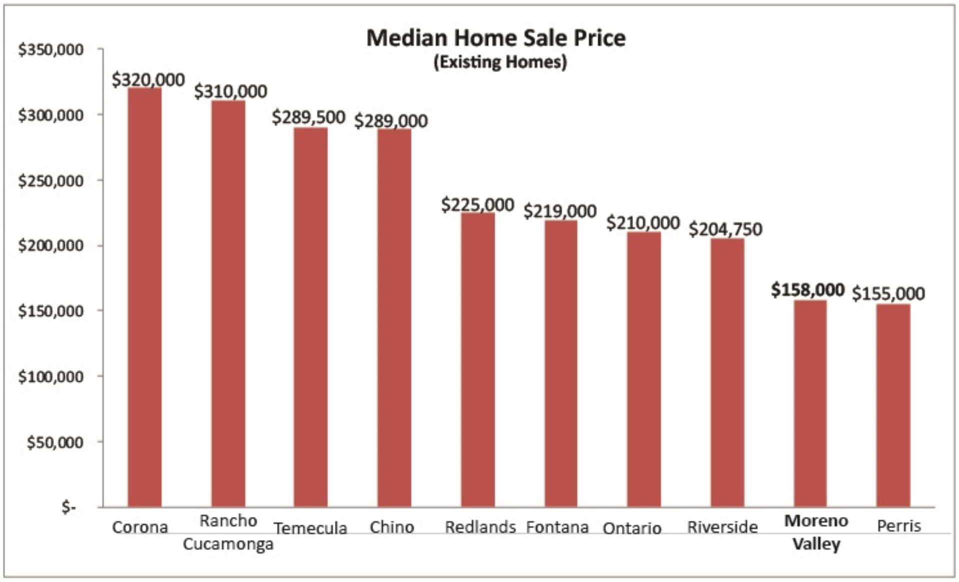
Comparison of Unemployment Rates *(Monthly Labor Force Data for Cities, California Employment Development Department, April 2014)*



Comparison of Median Home Sale Prices
(SCAG City Profiles, May 2013)

In April of 2011, the City adopted a 2-year Economic Development Action Plan as a short-term and long-term approach to the difficult economic conditions facing the City. The logistics and healthcare industries were identified as the two primary areas of opportunity for the City. The Action Plan focused on five areas of opportunity in the City and established key initiatives for each one. In April 2013 the City conducted additional public hearings and adopted a 3-year Action Plan which established fourteen objections aimed at increasing the City’s overall economic development efforts and expanded these efforts to nine areas in the City. The World Logistics Center project is identified as one of the Action Plan's goals for eastern Moreno Valley. The World Logistics Center project directly responds to the City's Action Plan, representing a major shift in the City's approach to long-range community planning and economic stability.

4.13.1.5 Economic Assessment Factors

The *Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California* (David Taussig & Associates, Inc. (DTA), 2014) prepared for the WLC project evaluates the likely fiscal and economic impacts of the WLC project within the City. The following information is from the Executive Summary of the DTA study:

> The purpose of the study is to estimate the net fiscal impacts of the WLC project and construction of the project on the City's General Fund. The fiscal impacts identified in the study include recurring municipal revenues and costs to the City General Fund that result from the land use scenario analyzed. City General Fund revenues are generated from a variety of sources including property taxes, sales taxes, fees, and fines. Costs to the City's General Fund are associated with a variety of services, such as police protection, fire protection, public works maintenance, and general government services. While the City also expends revenues from a series of other special funds outside of the General Fund, these revenues include a Moreno Valley Library property tax, Community Services District and Community Facilities District assessments and special taxes, and various enterprise funds. As these revenues are generally equal to the cost of the services that they finance, they are essentially break-even and are not typically included in a fiscal analysis for a municipality. As a result, most fiscal analyses focus on the General Fund, where any shortfalls or surpluses can be easily identified, and such is the case for this Study.
>
> However, in preparing the World Logistics Center's (the Center) fiscal analysis, DTA did notice certain anomalies occurring related to the Moreno Valley Fire property tax, in that the revenues generated by this special fund appear to be greater than the fund's expenditures on fire services to be provided by the City to the Center. While the projected fiscal surplus generated by the Moreno Valley Fire property tax fund was not included in the General Fund analysis, DTA felt that a brief discussion of this revenue source within the text of the Study would better inform the public regarding the entire fiscal impact of the Center on the City.
>
> The fiscal analysis focuses on the impacts of the Center on the General Fund if it were built during fiscal year 2012-13, based on cost and revenue criteria and assumptions existing during that fiscal year. As is the case for most General Fund fiscal analyses, it would be speculative to *Fiscal & Economic Impact Study May 21, 2014 World Logistics Center – City of Moreno Valley Page II* project future cost and revenue factors because there is no certainty regarding what those factors will be. For example, while the City will be increasing its annual costs as it eliminates a furlough program that it established during the Great Recession, the Center itself is expected to generate additional revenues in future fiscal years due to increases in logistics facilities property values above the $90 per square foot assumed in the Study. Based on a recent appraisal prepared by Coldwell Banker, the Center site's property valuation has already increased by more than 10%. Assumptions made regarding the relative levels of cost and revenue increases for factors such as these in future years would typically create a bias in the fiscal analysis that could in itself invalidate the results of the Study.

The DTA study also identifies the general economic impacts on the City that would occur and quantifies these impacts wherever possible. General economic impacts include additions to the City's employment, economic output, and earnings. The study also distinguishes between one-time impacts and permanent impacts. One-time impacts include benefits to the City that occur on a non-recurring basis as a result of construction activity, while permanent impacts refer to benefits that occur on a continuing basis, year after year. An examination of these conditions relative to potential population, housing and employment impacts is provided in Section 4.13.5.1, *Population Growth*.

4.13.1.6 NOP/Scoping Comments

A representative of a conservation group and several individuals said the EIR should address the loss or transfer of 7,700 housing units from the Moreno Highlands Specific Plan to other locations in the City. Some residents commented that fiscal commitments by the City on other local projects by this developer have resulted in expenditures of funds that could otherwise have been used for City services. It should be noted the analysis of this change was largely addressed in the updated (2011) Housing Element that recognized the Moreno Highlands Specific Plan would probably not be built.

4.13.2 Existing Policies and Regulations

4.13.2.1 Federal Regulations

The Federal Community Development Block Grant (CDBG) monies are part of Federal housing assistance programs at the local level. Housing and Urban Development (HUD) and CDGB monies are a function of the potential change in the jobs and housing mix (http://www.hud.gov/offices/cpd/about/conplan/). The HUD's Office of Community and Planning Development's (CPD's) Consolidated Plan is designed to help states and local jurisdictions to assess their affordable housing and community development needs and market conditions, and to make data-driven, place-based investment decisions. The consolidated planning process serves as the framework for a communitywide dialogue to identify housing and community development priorities that align and focus funding from the four CPD formula block grant programs: the CDBG, the HOME Investment Partnership (HOME), the Emergency Solutions Grant (ESG) program, and the Housing Opportunities for Persons with AIDS (HOPWA) program.

CPD Maps is an online data mapping tool for place-based planning. Grantees and the public can use CPD Maps to analyze and compare housing and economic conditions across their jurisdictions. The CPD Maps tool is publicly available, giving all community stakeholders access to the same data. The Consolidated Plan template allows grantees to insert maps and data tables from CPD Maps with ease, throughout their plans.

4.13.2.2 State Regulations

The Regional Housing Needs Assessment (RHNA) is mandated by State Housing Law as part of the periodic process of updating local housing elements of the General Plan. The RHNA quantifies the need for housing within each jurisdiction during specified planning periods. The most recently completed RHNA planning period is January 1, 2006, to June 30, 2014. Due to the requirements of SB 375, SCAG is preparing the next RHNA planning cycle, which will cover October 1, 2013, to September 30, 2021.

4.13.2.3 Regional and Local Regulations

County of Riverside Housing and Land Use Policies. The Housing Element is one of the seven General Plan elements mandated by the State of California as articulated in Sections 65580 and 65589.8 of the Government Code. Each city and county is required to discuss how it will meet its fair share of the housing need in the State.

The County of Riverside has a relevant policy in the Land Use Element of the County General Plan. To support future growth of the population and housing stock in the County of Riverside, the Land Use Element contains policies to ensure adequate utilities for new development (County of Riverside 2003). Specifically the policy LU 1.6 states…"Coordinate with local agencies, such as the Local Agency Formation Commission (LAFCo), service providers, and utilities to ensure adequate service provision for new development."

City of Moreno Valley General Plan. The City's General Plan Chapter 9 (Goals and Objectives) establishes goals and objectives to guide the development, redevelopment, and preservation of a balanced housing inventory within the City. Specific policies relevant to the WLC project include:

Objective 2.5	Promote a mix of industrial uses which provides a sound and diversified economic base and ample employment opportunities for the citizens of Moreno Valley with the establishment of industrial activities that have good access to the regional transportation system, accommodate the personal needs of workers and business visitors; and which meets the service needs of local businesses.
Goal 2.2	An organized, well-designed, high quality, and functional balance of urban and rural land uses that will meet the needs of a diverse population, and promote the optimum degree of health, safety, well-being, and beauty for all areas of the community, while maintaining a sound economic base.
Goal 2.4	A supply of housing in sufficient numbers suitable to meet the diverse needs of future residents and to support healthy economic development without creating an oversupply of any particular type of housing.

4.13.3 Methodology

To determine the potential for impacts related to population and housing, the current uses, overall condition of the project site, historic and current population and housing characteristics, and future projections for population, housing, and employment were identified. This analysis is based on data published by the DOF and SCAG, as well as information presented in the City's General Plan and the County of Riverside General Plan.

As identified in the study prepared by David Taussig & Associates, Inc. (DTA), fiscal impacts arising from a land development project can be broadly categorized as one of two types: one-time and recurring impacts. Each of these broad types can be divided into a revenue component and a cost component. The study assumes that one-time revenues would directly offset one-time costs; therefore, the fiscal impacts considered focus on ongoing, or recurring, fiscal impacts of the WLC project on the City's General Fund. Revenues generated outside of the City's General Fund (e.g., special district revenue) or costs incurred by the City outside of the General Fund (e.g., costs financed through a special district) are not included in this analysis.

This methodology involves calculating the average citywide revenues/costs per Persons Served,[1] utilizing the fiscal year 2012–2013 City budget, and applying these revenue/cost factors to the specific number of Persons Served projected for the WLC project. For analysis purposes, all recurring revenues and costs are stated in constant (uninflated) 2012 dollars based on the assumption that the relative impacts of inflation in future years will be the same for both of these fiscal impact categories.

---

[1] A service population comprising all residents and 50% of employees.

Direct economic impacts reflect the initial or first-round increases in jobs, earnings, and output, all of which occur directly on site. Indirect/induced economic impacts are the secondary and other additional rounds of economic activity that occur as a consequence of the direct impacts, and can occur elsewhere within the City. The indirect impacts represent the economic activity (buying and selling of goods and services) of suppliers to the proposed land uses. The induced impacts represent the economic activity that results from household spending by employees of all companies directly and indirectly affected by the construction and operation of the WLC project. The study estimated the number of direct employees in the WLC project based upon an average employee per square foot ratio for similar land uses in the region. Additionally, all economic impacts are stated in constant (uninflated) 2012 dollars, based on the assumption that the relative impacts of inflation in future years may be difficult to gauge.

4.13.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts related to population and housing are based on *CEQA Guidelines* (2011). A project would have a significant impact on population and housing if it would:

- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);
- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) that may lead to fiscal or economic impacts;
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere; and/or
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

4.13.5 No Impact/Less than Significant Impacts

4.13.5.1 Population Growth

Threshold	Would the WLC project induce substantial population growth in an area, either directly (e.g., new homes and businesses) or indirectly (e.g., extension of roads and infrastructure)? Would the WLC project induce substantial population growth in an area, either directly (e.g., new homes and businesses) or indirectly (e.g., extension of roads and infrastructure) that may lead to fiscal or economic impacts?

Growth-Related Impacts. CEQA requires a discussion of ways in which the WLC project could be growth inducing (see also Section 5.0, *Other CEQA Topics*). The *CEQA Guidelines* identify a project as growth inducing if it fosters economic or population growth, or the construction of additional housing either directly or indirectly in the surrounding environment (*CEQA Guidelines* Section 15126.2[d]). New employees from commercial or industrial development and new population from residential development represent direct forms of growth. These direct forms of growth have a secondary effect of expanding the size of local markets and inducing additional economic activity in the area.

A project could indirectly induce growth by reducing or removing barriers to growth, or by creating a condition that attracts additional population or new economic activity. However, a project's potential to induce growth does not automatically result in growth. Growth can only happen through capital investment in new economic opportunities by the private or public sectors. Under CEQA, growth inducement is not considered necessarily detrimental, beneficial, or of little significance to the environment. Typically, the growth-inducing potential of a project would be considered substantial if it fosters growth or a concentration of population in excess of what is assumed in pertinent master plans, land use plans, or in projections made by regional planning agencies (e.g., SCAG). Substantial growth impacts could also occur if a project provides infrastructure or service capacity to accommodate growth beyond the levels currently permitted by local or regional plans and policies. In general, growth induced by a project is considered a significant impact if it directly or indirectly affects the ability of agencies to provide needed public services, or if it can be demonstrated that the potential growth significantly affects the environment in some other way.

A project could indirectly induce growth at the local level by increasing the demand for additional goods and services associated with the increase in project population and thus reducing or removing the barriers to growth. This occurs in suburban or rural areas where population growth results in increased demand for service and commodity markets responding to the new population. This type of growth is, however, a regional phenomenon resulting from introduction of a major employment center or regionally significant housing project. Additional commercial uses may be drawn to the area by the increased number of residents in the area as a result of a project; however, it is expected that any such development would occur consistent with planned growth identified in the General Plan or applicable specific plans.

As shown in previously referenced Tables 4.13.A and 4.13.B, the City's population has grown steadily over the past decades. Population projections developed by SCAG estimate the City's population will reach approximately 213,700 persons by the year 2020 and approximately 255,200 persons by the year 2035.

NOTE: The following changes have been made due to revision to the Specific Plan project size.

The extent to which the new jobs created by a project are filled by existing residents is a factor that tends to reduce the growth-inducing effect of a project. Construction of the WLC project will create short-term construction jobs. These short-term positions are anticipated to be filled by workers who, for the most part, reside in the project area; therefore, construction of the WLC project will not generate a permanent increase in population within the project area. Development envisioned under the proposed WLCSP consists of approximately 40.6 million square feet of logistics warehouse and general warehouse facilities (WLCSP, September 2014).

An economic study of the project prepared by DTA concluded that the WLC project could directly generate up to 20,300 new jobs within the City.[1] In addition to the projected on-site job creation, the DTA study estimates the WLC project could generate new off-site jobs (i.e., indirect/induced employment) in all industries of the economy. The DTA study also estimated that an additional 7,386 indirect/induced jobs could be created in the County, of which 3,693 jobs were projected to be within the City as a result of project implementation. This estimate is derived from the Impact Analysis for Planning (IMPLAN) Input/Output Modeling System, which is a quantitative economic model that provides an approximate measure of the "multiplier effect" of a firm's spending on payroll and purchase of goods and services. While the specific location of the potential additional indirect/induced jobs created within the County cannot be specifically determined, it is reasonable to assume that some percentage of these jobs will be support service jobs and are likely to be located in the WLC project vicinity, and therefore the City.

---

[1] Table B, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California (David Taussig & Associates, Inc., September 2014.

The WLC project does not include a residential component. The WLC project is located within an area that is currently largely vacant and planned for mix of residential, commercial, business park, and open space land uses in accordance with the General Plan Community Development Element. The WLC project includes a General Plan Amendment to change the existing mix of land use designations to Logistics Development and Light Logistics.

If approved, the WLCSP would supplant the approved Moreno Highlands Specific Plan (MHSP) project that did have a residential component. The EIR for that project indicated it would have increased the City's population by 17,019 persons over 15 years (7,736 units × 2.2 persons/unit). However, because the City is considered housing rich (and jobs poor) by SCAG, the loss of that projected population growth is not considered a significant impact and, in fact, a number of State policies (e.g., SB 375) encourage the creation and development of jobs-producing development in areas with poor jobs/housing numbers such as that which exists in the City.

Most of the site has been used for dry farming since the early 1900s and much of the WLC project site continues to be used for dry farming at the present time. Currently, there are seven single-family homes in various locations on the property along with associated ranch/farm buildings. Streets, water and sewer utilities, and municipal services would be extended to serve the WLC project. The WLC project may benefit other development projects in the project area by the installation of infrastructure (e.g., roads and utilities), but is not expected to induce substantial population growth into the area since there would be no large areas of vacant land left in the east end of the City (south of SR-60) that could be developed with residential uses.

Development of high-cube logistics warehouse and general warehouse facilities will create jobs in the local economy. However, it is difficult to predict exactly how many new jobs would be generated by the proposed WLCSP. One concern expressed during the NOP/scoping period was the amount of new employment that would actually be generated by the WLC project. Table 4.13.F provides several sources for estimating potential new direct employment for the project, which could range from 16,240 to 21,315 jobs, depending on what data source is selected to predict future employment within the WLCSP.

NOTE: The following changes to the table have been made due to revision to the Specific Plan project size and to clarify the discussion on projected jobs by the Skechers and HF Corporate Park.

Table 4.13.F: Comparison of Direct Employment Projections for Other High-Cube Logistics Projects

Source/Project (Jurisdiction)	Jobs / 1000 ft^2)	Square Feet/ Employee	Square Feet of Building	Projected Direct Jobs
World Logistics Center[1] Specific Plan (City of Moreno Valley)	0.5:1,000	2,000:1	40,600,000	20,300
Stratford Ranch[3] (City of Perris)	0.4:1,000	2,500:1	1,712,880	685
Skechers Only (City of Moreno Valley)	0.5:1,000	2,000:1	1,820,000	910[4]
Husing Logistics Report[5] (City of Moreno Valley)	0.525:1,000	1,906:1	NA	NA
Vogel Industrial Project[6] (City of Moreno Valley)	0.4:1,000	2,500:1	1,616,133	646

Table 4.13.F: Comparison of Direct Employment Projections for Other High-Cube Logistics Projects

Source/Project (Jurisdiction)	Jobs / 1000 ft^2)	Square Feet/ Employee	Square Feet of Building	Projected Direct Jobs

[1] DTA Public Works Database; confirmed by "Employment Density Study," SCAG (2001), and "Logistics Trends and Specific Industries," NAIOP Research Foundation (March 20110).

[3] Inland Empire Distribution Center Operations Profile, WCL Consulting, June 10, 2008. 2,500 square feet per employee is an average of the Inland Empire rates.

[4] Total projected direct employment.

[5] From Husing report to the City Council in January 2012 based on 2003 study by U.S. Energy Information Agency shipping and distribution centers increase by 5% making it 1 employee/ 2,000 square feet.

[6] Inland Empire Distribution Center Operations Profile, WCL Consulting, June 10, 2008. 2,500 square feet per employee is an average of the Inland Empire rates.

It should be understood that the actual eventual number of employees generated by the project will vary depending on a variety of economic factors (e.g., actual companies that relocate and current hiring conditions). The projected employment estimate also does not take into account relocation of existing employees from other jurisdictions as a result of existing businesses relocating into the WLC project. However, these would be counted as "new" employees for the City of Moreno Valley. For the purposes of this analysis, the EIR will use 20,300 employees working at the WLC or one employee per 2,000 square feet as a conservative estimate (in terms of environmental impacts) for future employment growth from WLCSP development.

The new employment opportunities resulting from development of the proposed high-cube logistics warehouse and general warehouse uses will raise the City's current jobs-to-housing ratio by providing additional jobs to local residents. While the place of residence of the persons accepting employment provided by the proposed uses is uncertain, due to the City's projected jobs/housing ratio, it is reasonable to assume and therefore expect that some percentage of these jobs would be filled by persons already living within the City or project area. Therefore, no significant increase in population of the City would result from the development or operation of the WLC project, resulting in a less than significant impact associated with growth inducement and no mitigation is required.

The second threshold for significance is "Would the WLC project induce substantial population growth in an area, either directly (e.g., new homes and businesses) or indirectly (e.g., extension of roads and infrastructure) that may lead to fiscal or economic impacts?" In that regard, the following provides an analysis of the projected fiscal effects of the proposed WLCSP project.

Indirect City Population Impacts Related to Fiscal and Economic Changes. If the MHSP project is not built, it could be argued the City may experience a financial impact from the loss of property tax, sales tax, and other revenues related to growth and development. The following analysis demonstrates that the City will benefit financially by employment and development of logistics warehousing as a result of the WLCSP project.

As detailed in the DTA study, recurring municipal revenues available to the City include those listed in Table 4.13.G. Total recurring revenues available to the City are estimated at approximately $11,257,466 per year. As shown in Table 4.13.G, the greatest percentage of revenue is attributed to the Property Tax In-Lieu of Vehicle License Fee (40.2%), followed by Secured Property Tax (29.1%), and Business Receipts Tax and Licenses (10.8%).

Table 4.13.G: Recurring Fiscal Revenues City of Moreno Valley (City General Fund)

Source	Amount	Percent[1]
Property Tax In-Lieu of Vehicle License Fee	$ 4,522,818	40.2%

Table 4.13.G: Recurring Fiscal Revenues City of Moreno Valley (City General Fund)

Source	Amount	Percent[1]
Secured Property Tax	$ 3,276,191	29.1%
Business Receipts Tax & Licenses	$ 1,210,847	10.8%
Tax Revenues	$ 607,657	5.4%
Indirect Sales Tax	$ 423,144	3.8%
Charges for Services	$ 386,032	3.4%
Unsecured Property Tax	$327,619	2.9%
Franchises	$ 251,896	2.2%
Property Transfer Tax	$ 100,495	0.9%
Intergovernmental Revenues	$ 60,918	0.5%
Licenses/Permits	$ 57,771	0.5%
Direct Sales Tax	6,000	0.1%
Other Revenues	$ 12,285	0.1%
Fines and Forfeitures	$ 6,498	0.1%
Transfers In	$ 3,757	0.0%
Use of Money & Property	$ 2,538	0.0%
Total	**$ 11,257,466**	**100.0%**

[1] Numbers may not sum correctly due to rounding to the nearest hundredth.
Source: Table 3A, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates, September 2014.

Recurring municipal services costs to the City include those listed in Table 4.13.H. Total recurring costs to the City are estimated at approximately $5,557,674 per year. As shown in Table 4.13.H, the greatest percentage of cost is attributed to the Police Services (35.8%), followed by Infrastructure and Parks Maintenance Costs (34.1%), and Fire Services (13.3%).

Table 4.13.H: Recurring Fiscal Costs City of Moreno Valley (City General Fund)

Source	Amount	Percent[1]
Police	$ 1,992,019	35.8%
Infrastructure & Parks Maintenance Costs	$ 1,895,474	34.1%
Fire Services	$ 739,545	13.3%
General Government	$ 391,715	7.0%
Development Services	$ 211,893	3.8%
Public Works	$ 109,551	2.0%
Transfers Out	$ 63,761	1.1%
Other Uses	$ 63,659	1.1%
Animal Services	$ 47,719	0.9%
Community Development	$ 42,338	0.8%
Total	**$ 5,557,674**	**100.00%**

[1] Numbers may not sum correctly due to rounding to the nearest hundredth.
Source: Table 3B, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September, 2014.

Table 4.13.I provides an overall summary of the fiscal impact to the City based on projected revenues generated by the WLC project. As shown in Table 4.13.I, project recurring annual fiscal surplus that would be available to the City is estimated at $5,699,792, which is equal to 2.03 times the project annual City General Fund costs.

Table 4.13.I: Net Fiscal Impact City of Moreno Valley (City General Fund)

Category	Amount
Total Recurring Revenues	$ 11,257,466
Total Recurring Costs	$ 5,557,674
Annual Recurring Surplus/(Deficit)	**$ 5,699,792**
Total Annual Revenue/Cost Ratio	2.03

Source: Table 3C, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September 2014.

