Estimated Tree Inventory

Project Location	Tree Inventory Calculation Details	Tree Species	Trees
Automobile parking	1 tree/6 stalls x 10,981 stalls	Average	1,830
Building perimeters	Assuming an average of 1,500,000 sq. ft. per building; taking the square root and multiplying by 4 yields the building perimeter (4,900 feet x 27.8 buildings = 136,220 feet); 1 tree per 60 feet	Average	2,270
Redlands Boulevard, Bay Street	Length = 6,642 feet / 40 feet (1 side of road)	Pine	55
		Blue Palo Verde	55
		Sweet Acacia	55
Gilman Springs Road	Length = 12,257 feet / 40 feet (1 side of road)	Afghan Pine	306
60 Freeway	Length = 4,684 feet / 40 feet (1 side only)	Afghan Pine	59
		Date Palm (25' trunk height)	59
Street A	Length = 8,656 / 40 feet x 2 side of street	Chilean Mesquite/Algarrobo	216
		Mexican Fan Palm (30' trunk height	216
Eucalyptus Street	Length = 5,350 feet / 40 feet (1 side of road)	Brisbane Box	45
		Afghan Pine	45
		Date Palm (30' trunk height)	45
Street B	Length = 4,418 feet / 40 feet x 3 (two sides of street and median)	Brisbane Box	331
Streets C, D, E, F, G, H	Length = 38,363 feet / 40 feet x 2 sides of street	Chilean Mesquite/Algarrobo	1,918
Total			**7,506**

Note: For automobile parking, Table 9.11.040C-12 in Moreno Valley Code states that warehouse and distribution uses are required to have 1/1,000 sq. ft. of gross floor area for the first 20,000 sq. ft.; 1/2,000 sq. ft. of gross floor area for the second 20,000 sq. ft.; 1/4,000 sq. ft. of gross floor area for areas in excess of the initial 40,000 sq. ft. Assuming 27.8 buildings each 1,500,000 sq. ft. in size yields 10,981 stalls

memorandum

date	May 23, 2018
to	Highland Fairview Properties
cc	
from	Tommy Molioo, Sr. Associate Biologist
subject	World Logistics Center Specific Plan – Updated Biological Resources and Sensitive Surveys

On behalf of Highland Fairview Properties, Environmental Science Associates (ESA) conducted updated focused surveys for sensitive biological resources previously surveyed and have a potential to occur on the approximately 2,610-acre World Logistics Center (WLC) Specific Plan Area (Plan Area). The sensitive biological resources that have a potential to occur and were previously surveyed for preparation of the project's Final Environmental Impact Report (FEIR) include: burrowing owl (*Athene cunicularia*, BUOW), Los Angeles pocket mouse (*Perognathus longimembris brevinasus*, LAPM), and various Narrow Endemic Plant species (NEPs). ESA also ground-truthed the vegetation communities previously mapped on the Plan Area by First Carbon Solutions in 2012, and an updated vegetation map is not recommended as the vegetation communities remain nearly the same as previously mapped. Additionally, as a result of incidental detection of coastal California gnatcatcher (*Polioptila californica californica*, CAGN) during burrowing owl surveys, focused protocol surveys for this Federally Threatened species were conducted by a USFWS-permitted biologist and the details of the survey are discussed in a separate technical letter report. This memorandum includes a discussion of the methodology and results of the focused surveys conducted by ESA on the WLC Plan Area during Spring 2018.

Project Location

The WLC Specific Plan Area is located in the eastern portion of the City of Moreno Valley, in western Riverside County, California. The WLC Plan Area generally occurs north of State Route (SR) 74, south of SR-60, east of Interstate 215, and west of SR-79 (**Figure 1**). The Plan Area is specifically located south of SR-60, north of the San Jacinto Wildlife Area (SJWA), east of Redlands Boulevard, and west of Gilman Springs Road, and encompasses approximately 2,610 acres of primarily agricultural land. The Plan Area also occurs within the mapped boundaries of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP).

Project Background

The focused surveys described in this memorandum were conducted in order to support the revisions required by the California Supreme Court ruling for the Revised Final Programmatic EIR Sections. The Revised Final Programmatic EIR Sections is being revised and recirculated as required by a Ruling on Peremptory Writ of

Mandate issued by the Superior Court of California in February 2018. The previous focused surveys were conducted on the Plan Area as recently as 2013, and need to be updated in order to adequately address the current potential for special-status species to occur in the WLC Plan Area.

Vegetation Mapping

Methodology

ESA biologists ground-truthed the previous vegetation mapping prepared for the Plan Area by FirstCarbon Solutions in 2012. The vegetation mapping effort conducted by ESA in 2018, was carried out concurrently with the initial burrowing owl focused surveys on March 8 and March 28, 2018. ESA's biologists traversed the entire Plan Area to determine if current vegetation communities match what was previously mapped. The vegetation mapping effort focused on areas primarily outside of active agricultural land since these areas were previously and are still currently used for row crops of cultivated wheat.

Results

The majority of the Plan Area is still dominated by agricultural land surrounded by residential and commercial development, and paved roads. Scattered native habitat occurs within the drainage features in the eastern portion of the Plan Area, and foothills in the southwest corner of the Plan Area. The drainages contain scattered mulefat scrub and Riversidean alluvial fan sage scrub (RAFSS) habitat, while the foothills in the southwest corner contain Riversidean sage scrub (RSS) habitat intermixed with scattered oak trees and non-native grasses. Much of the existing vegetation communities within the Plan Area are similar in size, location, and composition to what was previously mapped in 2012. Therefore, no vegetation mapping revisions are proposed. The one change to the previous vegetation map is the off-site fallow agricultural fields within the adjacent SJWA have converted to non-native grassland through the abandonment of farming activities.

Narrow Endemic Plant Surveys

Methodology

ESA conducted a focused vegetation/rare plant survey of the entire Plan Area, concentrating on approximately 200 acres that contains native vegetation to identify presence for any threatened, endangered, or otherwise special-status plants species (criteria area and narrow endemic plant species), in accordance with CDFW protocol. These surveys were conducted concurrently with other species focused surveys in March and April 2018. Areas with the potential to support special-status plant species were surveyed on foot walking transects through suitable habitat that primarily included drainages, native scrub habitat in the northern and southern portions of the Plan Area, and along margins of agricultural fields. While 15 special-status plant species have a potential to occur on the Plan Area, the rare plant survey focused on three plant species that have a moderate to high potential to occur on the existing habitats within the Plan Area. These three species include: thread-leaf brodiaea (*Brodiaea filifolia*) a federally threatened species, smooth tarplant (*Centromadia pungens* ssp. *laevis*) a California Rare Plant Rank (CRPR) 1B.1, and Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*) a CRPR 1B.1. These three species are known to occur within the vicinity of the Plan Area and could all occur within disturbed areas with scattered native scrub habitat.

Results

No special-status plant species were observed during the 2018 focused survey effort. Each drainage previously surveyed for special-status plants was walked in March and April 2018 during other focused survey efforts.

Additionally, native scrub habitat in the northern and southern portions of the Plan Area were surveyed for the presence of the three species listed above with negative results.

Burrowing Owl Surveys

Methodology

Based on previous surveys of the Plan Area conducted between 2005 and 2013, burrowing owl (*Athene cunicularia*, BUOW) suitable habitat is present and surveys were conducted consistent with the Riverside County MSHCP protocol. The updated focused BUOW surveys in 2018 were conducted in two parts. The initial part (Phase 1) focused on surveying for suitable burrows and owl signs (white wash, feathers, track marks, pellets, prey remains), while the second part (Phase 2) focused on determining the presence/absence of BUOW. To survey for burrows and signs, the entire Plan Area plus a 150-meter buffer were walked in transects by qualified biologists, keeping a distance of no more than 30 meters apart between transects or at a distance such that the surveyor had 100% visibility. Suitable burrows, owl signs, and owls, were marked with a hand-held GPS unit and mapped on aerial field maps.

Four surveys were conducted focusing on surveying for BUOW. The first focused BUOW survey was conducted concurrently with the burrow survey; however, two survey days were needed to complete the first burrow and focused BUOW survey due to the size of the Plan Area and MSHCP protocol time restrictions. The four focused BUOW surveys were conducted one hour prior to sunrise until two hours after. First, surveyors searched for owls by scanning the area where mapped suitable habitat and signs of owls have been determined with the use of binoculars/spotting scopes. Then surveyors walked transects surveying for owl sign and owls. If any sign or owls were observed, they were marked with a hand-held GPS unit and mapped. Subsequent focused BUOW surveys were concentrated in areas that contain suitable burrows located in the vicinity of previous survey areas. The focused surveys were conducted during the breeding season (March 1st – August 31st) to accurately assess habitat use. In addition, weather conditions consisted of temperatures of 90ºF or below, wind speeds less than 20 miles per hour (mph), no rain, and no heavy fog. Table 1 below includes the weather conditions during each survey date, and the ESA biologists that conducted the surveys. Each survey was spaced a minimum of one week apart to be able to observe burrowing owl use on the Plan Area across an extended period. Due to rain events in the region, surveys were delayed to allow 5 days to pass after the rain event before conducting a subsequent focused BUOW survey.

Results

The Phase 1 portion of the focused BUOW survey consisted of locating any small mammal burrows that would be suitable to support a nesting BUOW. The focused burrow survey was conducted on March 8 and March 28, 2018, and covered the entire Plan Area, including a 500-foot buffer surrounding the WLC Plan Area for the total survey area. The focused burrow survey identified clusters of potentially suitable burrows along the perimeter of the agricultural fields, particularly within drainages, along berms and roadways, and adjacent to naturally vegetated areas. The majority of small mammal burrows observed belong to the California ground squirrel (*Otospermophilus beecheyi*). The four focused BUOW surveys were concentrated in areas that contain the majority of suitable burrows and located in the vicinity of the previous BUOW observation in 2012. These areas include the large drainage on the eastern portion of the WLC Plan Area, and a spoil pile and berm located parallel to Alessandro Boulevard within the middle of the survey area.

As indicated in Table 1 below, a single BUOW was observed on two separate survey dates within the large drainage channel on the eastern portion of the WLC Plan Area. The owl and its active burrow were observed and mapped during the March 8 survey, near the southern border of the WLC Plan Area, just north of the SWJA. The same owl was observed again on April 6, foraging within the same drainage channel, but further north closer to Alessandro Boulevard. Subsequent surveys on April 20 and April 27 did not observe the BUOW, and an inspection of the previously observed active burrow showed evidence of discontinued use due to the lack of fresh whitewash and the entrance of the burrow was overgrown with vegetation. This owl is most likely foraging within the WLC Plan Area and may be a solitary male that breeds at an offsite location. The 2018 observation of the BUOW is within the proximate vicinity of the 2012 observation that occurred along the berm paralleling Alessandro Boulevard. The locations of the observed burrowing owl and active burrow are depicted on **Figure 2**.

TABLE 1: BURROWING OWL FOCUSED SURVEY RESULTS

Survey Date	Personnel*	Survey Time	Survey Type	Weather Conditions			Results
				Temp. (°F)	Wind (mph)	Cloud Cover	
3/8/18	TM, DH, KF	0615 – 0830	Focused Burrow Survey and BUOW Survey #1	45	1-2	80%	1 BUOW observed
3/8/18	TM, DH, KF	0830 - 1130	Focused Burrow Survey	45	1-2	80%	Multiple burrows mapped

Los Angeles Pocket Mouse Trapping

Methodology

ESA conducted within the WLC Plan Area a single 5-day trapping effort for the Los Angeles pocket mouse (*Perognathus longimembris brevinasus*, LAPM), from the evening of May 6, 2018 to the morning of May 11, 2018, in accordance with the Riverside County MSHCP. A LAPM-experienced biologist (Kelly Rios) performed a US Fish and Wildlife Service (USFWS) small mammal protocol survey to determine the presence/absence of LAPM within the approximately 20-acres of suitable habitat within the WLC Plan Area. ESA set three trap lines within sandy soils along drainages and washes in the eastern and northeastern portions of the WLC Plan Area, respectively. In accordance with USFWS survey protocol, the trapping effort was conducted for five consecutive evenings, during when the species is active aboveground at night, and during a new moon phase. Each trap was baited with a birdseed mixture that is placed at the back of the trap. The traps are left in place and opened at dusk each night and inspected once each during the night and at dawn the following morning. Any animals, if trapped, were identified and released at the point of capture. All species captured were recorded, including number of individuals, and mapped locations, where applicable.

Results

Three trap line transects were placed within suitable habitat areas on the WLC Plan Area that contain RAFSS and mulefat scrub vegetation (Figure 2). Transect 1 consisted of 38 traps and Transect 2 consisted of 9 traps placed within the large drainage feature in the eastern portion of the Plan Area. Transect 3 consisted of 20 traps placed in the northern portion of the WLC Plan Area within a small drainage characterized by planted pomegranate trees. The 5-night trapping effort resulted in captures of four small mammal species: San Diego pocket mouse (*Chaetodipus fallax*), deer mouse (*Peromyscus maniculatus*), harvest mouse (*Micromys minutus*), and woodrat (*Neotoma* sp.). These species are all common in the region and are not considered sensitive. No LAPM individuals were trapped within the WLC Plan Area in 2018. These results are consistent with previous trapping efforts conducted by Kelly Rios within the WLC Plan Area in 2010 and 2012.

Coastal California Gnatcatcher Surveys

Methodology

CAGN is a federally threatened species and a California Species of Special Concern. The purpose of focused CAGN surveys was to determine the current presence or absence of CAGN in potentially suitable habitat within the survey area. Suitable habitat for the species is isolated to an approximately 7.6-acre stand of RSS vegetation in the northern portion of the WLC Plan Area. Focused CAGN surveys were not previously conducted on the WLC Plan Area, and since an incidental observation of this species occurred during BUOW surveys, focused CAGN surveys were conducted in order to determine the extent of the presence of this species and map its observed territory. The focused surveys were conducted by ESA biologists Tommy Molioo (TE-06873C-0.1) and Kelly Rios (TE-018909-5) who currently hold a USFWS-issued 10(a)(1)(A) recovery permit to survey for CAGN. These permitted biologists were assisted by ESA biologists Karl Fairchild, Karla Flores, Maile Tanaka, and Alanna Sullivan.

The focused surveys were conducted in accordance with the most current U.S. Fish and Wildlife Service protocol (USFWS 1997). The WLC Plan Area occurs within the MSHCP, and therefore, pursuant to the USFWS survey protocol, a total of three survey dates were conducted in suitable gnatcatcher habitat at least one week apart, between February 15 - August 31, and the hours of 6:00 AM and 12:00 PM. Surveys were performed on April 20, April 27, and May 7, 2018. The results of the surveys are included in **Table 2** below. Surveys were also conducted concurrently with other focused species surveys on the WLC Plan Area, particularly burrowing owl. ESA's biologists slowly walked throughout the approximately 7.6 acres of RSS habitat, watching for CAGN individuals and listening for CAGN vocalizations. If CAGN was not seen or heard, a recorded call was played. All observations by sight and sound were documented, including location, number of individuals, sex, age, and behavior.

Results

Prior to the start of the focused CAGN surveys, incidental observations of a pair of CAGN were made in the northern portion of the WLC Plan Area during focused burrow surveys for BUOW. Therefore, focused protocol surveys were conducted in this area as a result of the presence of suitable habitat and incidental observations of this species on two separate occasions. The focused CAGN surveys commenced on April 20, 2018 and resulted in the observation and detection of one pair (male and female) of CAGN within an isolated stand of RSS habitat characterized by a dominance of California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), and scattered blue elderberry (*Sambucus nigra* ssp. *caerulea*). The same CAGN pair was observed during subsequent focused surveys on April 27 and May 7, 2018. The observed territory for this pair was mapped on the subsequent surveys and is limited to the stand of RSS. A large patch of California buckwheat scrub occurs to the north of the mapped CAGN territory, which was also surveyed but determined to be currently absent of CAGN. Therefore, the northern portion of the WLC Plan Area is currently considered occupied by a single pair of CAGN. The results of the focused surveys are summarized in Table 2 below and the recorded locations of the CAGN pair and their observed territory is depicted on **Figure 3**.

TABLE 2: CAGN SURVEY RESULTS

Date	Personnel*	Start Time	End Time	Environmental Conditions	Observations
4/20/18	TM, DH, KF	8:00 AM	10:00 AM	Overcast to clear skies, 48-65° F, wind 0-2 mph	8:10 AM; adult pair foraging
4/27/18	TM, KaF, MT	8:30 AM	10:30 AM	Overcast to clear skies, 55-65° F, wind 0-2 mph	8:30 AM; adult pair foraging 9:00; male displaying territorial behavior
5/7/18	KR, AS	8:00 AM	10:00 AM	Overcast to clear skies, 68-76° F, wind 0-2 mph	8:00 AM; adult pair

*ESA biologists: TM=Tommy Molioo, DH=Dale Hameister, KF=Karl Fairchild, KaF=Karla Flores, AS=Alanna Sullivan, MT=Maile Tanaka

Conclusion

Overall, the vegetation communities within the WLC Plan Area remain in a similar condition as previously mapped by MBA, consisting of mainly agricultural fields with scattered native habitats within drainages and along the periphery of the WLC Plan Area. No Narrow Endemic Plant species were observed within the WLC Plan Area during the 2018 surveys, which is consistent with previous surveys conducted for the WLC Project. A single BUOW was observed in the large drainage on the eastern portion of the WLC Plan Area. This BUOW was flushed from its burrow in the southern portion of the large drainage during the March 8, 2018 survey, and was observed again in the northern portion of the same large drainage on April 6, 2018. This BUOW was not observed again during subsequent surveys and the bird may only be foraging within the WLC Plan Area, and may mate and breed in offsite areas. The LAPM trapping effort resulted in negative findings of LAPM, or any other special-status small mammal species, which is consistent with previous trapping efforts on the WLC Plan Area. Lastly, the northern portion of the WLC Plan Area is currently considered occupied by a pair of the federally-threatened CAGN, which is a covered species under the provisions of the MSHCP.

While the overall conditions of the WLC Plan Area have remained the consistent with previously documented results since 2012, BUOW and CAGN were observed in new locations of the WLC Plan Area. However, both species are covered by the MSHCP and potential impacts will be considered less than significant with avoidance measures incorporated at the project-level.