Table 4.13.J presents the project characteristics that are the basis for the fiscal impact assessment. The locations of the additional indirect jobs that will be created within the County cannot be specifically determined; however, some percentage of these jobs will be support service jobs and are likely to be located in the general project vicinity. Based on experience with similar types of projects, DTA estimated that half of these indirect jobs would be located within the City. The study also considers Total Output (i.e., total expenditures including sales or gross receipts, or other operating income) based on the different types of development projected to occur. For gross receipts, the study considers the initial or first-round increase in output (e.g., total spending/gross receipts, including payroll), all of which would occur directly on site. Indirect impacts represent the economic activity of supplier and/or supporting businesses. Induced impacts represent the economic activity that results from household spending by employees that may result from direct and direct employment generation of the WLC project.

NOTE: The following changes to the table have been made due to revision to the Specific Plan project size.

Table 4.13.J: Project-Related Economic Characteristics

Land Use Assumptions	**Square Feet**
Logistics Development (LD)	40,397,000
Light Logistics (LL)	200,000
“logistics support” fueling station	3,000
Employment Assumptions[1]	**Employees Per 1,000 Square Feet**
Logistics (LD/LL)	0.50
Retail (“light logistics”)	2.50
Wage Assumptions[2]	**Annual $**
Warehousing/Transportation (Logistics)[3]	$ 40,926
Construction	$ 48,825
Retail (“light logistics” fueling station)[4]	$22,885
Riverside County Average (2010)	$ 40,602

As previously noted, potential economic impacts that may occur with project implementation include permanent employment (direct on site and indirect/induced), permanent output (gross receipts; total direct output plus output produced by suppliers and employee spending), and one-time construction impacts. Table 4.13.K summarizes the permanent (recurring) employment, wage, and gross receipts values associated with the WLC project.

Table 4.13.K: Project Permanent (Recurring) Employment, Wages ,and Gross Receipts

Recurring Impact	Direct	Indirect/Induced	Total
Employees			
Countywide	20,307	7,387	27,693
Within City	20,307	3,693	24,000
Employee Wages			
Countywide	$831 Million	$ 300 Million	$ 1.13 Billion
Within City	$ 831 Million	$150 Million	$ 981 Million
Overall Output			
Countywide	$1.5 Billion	$ 870 Million	$2.37 Billion
Within City	$1.5 Billion	$435 Million	$1.94 Billion

Source: Tables 4B and 4C, Fiscal and Economic Impact Study World Logistics Center Moreno Valley, David Taussig and Associates September 2014.

The DTA study indicates that the creation of new jobs to the City will lead to more consumer spending by employees in existing retail establishments within the City, as well as new retail development that will be attracted to the City as a result of this spending. Job creation also results in increased tax revenues to the City through increased property taxes and sales taxes associated with development of the WLC project. However, it is important to note that because of the difference in timing of the development of the various phases of the WLC project, the number of employees summarized above will not be realized at the same time.

Table 4.13.L summarizes the construction (one-time) employment, wages, and gross receipts values associated with the WLC project.

Table 4.13.L: Project Construction (One-Time) Employment and Wages and Gross Receipts

Recurring Impact	Direct	Indirect/Induced	Total
Construction Employees			
Countywide	12,807	7,426	20,233
Within City	12,807	3,714	16,521
Construction Wages			
Countywide	$625 Million	$301 Million	$ 927 Million
Within City	$625 Million	$151 Million	$776 Million
Total Output from Construction Jobs			
Countywide	$ 1.67 Billion	$ 932 Million	$ 2.6 Billion
Within City	$ 1.67 Billion	$ 466 Million	$ 2.14 Billion

Source: Tables 4D and 4E Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California, David Taussig and Associates, September 2013.

As summarized in Table 4.13.L, development of the WLC project is projected to create approximately 16,521 construction-related full-time equivalent (FTE) jobs within the City. Similar to recurring employment (i.e., permanent), it is likely that some percentage of these jobs will be associated with support services and are likely to be located in the vicinity of the WLC project and therefore within the City.

The WLC project does not include a residential component, so it would not directly generate additional new housing. Employees of the project that choose to live in the City would likely utilize the existing supply of housing within the City.

Based on the potential increase in jobs (additional 20,307 direct jobs) within the City and no substantial increase in population as a result of the project, the City's jobs-to-housing ratio would improve from the existing (2011) ratio of 0.45 to 0.82, thus achieving a greater jobs-to-housing balance within the City. Similarly, the potential new County employees that may be generated by the WLC project would increase the total County employment to 571,799 from 551,492 resulting in a ratio of 0.71 from 0.69.

As development of the WLC project is expected to occur over the course of many years, the jobs-to-housing ratio will not significantly change immediately. The City's current jobs-to-housing ratio is exceptionally low when compared to SCAG standards; therefore, the need for employment is immediate. A balance between jobs and housing within the City would have a positive impact by decreasing costs associated with commuting and traffic congestion. It also provides savings to consumers in the operation and maintenance of automobiles, and saving to local public agencies in terms of the need to construct and maintain new road improvements.

Summary of Impacts. Based on the foregoing discussion and as evidenced in Tables 4.13.I, 4.13.K, and 4.13.L, implementation of the WLC project would not result in a deficit in the City's General Fund. The estimated surplus is $5,699,792, which is equal to 2.03 times the projected annual City General Fund costs. Additionally, the WLC project is expected to generate sizeable, substantial, and lasting employment, wages, output, and revenues for the City and region. Therefore, potential fiscal and economic changes that could affect the City's population or housing are considered to be less than significant, and no mitigation is required.

4.13.5.2 Displace Substantial Housing/People

Threshold	Would the WLC project displace substantial numbers of people or existing housing, necessitating the construction of replacement housing elsewhere?

Displace Existing People/Housing. The WLC project site currently contains seven rural residences. At the City Council meeting on May 22, 2012, some of the existing residents stated that they did not want to be included in the Specific Plan. After deliberation, the Council decided to include the rural properties in the Specific Plan in the interest of comprehensive land planning for the WLC property. Upon approval of the Specific Plan, these properties can continue as non-conforming uses, and the WLC Specific Plan designates these properties as "Light Logistics" (LL), which allows for future industrial-related uses (vehicle storage, light assembly, etc.). In this way, the WLCSP will not remove or displace any of the existing residents or residences from the project site. As large warehouse buildings are developed near or adjacent to these residences, it may become less desirable to reside within the WLCSP area; however, the project itself does not cause housing displacement.

Therefore, impacts to the seven on-site residences would not be considered a significant housing impact. For these reasons, the WLCSP will not have significant population or housing impacts related to displacing substantial numbers of people or existing housing.

Displace Potential Future People/Housing. The City of Moreno Valley has been housing "rich" for many years, with much more housing stock than jobs according to data available from the SCAG. In addition, the recent economic downturn and related foreclosure/short sale conditions have left Moreno Valley, as with many housing rich communities, with an overabundance of housing stock. Section 4.10, *Land Use and Planning*, examines the potential environmental impacts related to the "loss" of 388 affordable housing units from the MHSP, as outlined in the City's 2011 Housing Element. The Element acknowledges that the MHSP property may have to be used for employment-generating uses, and that "land use changes with the Moreno Highlands Specific Plan area will not hinder the City's ability to meet its RHNA obligations."[1] The 2011 Housing Element therefore documents that the City has an abundant supply of housing and can meet its RHNA requirements without relying on any units from the MHSP.

During the NOP/scoping process, several residents commented that development of the proposed WLCSP would result in the loss of 7,700 housing units from the project site that would have to be "made up" elsewhere in the City. The 2006 City Housing Element identified a potential for 5,240 units of the potential 7,700 housing units in the Moreno Highlands Specific Plan. However, an updated Housing Element adopted by the City in February 2011 indicated the Moreno Highlands area would be rezoned to support employment-generating uses rather than housing. It also concluded that "pursuing any land use changes with the Moreno Highlands Specific Plan area will not hinder the City's ability to meet its RHNA obligations." The term RHNA refers to the Regional Housing Needs Allocation (affordable housing allocations) from the SCAG.

Table 8-19.5 in the 2011 Housing Element states that after removing sites south of SR 60 and east of Redlands Boulevard, the Amended Inventory throughout the City west of Redlands accommodates:

- 4,100 Low and Very Low Income units, which is 1.3 times the RHNA number (3,045) (deleting sites south of SR-60 and east of Redlands Boulevard has no effect on low and very low income housing opportunities);
- 2,600 Moderate Income units, which is 2.1 times the RHNA number (1,239);
- 7,828 Above Moderate Income units, which is 2.5 times the RHNA number (3,068); and
- 14,528 total identified units, which is 1.94 times the total RHNA number (7,474).

Therefore, removal of the 388 affordable units originally identified in the MHSP (Table 8-19, page 40 of the Housing Element), including 233 "Very Low" and 155 "Low" units, will not have a significant impact on the City's Housing Element or its ability to achieve its RHNA allocation.

The State Housing and Community Development Department (HCD) certified the City's Housing Element as compliant with State law on May 31, 2011. This State HCD certification reinforces the conclusion that approval of the project will not impede the City's housing goals as set forth in the City's Housing Element.

In April 2011, the City adopted its Economic Development Action Plan, which also identified the eastern part of the City as a potential area for major job-producing land uses. The *Fiscal and Economic Impact Study World Logistics Center Moreno Valley, California* ("Study") prepared by DTA in 2014 concluded that the WLC project would generate 20,307 direct jobs/employees to the City. Section 4.10.5.3 determined that the WLC project is consistent with the 2011 Housing Element, and it will not displace substantial numbers of existing housing or necessitate the construction of replacement housing elsewhere. Therefore, no significant displacement impacts relative to people or housing are expected to occur, and no mitigation is required.

---

[1] Page 41, City of Moreno Valley Housing Element, February 2, 2011.

4.13.6 Significant Impacts

Based on the analysis in Section 4.13.5, the WLC project will not have any significant impacts relative to population, housing, or employment. Therefore, no mitigation is required. However, in response to Comment F-8-94 and other related comments, the Final EIR Volume 1 recommends the City add the following text to the WLCSP Development Agreement approval with the concurrence of the applicant:

> "*Highland Fairview will establish a WLC Local Hiring Program to actively encourage the hiring of Moreno Valley residents for job opportunities at the World Logistics Center. Highland Fairview will encourage its contractors, suppliers and tenants to be active participants in a Moreno Valley Employment Resource Center (ERC) job opportunity announcement program.*
>
> *World Logistics Center employers will be encouraged to submit all job announcements to the Moreno Valley Employment Resource Center at least one week prior to providing such announcements to other agencies or to the general public. Potential employers will be urged to provide information regarding job opportunities to the ERC including details regarding job titles, minimum qualifications, application processes, and employer contact information.*"

~~4.13.7 Cumulative Impacts~~

~~The cumulative area for the discussion of population and housing impacts is the City of Moreno Valley. The proposed WLC project would require a General Plan Amendment and Zone Change to re-designate the site from a mix of land uses and zoning designations to Logistics Development and Public Utility land uses and a Specific Plan zoning designation. The project would not contribute to substantial population growth and therefore would not result in an increased demand on the current or future housing in the region. In addition, the Moreno Valley area is considered housing rich and jobs poor by SCAG, so the loss of population (and planned housing) would actually be a regional benefit according to the Regional Transportation Plan. The project may result in an influx of new workers who would need to locate temporarily or permanently in the area, but the City has an overabundance of existing housing stock due to current market conditions. Implementation of the proposed WLC project would actually benefit population and housing conditions relative to employment and jobs/housing ratio and, therefore, not result in cumulatively adverse impacts to population or housing. The WLC project would also not significantly induce growth into areas where growth was not previously anticipated since the WLC project area represents the last largest remaining vacant land in the City of Moreno Valley.~~

~~4.14 PUBLIC SERVICES AND FACILITIES: TABLE OF CONTENTS~~

~~FIGURES~~

~~TABLES~~

NOTE TO READERS. *The cumulative portion of Section 4.14 has been deleted from the FEIR to allow for its reanalysis to include the impacts expected from other past, present and reasonably foreseeable future projects. The revised cumulative analysis can be found in Section 6.14 of this Revised Sections of the FEIR. All other portions of Section 4.14 of the FEIR remain unchanged. The absence of reference to a portion of Section 4.14 means that the corresponding portion of Section 4.14 in the FEIR remains unchanged or has been deleted.~~No major revisions have been made to this section in response to comments other than changes related to the revised Specific Plan~~.*

4.14 PUBLIC SERVICES AND FACILITIES

This EIR discussion includes an evaluation of police and fire services, as well as schools and parks. The analysis considers these public services in the project vicinity and evaluates the impacts to service providers that would result from the construction and operation of the proposed uses as described in the Specific Plan. The analysis contained in this section is based on the following reference documents:

- City of Moreno Valley General Plan, City of Moreno Valley, July 11, 2006;
- City of Moreno Valley General Plan Final EIR, City of Moreno Valley, July 2006;
- Letter from Joel Ontiveros, Moreno Valley Police Department Chief, July 10, 2012;
- Letter from City Fire Chief Abdul R. Ahmad dated June 27, 2012;
- Moreno Valley School District website information on Developer Impact School Fees; and
- San Jacinto Unified School District website May 2012.

~~NOTE: The following changes have been made due to revision to the Specific Plan project size~~.

For the reader's reference, this EIR has been written to evaluate the potential environmental impacts associated with the entitlement, construction and operation of the 40.6 million square feet World Logistics Center Specific Plan, as well as its associated infrastructure. The World Logistic Center Specific Plan covers 2,610 acres and associated off-site infrastructure covers 104 acres of land needed to support the development. ~~and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements.~~ The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.

This section describes the existing public services within the City of Moreno Valley. The project site consists of the lands within the project boundaries and the project vicinity. The project vicinity consists of areas adjacent to the project site. This section differs slightly from other sections in that it is organized by the public service provider so continuity is maintained. Police Service is found in Section 4.14.1, Fire Protection is found in Section 4.14.2, Schools are found in Section 4.14.3, Parks are found in Section 4.14.4, and Cumulative Impacts are found in Section 4.14.5.

4.14.1 Police Protection

4.14.1.1 Existing Setting

The City of Moreno Valley contracts with the Riverside County Sheriff's Department (RCSD) for police services. Through this contract, the RCSD staffs the Moreno Valley Police Department (MVPD). The MVPD Chief provided a letter on July 10, 2012, that provided the following information on police service in the City. The MVPD has a service area of 51.5 square miles and a service population of 196,495 people. The main police station is located in the City Public Safety Building (PSB) at 22850 Calle San Juan De Los Lagos in Moreno Valley. In addition, the MVPD operates four storefront substations throughout the City. The MVPD occupies 44,800 square feet or 98 percent of the 45,900-square foot PSB with the remainder used by the City Fire Department. The MVPD also utilizes 405 parking spaces in the PSB secured lot. The MVPD Chief has indicted the PSB and parking lot are already at or near full capacity at this time. The MVPD maintains five operational divisions: Patrol, Detective, Special Enforcement, Traffic, and Administrative.

The MVPD handles a service demand of more than 130,000 calls for service (CFS) each year. The MVPD has a current demand of 657 CFS per year per sworn officer, and each deputy on patrol averages 8 CFS per 10-hour shift. There are no set response time goals, but the current response times average 6.15 minutes for Priority 1 calls (emergency), 13.8 minutes for Priority 2 (service need) calls, and 32.4 minutes for Priority 3 (business) calls.

Police services are paid for out of the City of Moreno Valley General Fund. There are currently 255 employees working at the MVPD and 198 of them are sworn peace officers. The MVPD maintains 166 vehicles to support its operations but does not have any commercial vehicle enforcement equipment or personnel at this time.

According to the Federal Bureau of Investigation, Uniform Crime Reporting Program, the national average for police department staffing is 2.3 officers per 1,000 residents. By comparison, the nationwide average for cities of comparable size to Moreno Valley is 1.8 officers per 1,000 residents, while the average for "west coast" area cities of comparable size is 1.2 officers per 1,000 residents. The police service ratio within the City is 1.0 officer per 1,000 citizens, and the City has indicated a commitment to maintain that ratio.

The PSB is approximately 6.5 miles from the project site and would be the closest station to service the project site. The WLC site is located within City Beat 46 (MV46) but there are few calls from the project site at present.

NOP/Scoping Comments. Several residents asked during the scoping process what the impact of the project would be on existing and future public services like police and fire.

4.14.1.2 Existing Policies and Regulations

The City of Moreno Valley has developed policies and regulations in order to direct future activities and decisions in order to achieve the goals and objectives set forth in the City's General Plan and Municipal Code.

Community Design Element Policies

2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.

2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.

Safety Element Policies

6.8.1 Explore the most effective and economical means of providing responsive and adequate law enforcement protection in the future.

6.9.2 Require well-lighted entrances, walkways and parking lots, street lighting in all commercial, industrial areas and multiple-family residential areas to facilitate nighttime surveillance and discourage crime.

6.9.3 Incorporate "defensible space" concepts into the design of dwellings and nonresidential structures, including, but not limited to configuration of lots, buildings, fences, walls and other features that facilitate surveillance and reinforce a sense of territorial control.

6.11.1 Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.

6.12.1 Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.

~~*NOTE: The following changes have been made in response to Comment F-13-32 in Letter F-13 from Johnson & Sedlack on Behalf of Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley.*~~

Ultimate Goals

VII Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards.

City of Moreno Valley Municipal Code. Pursuant to Moreno Valley Municipal Code Section 3.42.070, the project is subject to Police Facilities Commercial and Industrial Development Impact Fees. These fees contribute to the police services facilities provided for in the Existing General Plan area and Capital Improvement Projects. The fees provide financing for the acquisition of land for police and fire facilities as well as design, construction, improvements, and maintenance to the extent permitted by law.

4.14.1.3 Methodology

Based on discussion with City staff and previous environmental documents prepared by the City, the evaluation of impacts associated with the project on police services includes the following:

- Determine the existing police response time for the City based on RCSD goals;
- Determine the length of time for police services to arrive at the project site based on average travel time;
- Compare existing police response time and potential police response time; and
- Determine funding mechanism for future police services, staff, and facilities.

Police service funding impacts were evaluated by identifying compliance with local and RCSD goals and policies. Response time impacts were evaluated by comparing existing and anticipated average responses through RCSD response time goals.

4.14.1.4 Thresholds of Significance

Based on Appendix G of the *CEQA Guidelines,* police protection impacts would be considered significant if the following condition resulted from the construction or operation of the project:

- Substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services.

4.14.1.5 Less than Significant Impacts

Threshold	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered law enforcement facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police services?

The development and operation of the project would increase demand for police protection services. In addition, the MVPD Chief has indicated the department would not be able to maintain current service levels if the WLC project were built. Initially, crimes of grand theft and malicious mischief during construction would be the potential major crime issue. However, it is anticipated that private security would be utilized during the construction process, similar to other private security services that are utilized for other construction projects in the City. Typical operational police protection services involved with warehouse uses include after-hours patrol. Potential impacts would take the form of a need for expanded police protection services routinely associated with industrial growth, including routine patrols, responding to calls for service such as graffiti or vandalism, robbery, etc. In addition, commercial enforcement will be needed on surrounding streets. The number of additional service calls and call response times would slowly increase, and overall service levels would decrease incrementally as more warehouse buildings were built on the project site. The proposed warehouse uses would generate new employment opportunities. The new jobs that would be created by the project would probably not induce substantial population growth within the City, because most of the new jobs would either be filled by residents of the City and surrounding areas or transfer from existing jobs to the project site for existing warehousing that relocates to the WLC project site.

In his July 10 letter, the City Police Chief concluded that buildout of the WLC project would create a need for 15 full-time sworn officers, 4 classified staff, 2,635 square feet of new police building area, 11 police vehicles, and 24 more secured parking spaces. The Chief also concluded buildout of the WLC project would generate a need for two additional commercial enforcement vehicles and all the related equipment, the addition of two full-time sworn commercial enforcement police officers, and training for those officers.

According to the 2004 City of Moreno Valley Community and Economic Profile, a majority of funding for police protection services is funded through sales tax revenue. In addition, the project will be subject to all applicable impact fees at the time specific development is proposed.

The City collects fees from developers to offset police-related service impacts associated with new development. These development impact fees (DIFs) are one-time charges applied to new development and are imposed to raise revenue for the construction or expansion of capital facilities. DIFs enable the City to collect fair-share fees from new development projects to fund new infrastructure and services. In the City, developers are also required to pay development fees per square foot of development to offset impacts associated with increased demand on law enforcement services. DIFs are collected for specific infrastructure needs and are deposited into different accounts representing these requirements. The project would be designed and operated per applicable standards required by the City for new development in regard to public safety. In addition, the project would be required to pay development fees used to fund capital costs associated with constructing new public safety structures and purchasing equipment for new public safety structures.

The proposed WLCSP project will result in an increased need for police services as the project builds out. Serving the WLCSP project would initially require additional patrol and service time from existing staff, but would require additional personnel and/or equipment as new development is added.

Building security is a critical component of contemporary logistics facility design. Site design features routinely include restricted vehicular and pedestrian access, perimeter fencing and walls, and full-coverage cameras and monitoring systems. Tenants typically employ full-time security personnel and sophisticated internal security and monitoring systems. Facilities that operate as “Free Trade Zones,” as established by the U.S. Customs Service, are required to install and maintain extensive internal and external security facilities and systems.

General Plan and Municipal Code Consistency. Table 4.14.A evaluates whether the project is consistent with the City’s General Plan policies and Municipal Code requirements relative to police service

~~*NOTE: The following analysis was added to the table in response to Comment F-13-32 in Letter F-13 from the Sierra Club et al.*~~

Table 4.14.A: Project Consistency with General Plan Policies and Municipal Code Requirements for Police Service

General Plan Policies		Project Consistency
Ultimate Goals		
VII	Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards.	**Consistent.** The project will be consistent with this goal regarding public services by providing future sites and/or facilities for fire and police facilities as development occurs. The project will also protect onsite and offsite uses from flooding and other hazards. The revised air quality study indicates the project will not result in significant offsite health risks for adjacent land uses based on the SCAQMD ten in one million threshold for cancer risks.

Table 4.14.A: Project Consistency with General Plan Policies and Municipal Code Requirements for Police Service

General Plan Policies	Project Consistency
Community Design Element Policies	
2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.	**Consistent.** Initial project construction can be accommodated by existing police service. As development continues, additional police facilities, equipment, and services will be needed within the project, and the project will provide DIF and property tax revenues to support these future needs.
2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.	**Consistent.** This EIR provides information on the potential impacts of the project on City services and facilities, including police. As development occurs within the project, additional police facilities, equipment, and services will be needed within the project, and the project will provide DIF and property tax revenues to support these future needs.
Safety Element Policies	
6.8.1 Explore the most effective and economical means of providing responsive and adequate law enforcement protection in the future.	**Consistent.** This EIR provides information on the potential impacts of the project on City services and facilities, including police. As development occurs within the project, additional police facilities, equipment, and services will be needed within the project, and the project will provide DIF and property tax revenues to support these future needs.
6.9.2 Require well-lighted entrances, walkways and parking lots, street lighting in all commercial, industrial areas and multiple-family residential areas to facilitate nighttime surveillance and discourage crime.	**Consistent.** The Specific Plan provides site and building lighting guidelines for future development to discourage crime. In addition, many of the on-site uses will have gated access and private security, reducing the need for additional City police services.
6.9.3 Incorporate “defensible space” concepts into the design of dwellings and nonresidential structures, including, but not limited to configuration of lots, buildings, fences, walls and other features that facilitate surveillance and reinforce a sense of territorial control.	**Consistent.** The Specific Plan provides site and building design guidelines, including fencing and walls, lighting, security cameras, to discourage crime. In addition, many of the uses will have gated access and private security, reducing the need for additional City police services.
6.11.1 Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.	**Consistent.** Development according to the Specific Plan will allow full emergency access to this portion of the City as new buildings are constructed.
6.12.1 Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.	**Consistent.** Development according to the Specific Plan will allow regional emergency access to this portion of the City from SR-60 and Gilman Springs Road.

Table 4.14.A: Project Consistency with General Plan Policies and Municipal Code Requirements for Police Service

General Plan Policies	Project Consistency
City of Moreno Valley Municipal Code	
Pursuant to Moreno Valley Municipal Code Section 3.42.070, the project is subject to Police Facilities Commercial and Industrial Development Impact Fees. These fees contribute to the police services facilities provided for in the Existing General Plan area and Capital Improvement Projects. The fees provide financing for the acquisition of land for police and fire facilities as well as design, construction, improvements, and maintenance to the extent permitted by law.	**Consistent.** All development within the Specific Plan will pay applicable Development Impact Fees to the City.