SECTION 1: SUMMARY

FirstCarbon Solutions | Michael Brandman Associates (FCS) conducted a Habitat Assessment and MSHCP Consistency Analysis (FCS 2013a) to comply with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) and City of Moreno Valley CEQA requirements for an Environmental Impact Report (EIR) for the World Logistics Center project . This report includes an assessment of the riparian/riverine areas associated with the World Logistics Center project.

Within the World Logistics Center Specific Plan (WLCSP), Highland Fairview Operating Company is proposing to develop 40.6 million square feet of warehouse facilities and associated infrastructure. As part of the project design, a development setback area will occur along the southern boundary adjacent to the San Jacinto Wildlife Area (SJWA)A total survey area of 5,970 acres was examined during the MSHCP consistency analysis, which includes the WLCSP, offsite facilities, ,northern portion of the SJWA and additional survey areas. The examination was made through direct pedestrian surveys, literature reviews, and/or aerial photography reviews. All graphical and textual references to the "CDFW Conservation/Buffer Area" in this document are hereby replaced with the "San Jacinto Wildlife Area (SJWA)".

Fifteen drainage features were documented within the project site based on the Delineation of Jurisdictional Waters and Wetlands for the World Logistics Center Specific Plan (FCS 2013b). ESA conducted an update to the jurisdictional delineation and verified a total of 11 drainage features with the potential for regulatory jurisdiction (ESA 2016).

Portions of five of these features are considered riparian/riverine areas, as described in the Delineation of Jurisdictional Waters and Wetlands for the World Logistics Center Specific Plan. Based on current design plans, a program-level Determination of Biologically Equivalent or Superior Preservation (DBESP) will be required if these drainage features are likely to be impacted by future project development. If impacts to any of these areas are proposed on a project-level basis, then a subsequent project-level DBESP will be required to assess the extent of impact and the measures taken to reduce the impact or determine mitigation measures for implementation either onsite or through offsite credits.

SECTION 2: INTRODUCTION

2.1 - Project Location

The survey area is generally located north of State Route 74 (SR-74), south of SR-60, east of Interstate (I) 215, and west of SR-79 (Exhibit 1). Specifically, the survey area is located within Sections 1, 2, 10, 11, 12, 13, and 14 of Township 3 South, Range 2 West; and Sections 5, 6, 7, 8, 9, 16, 17, 18, 19, 20, and 21 of Township 3 South, Range 3 West as depicted on the Sunnymead and El Casco, California, United States Geological Survey (USGS) 7.5-minute topographic maps (Exhibit 2). The survey area is specifically located south of SR-60, east of Redlands Boulevard, and west of Gilman Springs Road (Exhibit 3). The survey area encompasses several contiguous parcels totaling approximately 5,970 acres, including potential offsite improvements on the eastern, northern, and western margins of the WLCSP to assess indirect impacts to "wildlands areas." Highland Fairview Operating Company is proposing to develop the WLCSP within 2,610 acres of the northern portions of the survey area.

Land use within the survey area includes extensive agricultural lands, seven remaining private residences, natural gas compressor station, water district facility, and general open space. Off-site facilities are located in residential development and general open space areas.

Land use in the general vicinity of the site includes residential development to the west, active agricultural to the north and south, and open space areas to the east.

2.2 - Project Description

The WLCSP encompasses approximately 2,610 acres of land in eastern Moreno Valley. Associated offsite improvements areas include infrastructure extensions , north, west, and east of the WLC and encompass an additional 302 acres inclusive of roadway and utility improvements as well as potential debris basins on the east side of Gilman Springs Road. The proposed General Plan Amendment and Zone Change deletes the current residential mixed-use land uses (the Moreno Highlands Specific Plan) and replaces them with job-producing land uses (the WLCSP) in the development areas. The General Plan Amendment and Zone change encompasses an additional 1,104 acres of "Open space" and "public" uses which will be provided in the undeveloped areas. The northerly 70 percent of the survey area is within the proposed WLCSP, which will function as the development regulations for the World Logistics Center, a master-planned logistics complex.

The most southerly 30 percent of the survey area (1,104 acres) will not be developed as part of the WLCSP, but will be designated as "open space" and/or "public" uses by the General Plan Amendment and Zone Change. A 502-acre area is associated with an expanded survey area to cover potential indirect impacts associated with the SJWA and Core H of the MSHCP and the lands associated with the eastern side of Gilman Springs Road and proposed Core 3. The remaining 1,452 acres is additional survey areas considered for potential offsite improvements (Exhibit 4**)**.

Offsite environmental impacts are associated with roadway and utility improvements, which are also included as part of the WLCSP. These include a potential drainage improvements near Sinclair Street, north of SR-60, and one or more potential drainage improvements in various canyons along the north side of Gilman Springs Road. Potential water reservoirs and an access road are proposed for a hilly area west of Moreno Beach Drive/north of Cottonwood and on a hillside west of Theodore Street/south of Ironwood Avenue. Sewer improvements are planned for Redlands Boulevard, Gilman Springs Road, Bay Avenue, Merwin Street, Brodiaea Avenue, and Quincy Street. Water supply improvements are planned for Cottonwood Avenue, Eucalyptus Avenue, Merwin Street, Redlands Boulevard, and Gilman Springs Road.

The area immediately south of the WLCSP consists of the SJWA, , and a 194-acre San Diego Gas and Electric (SDG&E) compressor station. SDG&E controls approximately 194 acres, of which 19 acres are used for the compressor site and other natural gas facilities. This area has been included in the survey area because it included in the proposed General Plan Amendment and Zone Change. These lands are not a part of the Specific Plan development and no direct impacts to this area will occur.

A 74.3-acre area (Planning Area 30 in the WLCSP) is designated as open space in the WLCSP and therefore was not given any designation in the MSHCP document. The Applicant will offer the land for dedication to the State or the RCA. There are existing utilities that will require occasional routine maintenance and therefore, the designation of this area as a “conservation area” may not be feasible. For this reason, the area was not labeled as a conservation area in the document. During the project-specific development process, all or part of this property may be considered for conservation or otherwise left as proposed open-space designation in the Specific Plan. This can be further discussed with RCA at a project-specific level in the future.

This biological resources assessment examines potential indirect impacts associated with both construction and operations of the proposed facilities on the WLCSP lands, as well as those in the rest of the survey area. Studies on indirect impacts are based on a combination of literature reviews, aerial photograph interpretation, and projects completed within the vicinity of the WLCSP. This 1,000-foot area is hereafter referred to as the Indirect Impact Zone. It is defined as an area extending 1,000 feet beyond the boundaries of the Specific Plan in areas with substantially undeveloped land adjacent to or proposed for conservation by the MSHCP, but does not include areas contained within the SJWA. Current plans call for a phased development over 15 years; thus, a programmatic analysis of the project is the preferred methodology. In previous documents, including the Draft EIR, the phased development has varied from 10 to 20 years. For consistency throughout all environmental documents, a 15-year build-out is now the current plan for development. As individual developments occur and project-specific applications are processed additional site-specific studies may be required.

Exhibit 1: Regional Location Map

Exhibit 2: Local Vicinity Map, Topographic Base

Exhibit 3: Local Vicinity Map, Aerial Base

SECTION 3: METHODOLOGY

3.1 - Literature Review

Prior to conducting the DBESP analysis for the riparian/riverine areas, a literature review was conducted of the environmental and regulatory setting for the biological survey area. The literature review provides a baseline from which to evaluate the riparian/riverine areas potentially occurring within the survey area, and within the local and regional vicinity.

The literature review began with a thorough examination of existing technical reports associated with the WLCSP and surrounding area. Recent and historical aerial imagery was reviewed, as well as the topographic electronic and hard copies of the Lakeview, Sunnymead, and El Casco, California USGS 7.5-minute topographic quadrangle maps. The Delineation of Jurisdictional Waters and Wetlands for the World Logistics Center Specific Plan was used to confirm the current locations of drainage features likely to be considered riparian/riverine under the MSHCP.

The MSHCP requires that an assessment be completed of the potentially significant effects of the project on riparian/riverine areas, and vernal pools. According to the MSHCP, the documentation for the assessment shall include mapping and a description of the functions and values of the mapped areas with respect to the species listed in Section 6.1.2, protection of species associated with riparian/riverine areas and vernal pools.

3.2 - Field Investigation

The habitat assessment component of the subject DBESP report was based on the findings of the field reconnaissance surveys most recently conducted on June 13, 20, 21, and 27, and July 3, 7, and 9, 2013. FCS's biologists conducted various surveys of the project site on foot, including habitat assessment surveys for sensitive plant and wildlife species, and thorough analyses of all potential drainage features onsite, particularly those that qualify as riparian/riverine habitat. ESA biologists conducted their site visit on November 2, 2016.

Environmental conditions and biological resources that were observed or otherwise detected during the surveys of the project site were recorded in field notebooks. Data used in determining jurisdictional limitations for FCS's delineation of jurisdictional waters and wetlands were collected using a Trimble GeoXt GPS unit with an accuracy of ±1 foot , as well as mapping on standard 7.5-minute USGS topographic quadrangles and aerial photographs. Other materials used to delineate the limits of the drainage features included a 30-meter tape measure, shovel, and Munsell color chart.

All 15 drainage features observed onsite were systematically inspected to record existing conditions and measure widths and length. Width measurements were taken from bank to bank at the ordinary high water mark (OHWM), at approximately 300-foot intervals. Any associated riparian vegetation coverage was recorded on aerial photographs and verified during the site visit. Width and length measurements were entered into Geographical Information System (GIS) Arcview software to identify drainage area locations and dimensions. The Arcview application was then used to compute the surface area of each riparian/riverine feature in acres. Acreage computations were verified using the aerial photographic and field data to estimate the approximate drainage length. Surface area was calculated by multiplying total length of each feature by its average width as determined at the measurement intervals. Features 2, 3, 13, and 14 were determined to be non-jurisdictional by ESA (ESA 2016).

SECTION 4: DETERMINATION OF BIOLOGICAL EQUIVALENT OR SUPERIOR PRESERVATION (DBESP) ANALYSIS

4.1 - Purpose and Need for the DBESP Analysis

Section 6.1.2 of the Western Riverside County MSHCP requires an assessment of the potentially significant effects of a project on Riparian/Riverine Areas and Vernal Pools and associated riparian/ riverine species. This assessment is independent from considerations given to waters of the United States (U.S.) and waters of the State under the CWA and California Fish and Game Code (CFG Code).

Projects within the boundaries of the Western Riverside County MSHCP area that have the potential to impact existing riparian/riverine habitat require an analysis of the functions and values of the habitat on and adjacent to the project impact area. In addition, a biologically equivalent or superior alternative to existing riparian/riverine conditions must be incorporated into the project. Functions and values include those that contribute to the biological sustainability of an area determined to be riparian/riverine, such as vegetation and faunal composition of the habitat, and the degree to which a riparian/riverine area provides habitat suitable for plant and wildlife species. Functions and values that pertain to the hydrology of the riparian/riverine area and the watershed, to which it is directly connected, include its contribution to flows that may affect water quality, flow rates, energy dissipation, flooding, erosion, scouring, and sediment transport into adjacent areas.

The DBESP analysis includes the following:

- Identification and delineation of all riparian/riverine habitat within the project area
- Description of pre-project functions and values of riparian/riverine habitat onsite
- Description of project design features, impacts, and avoidance and/or mitigation measures to conserve and/or protect existing riparian/riverine habitat onsite
- Demonstration of an increase in post-project functions and values of riparian/riverine habitat onsite and offsite through the implementation of the project and associated avoidance and mitigation measures

4.2 - Description of the Pre-Project Riparian/Riverine Functions and Values

Riparian/riverine areas are defined as containing habitat dominated by trees, shrubs, persistent emergent plants, or emergent mosses and lichens which occur close to, or depend upon soil moisture from, a nearby fresh water source, or areas with fresh water flow, during all or a portion of the year. Vernal pools are seasonal wetlands that occur in shallow depression areas that have all three wetland indicators (hydrology, hydric soils, and hydrophytic vegetation), during the wet portion of the growing season, but may lack wetland indicators during the dry portion of the growing season.

Fifteen drainage features were assessed as part of the riparian/riverine study as required under the MSHCP (Exhibit 4). Five of these drainage features meet the criteria as riparian/riverine under the MSHCP (Drainages 7, 8, 9, 12, and 15). This determination was based on two primary drainage requirements. Two of the drainage features (Drainages 12 and 15) have direct hydrologic connections to downstream drainage features and are tributary to larger drainage features. These two drainage features lack vegetation, but have a clearly defined bed and bank feature and evidence of flows. The other three drainage features (Drainages 7, 8 and 9) have a defined bed and bank feature for a portion of the drainage and some portion of the drainage has a stand of riparian vegetation, which is dominated by mule fat scrub or other riparian vegetation. The remaining ten drainage features are considered upland swales with minor erosional features. They contain no riparian vegetation and are not hydrologically connected to any downstream drainage features. Therefore, they have an extremely low function and value and are not considered riparian/riverine areas under MSHCP guidelines. If it is determined at a project-level basis that additional drainage features should be considered riparian/riverine, then those drainage features will also be included in a project-level DBESP for future development. Feature 2 is an agricultural ditch/swale; Feature 3 is a detention basin; Features 13 and 14 are agricultural basins.

None of the riparian/riverine plant species listed in the MSHCP's Section 6.1.2 were observed on the project site. This is consistent with survey results conducted by ESA in 2018. That list includes:

Brand's phacelia
California Orcutt grass
California black walnut
Coulter's matilija poppy
Engelmann oak
Fish's milkwort
Graceful tarplant
Lemon lily
Mojave tarplant
Mud nama
Ocellated Humboldt lily
Orcutt's brodiaea
Parish's meadowfoam
Prostrate navarretia
San Diego button-celery
San Jacinto Valley crownscale
San Miguel savory
Santa Ana River woolly-star
Slender-horned spineflower
Smooth tarplant
Spreading navarretia
Thread-leaved brodiaea
Vernal barley

None of the riparian vegetation observed on site is listed as threatened or endangered or otherwise sensitive. No onsite portions of WLCSP provide suitable habitat for any of the wildlife species listed in the MSHCP's Section 6.1.2. That list includes:

Arroyo toad
Mountain yellow-legged frog
California red-legged frog
Bald eagle
Least Bell's vireo
Peregrine falcon
Southwestern willow flycatcher
Western yellow-billed cuckoo
Sana Ana sucker
Riverside fairy shrimp
Vernal pool fairy shrimp

None of these species were observed during any of FCS's surveys. None of the species were observed during ESA's 2018 surveys. No vernal pools or suitable habitat for vernal pool plant or wildlife species occur on the project site.

The following is a complete description of the drainage features determined to be riparian/riverine within the project site. These drainage features are numbered based on the Delineation of Jurisdictional Waters and Wetlands for the World Logistics Center Specific Plan (FCS 2013b). Drainages 1, 2, 3, 4, 5, 6, 10, 11, 13, and 14 are not considered riverine riparian habitat. These features lack riparian habitat and are generally described as upland swales with sporadic bed and bank features and likely only contain flowing water during extremely large storm events. All of these features sheet flow and disappear prior to connecting to any significant downstream drainage feature and do not provide any downstream value to offsite drainage features. These features are not considered riparian/riverine and will not be further discussed in the document. Drainage features 7, 8, 9, 12, and 15 contain a clearly defined bed and bank feature that continues offsite to a significant downstream drainage feature or have riparian vegetation within the active channel and have some function and value as drainage features (Exhibit 4). None of these drainage features have both connectivity to a significant downstream drainage feature and riparian vegetation. The natural run-off from the agricultural field may be considered a significant source of pollution to downstream drainage features depending on the amount of fertilizer and pesticides that are used

4.2.1 - Drainage Feature 7

Drainage 7 is an agricultural ditch/swale that runs from north to south and originates in the Badlands approximately 0.75 mile north of the survey area. It passes beneath highway SR-60 through a corrugated steel pipe and continues as a soft-bottom channel with a dense stand of mule fat scrub with scattered arroyo willows (*Salix lasiolepis*). This habitat continues downstream for approximately 1,300 feet before the channel reverts to an unvegetated soft-bottom channel. The drainage continues to the south and eventually reverts to a mule fat scrub habitat immediately south of Alessandro Road. This portion of the channel is approximately 30 feet wide and 1,500 feet in length. The drainage continues in an unvegetated soft bottom channel until it reaches the southerly survey area boundary, where it again reverts to a mule fat scrub community. This portion of the channel extends for approximately 600 feet and then reverts to an unvegetated channel. The drainage eventually sheet-flows within an existing agricultural field south of the survey area and north of Mystic Lake with no direct hydrologic connection to any TNW or RPW.

Vegetation observed within Drainage 7 is primarily non-native herbaceous annual forbs and grasses, including short pod mustard, Russian thistle, ripgut brome, and red brome. Other sub-dominant species observed include tree tobacco, mule fat (*Baccharis salicifolia*), tarragon (*Artemisia dracunculus*), and Jimson weed (*Datura wrightii*). Additionally, there is a predominance of bare ground in the herbaceous layer. There is an intermittent dominance of hydrophytic vegetation observed within three separate reaches of the feature associated with patches of mule fat. There are no clearly defined bed and bank features throughout the drainage feature.

Soils observed within Drainage 7 are dominated by both San Emigdio loam and San Emigdio fine sandy loam, and do not exhibit any hydric soil indicators. Small inclusions of Badlands and Metz loamy sand also occur within the drainage. These soils can be considered hydric if adequate hydrology is present. There is no evidence of hydrophytic vegetation within areas designated as Badland or Metz loamy sand. The soils within Drainage 7 are permeable and promote very high percolation rates, thereby reducing the potential for any anaerobic or hydric conditions. No wetland hydrology, hydric soils, or obligate hydrophytes exist within Drainage 7.

The majority of Drainage 7 is a low quality drainage feature with little or no vegetative cover. There are three isolated patches of moderate quality riparian habitat within portions of the drainage feature. It conveys storm flows with little or no significant pollution sources. There is minimal erosion and overall the value of this drainage is moderate.