The project is consistent with the City General Plan policies and Municipal Code requirements relative to police services.

The WLCSP requires building and site design characteristics that specifically support police services by encouraging buildings that are safe and can be secured by design, fencing, security services, etc. The proposed WLCSP design guidelines are consistent with the goals of the General Plan relative to police protection and site design, as outlined in Section 4.14.1.2. In addition, future development within the WLCSP will be required to comply with the City's Development Impact Fee (DIF) requirements as new development is constructed. It is anticipated that DIF revenues will help fund additional equipment needs and increased property taxes would help fund increased service or staffing needs. Therefore, the project will have less than significant impacts relative to police service, and no mitigation is required.

4.14.1.6 Significant Impacts

Based on the analysis in Section 4.14.1.5, the project will have no significant impacts relative to police protection.

4.14.2 Fire Protection

4.14.2.1 Existing Setting

The following information is based in part on a letter from the City Fire Chief dated June 27, 2012. The City of Moreno Valley Fire Department (MVFD) contracts with the Riverside County Fire Department (RCFD) to provide fire protection, fire prevention, and emergency services. The RCFD is administered and operated by the California Department of Forestry and Fire Protection (CalFire). Within the City, the objective of the MVFD is to have an engine company arrive on the scene of a fire or emergency medical aid situation within four minutes of a notification (i.e., dispatch) 90 percent of the time and a complete first alarm assignment within eight minutes[1] 90 percent of the time. Moreno Valley is served by six fire stations and a one-minute preparation time plus a four-minute travel time to fire incidents and emergency medical aid calls (90% of the time) is considered to be the maximum time standard for serving urban and suburban uses in accordance with the National Fire Protection Association (NFPA) 1710 standard. The City requires any new developments to provide adequate fire suppression water flows. The MVFD responds to medical aid calls with advance life support services.

---

[1] Station assigned to respond after first responder assesses situation.

The MVFD participates in the Regionalized Cooperative Fire Protection Delivery System of Riverside County Fire/CalFire. This system ensures that the closest and most appropriate resources are dispatched to all requests for fire department emergency services regardless of jurisdiction.

The MVFD main office is located in the City PSB at 22850 Calle San Juan De Los Lagos in Moreno Valley. The MVFD occupies 1,100 square feet or 2 percent of the 45,900-square foot PSB, plus parking in the PSB secured lot. The City Police Chief has indicted the PSB and parking lot are already at or near full capacity at this time, so it is assumed this conclusion also applies to the Fire Department as well.

The City of Moreno Valley has six existing fire stations and one proposed fire station within the City limits as summarized in Table 4.14.B. Fire Station 58, Moreno Beach Station, is located at 28040 Eucalyptus Avenue and is the closest station to the project site. This station is approximately 1.25 miles northwest of the western limits of project site. The station is staffed on a 24/7 basis by three firefighters, one engine, one reserve aerial ladder truck, and a rescue squad.

Municipal Code Section 3.42.060 provides for the collection of Fire Facilities Commercial and Industrial DIFs and states that these fees shall be paid by applicants for commercial and industrial projects prior to the issuance of applicable building or occupancy permits.

NOP/Scoping Comments. During the NOP period, a comment was made about a future fire station planned at Redlands Boulevard/Brodiaea Avenue. Fire Chief Abdul R. Ahmad's letter (June 27, 2012) cites potential fire danger from the project being within both a high fire risk category and a non-fire high hazard risk category from building types, from emergency incidents (both fire and non-fire) during construction of the various phases of the project, and from being partially within a State-designated Very High Fire Hazard Severity Zone.

Table 4.14.B: Moreno Valley Fire Stations

Fire Station	Address	Personnel	Equipment
Station 2 (Sunnymead)	24935 Hemlock Avenue	7 Firefighters	1 Engine 1 Aerial Ladder Truck (100 foot) 1 Urban Search and Rescue Trailer
Station 6 (Towngate)	22250 Eucalyptus Avenue	3 Firefighters	1 Engine 1 Reserve Engine
Station 48 (Sunnymead Ranch)	10511 Village Road	3 Firefighters	1 Engine 1 Reserve Engine
Station 65 (Kennedy Park)	15111 Indian Street	3 Firefighters	1 Engine 1 Reserve Engine
Station 58 (Moreno Beach)	28040 Eucalyptus Avenue	3 Firefighters	1 Engine 1 Reserve Aerial Ladder Truck 1 Rescue Squad
Station 91 (College Park)	16110 Lasselle Street	7 Firefighters	1 Engine 1 Rescue Squad 1 Aerial Ladder Truck (75 foot)
Station 99 (Morrison Park) *Opened October 2012*	13400 Morrison Street	3 Firefighters	1 Engine

Source: Table 5.13-1 City of Moreno Valley General Plan Final EIR, July 2006; Moreno Valley Fire Department, 2012.

4.14.2.2 Existing Policies and Regulations

The City of Moreno Valley has developed policies and regulations in order to direct future activities and decisions in order to achieve the goals and objectives set forth in the City's General Plan and Municipal Code.

Community Design Element Policies

2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.

2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.

Safety Element Policies

6.11.1 Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.

6.12.1 Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.

6.13.1 Provide fire safety education to residents of appropriate age.

6.14.2 Relate the timing of fire station construction to the rise of service demand in surrounding areas.

6.15.1 Encourage programs to minimize the fire hazard, including but not limited to the prevention of fuel build-up where wildland areas are adjacent to urban development.

6.15.2 Tailor fire prevention measures implemented in wildland areas to both the aesthetic and functional needs of the natural environment.

6.16.1 Ensure that ordinances, resolutions and policies relating to urban development are consistent with the requirements of acceptable fire safety, including requirements for smoke detectors, emergency water supply and automatic fire sprinkler systems.

6.16.2 Encourage the systematic mitigation of existing fire hazards related to urban land development or patterns of urban development as they are identified and as resources permit.

6.16.3 Ensure that adequate emergency ingress and egress is provided for each development.

City of Moreno Valley Municipal Code. Municipal Code Section 3.42.060 provides for the collection of Fire Facilities and Commercial and Industrial Development Impact Fees and states that fees shall be paid by applicants for commercial and industrial projects prior to the issuance of applicable building or occupancy permits.

4.14.2.3 Methodology

Based on discussion with City staff and previous environmental documents prepared by the City, the evaluation of fire service impacts associated with the project includes the following:

- Determine the existing fire response time for the City based on Moreno Valley Fire Department goals identified in the Moreno Valley Fire Department Strategic Plan 2012–2022;[1]

---

[1] *Moreno Valley Fire Department Strategic Plan 2012–2022*, Moreno Valley Fire Department, December 2011.

- Determine the length of time for fire services to arrive at the project site based on average travel time;
- Compare existing fire response time and potential fire response time; and
- Determine the funding mechanism for future fire services and facilities.

Fire service funding impacts were evaluated by estimating compliance with local and RCFD goals and policies as indicated in the Moreno Valley Fire Department Strategic Plan 2012–2022. Response time impacts were evaluated by comparing existing and anticipated average responses with MVFD response time goals.

4.14.2.4 Threshold of Significance

Based on Appendix G of the *CEQA Guidelines*, impacts to fire protection services would be considered significant if the following condition resulted from the construction or operation of the project:

- Substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services.

4.14.2.5 Less than Significant Impacts

Threshold	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered fire-fighting facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire services?

The majority of the project site is currently undeveloped. The development and operation of the project would increase the demand for fire protection, prevention, and emergency medical services. Time is the critical component in fire/medical emergencies. Reductions in the emergency response time or the distance between fire/medical facilities and the site of an emergency would result in improved service and saved lives and property.

Construction materials for the warehouse buildings would likely be reinforced concrete and steel. Although fire occurring during the construction period for such buildings is rare, when they do occur they tend to be catastrophic due to a lack of completed fire protection and detection systems and the presence of considerable amounts of combustible materials that are normally on site during the construction phases. California Fire Code Section 8704 establishes fire safety standards for sites during the construction phase. All on-site construction as well as the use and storage of construction materials is required to conform to fire prevention/protection standards established by the RCFD, MVFD, and/or the City, which mirror standards prescribed in the California Fire Code. Adherence to safety standards required for sites during the construction phase established by the MVFD and/or the City would ensure that potential impacts during construction remain less than significant. Since portions of the project site are located within a State-designated Very High Fire Hazard Severity Zone, development within these zones is required to implement special construction features set forth in Chapter 7A of the California Building Code (CBC). Adherence to these specific requirements would ensure that potential impacts during construction remain less than significant.

All new development within the project would be required to pay DIFs to the City. These fees are determined by the City Council, in consultation with the Fire Prevention Bureau, based on an assessment of the activity occurring within the City as well as the needs of the City. Such fees would be used to fund capital costs associated with land acquisition, construction, purchasing equipment, and providing for additional staff.

The project will require that fire services be extended to the project site. In consultation with the MVFD through a letter dated June 27, 2012, submitted by Fire Chief Ahmad, the MVFD has identified that the estimated travel time from Fire Station 58 (the closest station to the project site) to the middle of the project site would exceed the NFPA 1710 standard for fire response time in the event of an emergency incident. Additionally, the MVFD identifies that buildings under construction are susceptible to fire and are likely to have a high rate of fire spread due to the absence of fire protection systems, fire detection systems, and fire protection features. Buildings under construction also lack compartmentalization of the interior to slow the rate of fire spread. The MVFD letter also notes that Fire Station 99 is expected to open in October of 2012;[1] however, the opening of an additional fire station would still result in service levels at the project site being below the NFPA 1710 standard.

The project would increase the need for fire services and would potentially affect the MVFD's ability to maintain current service levels within the City. Additional service would be needed in the form of new facilities, personnel, and/or equipment. The City of Moreno Valley does not set a ratio of personnel per population, nor does it set equipment and staffing levels; rather, additional personnel and equipment are based on assessment of the activity occurring in the City, including but not limited to, calls for service and response times in order to meet or exceed the NFPA 1710 standard, the California Fire Code, and City Municipal Code Amendments. According to the 2004 City of Moreno Valley Community and Economic Profile, a majority of funding for fire protection services is from sales tax revenue. The project will be subject to all applicable development impact fees.

In his June 27, 2012, letter, the Fire Chief indicated the Fire Department would require "construction of a fire station during the first phase of this project. The fire station shall be located on 1.5 acres of land and the facility shall be approximately 11,000 square feet in size. This location shall be identified by the Fire Chief prior to the approval of the specific plan for the World Logistics Center. Initially, this station will require the purchase of an aerial ladder truck, which will be staffed daily by four Fire Department personnel for a total of twelve personnel to provide seven-day-a-week, twenty-four-hour-a-day coverage of the aerial ladder truck. During the final phase of construction, the Fire Department will require an additional fire apparatus to be purchased and staffed. This shall consist of a fire engine with a daily staffing of three Fire Department personnel for a total of nine personnel to provide seven-day-a-week, twenty-four-hour-a-day coverage."

As previously described, the project would be designed, constructed, and operated per applicable fire prevention/protection standards established by the City. Such requirements include (but shall not be limited to) provisions for smoke alarms; sprinklers; building and emergency access; adequate emergency notification; and hydrant sizing, pressure, and siting. Due to the size and nature of the project and the potential for increased emergency incidents resulting from increased development and truck traffic will increase as development occurs, but payment of DIF fees and increased property taxes will offset increased service costs for this type of project. In addition, the Section 2.2.6 of the WLC Specific Plan indicates a future 1.5-acre urban fire station site will be dedicated to the City to help offset increased fire service needs. With these provisions, the project will have a less than significant impact on fire services.

General Plan and Municipal Code Consistency. Table 4.14.C evaluates whether the project is consistent with the City's General Plan policies and Municipal Code requirements relative to fire service.

---

[1] Fire Station 99 (Morrison Park) opened in October 2012.

Table 4.14.C: Project Consistency with General Plan Policies and Municipal Code Requirements for Fire Service

General Plan Policies		Project Consistency
Community Design Element Policies		
2.13.1	Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.	**Consistent.** Initial project construction can be accommodated by existing fire protection service. As development continues, the WLCSP provides a future fire station site, and the project will provide DIF fees and increased property taxes to compensate for future fire service needs.
2.14.3	Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.	**Consistent.** This EIR provides information on the potential impacts of the project on City services and facilities, including fire protection. As development occurs, the WLCSP provides a future fire station site, and the project will provide DIF fees and increased property taxes to compensate for future fire service needs.
Safety Element Policies		
6.11.1	Respond to any disaster situation in the City to provide necessary initial response and providing for key support to major incidents.	**Consistent.** Development according to the Specific Plan will allow emergency access to this portion of the City as new industrial warehouses are constructed.
6.12.1	Support mutual aid agreements and communication links with the County of Riverside and other local participating jurisdictions.	**Consistent.** Development according to the Specific Plan will allow regional emergency access to this portion of the City from SR-60 and Gilman Springs Road.
6.13.1	Provide fire safety education to residents of appropriate age.	**Consistent.** The project is for industrial warehouses and this policy generally applies to residential uses; however, warehouse operators will provide fire safety instruction and information to employees as encouraged by the Fire Department.
6.14.2	Relate the timing of fire station construction to the rise of service demand in surrounding areas.	**Consistent.** Initial project construction can be accommodated by existing fire protection service. As development continues, the WLCSP provides a future fire station site, and the project will provide DIF fees and increased property taxes to compensate for future fire service needs.
6.15.1	Encourage programs to minimize the fire hazard, including but not limited to the prevention of fuel build-up where wildland areas are adjacent to urban development.	**Consistent.** The Specific Plan provides site and building lighting guidelines for future development to discourage crime. Landscape palettes designed to reflect fuel modification criteria in wildland areas.
6.15.2	Tailor fire prevention measures implemented in wildland areas to both the aesthetic and functional needs of the natural environment.	**Consistent.** A portion of the project is in a High Fire Hazard Severity Zone and special construction features of the California Building Code will apply.
6.16.1	Ensure that ordinances, resolutions and policies relating to urban development are consistent with the requirements of acceptable fire safety, including requirements for smoke detectors, emergency water supply and automatic fire sprinkler systems.	**Consistent.** Future development will be required to comply with applicable fire protection requirements of the California Building Code.

Table 4.14.C: Project Consistency with General Plan Policies and Municipal Code Requirements for Fire Service

General Plan Policies		Project Consistency
6.16.2	Encourage the systematic mitigation of existing fire hazards related to urban land development or patterns of urban development as they are identified and as resources permit.	**Consistent.** Future warehouse development will have fire access lanes, building sprinkler systems and other fire suppression equipment and personnel to minimize fire-related risks.
6.16.3	Ensure that adequate emergency ingress and egress is provided for each development.	**Consistent.** Development according to the Specific Plan will allow emergency access to this portion of the City as new industrial warehouses and roadways are constructed.
City of Moreno Valley Municipal Code		
Pursuant to Moreno Valley Municipal Code section 3.42.060, Fire Facilities and Commercial and Industrial Development Impact Fees, states that fees shall be paid by applicants for commercial and industrial projects in the amounts adopted by the City Council by resolution from time to time. Neither building permit nor occupancy permit will be issued for any new commercial, industrial, or other non-residential building or structure unless the specified fees are paid.		**Consistent.** Future development within the Specific Plan will pay applicable Development Impact Fees to the City for fire-related services.

The project is consistent with the City General Plan policies and Municipal Code requirements relative to fire protection services.

~~*NOTE: The following information was added as a result of revisions to the WLC Specific Plan.*~~

The WLCSP will dedicate a new 1.5-acre urban fire station site within its boundaries to allow for expansion of fire protection services as the project develops (see WLCSP Section 2.2.4). The revised WLCSP indicates the new fire station will be at the north end of Planning Area 11, and it is required to be built during Phase I. Placement of the fire station is subject to review and approval by the Fire Chief (WLCSP Section 2.2.4 First Station Site).The WLCSP also requires building and site design characteristics that specifically support fire services by encouraging buildings that are safe and can be secured by design, fencing, security services, etc. The proposed WLCSP design guidelines are consistent with the goals of the General Plan relative to fire protection and site design, as outlined in Section 4.14.2.2. Finally, future development within the WLCSP will be required to comply with the City's DIF requirements as new development is constructed. Therefore, the project will have less than significant impacts relative to fire protection service, and no mitigation is required.

4.14.2.6 Significant Impacts

Based on the analysis in Section 4.14.2.5, the project will have no significant impacts relative to fire protection.

4.14.3 Schools

4.14.3.1 Existing Setting

The project area is served by two school districts, the Moreno Valley Unified School District (MVUSD) and the San Jacinto Unified School District (SJUSD) and is home to the Moreno Valley campus of Riverside Community College (RCC). The MVUSD operates a total of 30 schools; 20 elementary, six middle, and four high schools. The SJUSD encompasses the far southeastern portion of the project site (approximately 30 acres) and operates seven elementary schools, three middle schools, and two high schools.

NOP/Scoping Process. A number of residents were concerned about the WLC project only bringing in a small number of blue collar workers in a limited field (logistics warehousing), and that it would not help diversity or benefit to the workforce of the City (or their level of education) as a whole.

4.14.3.2 Existing Policies and Regulations

The City of Moreno Valley has developed policies and regulations in order to direct future activities and decisions in order to achieve the goals and objectives set forth in the City's General Plan and Municipal Code.

Community Design Element Policies

2.13.1 Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.

2.14.3 Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.

City of Moreno Valley Municipal Code. The project will be located mainly within the MVUSD with a small part in SJUSD. These school districts currently impose fees of $0.51 and $0.47, respectively, per square foot on new industrial construction to offset the cost of providing new school facilities. The project will be subject to these fees at the time of building permit issuance. However, no homes and no significant generation of school-aged children would be developed as part of the project.

4.14.3.3 Methodology

Evaluation of school service impacts associated with the project includes the following:

- Potential for student generation of the project in ways that would have direct or indirect impacts on local school districts;
- Cause other indirect educational impacts; and
- Cause negative impacts on existing or future school facilities or programs.

School impacts were evaluated by estimating compliance with local school district impact fee programs.

4.14.3.4 Thresholds of Significance

According to Appendix G of the *CEQA Guidelines*, a project would have a significant impact to schools if it would result in:

- Substantial adverse physical impacts associated with the provision of new or physically altered school facilities, need for new or physically altered school facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives.

4.14.3.5 Less than Significant Impacts

Threshold	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered school facilities, need for new or physically altered school facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives?

Section 4.13.5.1 indicates the project is expected to generate from 15,000 to 25,000 new jobs for the City and surrounding areas; however, it is speculative to estimate how many of those workers will actually live within the City and how many will commute from other areas. Although the exact number is speculative, any increase is not expected to be substantial and will not generate significant new demands related to need for new or altered school facilities. The project is an industrial project and not a residential project that would have a direct impact on school services by accommodating additional residents within the City. Construction of the project will create short-term construction jobs. These short-term positions are anticipated to be filled by workers who, for the most part, reside in the project area; therefore, construction of the project will not generate a permanent increase in population within the project area.

California Government Code (§65995[b]) establishes the base amount of allowable developer fees imposed by school districts. These base amounts are commonly referred to as “Level 1 fees” and are subject to inflation adjustment every two years. School districts are placed into a specific “level” based on school impact fee amounts that are imposed on the development.

Unlike residential development, where it is possible to ascertain impacts to a particular school or school district, because employees at a warehouse facility could reside in any number of school districts with their children attending a collection of schools, it is difficult to determine with any level of certainty what the potential impacts to a particular school or school district would be.

The project site is located within the jurisdictional boundaries of the MVUSD and SJUSD. The MVUSD imposes development fees of $0.51 per square foot of industrial development.[1] The SJUSD imposes development fees of $0.47 per square foot of industrial development.[2] These development fees are equal to the minimum fee established by the State (Level 1 fees). Per California Government Code (§ 65995[h]), “The payment or satisfaction of a fee, charge, or other requirement levied or imposed … are hereby deemed to be full and complete mitigation of the impacts … on the provision of adequate school facilities.”

It is anticipated that most of the new employment opportunities generated by the project will be filled by persons already residing in the community and surrounding areas. Because employees of the proposed on-site uses would be drawn from the local area, no substantial increase in population or corresponding increase in students attending local schools will occur. In addition, the project proponent would be required to pay these development fees in accordance with Government Code 65995 and Education Code 17620.

The project contains no residential development, so it would not cause a significant increase in the local population that would increase the number of students attending local schools (see Section 4.13, *Population and Housing*). Since payment of the school impact fees is required of all projects within MVUSD and SJUSD boundaries, impacts to school services and facilities would not occur. The WLC project is also consistent with the applicable General Plan policies in Section 4.13.3.2 as it will assist in the provision of adequate school facilities by providing legally required DIFs. Accordingly, impacts to

---

[1] *School Developer Impact Fees,* Moreno Unified School District, 2012. http://www.mvusd.net/apps/pages/index.jsp?uREC_ID=24969&type=d&pREC_ID=55535, accessed April 16, 2012.

[2] http://www.sanjacinto.k12.ca.us/districtPages/facilities/developerInfo.html, website accessed April 16, 2012.

the environment resulting from new or expanded school facilities would not occur, resulting in a less than significant impact and no mitigation is required.

General Plan and Municipal Code Consistency. Table 4.14.D evaluates whether the project is consistent with the City's General Plan policies and Municipal Code requirements relative to school services.

Table 4.14.D: Project Consistency with General Plan Policies and Municipal Code Requirements for School Services

General Plan Policies		Project Consistency
Community Design Element Policies		
2.13.1	Limit the amount of development to that which can be adequately served by public services and facilities, based upon current information concerning the capability of public services and facilities.	**Consistent.** The project consists of logistics warehousing and supporting uses and does not propose any residential uses that would add housing units or substantial numbers of new students to local schools.
2.14.3	Review development projects for their impacts on public services and facilities including, but not necessarily limited to, roadways, water, sewer, fire, police, parks, and libraries and require public services or facilities to be provided at the standards outlined in the Moreno Valley General Plan and the standards of applicable service agencies.	**Consistent.** This EIR provides information on the potential impacts of the project on City services and facilities, including schools.
City of Moreno Valley Municipal Code		
The project will be located mainly within the MVUSD with a small part in SJUSD which currently impose fees of $0.51 and $0.47, respectively, per square foot on new industrial construction to offset the cost of providing new school facilities. The project will be subject to these fees at the time of building permit issuance. However, no homes and no significant generation of school-aged children would be developed as part of the project.		**Consistent.** Future development within the Specific Plan will pay applicable School Impact Fees for non-residential uses.

The project is consistent with the City General Plan policies and Municipal Code requirements relative to school services. In addition, future development within the WLCSP will be required to comply with the City's DIF requirements as new development is constructed. Therefore, the project will have less than significant impacts relative to schools, and no mitigation is required.

4.14.3.6 Significant Impacts

Based on the analysis in Section 4.14.3.5, the project will not produce any significant school-related impacts, so no mitigation is required.

4.14.4 Parks, Recreation, and Trails

4.14.4.1 Existing Setting

The Moreno Valley Parks and Community Services Department (Department) maintains over 358 acres of parks and park facilities, and 10 miles of trails. See Figure 4.14.1 for De Anza Trail in the surrounding area. The Department also maintains and operates 39 parks and facilities; including senior recreation centers and conference centers as well as 20 lighted sports fields and lighted sports fields at three schools. The nearest park to the project site is Ridgecrest Park located on John F. Kennedy Drive less than a mile southwest of the project site.

Open space land can be classified into lands for preservation of natural resources (e.g., wildlife habitat), production of resources (e.g., farming), public health and safety (e.g., floodplains), low-density residential development, and outdoor recreation (e.g., parks). Open space for outdoor recreation includes public and private outdoor recreation facilities. Public recreation facilities in Moreno Valley include State, County, and City parks as well as public golf courses. Private outdoor recreation facilities include private golf courses, driving ranges, and other private outdoor recreation facilities. Two private outdoor recreation facilities are owned and operated by homeowner's associations in Sunnymead Ranch and Moreno Valley Ranch.