4.2.2 - Drainage Feature 8

Drainage 8 is an agricultural ditch/swale within the survey area. The majority of this feature is similar in form and function to Drainage 7. This feature originates in the Badlands approximately 1.6 miles north of the survey area, just south of the existing County landfill. This is an undisturbed ephemeral feature with an unvegetated channel. Drainage 8 passes beneath SR-60 within a corrugated steel culvert. The drainage flows southwest within an unvegetated channel until it reaches Gilman Springs Road. It flows parallel to the road until it reaches an underground culvert and goes beneath Gilman Springs Road where it enters the project area. The drainage then continues to the south as an agricultural ditch/swale for approximately 8,800 linear feet before the drainage feature terminates, allowing runoff to sheet-flow within the southern portion of the survey area. This drainage is physically interrupted by agricultural activities at several locations and does not flow continuously throughout its length. Drainage 8 appears to have been created as a result of artificial water channeling from historical agricultural activities .

Dominant vegetation associated with Drainage 8 is limited to sparse non-native herbaceous annual forbs and grasses including tree tobacco, annual sunflower, and red brome. Other plant species observed within portions of Drainage 8 include mule fat, horehound, and white horse nettle (*Solanum elaeagnifolium*). Scattered ruderal vegetation within the feature is dominated by tumbleweed (*Amaranthus albus*), annual sunflower (*Helianthus annuus*), and tree tobacco. No dominance of hydrophytic vegetation was observed within any portions of the feature.

Soils observed within Drainage 8 are dominated by Metz gravelly sandy loam, San Emigdio loam, and San Emigdio fine sandy loam. The soils within Drainage 8 are permeable and promote very high percolation rates, thereby reducing the potential for any anaerobic or hydric conditions.

The majority of Drainage 8 is a low quality drainage feature with little or no vegetative cover. It conveys storm flows that cross Gilman Springs Road, which can be considered a source of pollution from street run-off. There is minimal erosion and overall the value of this drainage is low.

4.2.3 - Drainage Feature 9

The segment of Drainage 9 that occurs within the survey area is approximately 1.3 miles long with an average OHWM ranging from 3 to 5 feet. This feature originates in the Badlands approximately 2.75 miles north of the survey area and is the most eroded drainage feature within the WLCSP. Water in Drainage 9 comes from three sources. A portion enters the survey area from a box culvert beneath Gilman Springs Road. Additional water flows over Gilman Springs Road in heavy rain events, and other flows travel along Gilman Springs Road and are diverted beneath Gilman Springs Road just north of Alessandro Boulevard. The drainage then flows in a southerly direction, and enters a small culvert beneath Alessandro Boulevard. The drainage then continues to the south as a highly eroded ephemeral drainage before transitioning to an upland swale and eventually sheet-flows south of the survey area. This drainage is physically interrupted by agricultural activities at several locations off site and does not flow continuously throughout its length. Drainage 9 appears to have been created as a result of runoff from the Badlands that flows under and across Gilman Springs Road and from onsite agricultural activities. Drainage 9 has become incised over the years due to occasional high runoff volumes and highly erosive soils.

The drainage feature contains signs of scouring and excessive erosion. It also contains a significant change in soil texture with a defined main channel and a single upland shelf. Drainage 9 is dominated by Metz loamy sand and San Emigdio fine sandy loam with a small inclusion of Metz loamy fine sand.

The majority of the drainage contains little or no vegetation along the channel bed. Vegetation is limited to the upland areas above the OHWM and is dominated by coastal sage scrub species. Dominant plant species include California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), desert brittlebush (*Encelia farinosa*), California sagebrush (*Artemisia californica*), and short-pod mustard. Other plant species observed within the channel include scale-broom (*Lepidospartum squamatum*), California aster (*Corethrogyne filaginifolia*), mayweed (*Anthemis cotula*), and four-winged saltbush (*Atriplex canescens*).

Soil within the drainage contains a noticeable change in texture from surrounding upland habitats. The sandy deposits contain no evidence of organic streaking or other hydric conditions. The drainage feature contains an intermittent OHWM between Gilman Springs Road and Alessandro Boulevard. Storm flows have cut a greatly incised channel, approximately 60 feet wide at the top of the channel and 10 to 20 feet in depth, just south of Alessandro Boulevard. The area immediately south of Alessandro Boulevard contains trash dumping, which includes yard waste, kitchen appliances, and old tires. This portion of the drainage feature does not meet the requirements for hydric soils.

The majority of Drainage 9 is a moderate quality drainage feature with scattered riparian and Riversidean sage scrub vegetation. It conveys storm flows that cross Gilman Springs Road, which can be considered a significant source of pollution from street run-off. There is some severe erosion located just south of Alessandro Boulevard. The overall value of this drainage is moderate.

4.2.4 - Drainage Feature 12

This feature flows along the east side of Merwin Street as a road-side ditch and enters a detention area designed as an energy reducer to minimize flood hazards to the adjacent residential development. The water continues to flow through an underground culvert beneath Alessandro Road and continues in an unvegetated channel until it flows offsite.

Drainage 12 has been artificially altered to receive additional flows due to the installation of several earthen berms designed to reduce flooding in the adjacent residential development. The additional earthen berms allow additional water to flow into the upstream portion of drainage 12, which originates just downstream of the intersection of Bay Avenue and Merwin Street within the WLCSP. The drainage is contained within an unvegetated channel for approximately 1,200 linear feet and is collected in a small detention area just north of Alessandro Boulevard. The Alessandro Boulevard Crossing was created as part of a flood control project along the western portion of the survey area and slows water flows to reduce erosion and flooding hazard. The drainage spills into a four-foot corrugated pipe and continues along the east side of Merwin Street, just south of Alessandro Boulevard.

This ephemeral drainage feature conveys flows only during and immediately following large storm events. The channel contains evidence of an intermittent OHWM and bed and bank features within the survey area. The majority of the drainage contains little or no vegetation and does not meet the minimum criteria for hydrophytic vegetation. Unlike Drainages 7, 8, and 9, this feature continues offsite within an improved flood control channel. South of Cactus Avenue, it flows south through an existing golf course, it continues southwest in the Perris Valley Storm Drain, which then connects to Canyon Lakes. As such, Drainage 12 directly connects to a downstream water of the U.S.

The drainage channel is dominated by San Emigdio loam and Hanford coarse sandy loam, which are typical soils within the survey area. Soil within Drainage 12 contains a noticeable change in texture from surrounding upland habitats. The sandy deposits contain no evidence of organic streaking or other hydric soils.

Drainage 12 contains no wetland hydrology indicators and does not meet the criteria for jurisdictional wetlands under the 3-criteria wetland determination guidelines (USACE 2001).

The majority of Drainage 12 is a low quality drainage feature with a nearly unvegetated channel with scattered weedy vegetation. It conveys storm flows that originate within the active agricultural area and areas directed around residential development. There is some erosion located just south of Alessandro Boulevard and overall the value of this drainage is low.

4.2.5 - Drainage Feature 15

Drainage 15 is located west of the project site and flows in a north-south direction. The drainage originates near the intersection of Quincy Street and Walther Avenue, approximately 2.0 miles northwest of the project site. The drainage is contained within a soft-bottom earthen channel and is an unvegetated channel with sparse riparian vegetation. This drainage flows into the downstream portion of Drainage 12 listed above, in an existing golf course area. Drainage 15 has a downstream connection to waters of the U.S.

Drainage 15 crosses a potential route of offsite infrastructure improvements and only a portion of the drainage feature is peripherally associated with the project site. It includes a clearly defined OHWM.

This ephemeral drainage feature conveys flows during and immediately following large storm events. It contains signs of scouring and excessive erosion. The channel contains a clearly defined OHWM at the location where the proposed offsite project feature is located.

The majority of the drainage contains little to no vegetation and does not meet the minimum criteria for hydrophytic vegetation.

The drainage channel is dominated by San Emigdio fine sandy loam, which is a typical soil scattered throughout Moreno Valley. Soil within the drainage contains a noticeable change in texture from surrounding upland habitats. The sandy deposits contain no evidence of organic streaking or other hydric soils.

The drainage feature contains no wetland hydrology indicators. The drainage feature does not meet the criteria for jurisdictional wetlands under the three-criteria wetland determination guidelines.

The majority of Drainage 15 is a low quality drainage feature with an unvegetated channel and scattered weedy species. It conveys storm flows from natural runoff and nuisance flows from adjacent residential development, which can be considered a significant source of pollution from street run-off. There is some severe erosion located along the length of the drainage and overall the value of this drainage is low.

4.3 - Potential Project Related Impacts

Although the WLCSP EIR analysis is a program level effort, project related impacts were estimated based on current specific plan design. The following is a brief discussion of the potential impacts associated with the riparian/riverine areas. This is necessary to establish estimated mitigation requirements necessary to offsite potential project related impacts at a specific-plan level. A total of 3.0 acres of riparian/riverine area occur within the WLCSP. The following is a general evaluation and estimate of the project related impacts to riparian/riverine areas.

4.3.1 - Drainage 7

Drainage 7 will be removed as part of the proposed development. All drainage associated with this feature will be contained within an underground storm drain system and flows will be conveyed to the southern boundary of the WLCSP where it will be returned to present flow patterns and rates. A total of 1.0 acre of riparian/riverine area will be permanently impacted within the WLCSP. This includes the three patches of riparian habitat as well as the unvegetated channel that connects them.

4.3.2 - Drainage 8

Drainage 8 will be removed as part of the proposed development. All drainages associated with this feature will be contained within underground storm drainage and flows will be conveyed to the southern boundary of the WLCSP where it will be returned to present flow patterns and rates. A total of 0.5 acre of riparian/riverine area will be permanently impacted.

4.3.3 - Drainage 9

Drainage 9 will remain in place and will be enhanced to provide higher quality riparian habitat as well as provide for wildlife movement between the Badlands and the SJWA. Proposed impacts associated with Drainage 9 include trash removal, construction of a single road crossing, removal of the existing Alessandro Boulevard, installation of energy dissipation devices, and the re-contouring of the upstream portion of the drainage between Gilman Springs Road and Alessandro Boulevard. Drainage 9 enhancement will begin with the removal of Alessandro Road. Currently, storm flows spill over the road and causes severe erosion south of Alessandro Boulevard. The upstream portion of drainage will be re-contoured to provide a more natural slope between Gilman Springs Road and Alessandro Boulevard. Energy dissipating devices will be installed periodically along Drainage 9 to reduce the flow velocity within the active channel, which will decrease downstream sediment deposition and erosion. Total area of riparian/riverine habitat within Drainage 9 is 0.9 acre. The estimated amount of permanent impacts will be approximately 0.2 acre with temporary impacts of approximately 0.7 acre. Most, if not all, portions of this drainage will be affected by future drainage improvements. However, once completed, the drainage will have a much higher function and value than what currently exists within the WLCSP.

4.3.4 - Drainage 12

The entirety of Drainage 12 will be impacted by project related activities within the WLCSP. This drainage has a total of 0.5 acre of riparian/riverine area. Half the impacts will be permanent (0.25 acre) and half will be temporary (0.25 acre). North of Alessandro Boulevard. Drainage 12 will be placed in an underground storm drain system and will outlet into a detention basin within the WLCSP. Downstream of Alessandro Blvd. Drainage 12 is proposed to be improved with a soft-bottom channel to Redlands Blvd. where it will connect to the existing improved channel.

4.3.5 - Drainage 15

Drainage 15 will be minimally disturbed throughout the proposed project development. There are two utility line upgrades that may be required at two road crossings of Drainage 15 (Cottonwood and Cactus). It is estimated that the area needed to complete the utility line upgrades is approximately 0.1 acre of riparian/riverine area.

4.4 - Project Design Features and Mitigation Measures

This program-level DBESP for impacts to riparian/riverine areas is required by the RCA and will be approved prior to final project approval. This DBESP includes a general discussion of mitigation options for impacts to riparian/riverine areas as well as general location and size of the mitigation area and will also include a monitoring program.

If impacts to riparian habitat within the WLCSP cannot be avoided at the time of project specific development, then a separate project-level DBESP and specific mitigation will be required under MSHCP guidelines.

Feasible mitigation measures are required to minimize the potentially significant impacts identified above. Many of the mitigation measures set forth below are standard mitigation measures approved by the United States Fish and Wildlife Service, California Department of Fish and Wildlife, County of Riverside, and City of Moreno Valley.

Exhibit 4: Riparian/Riverine Areas

4.4.1 - Mitigation Measures

Drainages 7 and 8, and portions of Drainage 12 will be filled as part of the proposed WLCSP. The affected areas of these drainages do not constitute functioning riparian habitat. Since these features are of low habitat quality, mitigating for impacts to these features will provide a beneficial use in the creation or preservation of riparian habitat rather than preserving the unvegetated drainage features onsite. These impacts will be mitigated through creation of riparian habitat on-site, creation of riparian habitat off-site, or purchase of credits at an approved mitigation bank. There will be a series of drainage improvements, which will be used for infiltration, to improve water quality and reduce erosion onsite, prior to entering the off-site drainage features. The WLCSP was designed to avoid the largest drainage feature within the WLCSP because it is a moderate-quality drainage feature, even though it does not connect to any downstream drainage features.

The post-project stream flows and sediment transport functions will be improved from the pre project conditions. Temporary impacts will be mitigated by restoring the affected portions of the drainage back to pre-project conditions, which includes removing the Alessandro Boulevard road crossing and re-contouring the upstream portion of the drainage between Gillman Springs Road and Alessandro Boulevard. No portion of Drainage 9 will be permanently impacted beyond disturbances associated with the new road crossing and energy dissipating devices. Installation of detention basins will provide a water quality component as well as reduced erosion and prevent downstream soil transport. The detention basins will provide improved function and value of riparian/riverine habitat within the WLCSP by reducing erosion and scour potential and increasing riparian habitat for local wildlife species.

Mitigation Measures/Riparian Habitat Creation

Post-construction stormwater discharges will be less than or equal to existing conditions onsite in accordance with Riverside County Flood Control requirements and all applicable water quality standards. This will be achieved through the installation of several detention/infiltration basins within the WLCSP, as well as several basins along the southern project boundary to capture, treat, and detain flows from the WLCSP before flows enter the adjacent CDFW Conservation Area.

The drainage improvements potentially occurring along the southern border of the WLCSP contain spreading structures that allow flows in an east-west direction to create a linear barrier between the proposed development and the adjacent open-space area. The proposed drainage improvements along the southern portion of the WLCSP can support as much as 52 acres, which includes approximately 45 acres of drainage bottom and 7 acres of drainage side slopes (Exhibit 5). In addition, portions of Drainage 9 will be enhanced with energy dissipating devices to reduce erosion and sediment loss. This will also include an additional riparian enhancement within the bottom of Drainage 9. Drainage 12 will be recontoured to support storm flows within and immediately downstream of the WLCSP. This area will also be enhanced and restored to a better than current existing condition by revegetation with native riparian plants that are associated with drier conditions.

Drainage improvements, such as detention basins, will be installed throughout the WLCSP to provide upstream detention and water quality treatment during a storm event's first flush. Drainage improvements along the southern boundary of the WLCSP, which will have spreading features, will be the final water quality treatment before entering an off-site drainage features. These areas may be used to create riparian habitat as part of the on-site mitigation option.

The term "functioning riparian habitat" describes a patch or area of riparian habitat that functions as a riparian habitat. It provides suitable habitat for plant and wildlife species that are commonly found in riparian habitats. Even low- quality riparian habitat may provide functional riparian habitat if it supports a population of riparian species. The riparian habitat onsite is extremely small and completely isolated from riparian habitat in the eastern portion of the City of Moreno Valley. The riparian vegetation onsite does not support wildlife species commonly found within riparian habitat such as common yellowthroat (*Geothlypis trichas sinuosa*), yellow warbler (*Setophaga petechia brewsteri*), yellow-breasted chat (*Icteria virens*), and summer tanager (*Piranga rubra*), as described in the Birds as Indicators of Riparian Vegetation (no date) condition in the western U.S. Bureau of Land Management, Partners in Flight, Boise, Idaho. Therefore, even though the WLCSP contains small patches of riparian vegetation, it does not function as a riparian habitat. A few plants in an isolated area do not create a functional habitat.

The post-project best management practices shall meet the treatment flow-based/volume-based capacity requirements of the Regional Water Quality Control Board. These detention basins will be designed to provide functioning riparian habitat, which will be maintained by the increase in available water due to the impermeable surface of the proposed development.

A full Habitat Mitigation and Monitoring Plan(HMMP) will be prepared and submitted to the RCA and Wildlife Agencies for review, if necessary. A full HMMP will only be required if mitigation monitoring is required. If project-related impacts are mitigated through the offsite purchase of mitigation credits within an approved mitigation bank, then a full HMMP will not be required. This information will be required at a project-level environmental analysis.

Mitigation Measures

The mitigation plan for the major impacts to Drainages 7, 8, 9, 12, and 15 consists of mitigating for impacts to 3.0 acres of riparian/riverine habitat at a minimum replacement ratio of no less than 1:1. Restoration of no more than 6.0 acres of riparian scrub habitat will be required, with components of Riversidean sage scrub/mule fat scrub habitat, using the following approach. If on-site mitigation is used, all existing invasive weedy plant species will be removed and transported offsite to reduce the seed back of noxious species. The designated habitat creation areas for each project site shall be cleared of weeds prior to any grading activities. Once grading activities have been completed, soil decompacting may be required by ripping, if necessary. The site will then be seeded with appropriate native plant species and mulched to protect the prepared soils and deter weed germination. Cuttings will be installed during the appropriate season to promote rapid establishment of healthy riparian vegetation.

Exhibit 5: DBESP Mitigation Areas

Supplemental irrigation may be supplied to this restoration area by an irrigation system for the first 2 years to help establish the vegetation. Weed control in the treated area will be performed primarily during the late winter and spring months (January through May) during times when weed germination is prevalent. If needed, supplemental planting and seeding in subsequent years shall be conducted during the late fall and winter (October 15 through January 31). Monitoring of the revegetation process will be conducted periodically throughout the year and annual performance evaluations will be performed during late spring (May–June). Annual monitoring reports will be submitted to the appropriate agency describing the site's performance through the year and any supplemental planting conducted.

Based on the Habitat Assessment and MSHCP consistency document (FCS 2013), approximately 3.0 acres of riparian riverine habitat may be impacted by proposed projects in the future. At a minimum, habitat replacement will be required at a 1:1 ratio but may be as high as 3:1 depending on the quality of the habitat. Because the riparian habitat in a few of the drainage features is of low to moderate quality, a 2:1 mitigation ratio may be most appropriate. Again, the mitigation ratio will be established at the project level, in consultation with the CDFW, USFWS, RCA, and the City of Moreno Valley. At a 2:1 mitigation ratio, the estimated amount of replacement habitat is approximately 6 acres.

Since these documents were prepared as a program-level document, several mitigation alternatives were provided. The project biologist has indicated a general shift in mitigation recommendations from resource agencies. The trend is use of large offsite mitigation banks rather than create small isolated mitigation areas within the project site. The onsite detention basins may constitute adequate mitigation for impacts to riparian/riverine resources if designed appropriately, which may be agreed to by the Wildlife Agencies, especially if the resulting habitat is superior to the current site conditions and is not disturbed by routine maintenance on an annual basis. The final mitigation requirements will be determined at a project-level analysis. Since the requirement for mitigation measures cannot be determined at this point, FCS respectfully requests to keep all three mitigation scenarios (onsite creation, offsite creation, and offsite purchase of mitigation credits) as options until a project-specific analysis can be completed.

The primary and initial purposes for having the basins are for drainage and water quality. As long as those functions are not compromised and FCS is not restricted in maintaining the basins for those purposes, FCS would like to generate as much riparian habitat as possible. Although the preferred method of mitigation is offsite purchase of mitigation credits through an approved mitigation bank, FCS would like to have other options in case that option is no longer feasible.

Project-specific mitigation measures have not been created nor approved because a program level document cannot provide that level of specificity. Long-term conservation mechanisms available today may not be available or necessary when the proposed project is developed. The preferred means of mitigation is to purchase offsite mitigation credits at an approved mitigation bank. That way, all long-term conservation mechanisms are built into the mitigation purchase. In the event that onsite or offsite habitat creation is required as mitigation, then a non-wasting endowment will be established to provide monitoring and maintenance activities in perpetuity. These conservation areas will require a conservation easement and will be deeded to a third-party management agency or similar conservation district to manage the land. The detailed project-specific information requested will only be available along with a project-level document.

The proposed mitigation measures address program-level issues. Many things can change over time, including the most effective ways of controlling erosion. More description of each mitigation measure will be provided at a project-level. For example, if the program-level DBESP's MM-DBESP 4 describes the erosion control measures to be installed as straw wattles, but the final project-level HMMP requires silt-fence and hay bales, will that constitute a significant change? As described above, MM-DBESP 5 will include project-specific details regarding the species to be planted, but only within a project-level document.

To ensure the preservation or improvement of the biological and hydrological functions and values of riparian/riverine habitat onsite, the following mitigation measures will occur:

- MM-DBESP 1 - Onsite creation of riparian habitat at a minimum of 1:1 ratio (due to poor quality habitat onsite), will be established within artificially created detention/infiltration basins to reduce storm flows, improve water quality and reduce sediment transportation. These detention basins will be large enough to provide long-term conservation to riparian habitat without the routine maintenance associated with smaller basins. Vegetation removal will only occur at the area surrounding the in-take and out-fall structures of the basins, leaving the majority of the basin undisturbed.
- MM-DBESP 2 - Habitat creation activities will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher-quality riparian habitat but still maintain the basins for detention without impacts to the detention function of the basins.
- MM-DBESP 3 - Onsite soils and substrate that will be temporarily removed as a result of removing the drainage features will be retained for post-project re-establishment, so that native seed banks and soil compositions are conserved for optimal regrowth within the basins.
- MM-DBESP 4 - Erosion control measures will be installed within Drainage 9 to reduce the amount of sediment transport.
- MM-DBESP 5 - Additional riparian habitat will be enhanced within Drainage 9 following the installation of the erosion control measures.

4.4.2 - Measures to Reduce/Minimize Indirect Impacts

According to the MSHCP, the Urban/Wildlands Interface Guidelines are intended to address indirect effects associated with locating development in proximity to the MSHCP Conservation Area (MSHCP, page 6-42). Portions of the WLCSP are located within three Criteria Cells (1204, 1297, and 1364). There is a small portion of Core Area H within the southwestern portion of the WLCSP. The southeastern portion of the WLCSP contains a small portion of and is immediately adjacent to Proposed Core 3. There is also an off-site improvement located north of the WLCSP that is also within Proposed Core 3 (Exhibit 4).

The Urban/Wildlife Interface Guidelines, as discussed below, will be included in the project to ensure that indirect, project-related impacts to the riparian/riverine habitat (including drainage, toxics, lighting, noise, invasive plant species, barriers, and grading/land development) are avoided or minimized.

Drainage

Detention/infiltration basins are part of the project design. During construction, the runoff leaving construction areas will be directed to these basins and away from downstream drainage features offsite. These basins will be active during the operational phase of the proposed project. The basins will be designed in accordance with all federal, state, regional, and local standards and regulations concerning water quality. The entire length of Drainage 9 will maintain existing flows through the WLCSP. These measures will assure that the project stormwater discharges are no greater in rate and velocity than current undeveloped conditions and that the water leaving the site complies with all applicable water quality standards.

Toxics

As part of the project specific water quality management plan (WQMP) source control Best Management Practices (BMPs) will be determined to minimize the potential for accidental release of hazardous materials. A project WQMP is a plan for managing the quality of stormwater or urban runoff that flows from a developed site after construction is completed and the facilities or structures are occupied and/or operational. A project WQMP describes the BMPs that will be implemented and maintained throughout the life of a project and is used by property owners, facility operators, tenants, facility employees, maintenance contractors, etc. to prevent and minimize water pollution that can be caused by stormwater or urban runoff.

All projects within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (SWPPP). The purpose of the SWPPP is to identify potential pollutant sources that may affect the quality of discharges associated with construction activity, to identify non-storm water discharges, and to design the use and placement of BMPs to effectively prohibit the entry of pollutants from the construction site into the storm drain system during construction. The WLCSP is required to stage construction operations as far away from the riparian/riverine habitat to the maximum extent feasible. Erosion and sediment source control BMPs shall be considered for both active and inactive (previously disturbed) construction areas. BMPs for wind erosion and dust control are also included as part of the SWPPP.

Invasive Plant Species

Invasive species identified in Table 6.2 of the MSHCP shall not be included in any landscape palette for land within 250 feet of CDFW-owned lands (see Table 1). All landscape plans shall be reviewed by the City for compliance with this requirement. Additionally, final landscaping and restoration plans will be consistent with the approved Conceptual Fuel Modification Plan for the project, if applicable.

Based on the discussion on page 111, as described in Section 6.1.6 of the MSHCP consistency analysis document, under invasive species, the project shall incorporate special edge treatments designed to separate development areas from open space areas. Landscape buffers shall be incorporated into the project design to prevent the intrusion of invasive plant species into natural areas. None of the plant species listed in Section 6.1.4 of the MSHCP shall be used for landscaping for any proposed project element. All landscape plans shall be reviewed by a qualified biologist to ensure invasive weedy species and other harmful non-native plant species are avoided in the landscape plan.

Table 1: Invasive Plant Species

Botanical Name	Common Name
Acacia spp. (all species)	acacia
Achillea millefolium var. *millefolium*	common yarrow
Ailanthus altissima	tree of heaven
Aptenia cordifolia	red apple
Arctotheca calendula	cape weed
Arctotis spp. (all species & hybrids)	African daisy
Arundo donax	giant reed or arundo grass
Asphodelus fistulosus	asphodel
Atriplex glauca	white saltbush
Atriplex semibaccata	Australian saltbush
Carex spp. (all species*)	sedge
Carpobrotus chilensis	ice plant
Carpobrotus edulis	sea fig
Centranthus ruber	red valerian
Chrysanthemum coronarium	annual chrysanthemum
Cistus ladanifer (incl. hybrids/varieties)	gum rockrose
Cortaderia jubata (syn. C. Atacamensis)	jubata grass, pampas grass
Cortaderia dioica (syn. C. sellowana)	pampas grass
Cotoneaster spp. (all species)	cotoneaster
Cynodon dactylon (incl. hybrids varieties)	Bermuda grass
Cyperus spp. (all species*)	nutsedge, umbrella plant
Cytisus spp. (all species)	broom
Delosperma 'Alba'	white trailing ice plant

Dimorphotheca spp. (all species)	African daisy, Cape marigold
Drosanthemum floribundum rosea	rosea ice plant

Table 1 (cont.): Invasive Plant Species

Botanical Name	Common Name
Drosanthemum hispidum	purple ice plant
Eichhornia crassipes	water hyacinth
Elaegnus angustifolia	Russian olive
Eucalyptus spp. (all species)	eucalyptus or gum tree
Eupatorium coelestinum (syn. *Ageratina* sp.)	mist flower
Festuca arundinacea	tall fescue
Festuca rubra creeping	creeping red fescue
Foeniculum vulgare	sweet fennel
Fraxinus uhdei (and cultivars)	evergreen ash, shamel ash
Gaura(spp. (all species)	gaura
Gazania spp. (all species & hybrids)	gazania
Genista spp. (all species)	broom
Hedera canariensis	Algerian ivy
Hedera helix	English ivy
Hypericum spp. (all species)	St. John's wort
Ipomoea acuminata	Mexican morning glory
Lampranthus spectabilis	trailing ice plant
Lantana camara	common garden lantana
Lantana montevidensis (syn. *L. sellowiana*	lantana
Limonium perezii	sea lavender
Linaria bipartita	toadflax
Lolium multiflorum	Italian ryegrass
Lolium perenne	perennial ryegrass
Lonicera japonica (incl. ‘Halliana’)	Japanese honeysuckle
Lotus corniculatus	birdsfoot trefoil
Lupinus arboreus	yellow bush lupine
Lupinus texanus	Texas blue bonnets

Table 1 (cont.): Invasive Plant Species

Botanical Name	Common Name
Malephora crocea	ice plant
Malephora luteola	ice plant
Mesembryanthemum nodiflorum	little ice plant
Myoporum laetum	myoporum
Myoporum pacificum	shiny myoporum
Myoporum parvifolium (incl. *'Prostratum'*)	ground cover myoporum
Oenothera berlandieri	Mexican evening primrose
Olea europaea	European olive tree
Opuntia ficus-indica	Indian fig
Osteospermum spp. (all species)	trailing African daisy, African daisy
Oxalis pes-caprae	Bermuda buttercup
Parkinsonia aculeata	Mexican palo verde
Pennisetum clandestinum	Kikuyu grass
Pennisetum setaceum	fountain grass
Phoenix canariensis	Canary Island date palm
Phoenix dactylifera	date palm
Plumbago auriculata	cape plumbago
Polygonum spp. (all species)	knotweed
Populus nigra 'italica'	Lombardy poplar
Prosopis spp. (all species*)	mesquite
Ricinus communis	castorbean
Robinia pseudoacacia	black locust
Rubus procerus	Himalayan blackberry
Sapium sebiferum	Chinese tallow tree
Saponaria officinalis	bouncing bet, soapwort
Schinus molle Peruvian	Peruvian pepper tree, California pepper
Schinus terebinthifolius	Brazilian pepper tree
Spartium junceum	Spanish broom
Tamarix spp. (all species)	tamarisk, salt cedar
Trifolium tragiferum	strawberry clover

Table 1 (cont.): Invasive Plant Species

Botanical Name	Common Name
Tropaelolum majus	garden nasturtium
Ulex europaeus	prickly broom
Vinca major	periwinkle
Yucca gloriosa	Spanish dagger
Note: An asterisk (*) indicates some native species of the genera exist that may be appropriate.	

Barriers

Pedestrian and vehicular access to areas of riparian/riverine habitat will be prohibited except for controlled maintenance access. Plot plans for development adjacent to such areas shall include details of the means to achieve this restriction. All required barriers shall be in place and functional prior to occupancy of affected buildings. Barrier treatments shall be compatible throughout the WLC project.

Each individual project shall incorporate special edge treatments designed to separate development areas from open space areas. These areas will serve to minimize unauthorized access, domestic animal predation, and illegal trespass and dumping. Specific details regarding barriers to prevent pedestrian and vehicle access to riparian areas are not necessary for a program-level document. Specific project features to achieve these purposes will be designed on a project-by-project basis during the project-level analysis. Barriers, such as retaining walls, planters, sound walls, and assorted fencing materials may be used to prevent pedestrian and vehicle access.

Grading/Land Development

As described on the grading plan, no grading shall be permitted within conserved riparian/riverine habitat areas except for grading necessary to establish or enhance said habitat areas. All such riparian/riverine areas shall be clearly delineated on all grading plans to ensure this restriction is enforced.

The WLCSP, on a project-by-project basis, shall incorporate special edge treatments designed to separate development areas from open space areas. Landscape buffers shall be incorporated into the project design to prevent the intrusion of non-native plant species into natural areas. None of the plant species listed in Section 6.1.4 of the MSHCP shall be used for landscaping for any proposed project element. All landscape plans shall be reviewed by a qualified biologist to ensure invasive weedy species and other harmful non-native plant species are avoided in the landscape plan. Therefore, there should no justification for a discussion on invasive plant species above what is already included in Section 6.1.6 MSHCP consistency analysis document. A habitat mitigation and monitoring plan and/or a habitat restoration plan may be required on a project-by-project basis in consultation with RCA and CDFW.

To reduce potentially significant indirect impacts to the biological and hydrological functions and values of riparian/riverine habitat onsite, the following mitigation measures will occur:

- MM-DBESP 6 - During construction, the runoff leaving construction areas will be directed to on-site detention basins and away from downstream drainage features located offsite.
- MM-DBESP 7 - All projects within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (SWPPP).
- MM-DBESP 8 - Invasive species identified in Table 6.2 of the MSHCP shall not be included in any landscape palette for land within 250 feet of CDFW-owned lands.
- MM-DBESP 9 - Pedestrian and vehicular access to areas of riparian/riverine habitat will be prohibited except for controlled maintenance access.
- MM-DBESP 10 - No grading shall be permitted within conserved riparian/riverine habitat areas except for grading necessary to establish or enhance said habitat areas.

4.4.3 - Fuels Management Guidelines

Fuels management focuses on hazard reduction for humans and their property (MSHCP, page 6-72).

According to the Fuels Management Guidelines, for new development that is planned adjacent to sensitive habitat, including riparian/riverine habitat or other undeveloped areas, brush management shall be incorporated in the development boundaries and shall not encroach into the habitat (MSHCP, page 6-72). The project shall be consistent with the Conceptual Fuel Modification Plan prepared for each individual project, pursuant to the City of Moreno Valley's Municipal Code and Fire Department, and National Fire Protection Association's Standard.

4.5 - Demonstration of Increase in Post-Project Riparian/Riverine Functions and Values

The post-project conditions of the onsite riparian/riverine habitats will be functionally superior to the pre-project conditions with the implementation of the conservation and avoidance strategies in the current WLCSP design, and the proposed mitigation options. Specifically, superior preservation will include the following:

- The enhancement of Drainage 9 with energy dissipation devices and restoration of mule fat scrub will improve riparian habitat quality while reducing soil erosion and thereby increasing the biological function for covered species.
- The detention basins with spreading structures will facilitate the creation and maintenance of riparian scrub vegetation within the WLCSP and stabilize the hydrologic regime by reducing erosion and scour potential, as well as assisting with energy dissipation during seasonal flooding. Slowing of surface flow rates will provide decreased sedimentation, reduction of erosion, and increased water quality.

- Increased habitat quality resulting from the proposed projects' improvements will collectively contribute to habitat function of the entire watershed. .

Typically, mitigation areas are required to meet a percentage of the visually estimated percent cover of the vegetation within the previous active channel prior to drainage relocation or removal. Prior to construction activities associated with the channel removal or enhancement, the percent of vegetation cover along the slopes and bottom of the channel should be visually estimated at the portion of the channel with the greatest percentage of vegetative cover occurs. The vegetative cover of the previously existing side slopes, on average, was estimated to be 30 percent with a 5-percent cover of the drainage bottoms. Therefore, the success criteria are a percentage of the estimated 30 percent side slopes and 5 percent drainage bottom.

4.5.1 - Performance Criteria for Mitigation Sites

Success Criteria

The success criteria for the total percent cover of all native plant species are detailed in Table 2.

Table 2: Target Total Native Coverage Guidelines

Year	Acceptable Range as a Percentage of Existing Conditions
1	25 to 30%
2	35 to 50%
3	40 to 60%
4	60 to 70%
5	Minimum 70% (plus 15% Bare Ground)

4.5.2 - Minimum Success Standards

In addition, the following minimum success standards must be achieved or exceeded for the revegetation effort to be considered successful:

1. **Total Coverage:** Vegetative cover is present over at least 70 percent of the total ground surface area within the treated area.
2. **Native Vegetation Coverage:** Native species must provide at least 75 percent total coverage within the treated area. This standard implies that no more than 10 percent of all vegetative cover may consist of ruderal non-native species. However, of the ruderal species "permitted" on the site, only species of very common, "naturalized," non-native grasses and herbs (e.g., Bromus, Avena, Conyza, Brassica spp.) may be allowed, particularly if their removal would be likely to promote erosion or incur significant collateral damage to healthy native species.
3. **Exotic Vegetation Coverage:** Particularly noxious invasive exotic species (tree tobacco, artichoke thistle, castor bean, tamarisk, etc.) must not contribute more than 1 percent of all vegetative cover.

4. **Species Diversity:** The composition of vegetation in the treated area must exhibit species diversity that is indicative of a transitional community with elements common to mule fat scrub and Riversidean sage scrub communities. Diversity may be measured in terms of the numbers of dominant (comprising >5 to 10 percent relative cover), and sub-dominant (at least 1 to 5 percent relative cover) native shrubs, succulents, and herbs identified by both visual estimates and linear transect data collections. Both mule fat scrub and Riversidean sage scrub must exhibit a minimum of 10 percent relative cover within at least 0.5 acre of the restoration area.
5. **Irrigation Limitation:** Supplemental irrigation shall be discontinued or reduced in the restoration area after a minimum of 2 years.

4.6 - Determination of Biologically Superior Preservation

Implementation of the proposed project and execution of the proposed design features will result in an increase in habitat quality and long-term sustainability of the existing riparian/riverine habitat on the project site. Onsite restoration of riparian habitat will improve the existing moderate quality riparian habitat, providing more dense stands riparian vegetation throughout Drainage 9, and increase the overall function and long-term value of riparian habitat within the proposed detention basins at a key juncture with Criteria Cells and the San Jacinto Wildlife Area.