A large amount of the City's open space lands is managed for the preservation of natural resources. These areas include the Box Springs Mountain Reserve, the San Timoteo Canyon Park property, the Lake Perris State Recreation Area, and the San Jacinto Wildlife Area. These areas are also used for hiking, horseback riding, fishing, boating, and other uses.

The Box Springs Mountain Reserve and the San Timoteo Canyon Park property are owned and operated by Riverside County Regional Park and Open Space District. They are primarily mountainous natural open space parks. The Box Springs Mountain Reserve is located at the northwest corner of Moreno Valley. The Reserve consists of three noncontiguous land areas, two of which are within the City's Sphere of Influence. San Timoteo Canyon Park property is located east of the City's Sphere of Influence along the north side of SR-60. Approximately 1,100 acres of the property, including the Badlands Landfill is jointly owned by the Regional Park and Open Space District and Riverside County Waste Management District.

Lake Perris State Recreation Area, located south of Moreno Valley, is approximately 8,000 acres. It contains a major reservoir, natural open space and facilities for boating and fishing, picnicking and camping. About 1,600 acres of the property were dedicated to the State of California as mitigation for loss of wildlife habitat due to development of the Moreno Valley Ranch Specific Plan. The Lake Perris State Recreation Area serves as one of several habitat reserves for the endangered Stephens' kangaroo rat (*Dipodomys stephensi*).

The San Jacinto Wildlife Area in the southeastern corner of the study area consists of gently sloping grasslands, sage scrub and natural and man-made wetlands that support migratory birds and resident wildlife. Bird watching and hunting are popular activities. Some of the adjoining property is owned by private organizations dedicated to hunting and wildlife conservation.

Several open space areas are located along soft-bottomed drainage courses within the planned communities of Sunnymead Ranch and Hidden Springs. The City also owns two natural open space areas. One open area is adjacent to the Moreno Valley Equestrian Center, located at the northeast corner of Redlands Boulevard and Locust Avenue. A second natural open space area is located north of Sunnymead Ranch Parkway, on the east side of Perris Boulevard.

THIS PAGE INTENTIONALLY LEFT BLANK

Natural open space can also be found within the steeply sloping areas designated Rural Residential and Hillside Residential on the General Plan land use map. These areas contain wildlife habitat, watershed benefits and scenic values that can be conserved even as these areas are developed. Natural open space can be conserved because these areas are planned for low-density residential development. Low-density development requires a minimal amount of land disturbance.

The City's General Plan also discusses trail facilities. The City owns and maintains about 10 miles of developed trails. Multiuse trails are popular with the equestrian community. The Moreno Valley Equestrian Center, dedicated in 2003, provides additional facilities of interest to equestrians. This 45-acre park is located at the northeast corner of Redlands Boulevard and Locust Avenue. The park features equestrian facilities, including an arena, with bleachers, a water trough, night lighting and parking for horse trailers.

Multiuse trails should be designed with considerations for safety, accessibility, proper design and construction, signage and relative location. The City's trail network should also connect to the County and State regional trail systems.

There is one existing multiuse trail adjacent to the project limits, located along Redlands Boulevard and Cottonwood Avenue. There are several proposed trails shown on the current General Plan within the project area along Redlands Boulevard, Cottonwood Avenue, Brodiaea Avenue, Dracaea Avenue, World Logistics Center Parkway~~Theodore Street~~, Fir Avenue, Sinclair Street, and Davis Road.

NOP/Scoping Comments. One written comment was received specifically about park impacts. The State requested that the WLCSP project not have any adverse impacts on the Lake Perris Recreational Area. In addition, at least one resident urged the City to provide an integrated network of trails that would connect to other trails planned in the region (e.g., Juan Bautista de Anza trail).

4.14.4.2 Policies and Regulations

a. State Regulations

Quimby Act (California Government Code 66477). This State policy requires the dedication of land and/or imposes a requirement of fees for park and recreational purposes as a condition of approval of tentative map or parcel map.

b. Local Regulations, City of Moreno Valley General Plan

Parks, Recreation and Open Space Element Policies

4.2.7 The City level of service standard is 3 acres of developed parkland for every 1,000 new residents. Exceptions from this ratio may be made in exchange for extraordinary amenities of comparable economic value. Land not suitable for active recreation purposes may not be counted toward fulfilling parkland dedication requirements.

4.2.8 Encourage the development of recreational facilities within private developments, with appropriate mechanisms to ensure that such facilities are properly maintained and that they remain available to residents in perpetuity.

4.2.17 Require new development to contribute to the park needs of the City.

4.3.1 The City's network of multiuse trails, including regional trails, community trails, and local feeder trails, shall (1) be integrated with recreational, residential and commercial areas, schools and equestrian centers; (2) provide access to community resources and facilities, and (3) connect urban populations with passage to hillsides, ridgelines, and other scenic areas.

4.3.3 All new development approvals shall be contingent on trail right-of-way dedication and improvement in accordance with the Master Plan of Trails.

4.3.4 In conjunction with all development review, the City shall consider multiuse trail access and traditional travel routes through the property.

4.3.5 In conjunction with the review and approval of non-residential developments, the City should consider the use of multiuse trail amenities such as hitching posts, benches, rest areas, and drinking facilities.

4.3.7 Trail design and construction should take into consideration the safety and convenience of all trail users as the primary concern.

4.3.8 The City should facilitate the development of a multiuse regional trail system.

4.3.9 Unless otherwise specified due to fire department requirements, access or as established by a specific plan, city trails along roadways shall be ten (10) feet wide and shall be constructed with decomposed granite or equal material and shall provide appropriate fencing or other devices where needed to delineate trails from vehicular rights-of-way.

4.3.10 Where firefighting access is required, trails shall be 20’ wide to meet the needs of the Fire Department and its equipment. Fire Department requirements shall be met in all conditions where access is required.

4.3.11 In unusual situations where legal or topographical barriers exist (e.g., excessive slope, the configuration of right-of-way, existing vegetation, etc.), the City shall have the discretion to amend the trail requirement as needed to accomplish the goals of this General Plan.

4.3.14 Where feasible, use drainage courses, utility rights-of-way and other such opportunities to incorporate trail and open space elements in the design of major development projects.

4.14.4.3 Methodology

The potential impacts of the project on recreation and park resources were evaluated based on whether implementation of the project could result in increased use of existing recreation and park resources, or whether implementation of the project could necessitate the construction or expansion of recreation and park facilities.

4.14.4.4 Thresholds of Significance

The following thresholds of significance regarding potential impacts to recreational facilities and resources are based on questions contained in Appendix G of the *CEQA Guidelines*. The project would result in a significant impact on recreation resources if any of the following occurs:

- The project increases the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; and/or
- The project includes recreational facilities or requires the construction or expansion of recreational facilities that have an adverse physical effect on the environment.

4.14.4.5 Less than Significant Impacts

Threshold	Would the project result in increased use of existing neighborhood and regional parks or other recreational facilities (e.g., trails) where substantial physical deterioration would occur or be accelerated?

The WLC project proposes the development of a master-planned logistics center; no residential development is proposed. There is a potential for the project to indirectly generate new residents in the City, although predicting the exact number would be too speculative. Increases in the City's population from future residential development will help fund new parks and trails through dedications of land and the payment of Development Impact Fees.

The WLCSP project proposes a General Plan Amendment to the Master Plan of Trails to reduce the extent of trail systems in the area to reflect the change from a residential neighborhood (Moreno Highlands) to a non-residential neighborhood (World Logistics Center). Trail linkages are provided in the WLC project to extend existing trail routes from the western edge of the project to the east, providing for future linkages to Gilman Springs Road, to the Lake Perris State Recreation Area, and to the San Jacinto Wildlife Area.

Implementation of these new trails and the General Plan Amendment (i.e., revised Master Plan of Trails) will allow the project to be consistent with the General Plan policies relative to trails (4.3.1 and 4.3.8).

General Plan and Municipal Code Consistency. Table 4.14.E evaluates whether the project is consistent with the City's General Plan policies and Municipal Code requirements relative to parks, recreation, and open space:

Table 4.14.E: Project Consistency with General Plan Policies and Municipal Code Requirements for Parks, Recreation and Open Spaces

General Plan Policies		Project Consistency
Parks, Recreation and Open Space Element Policies		
4.2.7	The City level of service standard is 3 acres of developed parkland for every 1,000 new residents. Exceptions from this ratio may be made in exchange for extraordinary amenities of comparable economic value. Land not suitable for active recreation purposes may not be counted toward fulfilling parkland dedication requirements.	**Not Applicable.** The project consists of logistics warehousing and supporting uses, and does not propose any residential uses that would add new housing units or residents who would use local parks.
4.2.8	Encourage the development of recreational facilities within private developments, with appropriate mechanisms to ensure that such facilities are properly maintained and that they remain available to residents in perpetuity.	*The following changes have been made due to revision to the Specific Plan project size.* **Not Applicable.** The project does not generate a need for new active recreational facilities, so no maintenance costs will be involved. However, the project does provide 74.3 acres of Open Space in the southwestern corner of the site adjacent to Mount Russell to be dedicated to the City of Moreno Valley.
4.2.17	Require new development to contribute to the park needs of the City.	*The following changes have been made due to revision to the Specific Plan project size.* **Not Applicable.** The project consists of logistics warehousing and supporting uses, and does not propose any residential uses that would add new housing units or residents who would use local parks. However, the project does provide 74.3 acres of Open Space in the southwestern corner of the site adjacent to Mount Russell.

Table 4.14.E: Project Consistency with General Plan Policies and Municipal Code Requirements for Parks, Recreation and Open Spaces

General Plan Policies		Project Consistency
4.3.1	The City's network of multiuse trails, including regional trails, community trails, and local feeder trails, shall (1) be integrated with recreational, residential and commercial areas, schools and equestrian centers; (2) provide access to community resources and facilities, and (3) connect urban populations with passage to hillsides, ridgelines, and other scenic areas.	**Consistent.** The Specific Plan proposes a trail along the southwestern portion of the site to tie into an existing trail along the west side of Redlands Boulevard and an existing trail west along Cactus Avenue. The project will also provide a trail connection from the southwest corner of the project around the Open Space area and a trailhead that will allow a future connection to the SJWA property that would be installed and maintained by the CDFW.
4.3.3	All new development approvals shall be contingent on trail right-of-way dedication and improvement in accordance with the Master Plan of Trails.	**Consistent.** The new trail and related improvements will be consistent with the City's requirements in this regard. The project entails a General Plan Amendment to modify the Master Plan of Trails consistent with the proposed Specific Plan trails.
4.3.4	In conjunction with all development review, the City shall consider multiuse trail access and traditional travel routes through the property.	**Consistent.** See discussion under Policy 4.3.1 above.
4.3.5	In conjunction with the review and approval of non-residential developments, the City should consider the use of multiuse trail amenities such as hitching posts, benches, rest areas, and drinking facilities.	**Consistent.** The new trail and related improvements will be consistent with the City's requirements in this regard.
4.3.7	Trail design and construction should take into consideration the safety and convenience of all trail users as the primary concern.	**Consistent.** The new trail and related improvements will be consistent with the City's requirements in this regard.
4.3.8	The City should facilitate the development of a multiuse regional trail system.	**Consistent.** The proposed trail connections within the Specific Plan would connect to existing regional trails to the west and future regional trails to the southeast through the SJWA property.
4.3.9	Unless otherwise specified due to fire department requirements, access or as established by a specific plan, city trails along roadways shall be ten (10) feet wide and shall be constructed with decomposed granite or equal material and shall provide appropriate fencing or other devices where needed to delineate trails from vehicular rights-of-way.	**Consistent.** The new trail and related improvements will be consistent with the City's requirements in this regard.
4.3.10	Where firefighting access is required, trails shall be 20' wide to meet the needs of the Fire Department and its equipment. Fire Department requirements shall be met in all conditions where access is required.	**Consistent.** The new trail and related improvements will be consistent with the City's requirements in this regard.
4.3.11	In unusual situations where legal or topographical barriers exist (e.g., excessive slope, the configuration of right-of-way, existing vegetation, etc.), the City shall have the discretion to amend the trail requirement as needed to accomplish the goals of this General Plan.	**Consistent.** The new trail and related improvements will be consistent with the City's requirements in this regard.

Table 4.14.E: Project Consistency with General Plan Policies and Municipal Code Requirements for Parks, Recreation and Open Spaces

General Plan Policies		Project Consistency
4.3.14	Where feasible, use drainage courses, utility rights-of-way and other such opportunities to incorporate trail and open space elements in the design of major development projects.	**Consistent.** The proposed trails will allow for connections to existing and future trails as outlined in Policy 4.3.1 above.

The project is consistent with the City General Plan policies relative to parks, recreation, and trails.

The WLCSP will provide connections to existing trails to the west and southwest, and a connection to and trailhead for a future planned trail in the San Jacinto Wildlife Area south of the site, as outlined in Specific Plan Section 3.4.2, *Multi-Use Trails*, and as shown on Figure 3-11 of the Specific Plan. In addition, future development within the WLCSP will pay applicable DIFs to offset any potential impacts to parks or recreational services. Based on this, the project will not create significant impacts on parks, recreation, or trails.

Threshold	Would the project result in construction or expansion of recreational facilities that would have an adverse physical effect on the environment?

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

The WLC project proposes development of up to approximately 40.6 million square feet of high-cube logistics warehouse facilities. It does not include the construction or expansion of a recreational facility since it would not create any substantial demands on recreational facilities. Section 4.13.5 concluded that the project would have a less than significant impact on population or housing; therefore, no new demand on existing park facilities would occur, and no expansion of existing parks or the construction of new parks would be required.

~~*NOTE: The following changes have been made due to revision to the Specific Plan project size.*~~

As noted in the Specific Plan, the project includes an Open Space (OS) designation covering 74.3 acres on the lower elevations of Mount Russell in the southwestern portion of the WLCSP project site.

4.14.4.6 Significant Impacts

The analysis in Section 4.14.4.5 determined that all impacts of the WLC project relative to parks and recreation are less than significant, therefore, no mitigation is required.

~~4.14.5 Cumulative Impacts~~

~~The cumulative areas for police and fire protection services are the service areas for the RCSD and RCFD. The need for the public services and associated facilities is measured by service area population, or the number of residents and workers within the City's service area. Service population, as well as the type and density of development, determines the need for new or expanded police and services. Utilizing statistical information, local planning policies, and by interacting with other agencies, fire and police service providers can delineate past patterns, emerging trends, and future issues of concern. Once identified, service providers can redeploy resources to meet future needs.~~

~~Sections 4.14.1.6 and 4.14.2.6 identified the possible need for new fire station within the WLC project. Payment of DIFs and provision of a new fire station site within the WLCSP is expected to fully mitigate potential impacts of the WLC project relative to fire services. In addition, payment of DIFs is expected to fully mitigate potential impacts of the WLC project relative to police services.~~

~~As additional development occurs in the City of Moreno Valley and region, there may be an overall increase in the demand for law enforcement and fire protection services, including personnel, equipment, and/or facilities. Increases in demand are routinely assessed by these agencies as part of the annual monitoring and budgeting process. New development within the service areas of the RCSD and RCFD would be required to adhere to conditions established by fire and police service providers, and pay applicable DIFs to ensure adequate staffing and equipment levels. Therefore, there would be no cumulative impact on police and fire services in the City. Accordingly, cumulative impacts to the environment resulting from new or expanded police and fire protection facilities would not occur, resulting in a less than significant impact and no mitigation is required.~~

~~The cumulative area for school-related issues encompasses the two school district(s) that provide school services/facilities in the project area. While no significant population increase is anticipated to result from the construction and operation of the proposed project, future development (particularly residential development) forecast in the City's General Plan will increase the demand for school facilities and services. New school facilities are currently being constructed to accommodate the growth in the local student population. Additionally, school districts are engaged in planning new facilities in anticipation of future local and regional growth. Each district requires the payment of development fees to provide for new school services and/or facilities. As every new development is mandated to provide the fees applicable to the school district affected, there would be no cumulative impact on school services in the City. Accordingly, cumulative impacts to the environment resulting from new or expanded school facilities would not occur, resulting in a less than significant impact and no mitigation is required.~~

~~Implementation of the proposed project will not increase the use of existing parks and recreation facilities. As future residential development is proposed, the City will require developers to provide the appropriate amount of parkland or payment of in-lieu fees, which will contribute to future recreational facilities. Payment of these fees and/or implementation of facilities on a project-by-project basis would offset cumulative parkland impacts by providing funding for new and/or renovated parks equipment and facilities. As such, the cumulative impact of buildout associated with the implementation of the proposed project, when considered with cumulative projects in the area, would be less than significant with implementation of the WLC project.~~

4.15 TRAFFIC AND CIRCULATION: TABLE OF CONTENTS

FIGURES

TABLES

~~**THIS PAGE INTENTIONALLY LEFT BLANK**~~

~~***NOTE TO READERS.*** *This section has been revised based on changes to the WLC Specific Plan, the project traffic study, and in response to comments on the original DEIR. Three street names have also changed (Street C now named Alessandro Boulevard, D now named Cactus Avenue, and E a portion of which is now named Alessandro Boulevard) and may still be referenced in the section. For correct street names see Circulation Master Plan Figure 3.10. In addition, Streets E and C have been realigned to follow the historical alignment of Alessandro Boulevard.*~~

~~*Large amounts of text, tables, and/or graphics were removed or heavily modified from those in the original DEIR. The changed text is shown in underline/strikeout wherever possible. To maintain readability, however, some sections have notes that refer the reader to the original DEIR for the complete text, table, or graphic from the original DEIR.*~~

4.15 TRAFFIC AND CIRCULATION

~~*Revisions to this section have been made due to changes to the revised*~~

A. PURPOSE OF THE TRAFFIC IMPACT ANALYSIS

The purpose of this Traffic Impact Analysis (TIA) ~~*Report for the*~~ is to fully analyze the local and regional traffic impacts of the proposed World Logistics Center ~~*prepared by Parsons Brinckerhoff and dated September 2014 (FEIR Volume 2, Appendix L-1). The vast majority of the changes to the TIA, and in turn replicated in the following Final EIR traffic section, are associated with:*~~

~~*1) Project Reduction. A reduction in the project area in the amount of 100 acres that occurred between the Draft EIR and this Final EIR. The reduced project area would result in a reduction in the proposed quantity of high-cube warehouse development in the WLC by one million square feet and an increase in the quantity of background (i.e., non-project related) development in year 2035 by 220 dwelling units. The area of land that was eliminated is*~~ (WLC) located in ~~*the southwest corner of the previous WLC site that was analyzed in the previous TIA and Draft EIR.*~~

~~*2) Baseline Plus Phase 1 Analysis. Added an Existing Plus Phase 1 (only) scenario that was added to the revised TIA and Final EIR, in order to provide a "baseline plus Phase 1 analysis."*~~

~~*3) Revised Project Schedule. A revision to the WLC implementation schedule so that Phase 1 is scheduled for completion in year 2022 as analyzed in the revised TIA and Final EIR, rather than in Year 2017 as analyzed in the previous TIA and Draft EIR. The scenarios for Year 2017 were revised to Year 2022 and include analysis of Phase 1 only and not full buildout of the WLC in the revised TIA and Final EIR, while the analysis of the previous Year 2022 scenarios were dropped from the revised TIA and Final EIR.*~~

~~*Additional revisions to this section have been made due to comments received on the Draft EIR and previous TIA. In summary, these changes include:*~~

~~*4) Truck Trips to Ports of Los Angeles and Long Beach. Analysis of freeway impacts from WLC trucks was extended to the Ports of Los Angeles and Long Beach. The extended analysis, covering more than 60 additional centerline miles of freeway, did not find any new impacts that were not already identified in the Draft TIA (see TIA Chapter 12, Section F) and replicated in this Final EIR traffic section (see Section 4.15.6.5 of this Final EIR). These changes have been made in response to: Comment F-1-49 in Letter F-1 from the Center for Biological Diversity/San Bernardino Valley Audubon Society; Comment F-3-4 in Letter F-3 from the California Clean Energy Committee; Appendix 78 in Letter F-3 from the California Clean Energy Committee; Comment F-9A-22 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comments F-9C-2, 4, 5, 6, and 7 in Letter F-9C from Sustainable Systems Research, LLC; Comment F-11-23 in Letter F-11 from the Sierra Club, San Gorgonio Chapter; Comment F-13-11 in Letter F-13 from the Sierra Club and Friends for a Livable*~~ Moreno Valley~~*; and Comment G-51-45 in Letter G-51 from Michael McCoy.*~~

~~*5) Rail Analysis. Analysis of the feasibility of shipping cargos between the WLC and the Ports of Los Angeles and Long Beach by rail instead of by truck was added. The analysis found that this was not feasible for a variety of reasons, including the cost and environmental impacts of a new rail alignment, the high fixed handling costs for rail cargo that makes short hauls uneconomical, and system constraints with the rail system itself. This analysis is provided in the revised TIA (see TIA Chapter 4, Section F) and replicated in this Final EIR traffic section (see end of Section 4.15.3.2 of this Final EIR). These changes have been made in response to: Comments F-3-5, 11, and Appendix 176 in Letter F-3 from the California Clean Energy*~~

~~*Committee; Comments F-6-1, 2, and 3 in Letter F-6 from the Endangered Habitats League; Comment F-9A-45 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comment F-9B-45 in Letter F-9B from Tom Brohard and Associates; Comment F-11-29 in Letter F-11 from the Sierra Club, San Gorgonio Chapter; Comment G-2-7 in Letter G-2 from Perry Johnson; Comment G-17-2 in Letter G-17 from Joanne Lindgren; Comment G-18-1 in Letter G-18 from Sam Zaidy; Comment G-34-5 in Letter G-34 from Lindsay Robinson; Comment G-35-4 in Letter G-35 from Peggy Hadaway and John Neal; Comment G-49-18 in Letter G-49 from Karen Jakpor; Comment G-50-2 in Letter G-50 from Ann McKibben; Comment G-51-5 in Letter G-51 from Michael McCoy; Comments G-52-1 and 2 in Letter G-52 from Steve Jiannino; Comment G-53-4 in Letter G-53 from Deanna Reader and Kenny Bell; Comment G-57-1 in Letter G-57 from Tracy Hodge; Comment G-68-3 in Letter G-68 from Craig and Joan Givens; Comment G-96-3 in Letter G-96 from Margie Breikreuz; and Comment G-97-1 in Letter G-97 from Otana Jakpor.*~~

~~*6) Project Traffic Near Schools. Analysis of the potential safety impacts of WLC traffic on local schools was added, including the new proposed high school #5 located north of SR-60. The traffic analysis for this proposed school can be found in the Tech Memo on High school # 5 Appendix L. The analysis found that the project would pose little safety risk and that appropriate safety features were already present on roads*~~, California. The TIA identifies the specific near ~~*local schools. This analysis is provided in the revised TIA (see TIA Chapter 12, Section B) and replicated in this Final EIR traffic section (see Section 4.15.5.2 of this Final EIR). These changes have been made in response to: Comment E-3-13 in Letter E-3 from the Moreno Valley Unified School District; Comment F-11-36 in Letter F-11 from the Sierra Club, San Gorgonio Chapter; and Comment G-96-4 in Letter G-96 from Margie Breikreuz.*~~

~~*7) Additional Changes. Additional changes have been made to the revised TIA and replicated in the Final EIR traffic section based on comments received on analytical details contained in the Draft EIR and/or previous TIA. These changes have been made in response to: Comments B-2-2 through B-2-14 in Comment Letter B-2 from the California Department of Transportation District 8; Comment B-5-12 in Letter B-5 from the California Air Resources Board; Comment C-3-17 in Letter C-3 from the South Coast Air Quality Management District; Comments E-2A-2 through E-2A-12 in Comment Letter 2A from the City of Riverside; Comments E-2B-1 through E-2B-23 in Appendix 1 to Comment Letter 2-A from the City of Riverside; Comment E-3-5 in Letter E-3 from the Moreno Valley Unified School District; Comments E-5-1 through E-5-5 in Comment Letter E-5 from the City of Redlands; Comments F-3-3, F-3-4, and F-3-6 to F-3-10 in Letter F-3 from the California Clean Energy Committee; Comments F-8-68 and F-8-69 in Comment Letter F-8 from Shute, Mihaly & Weinberger LLP; Comments F-9A-3 and F-9A-7 through F-9A-22 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comments F-9B-1 and F-9B-2, F-9B-4 through F-9B-47 in Letter F-9B from Tom Brohard and Associates; Comments F-13-9, F-13-26, and F-13-89 through F-13-98 in Letter F-13 from the Sierra Club and Friends for a Livable Moreno Valley; Comment G-17-1 in Letter G-17 from Joanne Lindgren; Comments G-51-19, G-51-28 through G-51-30, G-51-47, and G-51-61 through G-51-65 in Letter G-51 from Michael McCoy; Comments G-57-5 through G-57-7 in Letter G-57 from Tracy Hodge; and Comments G-90-7 and G-90-14 in Letter G-90 from Mr. and Mrs. H.W. Wolterbeek.*~~