Project-specific mitigation measures cannot be determined at this point; therefore, the three mitigation scenarios (onsite creation, offsite creation, and offsite purchase of mitigation credits) should be retained as options until each project-specific analysis is completed. Because of the low-to-moderate quality riparian/riverine habitat within the WLCSP, any combination of onsite creation, offsite creation or offsite purchase of mitigation credits would result in an overall increase in function and value of riverine/riparian habitat on a local and regional scale.

SECTION 5: CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present data and information required for this DBESP Analysis, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

APPENDIX C

Hydrology/Water Quality Technical Memorandum

TECHNICAL MEMORANDUM

TO:	Highland Fairview
PREPARED BY:	Woodard & Curran
DATE:	May 4, 2018
RE:	World Logistics Center Environmental Impact Report: Updated Cumulative Impacts Analysis for Hydrology and Water Quality

---

The purpose of this memo is to present the updated cumulative impacts analysis for hydrology and water quality for the *World Logistics Center Project Final Programmatic Environmental Impact Report* (WLC EIR, LSA, 2015). The proposed Project as evaluated by the WLC EIR is the World Logistics Center Specific Plan, a master plan covering 2,610 acres and proposing a maximum of 40.4 million square feet of "high-cube logistics" warehouse distribution uses (approximately 99.5 percent of the total building area) classified as "Logistics Development" and 200,000 square feet (approximately 0.5%) of warehousing-related uses classified as "Light Logistics".

1. INTRODUCTION

As part of the hydrology and water quality technical studies for the WLC EIR the *Master Plan of Drainage Report* (CH2M HILL, 2014) and the *Project Specific Water Quality Management Plan* (CH2M HILL, 2014) were prepared. These reports discuss the hydrology and water quality aspects of the WLC Project and the mitigation measures to be implemented as part of the WLC Project.

The WLC EIR discussed the cumulative impacts of the WLC Project and concluded that the proposed WLC Project, including implementation of its *Master Plan of Drainage* and *Project Specific Water Quality Management Plan*, will not make a significant contribution to any cumulatively considerable impacts related to drainage or water quality on a local or regional basis. The cumulative impacts analysis was based on the "summary-of-projections" method. This technical memorandum presents an updated analysis of the cumulative impacts based on a hybrid approach of the "summary-of-projections" and the "list" method. Both the General Plan build-out and the past, present, and probable future projects were included in this analysis.

2. CUMULATIVE PROJECTS AREA AND PROJECTS LIST

2.1 Cumulative Projects Area

To evaluate the hydrology and water quality cumulative impacts of the WLC Project, the cumulative projects area was determined based upon a review of the tributary drainage area, flow direction of stormwater runoff from the WLC Project and a review of the downstream drainage areas and facilities.

As outlined in the WLC EIR, stormwater runoff from the WLC Project flows in a southerly direction to the San Jacinto River. As shown in Figure 1, a topographic divide located west of Theodore Street separates stormwater flows from the WLC Project to the San Jacinto River by two routes. Runoff west of the divide flows to the Perris Valley Storm Drain (PVSD) at a gradient also ranging from 1 to 2 percent. Runoff east of the divide flows through the San Jacinto Valley at a gradient also ranging from 1 to 2 percent to the San Jacinto Wildlife Area (SJWA).

The area tributary to the PVSD consists of two subareas, Sunnymead and Moreno, as delineated by the Riverside County Flood Control & Water Conservation District (RCFC&WCD). The PVSD watershed begins in the Badlands to the north and extends to Mariposa Avenue to the south, Ellsworth Street to the west, and the topographic divide within the WLC Project to the east. The area tributary to the SJWA incudes the Middle and Upper San Jacinto River watershed area and extends from the Badlands to the north, the Bernasconi Hills and Lakeview Mountains to the south, the headwaters of the San Jacinto River to the east, and the topographic divide just west of Theodore Street. Both the PVSD and the SJWA watershed areas flow to the lower San Jacinto River south of the project site. Flows are then conveyed through the lower San Jacinto River to Canyon Lake, again to the lower San Jacinto River, and ultimately to Lake Elsinore.

2.2 Cumulative Projects List

For the PVSD area, SJWA, and other portions of the San Jacinto River watershed areas, the past, present, and probable future projects were identified and included in the cumulative impacts analysis. These projects are listed in Table 1 and shown on Figure 1. For the area tributary to the PVSD there are a total of 106 projects. These projects consist of a variety of project types and sizes including various commercial areas such as a gas station, a commercial auto mall, a Walmart, and several apartments and single-family developments. For the area tributary to the SJWA, there are 14 planned projects, including four projects adjacent to, within, or near the SJWA. These four projects are the Badlands Landfill Improvement Project, the Quail ranch Specific Plan, the SJWA Land Management Plan and the Villages of Lakeview Project. For the other portions of the San Jacinto Watershed south of the PVSD area and SJWA there are 120 projects consisting of a variety of commercial, business and residential projects.

Each of the projects are required to mitigate their impacts for hydrology and water quality and implement BMPs pursuant to the local agency's regulations such as the Moreno Valley Municipal Code Chapter 8.10 et seq. and § 8.21.170. Per the local regulations, each project is required to prepare a Water Quality Management Plan and comply with the Santa Ana Regional Quality Control Board Order No. R8-2010-0033, NPDES Permit No. CAS618033 (NPDES Permit). The environmental documents, where available, were reviewed for each project to determine the type of drainage and water quality facilities to be constructed incompliance with the NPDES Permit. Every project constructed drainage and water quality facilities to mitigate their impacts. Each project analyzed cumulative impacts and concluded that the impacts are less than significant since all projects in the watershed are required to comply with the local agency's drainage requirements and NPDES Permit and mitigate their individual impacts.

The drainage facilities consisted of construction of storm drains and detention basins to mitigate increased peak flows, velocities and volumes. The types of water quality facilities constructed include extended detention/sedimentation basins, infiltration basins, water quality basins sand filters, vegetated swales, and bioretention areas. For example, the ProLogis project includes on-site extended detention/sedimentation basins, sand filters, and vegetated swales which will treat all of the site's runoff. The Moreno Valley Logistics Center includes on-site, structural source control best management practices (BMPs) consisting of six water quality/detention basins as well as operational source controls prior to water being discharged from the site. The First Nandia Logistics Center includes three detention and water quality basins. The Modular Logistics Center constructed two water quality detention basins. The Villages of Lakeview Project includes construction of two regional water quality basins prior to flows being discharged to the San Jacinto River. The SJWA Land Management Plan includes construction of source control and low impact development (LID) BMPs including bioretention facilities, infiltration trenches, filter strips, or vegetated buffers to detain and treat runoff before letting it seep away slowly. The Quail Ranch Project does not have an environmental document completed yet. However, the Quail Ranch Project will be required to comply with the local regulations and NPDES permit, as well.

3. CUMULATIVE IMPACTS ANALYSIS

3.1 Hydrology

To analyze the cumulative impacts for hydrology, an appropriate study area was determined based on the watershed area and potential impacts to downstream drainage facilities. As discussed in section 2.1, the WLC Project is located in the San Jacinto River watershed and is tributary to two separate sub-watershed areas, the PVSD Watershed and the SJWA watershed, prior to flows reaching the San Jacinto River. For the area to the west, the PVSD is the most downstream drainage facility that the WLC Project is tributary to before flows reach the San Jacinto River. It is necessary to consider the downstream drainage areas and their facilities when evaluating cumulative impacts for hydrology. The PVSD is a major drainage facility draining a large area including the City of Moreno Valley and any flow impacts to the facility would be important to analyze the effects. For this reason, on the west side, the area tributary to the PVSD was selected as the appropriate geographic area for the cumulative impacts analysis. On the east side, flows drain to the SJWA before reaching the San Jacinto River. The SJWA is an important habitat and water feature within the watershed and it is necessary to analyze any potential flow impacts to the area. For this reason, for flows draining to the east, the area tributary to the SJWA was chosen as the cumulative study area. This includes the upstream portion of the San Jacinto Watershed as the SJWA extends to the south side of the San Jacinto River.

3.1.1 PVSD Watershed Area

The PVSD watershed area is divided into two sub-watersheds, Sunnymead and Moreno, tributary to the PVSD as shown in Figure 1. The RCFC&WCD has adopted Master Drainage Plans (MDPs) for each of the sub-watershed areas, *Sunnymead MDP* (RCFC&WCD, 1991) and *Moreno MDP* (RCFC&WCD, 2015) that serve as guides for development in these areas. The *Moreno MDP* was recently updated to include the hydrology of the WLC development. Each project is required to conform to the MDPs by mitigating any increase in project flows such that any flows leaving the project boundary are equal to or less than existing conditions. In addition, all projects are required to contribute through the MDP Fee Program for the construction of facilities identified in the MDPs.

Portions of the WLC Project are tributary to Line "F" of the *Moreno MDP*. As identified in the WLC EIR, Line "F" from Redlands Blvd to south of Eucalyptus Avenue will be constructed as part of the WLC Project. Because it is not known when the proposed *Moreno MDP* Sinclair Basin north of SR-60 will be constructed, Line "F" was sized without the Sinclair Basin and all flows pass under SR-60. In addition, a detention/infiltration basin will be constructed to detain and infiltrate onsite flows as required by Mitigation Measures 4.9.6.1A and 4.9.6.1B such that flows leaving the project boundary will be less than existing in terms of peak flow, velocities, and volume for each of the 2, 5, 10, 25, and 100-year storms. As such, there is no impact on downstream drainage facilities as a result of the development of the WLC Project and the WLC Project does not contribute to any cumulative impacts. In addition, construction of Line "F" by the WLC Project will exceed its obligation of MDP fees.

An analysis of the volume of runoff and infiltration for the pre and post project conditions was performed which included hydrologic modeling. Pre-project conditions consist of agricultural uses, Post-project conditions consist of the development of the WLC Project. Post-project detention basins will be constructed not only for storm peak attenuation but also for infiltration. The analysis showed that the WLC Project's impacts will be fully mitigated with the implementation of the detention/infiltration basins. The volume of runoff after the WLC Project is constructed will be less than the existing volume of runoff and the amount of infiltration and groundwater recharge will increase by a small amount which provides a net benefit to groundwater recharge.

The WLC Project's proposed drainage improvements will be designed to have sufficient capacity to accommodate and convey storm water runoff flows generated by the WLC Project as well as expected future storm water runoff flows associated with buildout of the *Moreno MDP* area. All development projects in the *Moreno MDP* and *Sunnymead MDP* areas are required to mitigate flows to equal to or less than existing and/or demonstrate that storm drain capacity is available to service their anticipated flows and that their project is consistent with the MDPs.

Section 15130 (a) (3) of the CEQA Guidelines states *"A project's contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact."* The WLC Project's compliance with the Moreno MDP meets this requirement. In addition, there is zero hydrologic impact on downstream drainage facilities due to the WLC Project and the project does not contribute to any cumulative impacts. As such, cumulative impacts would be less than significant and the proposed WLC Project's contribution of flows would thus be less than cumulatively considerable.

3.1.2 SJWA Watershed Area

As stated in Section 2.1, the WLC Project east of the topographic divide drains to the north side of the SJWA. In addition to the WLC Project, one current project is tributary to the north side of the SJWA, the Badlands Landfill Improvements Project located north of the WLC Project. Runoff from the Badlands Landfill flows through the WLC Project site. The hydrologic study for the WLC Project includes these flows from the Badlands Landfill. The pervious cover at the Badlands Landfill, which affects the amount of runoff from an area, is not changing. As such, flows from the Landfill Improvements Project would not increase above existing and would be consistent with the existing flows north of the WLC Project.

As required by Mitigation Measures 4.9.6.1A and 4.9.6.1B flows leaving the WLC Project boundary will be equal to or less than existing in terms of peak flow, velocities, and volume for each of the 2, 5, 10, 25, and 100-year storms. In addition, water leaving the site which flows into the SJWA will flow through detention/infiltration basins to further mitigate the peak flow, velocities, and volumes. An analysis of the volume of runoff and infiltration for the pre- and post-project conditions was performed as discussed in Section 3.1.1. The post-project detention basins will be constructed not only for storm peak attenuation but also for infiltration. The analysis showed that the project's impacts will be mitigated with the implementation of the detention/infiltration basins. The volume of runoff after the WLC Project is constructed will be less than the existing volume of runoff and the amount of infiltration and groundwater recharge will increase by a small amount which provides a net benefit to groundwater recharge.

The outlets from these detention/infiltration basins will be designed to mimic the existing sheet flow condition. Because flows leaving the WLC Project site will mimic existing conditions in terms of peak flows, velocities and volumes, there is no impact to the downstream hydrology of the SJWA with mitigation from the WLC Project. As such, there is zero impact on the downstream drainage area and facilities in the SJWA due to the WLC Project and, thus, the project does not contribute to any cumulative impacts. Thus, the proposed WLC Project's contribution of flows would be less than cumulatively considerable.

There are three potential future projects located within, near, or adjacent to the SJWA. South of the WLC Project, the proposed Quail Ranch Project and the Villages of Lakeview Project are adjacent to or near portions of the SJWA. The Quail Ranch project is located north of Gilman Springs Road and the Villages of Lakeview project is on the south side of the San Jacinto River. Flows from Quail Ranch drain south of Gilman Springs Road into the east side of the SJWA and flows from the Villages of Lakeview drain to the San Jacinto River adjacent to the south side of the SJWA. The third project is a project within the SJWA itself, the San Jacinto Wildlife Area Land Management Plan. Each of these projects will be required to mitigate its flows to less than significant and show that, like the WLC Project, their impacts are less than cumulatively considerable. The Villages of Lakeview Project includes construction of drainage facilities and water quality basins prior to flows being discharged to the San Jacinto River. The SJWA Land Management Plan includes construction of low impact development to detain and treat runoff before letting it seep away slowly. The Quail Ranch Project does not have an environmental document completed yet. However, they will be required to comply with the local regulations to mitigate their flow. Other projects within the Upper San Jacinto River watershed drain to other tributaries or directly to the San Jacinto River and do not affect the SJWA.

3.2 Water Quality

As outlined in Section 2.1 the WLC project is tributary to two sub-watersheds, the Perris Valley Storm Drain and the San Jacinto Wildlife Area. Both sub-watersheds are tributary to the downstream receiving waters of the San Jacinto River, Canyon Lake and Lake Elsinore. Both Canyon Lake and Lake Elsinore are impaired water bodies with 303(d) listings as outlined in Section 3.2.1 below. For this reason, the cumulative water quality analysis encompasses the entire San Jacinto watershed tributary to Lake Elsinore. In addition, the water quality of runoff from the WLC Project into the SJWA will be analyzed from a cumulative perspective following the analysis of the entire San Jacinto Watershed.

3.2.1 San Jacinto Watershed

During the operational phase of the WLC Project, the major source of pollution in stormwater runoff will be contaminants that accumulate on the land surface over which runoff passes. Storm runoff from roadways, parking lots, and commercial and industrial buildings carry a variety of pollutants such as sediment, petroleum products, commonly utilized construction materials, landscaping chemicals, and (to a lesser extent) trace metals such as zinc, copper, lead, cadmium, and iron, which can lead to the degradation of storm water quality in downstream channels. Runoff from landscaped areas may contain elevated levels of phosphorus, nitrogen, and suspended solids. Oil and other hydrocarbons from vehicles are also expected in stormwater runoff. These pollutants are commonly categorized into eight categories, sediments, nutrients, metals, toxic organic compounds, trash and debris, pathogens, oil and grease and pesticides.

The *Project Specific Water Quality Management Plan* prepared for the WLC Project identifies the proposed LID BMPs to be implemented to mitigate the water quality impacts of these pollutants. As outlined in the WLC EIR, the project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of LID BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by Mitigation Measure 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area.

Table 2 identifies the downstream receiving waters and states if the receiving water is listed as impaired on the 303(d) List or has a total maximum daily load (TMDL) adopted for a certain type of pollutant.

Table 2: Pollutant Stressors in Receiving Waters

Receiving Waters	303(d) Listing	Adopted TMDL Pollutants
San Jacinto River	None	None
Canyon Lake	Nutrients (Phosphorus & Nitrogen), Pathogens	Phosphorus, Nitrogen
Lake Elsinore	Nutrients, Organic Enrichment/Low Dissolved Oxygen, PCBs, Sediment Toxicity, Unknown Toxicity	Phosphorus, Nitrogen, Dissolved Oxygen

The project will comply with the Nutrient TMDL for Lake Elsinore and Canyon Lake by implementing LID-based BMPs in accordance with the *Comprehensive Nutrient Reduction Plan (CNRP) for Lake Elsinore and Canyon Lake* (prepared for Riverside County Flood Control and Water Conservation District by CDM Smith, January 28, 2013 in compliance with Order No. R8-2010-0033, NPDES Permit No. CAS618033).

The *CNRP for Lake Elsinore and Canyon Lake* modeled the water quality of the entire San Jacinto River watershed tributary to Lake Elsinore and Canyon Lake for nitrogen and phosphorus. The modeling accounted for the implementation of past, present, and future LID BMPs across the entire San Jacinto River Watershed, including those projects identified in Table 1, and accounted for the incremental effects of constructing these LID BMPs. LID BMPS are required by all new and redevelopment projects, including those listed in Table 1. The *CNRP* states that:

> "Post construction LID based BMPs required for new development and significant redevelopment projects are the only structural watershed based BMPs currently included in the CNRP. The newly developed WQMP requirements ensure that a portion of the wet weather runoff will be contained onsite for all future development projects subject to WQMP requirements. Implementation of WQMP requirements over time coupled with the in-lake remediation projects are expected to provide sufficient mitigation of nutrients."

The cumulative water quality effects of the WLC Project and those projects listed in Table 1 are mitigated with the construction of LID BMPs required of all projects in compliance with the *Water Quality Management Plan for the Santa Ana Region of Riverside County*. The Water Quality Management Plan states that:

> "LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted TMDLs in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives."

The WLC Project's proposed LID BMPs and the additional detention/infiltration basins will mitigate the water quality impacts of the WLC Project to less than significant. And, as stated above, all new and redevelopment projects in the San Jacinto Watershed are required to implement LID BMPs consistent with the *Water Quality Management Plan for the Santa Ana Region of Riverside County*. As stated above, LID BMPs treat discharges such that they do not cause or contribute to an exceedance of Receiving Water Quality Objectives. As such, with implementation of the LID BMPs, cumulative impacts from the WLC Project and the past, present, and probable future projects identified in Table 1, and the entire San Jacinto Watershed as modeled in the CNRP would be less than significant and the WLC Project's water quality impacts would be less than cumulatively considerable.

3.2.2 San Jacinto Wildlife Area

Although there are no 303(d) listed pollutants of concern identified as affecting the SJWA, the SJWA is a sensitive habitat area and is part of the Western Riverside County Regional Conservation Authority's Multiple Species Habitat Conservation Plan (MSHCP), (County of Riverside, 2003) and any pollutants; including sediment, nutrients, metals, toxic organic compounds, trash, pathogens, oil and grease, and pesticides could affect the wildlife and water features in the area. *Section 6.1.4*, *Guidelines pertaining to the Urban/Wildlands Interface* of the MSHCP, states:

> "Proposed Developments in proximity to the MSHCP Conservation Area shall incorporate measures, including measures required through the National Pollutant Discharge Elimination System (NPDES) requirements, to ensure that the quantity and quality of runoff discharged to the MSHCP Conservation Area is not altered in an adverse way when compared with existing conditions. In particular, measures shall be put in place to avoid discharge of untreated surface runoff from developed and paved areas into the MSHCP Conservation Area. Stormwater systems shall be designed to prevent the release of toxins, chemicals, petroleum products, exotic plant materials or other elements that might degrade or harm biological resources or ecosystem processes within the MSHCP Conservation Area. This can be accomplished using a variety of methods including natural detention basins, grass swales or mechanical trapping devices. Regular maintenance shall occur to ensure effective operations of runoff control systems."

Construction of the BMPs s outlined in Section 3.2.1 above comply with the MSHCP and these *Guidelines* as runoff from the WLC Project site is first treated with LID BMPs and then further treated by routing the runoff through detention/infiltration basins. By routing flows through the detention and infiltration basins, the runoff is receiving additional treatment for each of those potential pollutants beyond that required by the *Water Quality Management Plan for the Santa Ana Region of Riverside County* and the MSHCP and will reduce the impact on water quality to the SJWA to zero impact as the flows from typical storms will be infiltrated or detained on-site. In addition, MM4.9.6.3C states:

> "Prior to issuance of future discretionary permits for any development along the southern boundary of the World Logistics Center Specific Plan (WLCSP), the project developer of such sites, in cooperation with the Property Owners Association (POA), shall establish and annually fund a Water Quality Mitigation Monitoring Plan (WQMMP) to confirm that project runoff will not have deleterious effects on the adjacent San Jacinto Wildlife Area (SJWA). This program shall include at least quarterly sampling along the southern boundary of the site (i.e., at the identified outlet structures of the project detention basins) during wet season flows and/or when water is present, as well as sampling of any dry-season flows that are observed entering the San Jacinto Wildlife Area property from the project property, including Drainage 9, which is planned to convey only clean off-site flows from north of the World Logistics Center Specific Plan site across Gilman Springs Road. The program shall also include at least twice-yearly sampling after completion of construction, and a pre-construction survey must be completed to determine general water quality baseline conditions prior to and during development of the southern portion of the World Logistics Center Specific Plan. This sampling shall be consistent with and/or comply with the requirements of applicable Storm Water Pollution Prevention Plans (SWPPPs) for the development site.
>
> The project developer of sites along the southern border of the World Logistics Center Specific Plan shall be responsible for preventing or eliminating any toxic pollutant (not including sediment) found to exceed applicable established public health standards. In addition, the discharge from the project shall not cause or contribute to an exceedance of Receiving Water Quality Objectives for the potential pollutants associated with the project as identified in Table 4.9.J. Once development is complete, the developer shall retain qualified personnel to conduct regular (i.e., at least quarterly) water sampling/testing of any basins and their outfalls to ensure the San Jacinto Wildlife Area will not be affected by water pollution from the project site. This measure shall be implemented to the satisfaction of the City Land Development Division Manager based on consultation with the project developer, Eastern Municipal Water District, the Regional Water Quality Control Board-Santa Ana Region, and the Mystic Lake Manager."

The WLC Project's proposed LID BMPs and additional detention/infiltration basins will mitigate the water quality impacts of the WLC Project to less than significant. And, as stated previously, all new projects tributary to the San Jacinto Wildlife Area, including the Badlands Sanitary Landfill Improvement Project, the Quail Ranch Specific Plan, the Villages of Lakeview Project and the San Jacinto Wildlife Area Land Management Plan are required to implement LID BMPs consistent with the *Water Quality Management Plan for the Santa Ana Region of Riverside County and the* MSHCP. LID BMPs treat discharges to ensure they do not cause or contribute to an exceedance of Receiving Water Quality Objectives. As such, with implementation of the LID BMPs and the additional detention/infiltration basins, cumulative impacts from the WLC Project and the past, present, and probable future projects identified in Table 1 tributary to the SJWA, including the Villages of Lakeview Project and the Quail Ranch Project would be less than significant and the WLC Project's water quality impacts would be less than cumulatively considerable.

EXECUTIVE SUMMARY

The purpose of this Noise and Vibration Technical Report is to assess and discuss the impacts of potential noise and vibration impacts that may occur with the implementation of the proposed World Logistics Center Specific Plan (Project). The Specific Plan proposes 40.6 million square feet of logistics warehouse uses. These uses comprise a maximum of 40.4 million square feet of "high-cube logistics" warehouse distribution uses classified as "Logistics Development" (LD) and 200,000 square feet (approximately 0.5%) of warehousing-related uses classified as "Light Logistics" (LL). In addition, the LD designation includes land for two special use areas; a fire station and a "logistics support" facility for vehicle fueling and sale of convenience goods (3,000 square feet is assumed for planning purposes for the "logistics support").

The analysis describes the existing noise environment in the Project area, estimates future noise levels at surrounding land uses resulting from construction and operation of the Project, and identifies the potential for the Project to create significant impacts. An evaluation of the Project's potential to contribute to potential cumulative noise impacts is also provided. Noise worksheets and technical data used in this analysis are provided in the Appendices. The report summarizes the potential for the Project to conflict with applicable noise regulations, standards, and thresholds. The findings of the analyses are as follows:

- Construction activities would result in sporadic, temporary noise impacts to sensitive receptors within and adjacent to the Project Site, which would exceed established thresholds with mitigation incorporated.
- Project contributions to traffic noise would exceed established thresholds with mitigation incorporated.

SECTION 1
Introduction

1.1 Project Description

The Project proposes a maximum of 40.4 million square feet of “high-cube logistics” warehouse distribution uses classified as “Logistics Development” (LD) and 200,000 square feet (approximately 0.5%) of warehousing-related uses classified as “Light Logistics” (LL). In addition, the LD designation includes land for two special use areas; a fire station and a “logistics support” facility for vehicle fueling and sale of convenience goods (3,000 square feet is assumed for planning purposes for the “logistics support”). The Project is located in “Rancho Belago,” the eastern portion of the City of Moreno Valley, in northwestern Riverside County. The Project site is immediately south of SR-60, between Redlands Boulevard and Gilman Springs Road (the easterly city limit), extending to the southerly city limit. **Figure 1,** *Regional Location,* depicts the location of the Project within the region and the City of Moreno Valley. The major roads that currently provide access to the Project site are Redlands Boulevard, World Logistics Center Parkway, Alessandro Boulevard, and Gilman Springs Road.

1.2 Background

Characteristics of Noise

To the human ear, sound is technically described in terms of its loudness (amplitude) and pitch (frequency). Pitch is generally an annoyance, while loudness can affect our ability to hear. Noise is usually defined as unwanted sound; it consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

Measurement of Noise

The standard unit of measurement of the loudness of sound is the decibel (dB). Decibels are based on a logarithmic scale. The logarithmic scale compresses the wide range in sound levels resulting in a more usable range of sound level values, similar to the Richter scale used to measure earthquakes. To humans, a sound 10 dB higher than another is considered to be twice as loud; a sound 20 dB higher than another is considered four times as loud; etc. Typical daily sounds in the environment range from 30 dB (very quiet) to 100 dB (very loud).

Since the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel (dBA) scale performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear. Community noise levels are measured in terms of the dBA. **Figure 2,** *Typical A-Weighted Noise Levels,* shows examples of various noises sources and their typical dBA noise level.

There are two categories of noise that are measured to characterize noise conditions: single event noise and community or cumulative noise. Single event measurements describe the noise levels from an individual event such as a passing airplane or a heavy-duty truck. Cumulative measurements average the total noise in a community over a specific time period, which is typically 1 or 24 hours.

The noise impact analysis is based on assessment of both single event noise and community or cumulative noise. Several rating scales have been developed for measurement of community noise. These account for: (1) the parameters of noise that have been shown to contribute to the effects of noise on humans; (2) the variety of noises found in the environment; (3) the variations in noise levels that occur as a person moves through the environment; and (4) the variations associated with the time of day. They are designed to account for the known health effects of noise on people described previously. Based on these effects, the observation has been made that the potential for a noise to affect people is dependent on the total acoustical energy content of the noise. A number of noise scales have been developed to account for this observation. Two of the predominant noise scales are the Equivalent Noise Level (Leq) and the Community Noise Equivalent Level (CNEL). Leq is the sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. Leq is the “energy” average noise level during the time period of the sample. Leq can be measured for any time period, but is typically measured for 1 hour. This 1-hour noise level can also be referred to

World Logistics Center

Figure 2

Typical A-weighted Noise Levels

as the Hourly Noise Level (HNL). It is the energy sum of all the events and background noise levels that occur during that time period.

CNEL is the predominant rating scale now in use in California for land use noise compatibility assessment. The CNEL scale represents a time weighted 24-hour average noise level based on the dBA. Time weighted refers to the inclusion of penalties for noise that occurs during certain noise-sensitive time periods. The evening time period (7 p.m. to 10 p.m.) penalizes noises by 5 dBA, while nighttime (10 p.m. to 7 a.m.) noises are penalized by 10 dBA, reflecting people's increased sensitivity to noise during these time periods. A CNEL noise level may be reported as a CNEL of 60 dBA, 60 dBA CNEL, or simply 60 CNEL.

$L_{(\%)}$ is a statistical method of describing noise which accounts for variance in noise levels throughout a given measurement period. $L_{(\%)}$ is a way of expressing the noise level exceeded for a percentage of time in a given measurement period. For example, since 5 minutes is 25 percent of 20 minutes, $L_{(25)}$ is the noise level that is equal to or exceeded for five minutes in a twenty-minute measurement period. It is $L_{(\%)}$ that is used for most Noise Ordinance standards. For example most daytime County, State, and City noise ordinances use a standard of 55 dBA for 30 minutes per hour, or an $L_{(50)}$ level of 55 dBA. In other words, the noise ordinance may state that no noise level should exceed 55 dBA for more than fifty percent of a given period.

The maximum noise level (L_{max}) is the highest exponential time averaged sound level that occurs during a stated time period. The noise levels discussed in this analysis for short-term noise impacts are specified in terms of maximum levels denoted by L_{max}, which reflects peak noise conditions and addresses the annoying aspects of intermittent noise. It is often used together with another noise scale, or noise standards in terms of percentile noise levels, in noise ordinances for enforcement purposes. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

1.3 Existing Conditions

Noise-Sensitive Receptors Locations

Certain land uses are considered more sensitive to noise than others. Examples include residential areas, educational facilities, hospitals, childcare facilities, and senior housing. The project vicinity and World Logistics Center site are characterized by a mix of developed and undeveloped properties. Developed properties in the vicinity include an industrial/warehouse building in Moreno Valley to the northwest (Skechers), several residential neighborhoods along Redlands Boulevard along the western boundary of the project site, and scattered residential uses along Gilman Springs Road to the east of the project site. An area of the City known as "Old Moreno" is situated near the southwest portion of the project site, around the intersection of Redlands and Alessandro Boulevards. The homes along Merwin Street, east of Redlands Boulevard, constitute the closest sensitive receptors to the project site (i.e., they are adjacent to the property). Additionally, there are currently six occupied residential uses located within the northwestern portion of the World Logistics Center site.

Ambient Noise Levels

Existing noise levels in the vicinity of the project are used to establish baseline noise levels in key areas. Noise measurements within the Project site and in the surrounding area were conducted. The noise measurement locations were selected to provide coverage of the Project's potential noise impact area. The noise measurement locations are shown **Figure 3**, *Noise Measurement Locations*.

Noise measurements were conducted at 14 sites in the project vicinity Long-term (24-hour) measurements were conducted at locations R1 and R3 through R5, a 13-hour measurement was conducted at location R2, and short-term (15-minute) noise measurements were conducted at locations R6 through R14. Short-term ambient noise measurements were conducted between 8:00 A.M. to 12:00 P.M. on Thursday, March 15, 2018, and long-term ambient noise measurements were conducted from Thursday, March 15 through Friday, March 16, 2018 to characterize the existing noise environment in the Project vicinity. Nighttime noise measurements (between 10:00 P.M. and 8:00 A.M.) were conducted from Tuesday, July 18 through Wednesday, July 19 to characterize the existing nighttime noise environment at locations R6 and R11 through R14. Long-term measurements (typically 24 hours a day for several days) are used to characterize the diurnal traffic noise pattern at selected locations in the project area. This data can be used to identify the worst noise hour and to develop relationships between non-worst-hour and worst-hour noise levels. Long-term noise measurement locations were selected to represent the existing 24-hour noise environment at residential uses adjacent to the western boundary of the project site and short-term measurement locations were selected to represent each major developed area within the project site and serve as representative modeling locations. This information can be used to estimate worst-hour noise levels from levels measured during non-worst hour times. A summary of the noise measurements collected is provided in **Table 1**, *Existing Ambient Noise Measurements*.

The ambient noise measurements were conducted using the Larson-Davis 820 Precision Integrated Sound Level Meter (SLM). The Larson-Davis 820 SLM is a Type 1 standard instrument as defined in the American National Standard Institute S1.4. All instruments were calibrated and operated according to the applicable manufacturer specification. The microphone was placed at a height of five feet above the local grade.

Existing Roadway Noise Levels

The primary existing noise sources in the Project area are transportation facilities. Traffic on SR-60, Redlands Boulevard, Theodore Street, World Logistics Center Parkway, Gilman Springs Road, and other local streets is the dominant source contributing to the ambient noise levels in the Project vicinity. Noise from motor vehicles is generated by engine vibrations, the interaction between the tires and the road, and the exhaust system. **Table 2**, *Existing Traffic Noise Levels*, identifies the existing (2018) traffic noise levels adjacent to roadway segments in the Project vicinity without consideration of existing noise barriers.

SECTION 2

Regulatory Framework

The applicable noise standards governing the Project site are the criteria in the City of Moreno Valley General Plan Safety Element (Environmental Safety, Noise) and Municipal Code (Noise Ordinance). The City's Safety Element of the General Plan does not contain specific noise standards or significance thresholds. However, the General Plan does cite applicable State standards including the California Administrative Code, Section 1092 of Title 25, Chapter 1, Subchapter 1, Article 4 and Section 5014 of Title 21, Subchapter 6, Article 2. In addition, other applicable standards identified in the *California Noise Insulation Standards*[1] and the *State of California Vehicular Code*[2]. The following sections list the City of Moreno Valley General Plan policies, City of Moreno Valley Municipal Code, and State standards relevant to noise for the project. Construction- and traffic-related noise could potentially impact uses in neighboring jurisdictions. Therefore, General Plan goals and policies and Noise Ordinance standards for the City of Perris, City of Riverside, and County of Riverside have also been included herein.

City of Moreno Valley General Plan Policies

Chapter 9 of the *City of Moreno Valley General Plan*[3] defines goals, objectives, policies, and action items related to noise conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

Objective 6.3 Provide noise compatible land use relationships by establishing noise standards utilized for design and siting purposes.

Policy 6.3.5 Enforce the California Administrative Code, Title 24 noise insulation standards for new multi-family housing developments, motels and hotels.

Policy 6.3.6 Building shall be limited in areas of sensitive receptors.

Objective 6.4 Review noise issues during the planning process and require noise attenuation measures to minimize acoustic impacts to existing and future surrounding land uses.

Policy 6.4.1 Site, landscape and architectural design features shall be encouraged to mitigate noise impacts for new developments, with a preference for noise barriers that avoid freeway sound barrier walls.

---

[1] California Code of Regulations, Title 24, Part 2, §3501, *California Noise Insulation Standards*.

[2] Governor's Office of Planning and Research, *State of California General Plan Guidelines*, October 2003, pages 249 and 250.

[3] *City of Moreno Valley General Plan*, City of Moreno Valley, July 2006.

Objective 6.5	Minimize noise impacts from significant noise generators such as, but not limited to, motor vehicles, trains, aircraft, commercial, industrial, construction, and other activities.
Policy 6.5.1	New commercial and industrial activities (including the placement of mechanical equipment) shall be evaluated and designed to mitigate noise impacts on adjacent uses.
Policy 6.5.2	Construction activities shall be operated in a manner that limits noise impacts on surrounding uses.

City of Moreno Valley Municipal Code

The *Moreno Valley Municipal Code*[4] establishes a Noise Ordinance that describes the noise standards within the City. Chapter 11.80.030 (Title 11) lists specific prohibited acts.

The City's Municipal Code, Section 6.04.030.J states that "to create, allow or maintain any loud or unusual noise or operate or maintain any device, instrument, vehicle, or machinery in such a manner as to create loud or unusual noise, cause vibrations, or unreasonable light spillage or glare which causes discomfort or annoyance to reasonable persons of normal sensitivity, or which endangers the comfort, repose, health or peace of the public or of any person using or occupying other property in the vicinity" is prohibited.

The City's Municipal Code, Section 9.10.140, specifies that all commercial and industrial uses shall be operated so that noise created by any loudspeaker, bells, gongs, buzzers, or other noise attenuation or attracting devices shall not exceed 55 dBA at any one time beyond the boundaries of the property.