~~*Note: As a result of these various changes, the level of significance of traffic impacts has not changed in comparison to the Draft EIR. However, the following changes to individual roadway, intersection, and/or freeway impacts and the reason for these changes are as follows:*~~

~~*Intersections*~~

~~*Indian Street/Cactus Avenue (IN-64). Although this intersection exceeds the level of service standard in the Year 2035 Cumulative Plus Project analysis, the revised project does not increase the delay in comparison to the No Project condition. Consequently, no mitigation is required.*~~

~~*Ellsworth Street/Alessandro Boulevard (IN-71). Due to the reduction in the project size, this intersection does not exceed the level of service standard and therefore no*~~ -term and longer ~~*requires mitigation.*~~

~~*Ellsworth Street/Cactus Avenue (IN-74). The Draft EIR TIA identified required mitigation for the Ellsworth Street/Cactus Avenue intersection (IN-74) in Table 69 (page 325). The mitigation included widening the northbound approach to provide three left-turn lanes, one through lane, and one right-turn lane, and adding a westbound left-turn lane and eastbound right-turn lane. This mitigation was inadvertently omitted from the mitigations chapter text and Table 80 in the Draft EIR TIA. This mitigation has been corrected in the Final EIR TIA and added to the mitigation discussion in the Final EIR.*~~

~~*Bridge Street/Ramona Expressway (IN-122). Mitigation for this intersection was included in the Draft EIR for project direct impacts (Existing Plus Project). Upon further review, it was determined that the mitigation was not warranted because the intersection will be eliminated and replaced by a grade separation. A discussion of this has been included in the Revised Draft EIR, however, the impact remains significant and unavoidable.*~~

~~*Roadway Segments*~~

~~*Theodore Street from SR-60 Westbound Ramps to Ironwood Avenue (S-1). Due to the reduction in the project size, this roadway segment does not exceed the level of service standard and therefore no longer requires mitigation.*~~

~~*Freeway Segments*~~

~~*Southbound I-215 from SR-74 to Ellis Avenue (F-71). In the Draft EIR, this freeway segment was listed as "I-215 SR-74/Case Road to Redlands Avenue" and shown as having an impact. In the Final EIR TIA, the segment where the level of service exceedance will occur (between SR-74 and Ellis Avenue) is listed as "I-215 SR-74 to Redlands Ave" in Table 76 for project direct impacts but as "I-215 SR-74 to Ellis Ave" in Table 79 for cumulative impacts. In each table, however, the same identification number (F-71) was used. In summary, this is not a new impact; as it was already identified in the Draft EIR. A footnote has been added to the Revised EIR as follows: "I-215 currently runs unbroken between SR-74 and Redlands Avenue. The RTP includes a project (3M0731) that would split this freeway mainline section by adding a new interchange at Ellis Avenue. For this reason, this freeway section is listed as "I-215 SR-74 to Redlands" on the tables in the TIA and EIR describing conditions prior to construction of the Ellis Avenue interchange."*~~

-term circulation

~~Southbound~~ ~~*I-215 from Baseline Road to Highland Avenue (F-83). This freeway segment was identified as a significant and unavoidable project direct impact (Existing Plus Project). Upon further review, it was determined that the significant and unavoidable impact will occur in the Year 2035 Cumulative Plus Project scenario. For this reason, the impact has been moved to the Year 2035 Cumulative Plus Project analysis. Regarding F-83, the WLC would have a direct impact which was identified in the analysis of the Existing Plus Project scenario. However, the identified mitigation for this is already under construction. As a result, the direct impact will never exist. In the Cumulative scenario, F-83 would be deficient with or without WLC, even with the new lane currently under construction. Since the WLC is adding to a deficient condition it would have a cumulative impact on this segment. The solution to this would be to add yet another lane, but this is not feasible given the constraints at the site.*~~

~~This section of the EIR assesses traffic impacts by examining the proposed project's impacts on Existing Baseline 2012, Opening Year 2022, and Year 2035 Cumulative traffic analysis time horizons. The impact of the entire proposed project has been assessed in the Baseline 2012 and Buildout Year 2035 time horizons, while the Baseline 2012 and Future Year 2022 analyses assess impacts of Phase 1 of the proposed project.~~

~~For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements, which affect several separate, adjacent and related properties. The following information is summarized from Section 3.0, *Project Description*. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes the WLC Specific Plan Area (2,610 acres), the CDFW Conservation Buffer Area (910 acres), the Public Facilities Lands area (194 aces), plus 104 acres of land affected by off-site~~ improvements ~~needed to support the proposed development. The proposed entitlements are summarized below~~that would be required to mitigate project impacts and maintain acceptable peak hour and daily levels of service (LOS) on surface streets and freeways affected by the project. As part of this comprehensive analysis special attention was paid to analyzing truck access routes, safety issues relating to trucks, and the effects of truck traffic on traffic operations.

~~*Note: The following changes have been made due to revision to the Specific Plan project size*.~~

~~For the reader's reference, this EIR and each of the technical reports and analyses contained herein have been written to address a series of planning entitlements that affect several separate, adjacent and related properties. The overall project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land, which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. The proposed entitlements are summarized below.~~

~~A General Plan Amendment is proposed covering 3,714 acres, which redesignates approximately 70 percent of the area (2,610 acres) for logistics warehousing (new LD and LL zones) and the remaining 30 percent (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives.~~

~~A new Specific Plan (September 2014) will be adopted to govern development of the World Logistics Center for the 2,610 acres. A separate zoning amendment will also be processed and adopted to rezone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.~~

~~In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a Tentative Parcel Map covering 1,539 acres (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner.~~

~~The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.~~

~~Finally, a Development Agreement between the City and Highland Fairview (the project applicant) is included as one of the project entitlements. The details of all the project entitlements are included in Section 3.4 of the EIR, *Project Characteristics*.~~

~~The analysis contained in this section is based on the following technical studies prepared for the proposed project:~~

- ~~*Traffic Impact Analysis Report for the World Logistics Center*, Parsons Brinckerhoff, September 2014 (Appendix L-1 of this EIR).~~
- ~~*Trip Generation Analysis for High-Cube Warehouse Distribution Center Land Use for the NAIOP Inland Empire*, Kunzman Associates, Inc., December 20, 2011 (Appendix L-2 of this EIR).~~
- ~~*Assessment of Available High-Cube Trip Generation Rates*, Memorandum from Aric Evatt, Urban Crossroads, Inc., to Ahmad Ansari, City of Moreno Valley, February 1, 2012 (Appendix L-3 of this EIR).~~
- ~~Letter from George Rhyner, Crain & Associates, to Mr. Robert Evans, NAIOP Inland Empire, regarding Response to the South Coast Air Quality Management District White Paper, dated December 1, 2011 (Appendix L-4 of this EIR).~~

~~In addition to these technical studies, the analysis contained in this section is also based on the following reference document:~~

- ~~Moreno Valley General Plan Circulation Element, adopted July 2006.~~

~~The TIA for the proposed project has been prepared in accordance with accepted standards and practices of the traffic engineering industry as summarized in a scoping agreement with the City of Moreno Valley. The TIA analyzes roadway segments, intersections, freeway mainline segments, freeway weaving areas, and freeway ramp merge/diverge locations and complies with the TIA Guidelines of the City and Caltrans. Figures 4.15.1, 4.15.2, 4.15.3, and 4.15.4 illustrate the locations of analysis roadway segments, intersections, freeway mainline segments, freeway weaving segments, and freeway ramp merge/diverge locations.~~

~~THE STUDY AREA FOR ROADWAY SEGMENTS INCLUDED THE ROADWAYS THAT WILL BE AFFECTED BY THE PROPOSED GENERAL PLAN AMENDMENT.~~ B. SCOPE OF STUDY

The study considers seven development scenarios, namely:

1) Existing baseline conditions (2018) without the WLC project
2) Existing baseline conditions plus Phase 1 (only) of the WLC project
3) Existing baseline conditions plus the Full Build-out of the WLC project
4) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2025, without the WLC project
5) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2025, plus Phase 1 (only) of the WLC project
6) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2040, including full build-out of the City of Moreno Valley General Plan, except that existing conditions remain on the site of the WLC project. The horizon year 2040 corresponds with the long-term planning horizon in the Southern California Association of Governments (SCAG) regional forecasts.
7) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2040, including full build-out of the City of Moreno Valley General Plan except for the WLC site, where full build-out of the WLC project was assumed.

2040 was selected for the horizon year because it corresponds to the horizon year used by agencies in the SCAG region for the most recent Sustainable Communities Strategy. The interim year analysis shows the Project when it is approximately half built out. 2025 was selected for the interim year based on SCAG's projection that 222 million square feet of logistics warehouses would be built in the region between 2016 and 2025[1], and the assumption that the WLC would attract approximately 10% of the regional total (around 22 million square feet).

Most of the LOS analyses focused on the morning and evening peak hours because that is when capacity problems most frequently occur. An analysis was performed using daily traffic volumes to determine if the proposed circulation element amendment would achieve City LOS goals.

The study area for ~~intersections in Moreno Valley~~surface streets covered all intersections ~~between streets classified as~~ in Moreno Valley of collector or higher ~~and~~functional classification with another collector or higher classification street, at which the proposed project would add 50 or more peak hour trips~~. This~~[2]. The study area ~~criterion was~~ also ~~applied to~~included the main routes between the project and the neighboring ~~cities~~communities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area also extended west to the nearest ramps to ~~State Route (~~SR-91~~)~~ and as far south as the I-215 ramps at Redlands ~~Avenue~~Ave. in Perris. These limits represent the extreme range of the RIVTAM model's capacity to accurately predict real differences between the No-Project and Plus-Project scenarios. **Error! Reference source not found.**~~**Error! Reference source not found.**~~ shows the study area for surface street intersections.

The study area for freeways ~~included~~was selected to encompass the freeway routes extending from the project site to the north, south, east, and west. The analysis covered SR-60 from I-10 in the east to SR-71 in the west, SR-91/~~I~~I-215 from I-210 in the east to I-15 in the west, I-215 from Redlands ~~Avenue (4th Street)~~Ave. in the north to the Scott ~~Road~~Rd. interchange in the south, and I-10 from SR-62 in the east to SR-60 in the west. (see **Error! Reference source not found.**). These limits represent the extreme range of the RIVTAM model's capacity to accurately predict differences between No-Project and Plus-Project scenarios. In addition, the two main routes to the ~~Ports~~ports of Los Angeles and Long Beach were ~~assessed~~studied (see **Error! Reference source not found.**). For these corridors, trips from the WLC were manually added to forecasts for the No-Project scenario taken from the SCAG model[3].

Any freeway ramp where the project added 100 or more peak-hour trips was also studied. These included:

CHANGES SINCE 2014

In 2012 an application was made to the City of Moreno Valley for the World Logistics Center (WLC), a new plan for the area that had been subject to the Moreno Highlands Specific Plan. A notice of preparation for the WLC environmental impact report (EIR) was issued in February 2012. A traffic impact analysis (TIA) was prepared as one of several technical studies in support of the EIR and submitted to the City in September 2014. The full Draft EIR, including traffic sections based on the TIA, was submitted for public comment in February 2013 and was the subject of public hearings held in June 2015. The General Plan Amendment, zoning change, and the WLC Specific Plan, were adopted by the City Council in August 2015 and adopted again by ballot initiative in November 2015.

In the time since the 2014TIA, a number of developments have occurred that effect the forecast of traffic impacts from the WLC. These changes include:

- The most important new development was the completion in October 2016 of *High-Cube Warehouse Vehicle Trip Generation Analysis*, a major trip generation study for high-cube warehouses, the predominant form of land use in the WLC. This study was jointly sponsored by the South Coast Air Quality Management District (SCAQMD) and the National Association of Industrial and Office Properties (NAIOP), and was conducted by the Institute of Transportation Engineers (ITE). The results were incorporated into the 10th edition of ITE's *Trip Generation Manual*.

  This study replaces the multitude of earlier, smaller studies that produced conflicting results and created uncertainty regarding the amount of traffic generated by the newer, more automated type of high-cube warehouse proposed for the WLC. The 2016 study found that on average, warehouses generate fewer trips than had been assumed in the previous TIA for every analysis period (24% fewer in the AM peak period, 14% fewer in the PM peak hour, and 15% fewer on a daily basis). However, the volume of truck trips being generated in off-peak periods was higher than had been previously assumed.

- The trip generation rates for other land uses (light logistics, convenience market, etc.) were also updated to those in the 10th edition of ITE's *Trip Generation Manual*.
- The study analysis years were updated so that 2018 is used for Existing Conditions, 2025 is used for Phase 1, and 2040 is used for the Cumulative Scenarios.
- The assumptions regarding background (i.e. non-WLC) land development have been updated to reflect the Sustainable Community Strategy adopted by SCAG in 2016. The list of reasonably foreseeable projects was also updated to account for projects that have been completed or have dropped out, and for proposed projects that have been added to the pipeline.
- The assumptions regarding changes to the transportation network have been updated to reflect the Regional Transportation Plan adopted by SCAG in 2016. The existing conditions network was also updated to account for projects completed since the base year of the previous TIA (2012).
- New traffic counts were performed for all study intersections and roadway segments, and new data was collected for volumes on the study freeway segments.
- An analysis of the effect of the Project on regional vehicle-miles of travel (VMT) has been added. This analysis was done primarily to provide data needed for the air quality analysis. Readers may be aware that, as a result of Senate Bill 743 (Steinberg, 2013), CEQA analysis of traffic impacts is likely to change at some point in the future from LOS-based to VMT-based. This change will not take effect before January 1st 2020 at the earliest, so the LOS approach that is the primary focus of the current study accords with current state law. The VMT analysis is therefore included in this traffic study for informational purposes only.

4.15.1 Existing Setting

4.15.1.1 Traffic Level of Service Definitions

Level of Service (LOS) is an expression of a transportation facility's operations and is dictated by the relationship between capacity and traffic volumes. LOS is generally defined using the letter grades A through F (Table 4.15.A). These levels reflect the reality that conditions rapidly deteriorate as traffic approaches the absolute capacity of a thoroughfare.

Table 4.15.A: Traffic Level of Service Definitions

Level of Service	Description
A	~~No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication. Typically, the approach appears quite open, turns are made easily, and nearly all drivers find freedom of operation.~~Volume-tocapacity ratio is low and either the progression is exceptionally favorable or the cycle length is short. If due to favorable progression, most vehicles during the green indication and travel through the intersection without stopping.
B	~~This service level represents stable operation, where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.~~Volume to capacity ratio is low and either the progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A
C	~~This level still represents stable operating conditions. Occasionally drivers may have to wait through more than one red signal indication, and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.~~Progression is favorable or the cycle length is moderate. Individual cycle failures (i.e. one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	~~This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak period; however, enough cycles with lower demand occur to permit periodic clearance of developing queues, thus preventing excessive backups.~~Volume-to-capacity ratio is high and either progression is ineffective or cycle length is long. Most vehicles stop and individual cycle failures are noticeable.
E	~~Capacity occurs at the upper end of this service level. It represents the most vehicles that any particular intersection approach can accommodate. Full utilization of every signal cycle is seldom attained no matter how great the demand.~~Volume-to-capacity ratio is high, progression is unfavorable and the cycle length is long. Individual cycle failures are frequent.
F	~~This level describes forced flow operations at low speeds, where volumes exceed capacity. These conditions usually result from queues of vehicles backing up from a restriction downstream. Speeds are reduced substantially and stoppages may occur for short or long periods of time due to the congestion. In the extreme case, both speed and volume can drop to zero.~~Volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

Roadway Segment Level of Service Methodology. Roadway segment operations have been evaluated using the City of Moreno Valley Daily Roadway Capacity Values provided in the City of Moreno Valley General Plan Circulation Element as shown in Table 4.15.B.

Table 4.15.B: City of Moreno Valley Level of Service Criteria for Roadway Segments

Roadway Classification	Level of Service*				
	A	B	C	D	E
6-Lane Divided Arterial	33,900	39,400	45,000	50,600	56,300
4-Lane Divided Arterial	22,500	26,300	30,000	33,800	37,500
4-Lane Undivided Arterial	15,000	17,500	20,000	22,500	25,000
2-Lane Industrial Collector	7,500	8,800	10,000	11,300	12,500
2-Lane Undivided Residential	N/A	N/A	N/A	N/A	2,000

*Maximum Average Daily Traffic (ADT)

Source: City of Moreno Valley *Traffic Impact Analysis Preparation Guide*, 2007.

Riverside County's LOS thresholds for surface streets were used for the assessment of impacts to Gilman Springs Road, as shown in Table 4.15.C.

Table 4.15.C: Riverside County LOS Thresholds for Surface Streets

Type of Roadway	Level of Service(1)		
	LOS C	LOS D	LOS E
8-Lane Urban Arterial	57,400	64,600	71,800
6-Lane Urban Arterial	43,100	48,500	53,900
4-Lane Urban Arterial	28,700	32,300	35,900
2-Lane Collector	10400	11700	13,000

Notes: All capacity figures are based on optimum conditions and are intended as guidelines for planning purpose only.

(1) Maximum two-way ADT values are based on the 1999 Modified Highway Capacity Manual Level of Service Tables as defined in the Riverside County Congestion Management Program.

Source: County of Riverside General Plan, Circulation Element, 2008

Intersection Level of Service Methodologies. LOS criteria for signalized intersections are identified in Table 4.15.D. Levels of service at signalized intersections were calculated using the methodology described in Chapter 16 of the *Highway Capacity Manual* (HCM) and generated by the Synchro analysis software. Signalized intersection LOS are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections, LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 4.15.D.

Table 4.15.D: Level of Service Criteria for Unsignalized and Signalized Intersections

Level of Service	Unsignalized Intersection and Roundabouts Average Delay per Vehicle (sec.)	Signalized Intersection Average Delay per Vehicle (sec.)
A	≤ 10	≤ 10
B	> 10 and ≤ 15	> 10 and ≤ 20
C	> 15 and ≤ 25	> 20 and ≤ 35
D	> 25 and ≤ 35	> 35 and ≤ 55
E	> 35 and ≤ 50	> 55 and ≤ 80
F	> 50	> 80

Table 4.15.D: Level of Service Criteria for Unsignalized and Signalized Intersections

Level of Service	Unsignalized Intersection and Roundabouts Average Delay per Vehicle (sec.)	Signalized Intersection Average Delay per Vehicle (sec.)

Source: *Highway Capacity Manual,* Transportation Research Board, Washington, DC, ~~2000.~~2010

LOS criteria for unsignalized intersections are also identified in Table 4.15.D. The City of Moreno Valley requires unsignalized intersection analysis based on the methodology described in Chapter 17 of the HCM.

Freeway Level of Service Methodology. Caltrans LOS criteria for freeway mainline segments, freeway weave segments, and freeway ramp merge/diverge locations are expressed in terms of density (passenger cars/mile/lane). Table 4.15.E shows the correlation between density and LOS for freeway segments and ramps.

Table 4.15.E: Level of Service Criteria for Freeway Segments

Level of Service	Freeway Segment Density (passenger cars/mile/lane)	Freeway Weaving Segment Density (pc/mi/lane)	Freeway Ramp Density (passenger cars/mile/lane)
A	0–11.0	≤ 10.0	≤ 10.0
B	11.0–18.0	> 10.0 and ≤ 20.0	> 10.0 and ≤ 20.0
C	18.0–26.0	> 20.0 and ≤ 28.0	> 20.0 and ≤ 28.0
D	26.0–35.0	> 28.0 and ≤ 35.0	> 28.0 and ≤ 35.0
E	35.0–45.0	>35.0 and ≤ 43.0	>35
F	> 45.0	>43.0	Exceeds Capacity

Source: (Table 11, PB 2013) *Highway Capacity Manual,* Transportation Research Board, Washington, DC, 2000.

4.15.1.2 Baseline Conditions

The project is located within the eastern portion of the City of Moreno Valley. The project site is located south of SR-60 and west of Gilman Springs Road. Tables 4.15.F and 4.15.G show existing intersection control types and roadway through lanes for the study area intersections and roadways, respectively. LOS and volumes are discussed below for existing (~~2012~~2018) without project conditions (otherwise known as the "baseline" condition).

Baseline Levels of Service. Existing (~~2012~~2018) traffic operations have been evaluated for study area intersections. The analysis was performed for the a.m. and p.m. peak hours. Existing traffic volumes at study area intersections are based on peak hour intersection turn movement counts. An intersection level of service analysis was conducted to determine current intersection performance for existing baseline conditions. The levels of service for existing baseline conditions at study area intersections are summarized in Table 4.15.F, which shows the following ~~12~~21 study intersections currently operate at an unsatisfactory level of service during either the a.m. and p.m. peak hour:

- N-10 Redlands ~~Boulevard/~~Blvd./Locust ~~Avenue (a.m. and p.m.);~~Ave. (AM, PM)
- ~~Redlands Boulevard/SR-60 Westbound ramps (a.m. and p.m.);~~
- IN-20 Oliver ~~Street/~~St./Alessandro ~~Boulevard (a.m.);~~Blvd. (AM)
- IN-23 Redlands Blvd./Alessandro Str. (PM)

- IN-37 Moreno Beach ~~Drive/~~Dr./SR-60 ~~Eastbound~~EB Ramps (~~p.m.);~~PM)
- ~~Lasselle Street/~~IN-39 Iris Ave./Perris Blvd. (PM)
- IN-65 Perris Blvd./Cactus ~~Avenue (a.m. and p.m.);~~Ave. (AM)
- ~~Alessandro Boulevard/~~IN-83 Martin Luther King Blvd./Canyon Crest Dr. (AM)
- IN-85 Martin Luther King Blvd./I-215 NB Ramps (AM, PM)
- IN-86 Central Ave./Chicago ~~Avenue. (p.m.);~~Ave. (PM)
- IN-94 Arlington Ave./Victoria Ave. (AM)
- IN-95 Alessandro Blvd./Chicago Ave. (PM)
- IN-107 Evans Rd./Rider St. (AM)
- IN-114 Evans Rd./Orange Ave. (AM, PM)
- IN-115 Evans Rd./Nuevo Rd. (AM)
- IN-122 Bridge St./Ramona Expy. (AM, PM)
- IN-123 Gilman Springs ~~Road/~~Rd./Bridge ~~Street (a.m.);~~St. (AM, PM)
- IN-124 SR-79 (Sanderson ~~Avenue) Northbound~~Ave.) NB/Gilman Springs ~~Road (a.m. and p.m.);~~Rd. (AM)
- IN-125 SR-79 (Sanderson ~~Avenue) Southbound~~Ave) SB/Gilman Springs ~~Road (a.m. and p.m.);~~Rd. (AM, PM)
- IN-132 San Timoteo Canyon ~~Road/~~Rd./Alessandro ~~Road (a.m. and p.m.);~~Rd. (AM)
- IN-133 San Timoteo Canyon ~~Road/~~Rd./Live Oak Canyon ~~Road (a.m. and p.m.); and~~Rd. (AM, PM)
- IN-134 Redlands ~~Boulevard/~~Blvd./San Timoteo Canyon ~~Road (a.m. and p.m.).~~Rd. (AM, PM)

- A roadway segment analysis was conducted to determine current roadway system performance for existing baseline conditions for the roadway segments that would be affected by the ~~proposed General Plan Amendment.~~ WLC project. Roadway segment operations have been evaluated using the City of Moreno Valley Daily Roadway Capacity Values provided in the City of Moreno Valley General Plan Circulation Element and summarized in previously referenced Table 4.15.B. The roadway segment levels of service are summarized in Table 4.15.G. The following two roadway segments currently exceed the threshold of significance established in the General Plan.