Chapter 11.80.030 of the City's Municipal Code also states:

> *Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 and Table 1-A specify sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the sound levels are being exceeded. No sound shall be permitted within the City which exceeds the parameters set forth in Table 11.80.030-1 [Table 3] and 11.80.030-1A [Table 4] of this chapter.*
>
> *No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimpulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 [Table 5] when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.*

---

[4] *Moreno Valley Municipal Code,* City of Moreno Valley, current through Ordinance 836 and the November 2012 code supplement.

The following uses and activities shall be exempt from the sound level regulations except the maximum sound levels provided in Tables 11.80.030-1 [Table 3] and 11.80.030-1A [Table 4]:

1. *Sounds resulting from any authorized emergency vehicle when responding to an emergency call or acting in time of an emergency.*
2. *Sounds resulting from emergency work as defined in Section 11.80.020.*
3. *Any aircraft operated in conformity with, or pursuant to, federal law, federal air regulations and air traffic control instruction used pursuant to and within the duly adopted federal air regulations; and any aircraft operating under technical difficulties in any kind of distress, under emergency orders or air traffic control, or being operated pursuant to and subsequent to the declaration of an emergency under federal air regulations.*
4. *All sounds coming from the normal operations of interstate motor and rail carriers, to the extent that local regulation of sound levels of such vehicles has been preempted by the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.) or other applicable federal laws or regulations.*
5. *Sounds from the operation of motor vehicles, to the extent they are regulated by the California Vehicle Code.*
6. *Any constitutionally protected noncommercial speech or expression conducted within or upon any public right-of-way, public space or other publicly owned property constituting an open or a designated public forum in compliance with any applicable reasonable time, place and manner restriction on such speech or expression or otherwise pursuant to legal authority.*
7. *Sounds produced at otherwise lawful and permitted city-sponsored events, organized sporting events, school assemblies, school playground activities, by permitted fireworks, and by permitted parades on public right-of-way, public space, or other publicly owned property.*
8. *An event for which a temporary use permit or special event permit has been issued under other provisions of this code, where the provision of Section 11.80.010 are met, the permit granted expressly grants an exemption from specific standards contained in this chapter, and the permittee and all persons under the permittee's reasonable control actually comply with all conditions of such permit. Violation of any condition of such permit related to sound or sound equipment shall be in violation of this chapter and punishable as such.*

Table 3 and Table 4 show the maximum sound levels that are permitted in the City for continuous and impulsive sounds, respectively.

Table 3
Maximum Continuous Sound Levels*

Duration Per Day Continuous Hours	Sound Level (dBA)
8	90
6	92
4	95
3	97
2	100
1.5	102

Table 3
Maximum Continuous Sound Levels*

Duration Per Day Continuous Hours	Sound Level (dBA)
1	105
0.5	110
0.25	115

* When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percentage of allowed period of sound exposure at each level exceeds 100 percent.

The City also restricts the sound levels for non-impulsive sound on lands designated for residential and commercial land uses during the daytime and nighttime time periods. These levels are shown in Table 5. Section 11.80.050 (3) clearly identifies the measurement as an "average" noise level, and therefore, the noise limits shown in Table 5 are interpreted as the L_{eq} noise level.

Should a noise disturbance occur during construction, the City prohibits all construction and demolition activities between the hours of 8:00 p.m. and 7:00 a.m. the day following the noise disturbance; with the exception of emergency work by public service utilities or for other work approved by the city manager or designee. A noise disturbance is defined as any sound which that disturbs a reasonable person of normal sensitivities, exceeds the sound level limits set forth in the Noise Ordinance, or is plainly audible. A noise disturbance is defined as plainly audible measured at a distance of 200 feet from the real property line of the source of the sound if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property.

City of Perris General Plan Policies

The Noise Element of the *City of Perris General Plan*[5] defines goals, policies, and implementation measures related to noise conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

Goal II	Roadway improvements compatible with existing noise-sensitive land uses.
Policy II.A	Appropriate measures shall be taken in the design phase of future roadway widening projects to minimize impacts on existing sensitive noise receptors.
Goal V	Future non-residential land uses compatible with noise sensitive land uses.
Policy V.A	New large scale commercial or industrial facilities located within 160 feet of sensitive land uses shall mitigate noise impacts to attain an acceptable level as required by the State of California Noise/Land use Compatibility Criteria.

City of Riverside General Plan Policies

The Noise Element of the *City of Riverside General Plan*[6] defines objectives and policies related to noise conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

Objective N-1	Minimize noise levels from point sources throughout the community and, wherever possible, mitigate the effects of noise to provide a safe and healthful environment.
Policy N-1.5	Avoid locating noise-sensitive land uses in existing and anticipated noise-impacted areas.
Policy N-1.7	Evaluate noise impacts from roadway improvement projects by using the City's Acoustical Assessment Procedure.
Policy N-1.8	Continue to consider noise concerns in evaluating all proposed development decisions and roadway projects.
Objective N-4	Minimize ground transportation-related noise impacts.
Policy N-4.1	Ensure that noise impacts generated by vehicular sources are minimized through the use of noise reduction features (e.g., earthen berms, landscaped walls, lowered streets, improved technology).
Policy N-4.2	Investigate and pursue innovative approaches to reducing noise from railroad sources.

---

[5] *City of Perris General Plan Noise Element*, City of Perris, August 2016.

[6] *City of Riverside General Plan*, City of Riverside, February 2018.

Policy N-4.3 Identify and aggressively pursue funding sources to provide grade separations and sound walls along train routes as noise reduction measures.

Policy N-4.5 Use speed limit controls on local streets as appropriate to minimize vehicle traffic noise.

County of Riverside General Plan Policies

The Noise Element of the *County of Riverside General Plan*[7] defines policies related to noise conditions in the City. The specific policies related to noise that are relevant to the project are as follows:

N.1.1 Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas. If the noise-producing land use cannot be relocated, then noise buffers such as setbacks, landscaping, or block walls shall be used.

N.1.2 Guide noise-tolerant land uses into areas irrevocably committed to land uses that are noise-producing, such as transportation corridors or within the projected noise contours of any adjacent airports.

N.1.4 Determine if existing land uses will present noise compatibility issues with proposed projects by undertaking site surveys.

N.1.5 Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Riverside County.

N.1.6 Minimize noise spillover or encroachment from commercial and industrial land uses into adjoining residential neighborhoods or noise-sensitive uses.

N.1.8 Limit the maximum permitted noise levels that cross property lines and impact adjacent land uses, except when dealing with noise emissions from wind turbines.

N.2.3 Mitigate exterior and interior noises to the levels listed in [Table 6] below to the extent feasible.

Table 6
Stationary Source Land Use Standards

Land Use	Interior Standards	Exterior Standards
Residential		
10:00 p.m. to 7:00 a.m.	40 L_{eq} (10 minute)	45 L_{eq} (10 minute)
7:00 a.m. to 10:00 p.m.	55 L_{eq} (10 minute)	65 L_{eq} (10 minute)

Source: *County of Riverside General Plan Noise Element*, County of Riverside, December 2015.

---

[7] *County of Riverside General Plan Noise Element*, County of Riverside, December 2015

N.3.3 Ensure compatibility between industrial development and adjacent land uses. To achieve compatibility, industrial development projects may be required to include noise mitigation measures to avoid or minimize project impacts on adjacent uses.

N.3.5 Require that a noise analysis be conducted by an acoustical specialist for all proposed projects that are noise producers. Include recommendations for design mitigation if the project is to be located either within proximity of a noise-sensitive land use, or land designated for noise-sensitive land uses.

N.3.6 Discourage projects that are incapable of successfully mitigating excessive noise.

N.3.7 Encourage noise-tolerant land uses such as commercial or industrial, to locate in areas already committed to land uses that are noise-producing.

N.4.1 Prohibit facility-related noise received by any sensitive use from exceeding the following worst-case noise levels:

a. 45 dBA-10-minute L_{eq} between 10:00 p.m. and 7:00 a.m.

b. 65 dBA-10-minute L_{eq} between 7:00 a.m. and 10:00 p.m.

N.4.3 Ensure any use determined to be a potential generator of significant stationary noise impacts be properly analyzed and ensure that the recommended mitigation measures are implemented.

N.4.4 Require that detailed and independent acoustical studies be conducted for any new or renovated land uses or structures determined to be potential major stationary noise sources.

N.4.5 Encourage major stationary noise-generating sources throughout the County of Riverside to install additional noise buffering or reduction mechanisms within their facilities to reduce noise generation levels to the lowest extent practicable prior to the renewal of conditional use permits or business licenses or prior to the approval and/or issuance of new conditional use permits for said facilities.

N.4.8 Require that the parking structures, terminals, and loading docks of commercial or industrial land uses be designed to minimize the potential noise impacts of vehicles on the site as well as on adjacent land uses.

N.6.3 Require commercial or industrial truck delivery hours be limited when adjacent to noise-sensitive land uses unless there is no feasible alternative or there are overriding transportation benefits.

N.9.2 Ensure the inclusion of noise mitigation measures in the design of new roadway projects in the county.

N.9.3 Require development that generates increased traffic and subsequent increases in the ambient noise level adjacent to noise-sensitive land uses to provide for appropriate mitigation measures.

N.9.4 Require that the loading and shipping facilities of commercial and industrial land uses, which abut residential parcels be located and designed to minimize the potential noise impacts upon residential parcels.

N.9.5 Employ noise mitigation practices when designing all future streets and highways, and when improvements occur along existing highway segments. These mitigation measures will emphasize the establishment of natural buffers or setbacks between the arterial roadways and adjoining noise-sensitive areas.

N.12.1 Utilize natural barriers such as hills, berms, boulders, and dense vegetation to assist in noise reduction.

N.12.2 Utilize dense landscaping to effectively reduce noise. However, when there is a long initial period where the immaturity of new landscaping makes this approach only marginally effective, utilize a large number of highly dense species planted in a fairly mature state, at close intervals, in conjunction with earthen berms, setbacks, or block walls.

N.13.1 Minimize the impacts of construction noise on adjacent uses within acceptable practices.

N.13.2 Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

N.13.4 Require that all construction equipment utilizes noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

Section 3

Significance Thresholds

3.1 State CEQA Guidelines Appendix G

A project would have a significant effect on the environment related to noise if it would substantially increase the ambient noise levels for adjoining areas or if it would conflict with adopted environmental plans and goals of the community in which it is located.

The applicable noise standards and guidelines governing the project are those specified previously in Section 2. In summary, these criteria are contained within the Safety Element of the General Plan, the Municipal Code, the California Vehicle Code, and the State Noise Compatibility Guidelines.

For the purpose of this analysis, a noise impact is considered significant if the project would result in:

a) Construction noise would expose persons to noise levels in excess of standards established by the *City of Moreno Valley General Plan, City of Moreno Valley Municipal Code,* or applicable standards of other agencies;

b) A substantial permanent increase in ambient noise levels in the vicinity of the project above levels existing without the project;

c) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;

The standards within the *City of Moreno Valley General Plan* and *City of Moreno Valley Municipal Code* determine the acceptable noise environment for project and its vicinity. The standards are as follows:

- Consider the following uses noise-sensitive and discourage them in areas where exterior noise levels exceed 65 dBA CNEL unless measures are implemented that reduce the noise exposure below this level: single-family and multiple-family residential uses, group homes, hospitals, schools and other learning institutions, and parks and open space areas where quiet is a basis for use.

- Noise from construction and demolition activities exceeding those identified in Chapter 11.80.030, Table 11.80.030-2 of the City of Moreno Valley Municipal Code (60 dBA L_{eq} between 8:00 a.m. and 10:00 p.m. and 55 dBA L_{eq} between 10:01 p.m. and 7:59 a.m.) at sensitive uses during project construction would result in violation of the City's noise ordinance (see Table 5).

- Construction activity that would increase ambient noise levels at sensitive land uses by 10 dB or more would result in substantial temporary or periodic increases in ambient noise and be considered significant.

Long-term impacts from the project's traffic noise that affect existing sensitive land uses are considered to be substantial and, therefore, constitute a significant noise impact if the project would:

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

SECTION 4
Methodology

4.1 Methodology

Evaluation of noise impacts associated with the project includes the following:

- Determination of the short-term construction noise impacts on on-site and off-site noise-sensitive uses;
- Determination of the long-term noise impacts, of vehicular traffic, on on-site and off-site noise-sensitive uses; and
- Determination of the required mitigation measures to reduce construction and traffic noise impacts.

Construction Noise

Analysis of the Project's temporary construction noise effects is based on estimates of construction equipment units and duration of use consistent with the air quality analysis. The analyses accounted for attenuation of noise levels due to distances that would be between the construction activity and the nearest sensitive land uses. Construction noise levels at nearby sensitive land uses were estimated using the Federal Highway Administration's (FHWA) Roadway Construction Noise Model (RCNM) assuming two of the loudest pieces of construction equipment would operate at the closest location point to the nearest sensitive receptor. Modeled construction noise levels at nearby sensitive receptors were compared to the City of Moreno Valley noise ordinance and to ambient noise levels.

The City of Moreno Valley prohibits construction from occurring outside of the hours of 8:00 p.m. to 7:00 a.m. that creates a noise disturbance. The project is anticipated to require limited nighttime construction activity, subject to the City's approval. Therefore, for this analysis, residences that are exposed to noise levels exceeding those identified in Chapter 11.80.030, table 11.80.030-2 of the City of Moreno Valley Municipal Code (see Table 5) during project construction (60 dBA L_{eq} between 8:00 a.m. and 10:00 p.m. and 55 dBA L_{eq} between 10:01 p.m. and 7:59 a.m.) would result in violation of the City's noise ordinance.

Construction noise impacts are also assessed relative to the increase in noise levels that could result from the operation of specified construction equipment compared to existing noise level conditions. The City of Moreno Valley General Plan and noise ordinance does not specify an incremental increase threshold for construction. For this analysis, substantial temporary or periodic increases in ambient noise would occur and it would be considered a significant impact in cases where sensitive land uses are exposed to construction noise levels that increase ambient noise levels by 10 dB. A 10 dB increase in noise is considered a doubling of loudness to the average person.[8]

Operational Traffic Noise

Roadway noise impacts were evaluated using the FHWA Traffic Noise Model (TNM) method based on the roadway traffic volume data provided in the Traffic Study prepared for the Project by WSP USA.[9] This method allows for the definition of roadway configurations, barrier information (if any), and receiver locations. Roadway noise attributable to Project development was calculated and compared to baseline noise levels that would occur under the "Without Project" condition.

SECTION 5
Environmental Impacts

5.1 Analysis of Project Impacts

Threshold a: Would the Project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Short-Term Construction

Construction noise levels in and around the Project area would fluctuate depending on the type, number, and duration of use of various pieces of construction equipment. Construction-related material haul trips would raise ambient noise levels along haul routes, depending on the number of haul trips made and types of vehicles used. In addition, certain types of construction equipment generate impulsive noises (such as pile driving or blasting), which can be particularly disruptive. Pile driving and blasting, however, is not proposed during Project construction. **Table 7**, *Reference Construction Equipment Noise Levels,* shows typical noise levels produced by the types of construction equipment that would likely be used during Project construction.

Table 7
Reference Construction Equipment Noise Levels

Type of Equipment	L_{max}, dBA (50 Feet from Source)	Hourly L_{eq}, dBA/percent Use[1] (50 Feet from Source)
Bore/Drill Rigs	85	78/20
Cement and Mortar Mixers	85	81/40
Cranes	85	77/16
Excavators	85	81/40
Forklifts	85	78/20
Graders	85	81/40
Pavers	85	82/50
Pumps	77	74/50
Rollers	85	78/20
Dozers	85	81/40
Scrapers	85	81/40
Skid Steer Loaders	85	81/40
Tractors	84	80/40

Loaders	80	76/40
Backhoes	80	76/40
Trenchers	85	78/20

NOTES:
1. Percent used during the given time period (usually an hour – hourly L_{eq}) were obtained from the FHWA Roadway Construction Noise Model User's Guide.

SOURCE: Federal Highway Administration, 2006. *FHWA Roadway Construction Noise Model*. January 2006.

As previously discussed in the *Methodology* discussion in Section 4, the City of Moreno Valley Noise Ordinance prohibits construction from occurring outside of the hours of 8:00 p.m. to 7:00 a.m. that creates a noise disturbance. Construction occurring within the allowable hours of 7:00 a.m. and 8:00 p.m. would not result in the violation of the City's Noise Ordinance. For this analysis, residences that are exposed to noise levels exceeding those identified in Table 5 during daytime or nighttime project construction would result in violation of the City's Noise Ordinance.

Construction operations would occur in two general areas; on-site and off-site. The on-site construction activities will be more intense. Some phases of the on-site construction are expected to occur for 24-hours a day, 7-days per week. For the purpose of this analysis, construction is anticipated to begin in 2020, periodically, for a total of 16-years. Off-site construction would be much less intense and consist of minor grading, drainage, interchange, utility and roadway improvements. Off-site construction activities would be of shorter duration and would only occur on weekdays during daytime hours. Both on-site and off-site construction are discussed in more detail below.

On-site construction activities are expected to occur outside of the allowed construction hours specified in the City of Moreno Valley Noise Ordinance. The operation of each piece of off-road equipment within the on-site construction areas (i.e., Plots 1 through 22) would not be constant throughout the day, as equipment would be turned off when not in use. Most of the time over a typical work day, the equipment would be operating at different locations within the various plots of the Project site and would not likely be operating concurrently. However, for a more conservative approximation of construction noise levels to which the nearest sensitive receptor would be exposed, it is assumed that two of the loudest pieces of construction equipment would be operating at the same time and located within the Project plots nearest to a sensitive receptor. The nearest sensitive receptors are the existing on-site residences, which would be located approximately 25 feet from construction activity of various Plots. As a worst case scenario, it has been assumed that all existing on-site residences will remain onsite throughout construction.

Based on the list of the construction equipment that would be used at each of the plots, it was assumed that the two loudest pieces of off-road equipment (a paver and scraper) would have a combined noise level of 85 dBA L_{eq} from a distance of 50 feet.[10] Using this reference noise level and a 7.5 dB per doubling of distance attenuation rate, the noise exposure level at representative locations around the project site were calculated and presented in **Table 8**, *Increase Over Ambient at Nearest Sensitive Receptor During On-Site Construction (dB) - Unmitigated*. The location of the modeled receptor locations is presented in **Figure 4**, *Onsite Plot Locations*. As

---

[10] Federal Highway Administration. FHWA Roadway Construction Noise Model User's Guide, January 2006.

shown in Figure 4 and Table 8, noise generated during construction of the plots, in some cases construction of various plots occurring concurrently, would expose sensitive receptors to noise levels that would exceed the City's 60 dBA L_{eq} daytime and 55 dBA L_{eq} nighttime exterior noise standard. Specifically, impacts would occur at existing residences located within and to the west of the project area. Affected receptors are all located within City of Moreno Valley boundaries.