- Gilman Springs Road: Alessandro to Bridge Street
- ~~Between~~Gliman Springs Road: SR60 to Alessandro ~~Boulevard and Bridge Street; and~~Blvd
- ~~Between~~Redlands Blvd: SR- 60 ~~and Alessandro Boulevard~~to Eucalyptus Ave.

A freeway analysis was conducted for existing baseline conditions to determine current freeway performance on SR-60, SR-91, I-215, and I-10 basic freeway segments where the project would add 100 or more peak-hour trips and on the freeway routes to the Ports of Los Angeles and Long Beach. A freeway weaving analysis was conducted on freeway segments where an on-ramp is closely followed by an off-ramp, and the two are joined by an auxiliary lane. Existing baseline freeway mainline and weaving section levels of service are summarized in Tables 4.15.H and 4.15.I, respectively, which show the following ~~17~~34 freeway mainline segments and ~~six~~7 weaving segments are currently operating at an unsatisfactory level of service during either the a.m. or p.m. peak hour:

North or Eastbound

- SR-60~~, South Reservoir Street to~~ Ramona ~~Avenue (Westbound a.m.);~~
- ~~SR-60, Ramona Avenue~~Ave. to Central ~~Avenue (Westbound a.m., Eastbound p.m.);~~Ave. (AM, PM)
- SR-60~~,~~ Central ~~Avenue~~Ave. to Mountain ~~Avenue (Eastbound p.m.);~~Ave. (PM)
- SR-60~~,~~ Mountain Ave. to Euclid ~~Avenue~~Ave. (PM)
- SR-60 Euclid Ave. to Grove ~~Avenue (Eastbound p.m.);~~Ave. (PM)
- SR-60~~,~~ Grove ~~Avenue~~Ave. to Vineyard ~~Avenue (Eastbound p.m.);~~Ave. (PM)
- SR-60~~,~~ Vineyard ~~Avenue~~Ave. to Archibald ~~Avenue (Eastbound p.m.);~~Ave. (PM)
- SR-60~~,~~ Market ~~Street~~St. to Main ~~Street (Eastbound p.m.);~~St. (PM)
- SR-60~~,~~ Martin Luther King ~~Boulevard~~Blvd. to Central ~~Avenue (Eastbound p.m.);~~Ave. (AM, PM)
- SR-60~~, I-215~~ Pigeon Pass Rd. to ~~Day Street (Westbound a.m.);~~Heacock St. (PM)
- SR-91~~, I-15 to McKinley Street (Eastbound p.m.);~~
- ~~SR-91,~~ Pierce ~~Street~~St. to Magnolia ~~Avenue (Westbound p.m.);~~Ave. (AM, PM)
- SR-91~~, Magnolia Avenue~~ Tyler St. to ~~La Sierra Avenue (Westbound p.m.);~~Van Buren Blvd. (PM)
- ~~I-215, SR-74/Case Road to Redlands Boulevard (Westbound a.m., Eastbound p.m.);~~
- ~~I-215, Barton Road~~SR-91 Adams St. to Madison St. (AM, PM)
- SR-91 ~~to Mt. Vernon Avenue/Washington Street (Northbound a.m.);~~
- ~~I-215, Baseline Road to Highland Avenue/SR-210 (Southbound a.m., Southbound p.m.);~~
- ~~SR-60, SR-71/Garey Avenue to Reservoir Street (Eastbound p.m.);~~
- ~~SR-60, SR-91 to Blaine Street/3rd Street (Eastbound p.m.);~~
- ~~SR-60, Blaine Street/3rd Street to University Avenue (Eastbound p.m.);~~
- ~~SR-60,~~ Central ~~Avenue~~Ave. to 14th St. (AM, PM)
- I-215 Barton Rd. to Mt. Vernon Ave./Washington St. (AM)
- I-215 Auto Plaza Dr. to Mill St. (PM)

Southbound or Westbound

- SR-60 Grove Ave. to Vineyard Ave. (PM)
- SR-60 Vineyard Ave. to Archibald Ave. (PM)
- SR-60 Market St. to Main St. (AM)
- SR-60 Main St. to SR-91 (AM)

- SR-60 Fair Isle ~~Drive/~~Dr./Box Springs ~~Road (Westbound a.m.);~~Rd. to I-215 (PM)
- ~~SR-91,~~SR-60 I-215 to Day St. (AM)
- SR-60 Pigeon Pass Rd. to Heacock St. (AM)
- SR-91 McKinley St. to Pierce St. (AM, PM)
- SR-91 Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 Magnolia Ave. to La Sierra Ave. (AM, PM)
- SR-91 La Sierra Ave. to Tyler St. (PM)
- SR-91 Tyler St. to Van Buren Blvd. (PM)
- SR-91 Van Buren Blvd. to Adams St. (PM)
- SR-91 Madison St. to Arlington ~~Avenue to Central Avenue (Eastbound a.m.); and~~Ave. (AM, PM)
- ~~SR-91, 14th Street to University Avenue (Westbound p.m.).~~

~~Table 4.15.F: Existing (2012) Intersection Levels of Service~~

~~ID~~	~~Study Intersection~~	~~LOS Standard~~	~~Traffic Control~~	~~AM Peak Hour~~		~~PM Peak Hour~~	
				~~Delay~~	~~LOS~~	~~Delay~~	~~LOS~~

▨ ~~denotes LOS exceeding the target threshold~~

~~"CSS" means cross-street is stop-controlled~~	~~"NB" and "SB" denote northbound and southbound, respectively~~
~~"AWS" means all-way stop~~	~~"EB" and "WB" denote eastbound and westbound, respectively~~
~~"RABT" means roundabout~~	~~"LT" and "RT" denote left turn and right turn, respectively~~

- I-215 Harley Knox Blvd. to Van Buren Blvd. (PM)
- I-215 Alessandro Blvd. to Eucalyptus Ave. (PM)
- I-215 Center St. to La Cadena Dr. (AM, PM)
- I-215 La Cadena Dr. to Barton Rd. (AM, PM)
- I-215 Barton Rd. to Mt. Vernon Ave. (PM)

Most of the freeway basic sections currently exceeding the target LOS involve congestion in the peak direction. That is why regional agencies stress the importance of promoting reverse commuting; to move some traffic from the congested side of the freeway to the uncongested side.

~~* Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways~~

~~** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.~~

~~*** LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways~~

▨ ~~Indicates LOS exceeds the target level~~

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.
** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.
*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.
▒ Indicates LOS exceeds the target level

~~4.15.1.3 Responses to NOP Comments~~

~~During the NOP comment period, the City received comments on the project. The comments pertaining to traffic and circulation and responses to those comments are provided below:~~

~~**Caltrans Comment Letter Dated February 29, 2012** (DEIR Appendix B)~~

~~A Traffic Impact Study (TIS) is necessary to determine this proposed project's near-term and long-term impacts to the State facilities and to propose appropriate mitigation measures. The study should be based on Caltrans'~~ *~~Guide for the Preparation of Traffic Impact Studies (TIS),~~* ~~which is located at http://www.dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa_files/tisguide.pdf. Minimum contents~~Levels of ~~the traffic impact study are listed in Appendix "A" of the TIS guide.~~Service

~~Response~~

~~1) A traffic impact assessment (TIA) has been performed for the project. The study has been prepared to cover the subjects required under Caltrans TIS guidelines.~~

~~It should be noted that the project proposes to move the Alessandro Boulevard access from Gilman Springs Road, which could potentially improve the operation of Alessandro Boulevard/Gilman Springs Road.~~

~~3) Any existing inadequacies of freeways and roads cannot be attributed to this proposed project, but are considered in the TIA. While it is true that a portion of the City near I-215 has been designated for industrial development, it is also true that much of the project site was designated for business park development in the current General Plan. Initial studies suggest that the traffic attributable to the proposed project will be substantially less than the traffic generated by the site under the uses proposed in the General Plan. The adequacy of the Theodore Street interchange to accommodate future traffic has been studied as part of the TIA.~~

~~4) Any existing inadequacies of freeways and roads cannot be attributed to this proposed project. The proposed project does not include any land north of SR-60, so the need for schools, fire stations, hospitals, and other public facilities north of SR-60 would need to be addressed through some mechanism other than this project. The need for the on-site road system to accommodate through traffic has been studied as part of the TIA.~~

~~5) One goal of the WLCSP Circulation Plan is to separate project-related trucks from passenger vehicle traffic on surrounding local streets. Much of the project traffic will access SR-60 via a new interchange at Theodore Street, and project truck traffic will be prohibited on Redlands Boulevard south of Eucalyptus Avenue and on Street D to Cactus Avenue southwest of the project.~~

~~6) The adequacy of the new proposed Theodore Street interchange to accommodate future (cumulative) traffic has been studied as part of the TIA.~~

~~7) The TIA takes into consideration known projects in neighboring jurisdictions to examine cumulative traffic impacts.~~

~~8) The TIA studied the number of lanes needed for the study roadways that are significantly affected by the project. The number of mid-block lanes and intersection approach geometry needed will depend on a combination of traffic volumes and anticipated turning movements, which will differ by location.~~

4.15.2 Existing Policies and Regulations

The City of Moreno Valley's current General Plan was approved in July 2006, and the following goals and policies are extracted from the Circulation Element of the current General Plan.

Community Development

Policy 2.2.17	Discourage nonresidential uses on local residential streets that generate traffic, noise, or other characteristics that would adversely affect nearby residents.

Circulation Element

Objective 5.1	**Create a safe, efficient, and neighborhood-friendly street system.**
Policy 5.1.1	Plan access and circulation of each development project to accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles.
Policy 5.1.2	Plan the circulation system to reduce conflicts between vehicular, pedestrian and bicycle traffic.
Policy 5.1.3	Require adequate off-street parking for all developments.
Policy 5.1.4	Driveway placement shall be designed for safety and to enhance circulation wherever possible.
Policy 5.1.5	Incorporate American Disability Act (ADA) and Title 24 requirements in roadway improvements as appropriate.
Policy 5.1.6	Design new developments to provide opportunity for access and circulation to future adjacent developments.
Objective 5.2	**Implement access management policies.**
Policy 5.2.1	Locate residential units with access from local streets. Minimize direct residential access from collectors. Prohibit direct single-family driveway access on arterials and higher classification roadways.
Policy 5.2.2	Feed short local street into collectors.
Policy 5.2.3	Encourage the incorporation of traffic calming design into local and collector streets to promote safe vehicle speeds.
Policy 5.2.4	Design new subdivisions to minimize the disruptive impact of motor vehicles on local streets. Long, broad and linear streets should be avoided. Residential streets should be no wider than 40 feet, and should have an uninterrupted length of less than one half mile. Curvilinear streets and cul-de-sacs are preferred. Streets within the subdivision should be designed to facilitate access to residences and to discourage through traffic.
Objective 5.3	**Maintain Level of Service (LOS) "C" on roadway links, wherever possible, and LOS "D" in the vicinity of SR 60 and high employment centers.**
Policy 5.3.1	Obtain right-of-way and construct roadways in accordance with the designation shown on the General Plan Circulation Element Map and the City street improvement standards.
Policy 5.3.2	Wherever feasible, promote the development of roadways in accordance with the City standard roadway cross-sections, as shown in Figure 9-3. Cross-sections range from two-lane undivided roadways to 8-lane divided facilities.

Policy 5.3.3	Create new roadway classifications to accommodate future traffic demand, including; Divided Major Arterial – Reduced Cross-Section, and Divided Arterial – 6-lane. These cross-sections are shown on Figure 9-3.
Policy 5.3.4	For planning purposes, utilize LOS standards shown on Table 5 –1 to determine recommended roadway widths.
Policy 5.3.5	Ensure that new development pays a fair-share cost to provide local and regional transportation improvements and to mitigate cumulative traffic impacts. For this purpose, require new developments to participate in Transportation Uniform Mitigation Fee (TUMF), the Development Impact Fee Program (DIF), and any other applicable transportation fee programs and benefit assessment districts.
Policy 5.3.6	Where new developments would increase traffic flows beyond the LOS C (or LOS D, where applicable), require appropriate and feasible mitigation measures as a condition of approval. Such measures may include extra right-of-way and improvements to accommodate left-turn and right-turn lanes at intersections, or other improvements.
Policy 5.3.7	Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible.
Policy 5.3.8	Pursue arterial improvements that link and/or cross the State Route 60 (SR-60) Freeway, including an additional over-crossing at Graham Street.
Policy 5.3.9	Address additional widenings at arterials providing access to SR-60 at Day Street, Frederick Street/Pigeon Pass Road, and Perris Boulevard.
Objective 5.4	**Maximize efficiency of the regional circulation system through close coordination with State and regional agencies and implementation of regional transportation policies.**
Policy 5.4.1	Coordinate with Caltrans and the Riverside County Transportation Commission (RCTC) to identify and protect ultimate rights-of-way, including those for freeways, regional arterial projects, transit, bikeways, and interchange expansion.
Policy 5.4.2	Coordinate with Caltrans and RCTC regarding the integration of Intelligent Transportation Systems (ITS) consistent with the principles and recommendations of the Inland Empire Regional ITS Architecture Project.
Policy 5.4.3	Work with property owners, in cooperation with RCTC, to reserve rights-of-way for potential Community and Environmental Transportation Acceptability Process (CETAP) corridors through site design, dedication, and land acquisition, as appropriate.
Policy 5.4.4	The City Council will commit to establishing ongoing relationships with all agencies that play a role in the development of the City's transportation system. Council members who are appointed to these agencies as City representatives shall seek out leadership roles to maximize their effectiveness on behalf of the City. Council will strive to maintain continuity in their appointments of representatives.
Policy 5.4.5	Work with RCTC, WRCOG, and the TUMF Central Zone Committee to facilitate the expeditious construction of TUMF Network projects, especially projects that directly benefit Moreno Valley.

Policy 5.4.6	Cooperatively participate with SCAG, RCTC, and WRCOG in the planning for a transportation system that anticipates regional needs for the safe and efficient movement of goods and people.
Policy 5.4.7	Utilizing a combination of regional, state and federal funds, development impact fees, and other locally generated funds, provide needed improvements along SR 60 and the associated interchanges, including interchange and grade separation improvements.
Policy 5.4.8	Reserve rights-of-way to accomplish future improvements as specified in the Caltrans District 8 Route Concept Fact Sheet for SR-60. Specifically, SR-60 shall be built to six general purpose lanes and two High Occupancy Vehicle (HOV) lanes through Moreno Valley. Additional auxiliary lanes may be required between interchanges. The need for auxiliary lanes will be determined from future studies.
Policy 5.4.9	Lobby the State Legislature to keep triple trailer trucks off highways in developed areas of California.
Objective 5.5	**Maximize efficiency of the local circulation system by using appropriate policies and standards to design, locate, and size roadways.**
Policy 5.5.1	Space Collectors between higher classification roadways within development areas at appropriate one-quarter mile intervals.
Policy 5.5.2	Provide dedicated left-turn lanes at all major intersections on minor arterials and higher classification roadways.
Policy 5.5.3	Prohibit points of access from conflicting with other existing or planned access points. Require points of access to roadways to be separated sufficiently to maintain capacity, efficiency, and safety of the traffic flow.
Policy 5.5.4	Wherever possible, minimize the frequency of access points along streets by the consolidation of access points between adjacent properties on all circulation element streets, excluding collectors.
Policy 5.5.5	Design streets and intersections in accordance with the Moreno Valley Municipal Code.
Policy 5.5.6	Consider the overall safety, efficiency and capacity of street designs as more important than the location of on-street parking.
Policy 5.5.7	For developments fronting both sides of a street, require that streets be constructed to full width. Where new developments front only one side of a street, require that streets be constructed to half width plus an additional 12-foot lane for opposing traffic, whenever possible. Additional width may be needed for medians or left and/or right turn lanes.
Policy 5.5.8	Whenever possible, require private and public land developments to provide on-site and off-site improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation system. The City may require developers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.
Policy 5.5.9	Design curves and grades to permit safe movement of vehicular traffic per applicable Caltrans and Moreno Valley standards.
Policy 5.5.10	Provide adequate sight distances for safe vehicular movement at all intersections and driveways.

Policy 5.5.11	Implement National Pollutant Discharge Elimination System (NPDES) Best Management Practices (BMPs) relating to construction of roadways to control runoff contamination from affecting water resources.
Objective 5.6	**Support development of a ground access system to March Inland Port in accordance with its development plan as a major cargo airport.**
Policy 5.6.1	Ensure that City arterials that provide access to and from March Inland Port are properly designed to accommodate projected traffic volumes, including truck traffic.
Policy 5.6.2	Ensure that traffic routes to March Inland Port are planned to minimize impacts to City residential communities.
Objective 5.7	**Design roads to meet the needs of the residents of the community without detracting from the “rural” atmosphere in designated portions of Moreno Valley. (Designated “rural” areas include those encompassed by the Residential Agriculture 2, Residential 1, Rural Residential and Hillside Residential zoning districts. “Urban” areas encompass all other zoning districts.)**
Policy 5.7.1	Pursue development of modified sidewalk standards for local and collector roads within low density areas to reflect the rural character of those areas.
Policy 5.7.2	Provide sidewalks on arterials in designated low density areas that provide access to schools and bus stops.
Objective 5.8	**Encourage development of an efficient public transportation system for the entire community.**
Policy 5.8.1	Support the development of high-speed transit linkages, or express routes, that would benefit the citizens and employers of Moreno Valley.
Policy 5.8.2	Support the efforts of the March Joint Powers Authority in its pursuit of a Transit Center.
Policy 5.8.3	Encourage public transportation opportunities that address the particular needs of transit dependent individuals in the City such as senior citizens, the disabled and low-income residents.
Policy 5.8.4	Ensure that all new developments make adequate provision for bus stops and turnout areas for both public transit and school bus service.
Policy 5.8.5	Continue ongoing coordination with transit authorities toward the expansion of transit facilities into newly developed areas.
Objective 5.9	**Support and encourage development of safe, efficient and aesthetic pedestrian facilities.**
Policy 5.9.1	Encourage walking as an alternative to single occupancy vehicle travel, and help ensure the safety of the pedestrian as follows: (a) All new developments shall provide sidewalks in conformance with the City’s streets cross-section standards, and applicable policies for designated urban and rural areas. (b) The City shall actively pursue funding for the infill of sidewalks in developed areas. The highest priority shall be to provide sidewalks on designated school routes.

Policy 5.9.2	Walkways shall be designed to minimize conflicts between vehicles and pedestrians.
Policy 5.9.3	Where appropriate, provide amenities such as, but not limited to, enhanced paving, seating, and landscaping to enhance the pedestrian experience.
Policy 5.9.4	Require the provision of convenient and safe pedestrian access to buildings from the public sidewalk.
Objective 5.10	**Encourage bicycling as an alternative to single occupant vehicle travel for the purpose of reducing fuel consumption, traffic congestion, and air pollution.**
Policy 5.10.1	Bikeways shall link residential neighborhood areas with parks, employment centers, civic and commercial areas, and schools.
Policy 5.10.2	Integrate bikeways, consistent with the Bikeway Plan, with the circulation system and maintain Class II and III bikeways as part of the City's street system.
Policy 5.10.3	Support bicycle safety programs, and active enforcement of laws relating to the safe operation of bicycles on City streets.
Policy 5.10.4	Link local bikeways with existing and planned regional bikeways.
Objective 5.11	**Eliminate obstructions that impede safe movement of vehicles, bicyclists, and pedestrians.**
Policy 5.11.1	Landscaping adjacent to City streets, sidewalks and bikeways shall be designed, installed and maintained so as not to physically or visually impede public use of these facilities. (a) The removal or relocation of mature trees, street trees and landscaping may be necessary to construct safe pedestrian, bicycle and street facilities. (b) New landscaping, especially street trees shall be planted in such a manner to avoid overhang into streets, obstruction of traffic control devices or sight distances, or creation of other safety hazards.
Policy 5.11.2	Driveways shall be designed to avoid conflicts with pedestrian and bicycle travel.
Objective 5.12	**Promote efficient circulation planning for all school sites that will maximize pedestrian safety, and minimize traffic congestion and neighborhood impacts.**
Policy 5.12.1	Coordinate with school districts to identify suggested pedestrian routes within existing and new subdivisions for school children to walk to and from schools and/or bus stops.
Program 5-1	Periodically review current traffic volumes, traffic collision data, and the pattern of urban development to coordinate, program, and as necessary revise the planning and prioritization of road improvements.
Program 5-2	Periodically reassess the goals, objectives and policies statements of the Circulation Element and propose amendments, as necessary.
Program 5-3	Develop a comprehensive strategy to ensure full funding of the circulation system. The strategy will include the DIF, TUMF, and other funding sources that may be available to the City. In addition, the creation of benefit assessment districts, and road and bridge fee districts may be considered where appropriate.

Program 5-4	Develop a multi-year transportation infrastructure improvement program that, to the extent feasible, phases the construction of new projects in advance of new development.
Program 5-5	The above-referenced program will prioritize circulation improvement projects to be funded from DIF, TUMF and other sources. Prioritization to consider the following factors: (a) Traffic safety; (b) Congestion relief; (c) Access to new development; and (d) Equitable benefit.
Program 5-6	Conduct studies of specified arterial segments to determine if any additional improvements will be needed to maintain an acceptable LOS at General Plan buildout. Generally, these segments will be studied as new developments are proposed in their vicinity. Measures will be identified that are consistent with the Circulation Element designation of these roadway segments, such as additional turn lanes at intersections, signal optimization by coordination and enhanced phasing, and travel demand management measures. The study of specified arterial segments will be required to identify measures to maintain an acceptable LOS at General Plan buildout for at least one of the reasons discussed below: (a) Segments will need improvement, but their ultimate volumes slightly exceed design capabilities. (b) Segments will need improvements but require inter-jurisdictional coordination. (c) Segments would require significant encroachment on existing adjacent development if built out to their Circulation Element designations.
Program 5-7	Establish traffic study guidelines to deal with development projects in a consistent manner. The traffic study guidelines shall include criteria for projects that propose changes it the approved General Plan land uses.
Program 5-13	Implement Transportation demand management (TDM) strategies that reduce congestion in the peak travel hours. Examples include carpooling, telecommuting, and flexible work hours.

4.15.3 Methodology

This section summarizes: i) the traffic volume scenarios analyzed in this EIR and methods of traffic volume projection; ii) the proposed project's trip generation, distribution and assignment~~; ~~, and iii) opening year~~, 2022 background and Year 2035 Cumulative background levels of service.~~

4.15.3.1 Traffic Volume Scenarios

Existing Baseline, Existing Baseline Plus Phase 1, and Existing Baseline Plus Project Conditions. The existing year (~~2012~~2018) represents the baseline traffic conditions as they existed at the time the ~~Notice~~Revised Sections of ~~Preparation~~the FEIR was issued to represent pre-project approval (existing physical conditions). The existing baseline plus project analysis determines direct project-related traffic impacts that would occur on the existing roadway system in a theoretical scenario in which the project is placed upon existing baseline conditions.

Within the WLC project site, the~~ proposed~~ Phase 1 land uses were used for the "Plus Phase 1" scenarios, the proposed project buildout land uses were used for the "Plus Project" scenarios, while the existing land uses were used for the "No Project" scenarios. The Existing Plus Phase 1 and Existing plus Project analyses are intended to identify the project-specific impacts associated solely with the development of the ~~proposed~~ project and the corresponding mitigation measures necessary to mitigate the project-related impacts.

Year ~~2017~~2025 and Year ~~2017 Plus Project Conditions.~~ ~~This analysis was removed from the revised TIA and DEIR sections – the reader is referred to Section 4.15.3.1 of the original DEIR for that text, tables, etc.~~

~~Year 2022 and Year 2022~~2025 Plus Phase 1 Conditions. The year ~~2022~~2025 analysis determines the project's cumulative contribution to near-term traffic impacts based on a comparison of year ~~2022~~2025 conditions to year ~~2022~~2025 plus Phase 1 of the project conditions. Within the site, the proposed Phase 1 land uses were used for the "Plus Phase 1" scenarios while the existing land uses were used for the "No Project" scenarios.

The opening year ~~2022~~2025 cumulative analysis has been utilized to determine if improvements funded through local and regional transportation mitigation fee programs, such as the Transportation Uniform Mitigation Fee (TUMF) program and the City of Moreno Valley Development Impact Fee (DIF) program, can accommodate the cumulative traffic at the target LOS identified in the City of Moreno Valley General Plan. If the regionally funded improvements can provide the target LOS, and the payment of such funds for such improvements is foreseeable, then the project's payment into the established fee programs will be considered as mitigation for cumulative impacts through the conditions of approval. Other improvements needed beyond the regionally funded improvements (such as localized improvements to non-TUMF, or non-DIF) are identified in the impacts section (Section 4.15.5).

The circulation system assumed in the analysis includes transportation improvement projects that are either under construction or are funded and planned for implementation in the short-term. These improvement projects are identified in SCAG's 2012-2035 Regional Transportation Plan (RTP). The RTP is a long-range transportation plan based on 20-year growth projections that is developed and updated by SCAG every four years. The Federal Transportation Improvement Program (FTIP) is a capital listing of all transportation improvement projects proposed over a six-year period for the SCAG region. The FTIP implements the transportation projects and programs listed in the RTP in compliance with state and federal requirements. For the ~~2022~~2025 scenarios, only the projects in the FTIP and the RTP's financially constrained[1] project list were assumed to be completed. The projects in the RTP's Strategic Plan were not included because funding for them is too uncertain. Also, the proposed East-West Freight Corridor included in the financially constrained plan was not included because the freight corridor is expected to be funded through tolls to be collected by a process that has not yet been established and whose future efficacy is unknown. If it is constructed, then traffic impacts would be less than those described in this EIR. The ~~2022~~2025 improvements are shown in Figure 4.15.5.

~~*Note: Figure 4.15.5 was added to the revised DEIR section.*~~

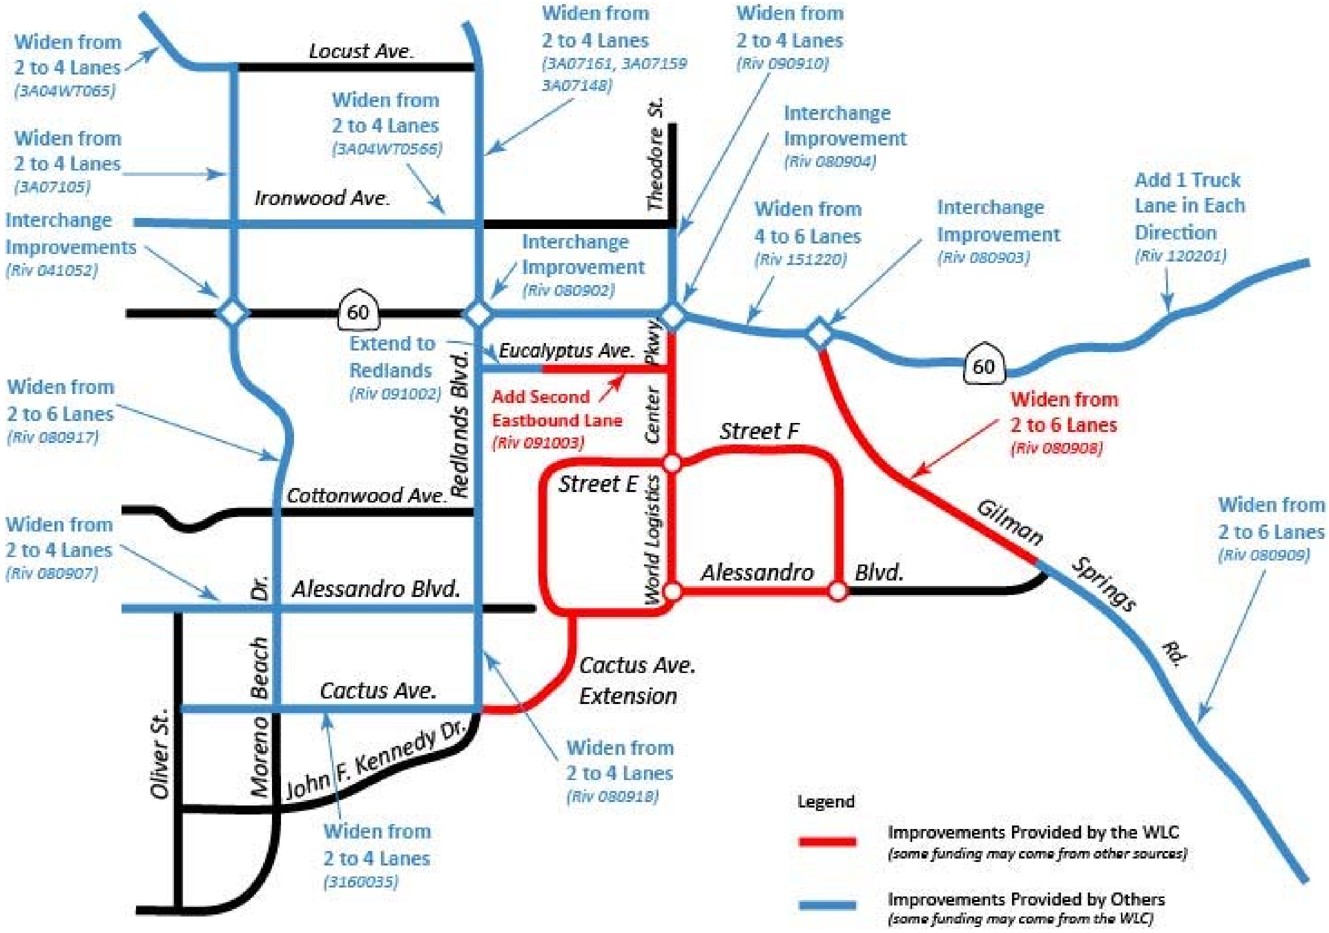

Figure 4.15.5: Roadway Improvements Assumed for ~~2022~~2025

Source: Traffic Impact Analysis Report for the World Logistics Center, ~~Parsons Brinckerhoff, September 2014.~~WSP, July 2018

Phase 1 of the proposed project will be completed in ~~2022~~2025 and includes 21,450,000 square feet of logistics warehouse uses. This is approximately 52 percent of the total project building space. The internal road system will be partially built out, with east-west through traffic served by the Cactus Avenue extension and Streets C and E. ~~Theodore Street~~World Logistics Center Parkway would serve north-south traffic as it does today.

Traffic projections for year ~~2022~~2025 conditions were derived from the RivTAM using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between existing (~~2012~~2018) baseline conditions and horizon year (~~2022~~2025) conditions. Specifically, traffic generated by other approved projects (cumulative projects) in the vicinity of the proposed project were included in the socioeconomic inputs for the year ~~2022 traffic volume scenario as shown on Figure 4 and Table 1 in the Traffic Impact Analysis Report, dated September 2014 (Appendix L-1). As noted previously, because some of the cumulative development projects may not be constructed at the anticipated time, or at all due to economic conditions, the cumulative impact analysis contained within the TIA is inherently conservative and would tend to overstate cumulative impacts. A detailed summary of the volume development methodology is included~~

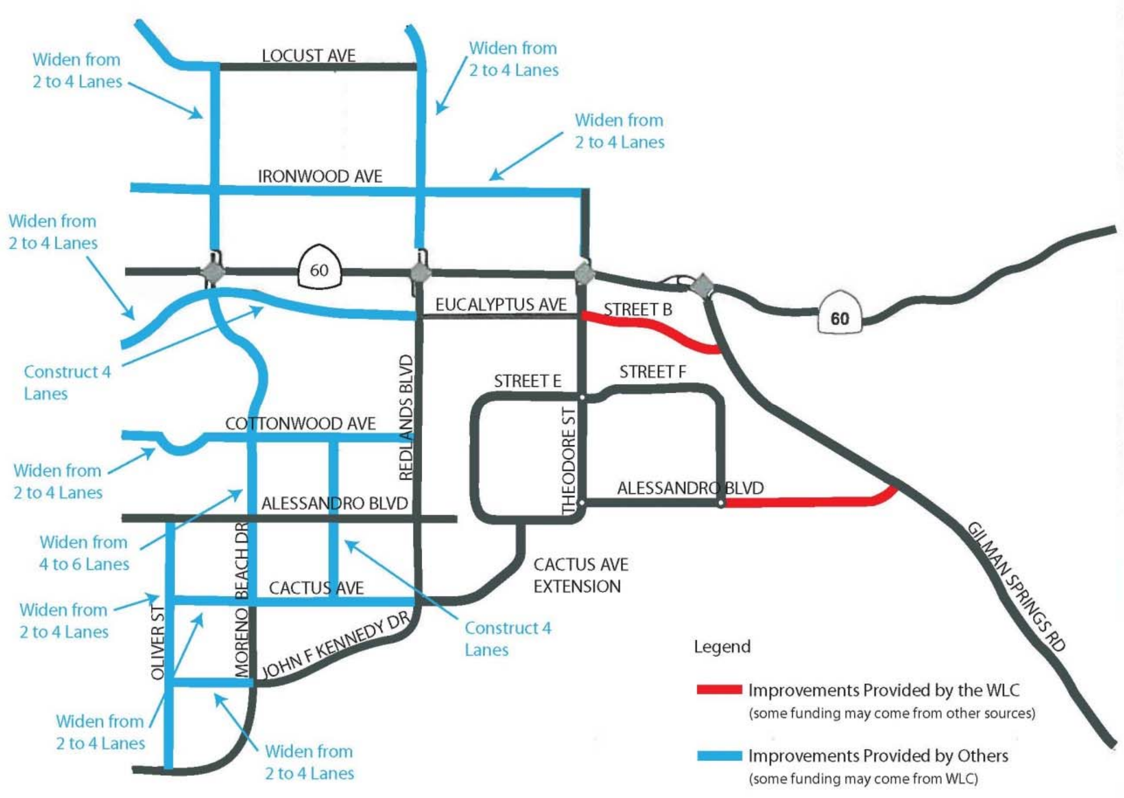
~~in the project Traffic Impact Analysis Report, dated September 2014 (Appendix L-1).~~2025 traffic volume scenario as shown in the Traffic Impact Analysis Report, dated July 2018.

~~Project traffic volumes at study locations were the added to opening year cumulative volumes to develop opening year cumulative plus project traffic volumes.~~

~~**Year 2035 Cumulative and Year 2035 Cumulative Plus Project Conditions.** Year 2035 Cumulative conditions determine the project's cumulative contribution to long-term traffic impacts under year 2035 with buildout of the land uses and circulation system in the General Plan. Within the project site, the proposed project buildout land uses were used for the "Plus Project" scenarios while the existing land uses were used for the "No Project" scenarios. This analysis has also been utilized to determine if improvements funded through local and regional transportation mitigation fee programs, such as the TUMF program and the City of Moreno Valley DIF program, can accommodate the cumulative traffic at the target LOS identified in the City of Moreno Valley General Plan. If the regionally funded improvements can provide the target LOS, and the payment of such funds for such improvements is foreseeable, then the project's payment into the established fee programs will be considered as cumulative mitigation through the conditions of approval. Other improvements needed beyond the regionally funded improvements (such as localized improvements to non-TUMF, or non-DIF) are identified in the impacts section (Section 4.15.5).~~

~~For the 2035 scenarios, the roadway projects from the FTIP and RTP included in the year 2022 network were also included in the 2035 network. The future circulation network from the City of Moreno Valley General Plan was also incorporated into the year 2035 network. The General Plan identifies future circulation improvements that are funded through the City's DIF, Western Riverside Council of Governments' TUMF, and improvements made directly by developers. It is reasonable to assume that these improvements will be in place parallel with buildout of the General Plan land uses, because most of the improvements will be funded through fees on the new developments. If other sites do not fully build out per the General Plan, then the LOS on the study streets and intersection would likely be better than shown in the TIA. The 2035 improvements are shown in Figure 4.15.6.~~

~~*Note: Figure 4.15.6 was added to the revised DEIR section.*~~



~~Figure 4.15.6: Roadway Improvements Assumed for 2035~~

~~Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.~~

~~Traffic projections for Year 2035 Cumulative conditions were derived from the RivTAM using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between existing (2012) baseline conditions and horizon year (2035) conditions. Specifically, traffic generated by other approved projects (cumulative projects) in the vicinity of the proposed project were included in the socioeconomic inputs to the RIVTAM for the Year 2035 Cumulative traffic volume scenario as shown in Figure 4 and Tables 1 and 2 in the Traffic Impact Analysis Report, dated September 2014 (Appendix L-1). As noted above, because some of the developments contained within the cumulative analysis may not be constructed at the anticipated time, or at all due to economic conditions, the cumulative impact analysis contained within the TIA is inherently conservative and would tend to overstate cumulative impacts. A detailed summary of the volume development methodology is included in the project Traffic Impact Analysis Report, dated September 2014 (Appendix L-1).~~

~~Project traffic volumes at study locations were to added Year 2035 Cumulative traffic volumes to develop Year 2035 Cumulative plus project traffic volumes.~~

Table 4.15.K summarizes the forecast years as well as each development scenario analyzed.

Table 4.15.K: Analysis Scenarios

Forecast Year	Scenarios Analyzed
~~2012~~2018	• Existing (~~2012~~2018) Baseline Conditions. • Existing (~~2012~~2018) Baseline Plus Phase 1 Conditions Project (21,450,000 square feet). • Existing Baseline plus Project Conditions.
~~2022~~2025	• Year ~~2022~~2025 without Project Conditions Analysis based on data from the RivTAM plus cumulative projects. • Year (~~2022~~2025) plus Phase 1 Project (21,450,000 square feet).
~~2035~~2040	• Year ~~2035~~2040 Cumulative, without Project: Analysis based on data from the RivTAM plus cumulative projects. • Year ~~2035~~2040 Cumulative plus Project.

4.15.3.2 Project Trip Generation, Distribution, and Assignment

~~*Note: The following changes have been made in response to: Comments F-3-5, 11, and Appendix 176 in Letter F-3 from the California Clean Energy Committee; Comments F-6-1, 2, and 3 in Letter F-6 from the Endangered Habitats League; Comment F-9A-45 in Letter F-9A from the Sierra Club, Center for Community Action & Environmental Justice, and Natural Resources Defense Council; Comment F-9B-45 in Letter F-9B from Tom Brohard and Associates; Comment F-11-29 in Letter F-11 from the Sierra Club, San Gorgonio Chapter; Comment G-2-7 in Letter G-2 from Perry Johnson; Comment G-17-2 in Letter G-17 from Joanne Lindgren; Comment G-18-1 in Letter G-18 from Sam Zaidy; Comment G-34-5 in Letter G-34 from Lindsay Robinson; Comment G-35-4 in Letter G-35 from Peggy Hadaway and John Neal; Comment G-49-18 in Letter G-49 from Karen Jakpor; Comment G-50-2 in Letter G-50 from Ann McKibben; Comment G-51-5 in Letter G-51 from Michael McCoy; Comments G-52-1 and 2 in Letter G-52 from Steve Jiannino; Comment G-53-4 in Letter G-53 from Deanna Reader and Kenny Bell; Comment G-57-1 in Letter G-57 from Tracy Hodge; Comment G-68-3 in Letter G-68 from Craig and Joan Givens; Comment G-96-3 in Letter G-96 from Margie Breikreuz; and Comment G-97-1 in Letter G-97 from Otana Jakpor.*~~

~~Trip generation represents the amount of traffic that is attracted and produced by a development project. The amount of traffic generated by a specific project is based on the specific land uses being proposed. Traffic engineers utilize different yet similar methodologies to anticipate trip generations. Many times, average trip generation rates as published by the Institute of Transportation Engineers (ITE) are used to forecast trip rates. In some circumstances, however, use of the ITE trip generation rates is not deemed to be the most accurate methodology of forecasting trip generation because more precise data are available. Therefore, in an effort to forecast the number of vehicle trips potentially generated by the proposed project accurately, the TIA examined and compared the results of four different trip generation sources: (1) the ITE *Trip Generation*, 9th Edition; (2) the Fontana Truck Trip Generation Study (2003); (3) the 2011 NAIOP trip generation study for high-cube logistics warehouses in Riverside and San Bernardino Counties; and (4) Skechers Trip Generation Study (2011). The City's TIA guidelines specify use of a combination of the first two sources, with the ITE Trip Generation Manual being the source of the trip generation rate and the City of Fontana Truck Trip Generation Study being the source of the vehicle mix percentages. Table 4.15.L summarizes the trip rates from each source.~~

~~Table 4.15.L: Trip Generation Rate Comparison *(Skechers Data Added)*~~

~~Source of Trip Generation Rates~~	~~A.M. Peak Hour~~			~~P.M. Peak Hour~~			~~Daily~~
	~~In~~	~~Out~~	~~Total~~	~~In~~	~~Out~~	~~Total~~	
~~ITE *Trip Generation Manual*~~	~~0.0759~~	~~0.0341~~	~~0.1100~~	~~0.0372~~	~~0.0828~~	~~0.1200~~	~~1.68~~
~~Fontana *Truck Trip Generation Study*~~	~~0.0357~~	~~0.0343~~	~~0.0700~~	~~0.0224~~	~~0.0506~~	~~0.0730~~	~~1.97~~

~~Skechers Traffic Counts~~	~~0.022~~	~~0.013~~	~~0.035~~	~~0.004~~	~~0.033~~	~~0.037~~	~~0.567~~

~~Source: Tables 3, 4 and 5, Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.~~

~~The trip generation rates derived from existing driveway traffic counts collected at the Skechers Warehouse Facility in November 2011 showed that for all time periods the traffic generated by the Skechers building was only about one-third of what the ITE trip generation rates would have predicted. Furthermore, the actual truck traffic was less than half (41%) of what the methodology mandated in the City of Moreno Valley's traffic impact guidelines (ITE trip generation rates with the vehicle mix from the Fontana Truck Trip Generation Study) would predict.~~

~~Several comments received on the Draft EIR suggested that the trip generation for the proposed project use a combination of a very high overall trip generation rate with a high heavy truck percentage to estimate the number of project truck trips. The City has found that this approach produces unreasonable trip generation rates when compared to actual field conditions. For example, the EIR for the Skechers high-cube warehouse building used this unreasonable approach and found the forecasts to be three times the actual post-construction trip generation for car trips and nearly eight times the actual trip generation for trucks[1]. This approach could result in the construction of oversized and unnecessary roadway infrastructure with its own environmental consequences, creating an undue burden on development, and could ultimately discredit the City's project review process in the eyes of the business community and members of the public. For these reasons, this approach was not used to estimate trips for the proposed project and the City's Traffic Impact Guidelines was appropriately used instead.~~

~~The 2011 NAIOP provides the more accurate trip generation for the proposed project as the NAIOP study is the most comprehensive trip study performed for high-cube logistics warehouses. As shown in previously referenced Table 4.15.L, when using the NAIOP and derived trip generation rates, project trips are forecast to be lower than if the ITE trip generation rates where used. However, in order to be conservative, this EIR and the TIA utilize the ITE 9th Edition trip rates, which have the effect of overestimating project impacts because high-cube logistics warehousing would comprise 99.4 percent of the overall project building area. Therefore, as determined in the TIA, trip generation rates for high-cube warehouse uses (Land Use 152) as published in the 9th Edition of ITE's *Trip Generation* manual, and currently widely accepted throughout Riverside and San Bernardino Counties, are the trip rates being utilized to determine the project's traffic impacts. For this reason, the actual traffic impacts of the proposed project are expected to be much less than those identified in the TIA and by extension this EIR. The project trip generation rates for the proposed project and existing land uses on the site are shown in Table 4.15.M.~~

---

[1] ~~These figures are based on traffic counts taken at the Skechers building after it had been fully operational for over a year. See Technical Memorandum *Traffic Generated by the Skechers Warehouse*, Parsons Brinckerhoff to the City of Moreno Valley, November 14, 2012.~~

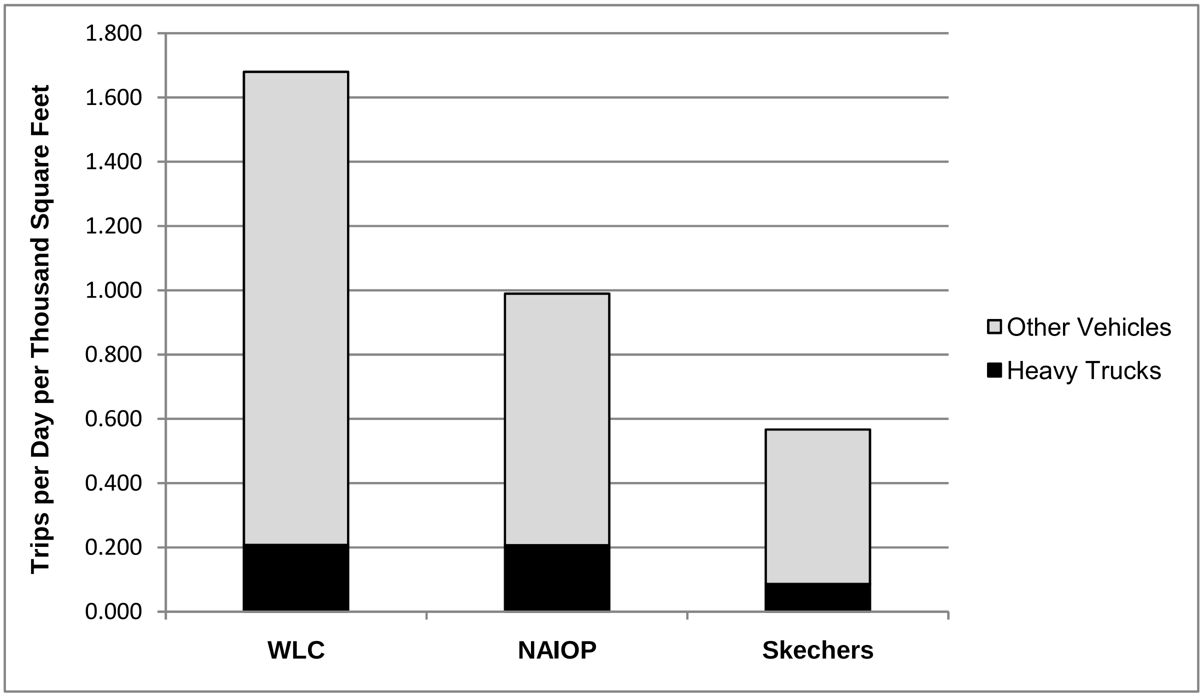
~~Figure 4.15.7 compares the trip generation estimate for the proposed project as used in this EIR to the trip generation assuming implementation of the NAIOP and Sketchers survey-derived rates. As shown in the figure, the trip generation estimate for the proposed project is much higher in comparison to the estimates using either the NAIOP or Sketchers rates, thus meeting CEQA's standard of substantial evidence.~~



~~Figure 4.15.7: Comparison of Trip Generation from Southern California Sources~~

~~Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.~~

~~As shown in previously referenced Table 4.15.N, the project is estimated to generate a net total of approximately 69,542 daily trips with approximately occurring during a.m. peak hour and 5,010 occurring during the p.m. peak hour. Daily and hourly trip counts take into account only the trips generated by the project. Refinements to raw trip generation estimated using the ITE rates have been made to provide a more detailed breakdown of trips by vehicle mix, similar to the existing baseline count data. Per City of Moreno Valley standard practice, vehicle mix percentages were obtained from the City of Fontana Truck Trip Generation Study, which is the recognized source throughout the County of Riverside and the County of San Bernardino for estimating the vehicle mix associated with industrial and warehouse uses. For this reason, the vehicle-mix from the Fontana Truck Trip Generation Study has been applied to ITE trip generation rates in order to determine the proposed project's passenger car and truck trip generation mix. Table 4.15.O shows the project trips by vehicle type. The PCE project trips by vehicle type differ between the surface street and freeway analyses because the freeway analysis uses a PCE factor of 1.5 for~~

~~medium and heavy trucks while the surface street analysis uses PCE factors of 2.0 and 3.0 for medium and heavy trucks, respectively.~~

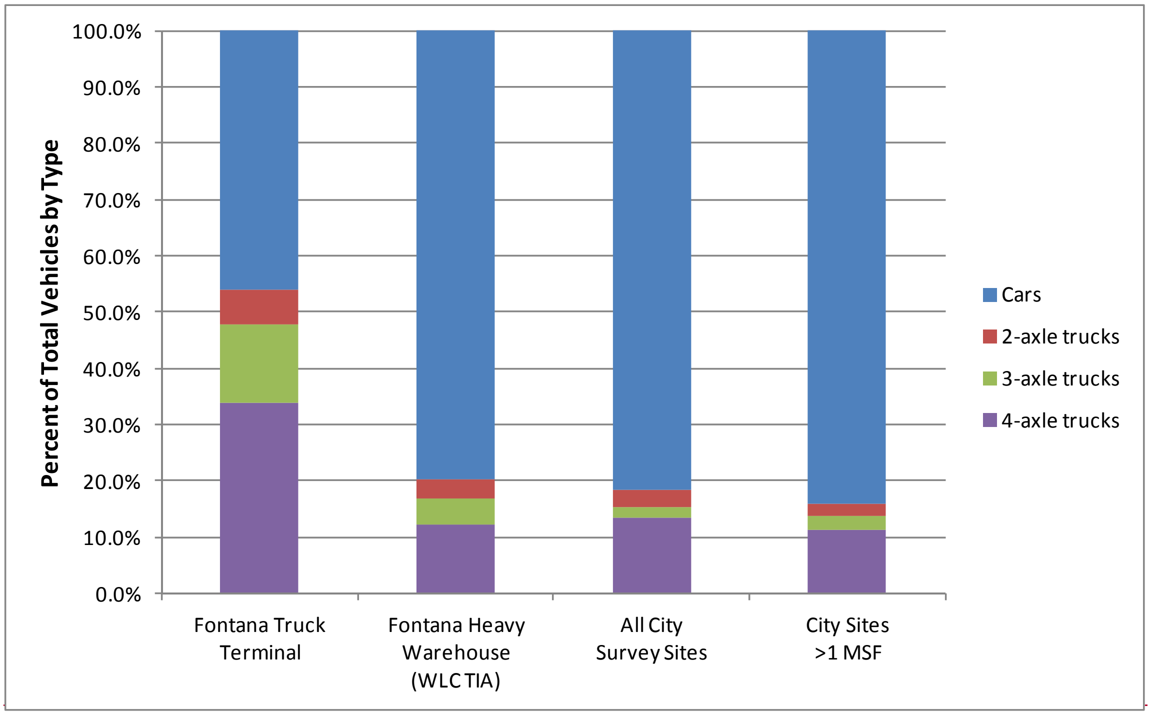
~~Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.~~

~~The City of Moreno Valley Transportation Engineering Division performed their own survey of trip generation at six warehouses in the City to address concerns over unrealistically high trip generation forecasts for warehouse oriented projects. This study used counts collected in Fall 2013, after the Draft EIR for the proposed project had been sent out for public review in February 2013. The City study confirmed that the vehicle mix for the Heavy Warehouse category in the Fontana *Truck Trip Generation Study* (i.e. the data used for the WLC TIA) produces a good, but conservative (i.e. somewhat high), estimate of truck trips percentages for high-cube warehouses while the Fontana Truck Terminal category produces an obvious over-estimate of truck traffic (see Figure 4.15.8).~~

~~For comparative purposes, the trip generation estimate for the proposed project was compared to the trip generation for existing approved land uses for the project area as shown in the final traffic study for the Moreno Highlands Specific Plan. The Moreno Highlands Specific Plan would generate 178,608 average vehicle trips per day, or more than two-and-a-half times as many trips (256%) as are forecast for the WLC (69,542 average vehicle trips per day). The Moreno Highlands traffic studies did not distinguish between car and truck traffic, and so did not provide a forecast in terms of PCEs. However, even if the Moreno Highlands plan were to generate no truck trips at all (only auto trips), it would still generate nearly twice as many PCEs trips as the WLC. Thus, the World Logistics Center would generate substantially less traffic than the existing approved land uses for the project area as envisioned in the existing Moreno Highlands Specific Plan.~~

~~Trip distribution represents the probable starting and ending locations of traffic generated by a project. Trip distribution is heavily influenced by the geographical location of a project site in relation to local and regional land uses (i.e., the starting and ending locations), and access to a project site from the~~

~~local and regional transportation system. The proposed project's trip distribution was developed for both passenger cars and trucks.~~



~~Figure 4.15.8: Comparison of Vehicle Mixes from the City Survey and the Fontana Study~~
~~Source: Traffic Impact Analysis Report for the World Logistics Center, Parsons Brinckerhoff, September 2014.~~

~~The Fontana Truck Trip Generation Study[1] found that 80 percent of the vehicles entering or leaving warehouse sites are passenger cars, nearly all of which are used for commute trips by employees of the warehouses. Most of these trips are local trips resulting from current and future residents of Moreno Valley who would be afforded the opportunity to work locally with very short commutes as wells as residents of neighboring cities who would access the project site using the local arterial network. Other passenger car trips would be generated by workers coming from more distant areas. In most cases, these trips would access the project site via SR-60 in the off-peak direction (i.e., commuters traveling to the project site from Los Angeles or Orange Counties).~~

Based on the proposed WLC Specific Plan, high-cube logistics warehousing would comprise 99.4% of the floor space of the WLC, so a considerable amount of deliberation and study went into the selection of the most appropriate trip generation rate for this particular type of building. In the 2014 TIA four possible sources of trip generation rates were identified and evaluated, with a combination of two sources eventually being used. These were ITE's *Trip Generation Manual 9th Edition* being the source of the overall trip generation rate and the City of Fontana *Truck Trip Generation Study* being the source of the vehicle mix percentages.

Given the growing importance of high-cube logistics to southern California and plethora of small, conflicting studies of trip-generation rates for that type of building, a consensus formed on the need for a single, comprehensive survey that would provide definitive trip-gen rates for use in TIAs going forward. Accordingly, the South Coast Air Quality Management

---

~~[1] Truck Trip Generation Study, City of Fontana, August 2003.~~

District (SCAQMD), a leading environmental agency for Riverside County, and the National Association of Industrial and Office Properties (NAIOP), representing developers, jointly sponsored a study to be conducted by a highly respected neutral party, ITE. The findings of this very large[1] study were released in October 2016 as a report entitled *High-Cube Warehouse Vehicle Trip Generation Analysis*.

The 2016 ITE study found that on average high-cube transload and short-term storage warehouses, the type of warehouse proposed for the WLC, generate fewer trips than had been assumed in the previous TIA for every analysis period (24% fewer in the AM peak period, 14% fewer in the PM peak hour, and 15% fewer on a daily basis). However, the volume of truck trips being generated in off-peak periods was higher than had been previously assumed. These results have been incorporated into the 10th edition of ITE's *Trip Generation Manual* in a new land use code (Code 154). SCAQMD has indicated its acceptance of these results on its website[2],

> *"Draft final results for the Warehouse Truck Trip Study were completed and were lower than SCAQMD recommended truck trip rates in the California Emissions Estimator Model (CalEEMod). Staff recommends truck trip rates from the Institute of Transportation Engineers (ITE) for high cube warehouse projects located in SCAQMD. Consistent with CEQA Guidelines, a CEQA document may use a non-default trip rate if there is substantial evidence in the recording supporting another rate is more appropriate for the air quality analysis."*

Based on the substantial evidence collected by ITE and presented in the 10th edition of ITE's *Trip Generation Manual* and in *High-Cube Warehouse Vehicle Trip Generation Analysis*, the data from these two sources were used in the current analysis of WLC traffic impacts. Specifically, the trip generation rates and directionality (percent of vehicle entering and leaving the site) were taken from the 10th edition of *Trip Generation Manual*, while the percentage of vehicles in each vehicle class was taken from *High-Cube Warehouse Vehicle Trip Generation Analysis*. A mixture was required because Trip Generation Manual reported the directional split but not the vehicle mix while High-Cube Warehouse Vehicle Trip Generation Analysis reported the vehicle mix but not the directional mix.

High-Cube Warehouse Vehicle Trip Generation Analysis classified vehicles into three classes, namely passenger vehicles, 2- to 4-axle trucks, and 5+ axle trucks. The "passenger vehicles" category corresponds directly with the "passenger vehicle" category used in the RIVTAM model, and all of the vehicles in the "5+ axle trucks" fall within RIVTAM's "Heavy Truck" category. However, ITE's middle category, 2- to 4-axle trucks, covers three different categories used in RIVTAM. Specifically, 2-axle trucks correspond with RIVTAM's "Light Truck" category, 3-axle trucks correspond with RIVTAM's "Medium Truck" category, and 4-axle trucks fall within RIVTAM's "Heavy Truck" category along with 5+ axle trucks. Vehicle mix data from NAIOP's survey of 31 southern California warehouses was used to disaggregate ITE's middle category into the corresponding RIVTAM vehicle classes.

Using these rates, the trips that would be generated by the WLC are shown in Table 4.15N.

---

[1] Counts were taken at 107 sites

Truck Distribution. The truck trip distribution patterns have been developed based on the anticipated travel patterns for the proposed project's high-cube logistics warehousing trucks. Since the internal trips, the port-related trips, and the majority of external trips (all but those on I-10) use routes west of the project site, it is anticipated that a large majority of the WLC truck traffic will be oriented to the west of the project, with a much smaller amount to and from the east. In addition, the majority of project truck traffic would use the freeway system to enter and leave the project area due to truck routing restrictions. Based on these factors, truck trips generated by the proposed project would be oriented in the following manner~~:~~ (See Figure 37 of the WLC TIA):

- 82 percent to/from the west via one or more freeways;
- 6 percent to/from the north via surface streets;
- 9 percent to/from the east utilizing SR-60 and I-10; and
- 3 percent to/from the southeast via surface streets.

Auto Distribution. Figure ~~29~~32 of the WLC TIA indicates that daily passenger vehicle traffic will distribute in the following directions:

- 44 percent to/from the west on SR-60;
- 9 percent to/from the east on SR-60 (east of Gilman Springs Road);
- 11 percent to/from the southeast on Gilman Springs Road;
- 29 percent to/from the south on Cactus Avenue; and

- 7 percent to/from the north along Theodore Street.

Moreno Valley currently has a jobs/housing imbalance that results in long westbound commutes for thousands of city residents every workday. The WLC would create approximately 25,000 new jobs; nearly doubling the number of jobs in Moreno Valley. This would have four effects on commute patterns. First, many current and future residents of Moreno Valley would be able to work locally with very short commute trips.

Second, residents of neighboring cities who work at the WLC would have short commutes and, importantly, be able to access the site using the arterial road network. This is consistent with the policies of the Western Riverside Council of Governments and the Riverside County Transportation Commission to promote use of the arterial road network as an alternative to freeways. Tests with the RIVTAM model (see Figure ~~29~~32 of the WLC TIA) suggest that nearly half of auto traffic associated with the WLC would be on surface streets; i.e., not on freeways.

Third, workers coming from more distant locations would, in most cases, be traveling on freeways in the off-peak direction; i.e., commuters traveling to the WLC from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to take advantage of the existing unused off-peak capacity of freeways, since the freeways were sized for flows in the peak direction.

Fourth, because the RIVTAM model assumes that WLC employees would work elsewhere if the WLC project were not implemented, then the availability of jobs at the east end of Moreno Valley would reduce the number of workers driving long commutes to distant jobsites to the west and southwest. Although the project would increase freeway auto traffic eastbound in the morning, it would also decrease the traffic in the more congested westbound direction. In the evening the pattern would reverse, with the project relieving traffic in the congested eastbound direction. Therefore, the WLC project would have a net beneficial impact on the regional freeway auto traffic. This is consistent with the policies of SCAG, WRCOG, and other regional governments and agencies to encourage better jobs/housing balances as a way to reduce peak directional flows on the regional freeway system.

The assignment of traffic from the project area to the adjoining roadway system is based upon the project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the project. For more information on project trip generation and distribution for both trucks and passenger vehicles over and above the summary above, see ~~Sections 4.C, 4.D, and 4.E in~~ the project TIA (~~PB 2013, EIR~~WSA July 2018, Revised Sections of the FEIR Appendix ~~L~~). It is important to note that all trucks must use established truck routes within the City of Moreno Valley by the Municipal Code, while passenger vehicles will distribute onto the freeway and local streets depending on their destinations.

It should be noted that all technical studies based all or in part on traffic (i.e., air quality, greenhouse gases, and noise) have used these same assumptions regarding trip generation, trip length, etc. from the project TIA for their assessments of project impacts.

Passenger Car Equivalents. The analytical methods used to forecast traffic impacts must take into account the driving characteristics of different classes of vehicles. This is typically done through the use of passenger car equivalent (PCE) factors, which convert the number of heavy vehicles in the traffic stream into an equivalent number of passenger cars. The term PCE was first used in the 1965 *Highway Capacity Manual* (HCM), and was determined by comparing the relative number of passing of trucks by passenger cars in relation to number of passing of passenger car by passenger cars. According to the *HCM 2000*:

> *The entry of heavy vehicles-that is, vehicles other than passenger cars (a category that includes small trucks and vans)-into the traffic stream affects the number of vehicles that can be served. Heavy vehicles are vehicles that have more than four tires touching the pavement.*
>
> *Trucks, buses, and recreational vehicles (RVs) are the three groups of heavy vehicles addressed by the methods in this manual. Heavy vehicles adversely affect traffic in two ways:*
>
> - *They are larger than passenger cars and occupy more roadway space; and*
> - *They have poorer operating capabilities than passenger cars, particularly with respect to acceleration, deceleration, and the ability to maintain speed on upgrades.*
>
> *The second impact is more critical. The inability of heavy vehicles to keep pace with passenger cars in many situations creates large gaps in the traffic stream, which are difficult to fill by passing maneuvers. The resulting inefficiencies in the use of roadway space cannot be completely overcome. This effect is particularly harmful on sustained, steep upgrades, where the difference in operating capabilities is most pronounced, and on two-lane highways, where passing requires use of the opposing travel lane.*

Grade is by far the most important determinant in the PCE factor to be used. The HCM's recommended PCE for trucks ranges from 1.5 for places with slopes of less than 2 percent up to 7.0 for places with steep grades more than a mile long. HCM's recommended PCE factors were used for the freeway analysis.

For the analysis of surface streets, the City's TIA guidelines mandate the use of PCE factors taken from the San Bernardino County CMP, 2003 Update. These are more precise and on average somewhat higher than the HCM rates~~; for example,~~, because HCM recommends ~~2~~two PCEs per heavy truck while the San Bernardino County CMP uses ~~3.~~three (see PCE Factors table below). This means that ~~use of~~ the San Bernardino County CMP PCE rates ~~represents~~used in the WLC analysis represent a deliberately conservative approach in the sense that the analysis will tend to over-state the impact of trucks on traffic conditions.

~~4.15.3.3 Year 2017 Conditions~~

~~Note: Due to a change in project conditions and phasing, the Year 2017 analysis was eliminated from the revised TIA and DEIR section.~~ ~~*The reader is referred to the original DEIR section for that analysis and related tables and figures.*~~

~~***Note: The following analysis of potential rail service to the project site was added in response to comments on the Draft EIR.***~~ PCE Factors for Surface Streets

Vehicle Class	HCM	San Bernardino CMP
Passenger Cars	1.0	1.0
2-Axle Trucks	2.0	1.5
3-Axle Trucks		2.0
4 or more-Axle Trucks		3.0

Potential Rail Alternative. This section describes why rail service is not considered a viable option for reducing the traffic impacts of the WLC. This conclusion is based on several factors, including the physical constraints to bringing rail service to the WLC site, the cost of cargo movement by rail relative to movement by truck, capacity constraints in the rail system that the WLC branch line would tie into, and the minimal effect that rail service would have even if all other factors could be overcome. These factors are discussed in turn below.

The Possible Alignments for Bringing Rail Service to the WLC Site. The WLC site is not currently served by rail. The rail lines nearest the site are the Union Pacific Yuma Line (single-track in this area), the Riverside County Transportation Commission's San Jacinto Branch Line (single-track, currently inactive), and the BNSF double-track line through the City of Riverside (see TIA Figure 36).

There are four general alignment possibilities for a branch line to the WLC. Each alignment is inherent with significant problems as follows:

- Western Alignment – Alignments running from the BNSF line in Riverside to the WLC, an approximate distance of 15 miles, would have to run through built-up areas of the Cities of Riverside and Moreno Valley. The cost of acquiring right-of-way through these areas, and the impacts to the community (noise, traffic disruption, safety, division of the community, etc.) render such alignments unviable. Moreover, trains using the at-grade rail crossings in the City of Riverside already impose substantial delays on road traffic. In fact, in recent years the City of Riverside has sued the ports over the issue of traffic impacts from additional trains passing through the city. Adding more crossings and more trains would exacerbate this problem.

- Southern Alignment – It would be possible to avoid densely populated and built-out areas by connecting to the San Jacinto Branch Line south of March Air Reserve Base. However, the only way to avoid established communities would be to pass along the northern portion of the Lake Perris State Recreation Area. The alignment, approximately 10 miles in length, would be a major impact as it would require constructing and operating a rail line along the slopes of the Lake Perris State Recreation Area and potentially the San Jacinto Wildlife Area. There would also be traffic impacts at road crossings, potential grade issues, and grade separated crossings needed for drainage channels and I-215. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways (which will be discussed in a later section).
- Northern Alignment – The shortest alignment to an existing rail line is to the north in the vicinity of Redlands Boulevard and connecting to the UP Yuma line near the intersection of Redlands Boulevard and San Timoteo Canyon Road, approximately five miles from the project site. This alignment would require extensive ROW acquisition, encounter very serious grade issues that would increase the length of track needed, result in environmental impacts on the Badlands, and require a grade separated crossing of SR-60. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways.
- Eastern Alignment – The final possibility would be to connect to the UP Yuma line along an alignment parallel to SR-60. This alignment would connect to the existing rail network near the Morongo Golf Club at Tukwet Canyon, approximately five miles to the east of the WLC site. The eastern alignment would be affected by the same drawbacks as the northern alignment, with the addition of the need to construct a bridge over San Timoteo Creek.

As can be seen from the discussion above, providing rail service to the WLC along any of the possible alignments would in itself create serious environmental impacts.

Relative Costs of Truck and Rail Service. The loading and unloading of rail cargos requires special equipment and handling and can only be performed at specialized places, which adds to the cost of shipping goods by rail. On the other hand, the actual movement of goods by rail is more energy-efficient and less expensive than movement by truck. This combination of relatively high fixed costs at each end of a trip with low variable costs for the distance traveled means rail can be a less expensive way to ship cargo than truck, but only if the shipping distance is sufficiently long.

The break-even distance between rail and truck shipping has been the subject of several studies. The industry rule-of-thumb is that the rail becomes economically viable when cargos are shipped more than 500 miles. For example, the National Rail Plan, a nationwide guiding document from the U.S. Department of Transportation Federal Railroad Administration, has set the freight rail goal to, “Develop strategies to attract 50 percent of all shipments 500 miles or greater to intermodal rail.” In addition, the Plan highlights the importance that trucks have in conjunction with rail when moving freight, as trucks “excel in providing time-sensitive delivery services for high-value goods being transported over medium and short haul distances.” A local example is the Ports of Long Beach/Los Angeles Rail Master Planning Study, which indicates that rail loaded with two levels of shipping containers, “traditionally competes well with trucks at distances greater than 500 miles.” The San Pedro Bay Ports Rail Market Study shows the break-even point between truck and rail freight transport beginning east of Las Vegas and Phoenix, and north of the Bay Area. For shipments between the Ports of Los Angeles and Long Beach and the WLC, a distance of about 70 miles, shipping by rail would be far more expensive than by truck. Even if a rail line were built to the WLC, it would be uneconomical to use it for trips to and from the ports.

Capacity Constraints in the Rail System. If a rail line could be built to the WLC site and tenants could be induced to use it despite higher costs, this would only be helpful if the regional rail system had sufficient capacity to accommodate WLC freight without detriment to other users.

In fact, there are serious capacity constraints in the rail network in the Los Angeles Basin. Among other things, both BNSF and UP rail operations are already capacity-constrained on the lines between the ports and western Riverside County. Two studies, completed in the early 2000s and using the year 2000 as the existing condition, found that many of the rail lines were already operating near capacity. The studies evaluated 10 and 25 years of projected growth on the network and found that within 10 years (of the date of the study) the network would be over capacity. Without capacity increasing improvements, 10 years of train traffic growth was forecast to increase delay more than six-fold. This did not include additional delays that would be caused by trains serving the WLC.

The Los Angeles-Inland Empire Railroad Main Line Advanced Planning Study from October 2002 found that the "region's rail system is inadequate for forecast train traffic." The study presented other findings that illustrate the near-capacity state of the rail network, for example, "… just 25 percent of the forecast 2010 traffic is sufficient to roughly double the average delay per train, to 67.6 minutes for BNSF freight and 54.4 minutes for UP freight." This occurs because small increases in train traffic result in disproportionate delays as the network nears capacity.

Several minor improvements to the rail network have been made since the 2002 study. However, accommodating estimated future demand in the year 2025 by providing capacity improvements alone would be costly; to meet future demand without rerouting would require capacity of some segments to be increased from two to four tracks. Therefore, an approach has been developed to revise train routing on the existing rail network and make limited capacity-increasing improvements. Even the limited improvements are estimated to cost over $2 billion.

The fact that the rail system has limited capacity to accommodate additional traffic means that potential users have to be prioritized so that the capacity can be allocated efficiently. Highest priority would be for long-distance rail service direct from the ports. Short-distance cargo trips between the ports and the WLC would receive much lower priority than long-distance shipments. If regional passenger trains (e.g., Metrolink) share the tracks with freight trains, as is the case for some lines, then service to WLC would drop even further on the priority list. Based on existing capacity of the rail network and projected growth, the studies indicated that the rail network would be over capacity without further capital investments, which is beyond the scope of the WLC project.

Minimal Reduction in Traffic. Assuming that a rail line could be built to the WLC site and assuming that WLC freight could be accommodated by the rail network and that the costs for these things could be covered by subsidies or by increasing the prices on goods moved through the WLC, the question must be asked, "how much of a reduction in truck traffic impacts would be achieved?"

The answer is, "very little." As was discussed earlier, the economics of freight shipment make rail viable only for trips of 500 miles or more. As is described in the TIA prepare for this EIR (Chapter 12, Section F), between 2 and 7 percent (depending on the year) of the truck trips beginning or ending in WLC go to the ports and these trips have no significant impact on freeway LOS for most of their lengths. So the effect of rail service on reducing truck impacts would be very small.

Conclusions About the Rail Alternative. This analysis of the rail alternative found that bringing rail service to the site would be very costly, result in serious environmental impacts, create major disruption to existing communities, and take many years to design, acquire right-of-way, and construct. Even if a line were built, both economics and system constraints would deter its use for cargos between the WLC and the ports. Even if built and used, rail service would have very little effect on reducing the traffic impacts of the WLC. Based on these considerations, rail service was not included in the design of the WLC and is not discussed further in this EIR.

4.15.3.4 Year ~~2022~~2025 Conditions

~~*Note: The analysis of Year 2022 conditions in the original DEIR was based on different project characteristics (i.e., +1 million square feet of warehousing) and different phasing. Therefore, the previous Year 2022 has been removed in its entirety and replaced with the following updated analysis. The reader is referred to the original DEIR section for the previous Year 2022 analysis.*~~

Levels of service are discussed below for year ~~2022~~2025. As noted above, Phase 1 of the proposed project will be completed in ~~2022~~2025 and includes 21,450,000 square feet of logistics warehouse uses. This is approximately 52 percent of the total project building space. The internal road system will be partially built out, with east-west through traffic served by the Cactus Avenue Extension and Streets C and E. ~~Theodore Street~~World Logistics Center Parkway would serve north-south traffic as it does today. As discussed previously, roadway projects that are either under construction or are funded and planned for implementation in the short-term (i.e., improvement projects on the FTIP and the RTP's Financially Constrained Project list) and therefore reasonably assured of being constructed within the scenario timeframe were added.