Based on these projections, anticipated worst-case construction noise levels would regularly be exceeded at residences within and near the project area. Based on an L_{eq} noise level of 85 dBA L_{eq} at 50 feet and an attenuation rate of 7.5 dB per doubling of distance, an observer would need to be at a distance of 500 feet from an active Project construction area to experience a noise level of 60 dBA L_{eq}, or 800 feet for a noise level of 55 dBA L_{eq}. Therefore, the on-site construction of the project would result in the exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley Noise Ordinance would result in a significant impact.

Off-site construction activities would occur within the allowed construction hours identified in the City's Noise Ordinance and would be consistent with the City's code. The nearest sensitive receptors are located at approximately 25 feet from off-site construction areas. Based on the operation of the two loudest pieces of equipment simultaneously at 25 feet, off-site construction could expose sensitive receptors to a noise level of 93 dBA L_{eq}, which would exceed the City's allowable daytime exterior noise level of 60 dBA L_{eq}. Therefore, the off-site construction activities would result in the exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley Noise Ordinance would result in a significant impact.

14	2,440	51 / 62	43	52 / 62	1 / 0

Notes:
Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.
1. Construction noise levels were modeled assuming two of the loudest construction equipment running at the same time and place nearest to a sensitive receptor. A distance of 25 feet was assumed between construction equipment and nearby receptors where plot boundaries abutted residential property boundaries. Construction noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.

* Increases in nighttime ambient noise were not modeled for receptor locations 6 and 11 due to their distance from the project site and on-site activity.

Source: ESA, 2018; FHWA, 2006

Long-Term Traffic Noise

The noise analysis for the project is based on the traffic volume data contained in the revised Traffic Impact Analysis (TIA) prepared for the Project.[11] The TIA addressed the intersections of surface streets in Moreno Valley of a collector or higher classification street with another collector or higher classification street, at which the project will add 50 or more peak hour trips. The study area also included the main travel routes between the Project and the neighboring cities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area extended west to the nearest ramps on SR-91 and as far south as the I-215 ramps at Redlands Avenue in Perris. The study area for freeways was selected to encompass the freeway routes radiating from the Project site to the north, south, east, and west. The traffic analysis covered SR-60 from I-10 in the east to SR-71 in the west, SR-91/I-215 from I-210 in the east to I-15 in the west, I-215 from Redlands Avenue in the north to the Scott Road interchange in the south, and I-10 from SR-62 in the east to SR-60 in the west.

Three hundred and thirty-nine (339) roadway links and eighty-nine (89) freeway segments were analyzed in the noise analysis. The change in noise level was calculated for all 428 roadway and freeway links with and without the Project for the existing (2018), 2025, and 2040 buildout scenarios. Segments with noise increases less than 1.5 dB would not have a substantial noise increase and were not presented in the main body of the noise report (i.e., the tables). Similarly, any segments that do not have sensitive receptors (e.g., residential uses or schools) were also not presented in the main body of the noise report. Based on this filtering process, of the 428 segments analyzed, 21 segments have sensitive receptors and an increase of 1.5 dB for at least one buildout scenario and were therefore addressed in the analysis.

The projected future daily traffic volumes for roadway segments in the Project vicinity were used in the traffic noise impact analysis. Modeled noise levels represent the worst-case scenario, which assumes that no shielding is provided between the traffic and the location where the noise contours are drawn. As previously identified, long-term impacts from the Project's traffic noise that affect existing sensitive land uses are considered to be substantial and, therefore, constitute a significant noise impact if the Project would:

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

---

[11] WSP USA, Inc. Traffic Impact Analysis Report for The World Logistics Center. June 2018

Existing 2018 Buildout Scenario

Operation of development that could occur within the project area would generate traffic along roadways in the Project vicinity. **Table 9**, *Existing Year (2018) Plus Project Buildout Traffic Noise Levels*, identifies existing with roadway traffic noise levels with the Project.

As identified in Table 9, build out of the project under 2018 conditions would result in substantial increases in traffic noise levels in the Existing plus Project Build Out scenario. The largest Project-related increase in traffic noise would be along Cactus Avenue Extension and Street F where increases of greater than 65 dBA are predicted. However, the increases associated with these roadway segments is attributable in part to Cactus Avenue Extension and Street F being new roads that will be constructed by the project. A total of 13 road or freeway segments would result in a substantial noise increase attributable to the Project, resulting in a significant impact requiring mitigation.

Table 9
Existing Year (2018) Plus Project Buildout Traffic Noise Levels (dBA)

Roadway Segment	CNEL (dBA) at 100 feet			
	Without Project	With Project	Change	Substantial Increase?

Freeways				
SR-60 (Perris Boulevard to Nason Street)	80.1	81.6	1.5	Yes
SR-60 (Moreno Beach Drive to Redlands Boulevard)	77.9	80.3	2.4	Yes
SR-215 (Mill Street to 2nd Street)	82.9	83.0	0.1	No
SR-215 (Baseline Road to Highland Avenue/SR-210	80.4	80.4	0.0	No

Phase 1 (2025) Buildout Scenario

Year 2025 (Phase 1) with and without Project scenarios projected daily traffic volumes on roadway segments in the Project vicinity were used to conduct the traffic noise modeling. The projected daily traffic volumes in the area were taken from the TIA prepared for the project. **Table 10**, *Phase 1 (2025) Plus Project Traffic Noise Levels,* identifies year 2025 without Project and with Project traffic noise levels.

As identified in Table 10, implementation of the project would result in changes in traffic noise levels in Year 2025 (Phase 1). The largest Project-related increase in traffic noise would be along Cactus Avenue Extension and Street F (east of World Logistics Center Parkway), where increases of 63.9 dBA and 58.1 dBA, respectively, are predicted for the 2025 With Project Phase 1 scenario over the Year 2025 without Project scenario. However, the increases associated with these roadway segments is attributable in part to Cactus Avenue Extension Street F being new roads that will be constructed by the project. A total of five road segments would result in a substantial noise increase attributable to the Project, resulting in a significant impact requiring mitigation.

Table 10
Phase 1 (2025) Plus Project Traffic Noise Levels (dBA)

Roadway Segment	CNEL (dBA) at 100 feet			
	Without Project	With Project	Change	Substantial Increase?
World Logistics Center Pkwy (Eucalyptus Avenue to Street F)	52.9	69.5	16.6	Yes

Sunset Drive (Crown Street to Alessandro Road)	49.0	49.0	0.0	No
SR-60 EB Ramps (SR-60 to Central Avenue)	65.2	65.5	0.3	No
Freeways				
SR-60 (Perris Boulevard to Nason Street)	80.8	81.6	0.8	No
SR-60 (Moreno Beach Drive to Redlands Boulevard)	79.2	80.4	1.2	No
SR-215 (Mill Street to 2nd Street)	83.1	83.1	0.0	No
SR-215 (Baseline Road to Highland Avenue/SR-210	80.5	80.6	0.1	No

Project Buildout (2040) Scenario

Operation of the project would generate traffic along roadways in the surrounding area during the buildout year (2040) scenario. Buildout Year (2040) with and without Project scenarios projected daily traffic volumes on roadway segments in the Project vicinity were used to conduct the traffic noise modeling. The projected daily traffic volumes in the area were taken from the TIA prepared for the project. **Table 11**, *Buildout Year (2040) Plus Project Traffic Noise Levels,* identifies the Buildout Year (2040) without Project and with Project traffic noise levels.

Table 11
Buildout Year (2040) Plus Project Traffic Noise Levels (dBA)

Roadway Segment	CNEL (dBA) at 100 feet			
	Without Project	With Project	Change	Substantial Increase?
World Logistics Center Pkwy (Eucalyptus Avenue to Street F)	54.2	71.0	16.8	Yes
Alessandro Boulevard (Cactus Avenue Extension to World Logistics Center Pkwy)	55.3	66.7	11.4	Yes
Cactus Avenue Extension (Alessandro Boulevard to Cactus Avenue)	0.0	66.8	66.8	Yes
John F Kennedy Drive (south of Cactus Avenue)	66.5	67.0	0.5	No
Redlands Boulevard (SR-60 to Eucalyptus Avenue)	69.2	69.2	0.0	No
Street F (east of World Logistics Center Parkway)	0.0	68.3	68.3	Yes
Cactus Avenue (west of Redlands Boulevard)	61.0	64.9	3.9	Yes
Ironwood Avenue (Redlands Boulevard to Highland Boulevard)	55.9	58.2	2.3	No
Theodore Street (SR-60 to Ironwood Avenue)	65.3	66.0	0.7	No
Ironwood Avenue (Moreno Beach Drive to Redlands Boulevard)	64.4	64.6	0.2	No
Cactus Avenue (Redlands Boulevard to Cactus Avenue Extension)	55.3	66.7	11.4	Yes
Locust Avenue (Moreno Beach Drive to Smiley Boulevard)	61.4	61.3	-0.1	No
Locust Avenue (Moreno Beach Drive to Redlands Boulevard)	60.7	60.9	0.2	No
Moreno Beach Drive (Locust Avenue to Ironwood Avenue)	62.8	63.0	0.2	No
Kitching Street (Krameria Avenue to Lurin Avenue)	68.5	68.4	-0.1	No
Sunset Drive (Crown Street to Alessandro Road)	49.0	49.0	0.0	No
SR-60 EB Ramps (SR-60 to Central Avenue)	65.5	66.5	1.0	No
Freeways				
SR-60 (Perris Boulevard to Nason Street)	81.6	82.4	0.8	No
SR-60 (Moreno Beach Drive to Redlands Boulevard)	80.5	81.6	1.1	No
SR-215 (Mill Street to 2nd Street)	82.9	84.8	1.9	Yes
SR-215 (Baseline Road to Highland Avenue/SR-210	80.4	82.1	1.7	Yes

Increases in noise levels associated with Buildout Year (2040) traffic conditions on area roadways range up to 68.3 dBA. As identified in the Table 11, the greatest increase in noise levels would be along Cactus Avenue Extension and Street F (east of World Logistics Center Parkway), where increases of 66.8 dBA and 68.3 dBA, respectively, are predicted for the Buildout Year 2040 With Project scenario over the Buildout Year 2040 without Project scenario. However, the increases associated with these roadway segments is attributable in part to Cactus Avenue Extension and Street F being new roads that will be constructed by the project. A total of eight road and freeway segments would result in a substantial noise increase attributable to the project, resulting in a significant impact requiring mitigation.

Tables 9 through 11 identify the noise increases directly caused by the project. These numbers represent the distance from the centerline of the road to the contour value shown. Note that the values given in Tables 9 through 11 do not take into account the effect of any existing noise attenuation in the form of barriers, soundwalls, or topography that may affect ambient noise levels.

It should be noted that the same noise increase occurs at all locations along a roadway link. In addition, the noise contours for the With Project scenarios cover a wider area around the local roadways than what was evaluated for existing conditions. State Route 60, however, continues to be the dominant noise source in the area.

Summary of Impacts

Within the Specific Plan Area. Six occupied noise-sensitive uses within the World Logistics Center site include residences that may remain with the implementation of the project. The Specific Plan would rezone the properties as Light Logistics, but it is anticipated that the residences may remain for some time. The Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain, must be considered sensitive land uses.

- *Street A/ World Logistics Center Parkway, South of SR 60 (Street B/Eucalyptus Avenue to Street F).* Three residences are located along Street A (World Logistics Center Parkway, South of SR 60) between the future Street B and Street F. These residences are anticipated to experience noise increases up to 18.5 dB due to the implementation of the project. As a result, existing noise levels at these residences will be changed significantly. Therefore, this would be a significant impact requiring mitigation.

- *Street F/Dracaea Avenue (east of Street A/ World Logistics Center Parkway, South of SR 60).* A single residence is located east of World Logistics Center Parkway, South of SR 60 along what is currently Dracaea Avenue (future Street F). Existing conditions identify low levels of traffic noise on Dracaea Avenue. With build out of the project in year 2040, this residence would experience noise increases up to 69.2 dB during the 2018 buildout year. Therefore, this would be a significant impact requiring mitigation.

- *Street E/Dracaea Avenue (east of Redlands Boulevard).* Two residences are located along Dracaea Avenue east of Redlands Boulevard. These residences would be most affected by traffic along Redlands Boulevard between Eucalyptus Avenue and Cottonwood Avenue, where no significant noise increase has been identified. Additionally, although the alignment of future Street E is not yet known, it is not anticipated that the future Street E centerline would be located less than 100 feet from these residences. Therefore, impacts would be less than significant and no mitigation is required.

Off-Site Areas Adjacent to the Specific Plan Area. For areas adjacent to the World Logistics Center site, 13 segments would experience a noise increase that would be greater than significance criteria specified previously. These areas are described below.

- *Street D/Cactus Avenue Extension (Alessandro Boulevard to Cactus Avenue).* Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the Project parallel to Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. These homes would experience noise level increases of up to 66.8 dB during the 2040 buildout year. Therefore, this would be a significant impact requiring mitigation.

- *Redlands Boulevard (from Eucalyptus Avenue to State Route 60).* There are homes located at the northwestern corner of Redlands Boulevard and Eucalyptus Avenue. The 2018 buildout scenario results in a significant noise increase of 2.8 dB. Therefore, this would be a significant impact requiring mitigation.

- *Cactus Avenue (west of Redlands Boulevard).* Existing residences are located along Cactus Avenue with rear yards facing Cactus Avenue with soundwalls located long the rear yards of the residences. The 2018 and 2040 buildout scenarios result in significant noise increases of 2.1 dB and 3.9 dB, respectively. Therefore, this would be a significant impact requiring mitigation.

- *Ironwood Avenue (between Redlands Boulevard and Highland Boulevard).* There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. A significant noise increase of 5.5 dB is projected for 2018 with full project build out. Therefore, this would be a significant impact requiring mitigation.

- *Cactus Avenue (Redlands Boulevard to Cactus Avenue Extension).* This area is occupied by a small group of single-family homes along Cactus Avenue between the future Street D/Cactus Avenue Extension and Redlands Boulevard. A significant noise increase is projected for all buildout scenarios. Currently, there is no soundwall along these homes. Therefore, this would be a significant impact requiring mitigation.

- *Locust Avenue (between Moreno Beach Drive and Smiley Boulevard).* There are three single-family homes along this roadway and they front onto the roadway. The 2018 buildout scenario results in a significant noise increase for this area. In 2018, the project will increase noise levels by 5.1 dB. Therefore, this would be a significant impact requiring mitigation.

- *Locust Avenue (between Moreno Beach Drive and Redlands Boulevard).* There are single-family homes along this roadway with front, rear, and side yards facing Locust Avenue. With project buildout in 2018, the project will increase noise levels by 5.7 dB. Therefore, this would be a significant impact requiring mitigation.

- *Kitching Street (between Krameria Avenue and Lurin Avenue).* There are single-family homes along this roadway with rear yards facing Kitching Street. Existing 6-foot high soundwalls are located along the residences and rear yard areas. Under the 2018 buildout scenario, the noise level is projected to increase by 3.2 dB. Therefore, this would be a significant impact requiring mitigation.

- *State Route 60 eastbound ramps (between SR-60 and Central Avenue).* Single-family homes are located south of SR-60 eastbound ramps. Under the project buildout scenario in year 2018, a noise level increase of 7.6 dB is anticiated. Therefore, this would be a significant impact requiring mitigation.

- *State Route 60 (from Perris Boulevard to Nason Street).* All residential areas along this stretch of freeway have soundwalls in place. The 2018 buildout scenario results in a significant noise increase of 1.5 dB. Therefore, this would be a significant impact requiring mitigation.

- *State Route 60 (from Moreno Beach Drive to Redlands Boulevard).* There are soundwalls in place for all residences in this area. The existing 2018 buildout scenario results in a significant noise increase of 2.4 dB. Therefore, this would be a significant impact requiring mitigation.

- *State Route 215 (from Mill Street to 2nd Street).* There are four residential uses located to the west of SR-215 south of 2nd Street with no soundwalls. The residential uses are set back from the freeway and are located at a lower grade than the freeway. The 2040 buildout scenario results in a significant noise increase of 1.9 dB. Therefore, this would be a significant impact requiring mitigation.

- *State Route 215 (from Baseline Road to Highland Avenue/SR-210).* There are residential uses on the west and east sides of SR-215. There are soundwalls in place along this segment of the SR-215 alignment. The 2040 buildout scenario results in a significant noise increase of 1.7 dB. Therefore, this would be a significant impact requiring mitigation.

Threshold b: Would the Project result in a substantial permanent increase in ambient noise levels in the vicinity of the Project above levels existing without the Project?

Permanent Increases in Ambient Noise

The analysis provided for “Threshold a” addresses the potential for Project operations to result in permanent increases in ambient noise levels in the Project vicinity. As stated therein, and as shown in Table 9 through Table 11, Project-related traffic would not result in a substantial permanent increase in ambient noise levels at the noise-sensitive receptors in the Project vicinity. Increases in ambient noise resulting from on-site operational activity such as truck movements, loading/unloading, and mechanical equipment would occur and potentially impact nearby sensitive receptors.

Threshold c: Would the Project result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project?

Temporary or Periodic Increases in Ambient Noise

The project has the potential of exposing sensitive receptors within the vicinity of on- and off-site construction areas to noise levels that could temporarily elevate the existing ambient noise level above the applied 10 dB substantial temporary increase threshold. As previously discussed in the *Methodology* discussion in Section 4, the City of Moreno Valley noise ordinance and general plan does not contain an incremental increase threshold for construction. Therefore, for purposes of this analysis, it would be considered a significant impact in cases where sensitive receptors are exposed to construction noise levels that increase ambient noise levels by 10 dB.

Construction crew commutes and the transport of construction equipment and materials to the site for the project would incrementally increase noise levels on access roads in the planning area. Using algorithms from the FHWA's TNM Technical Manual and the estimated work, vendor and haul truck volumes, project peak hour construction traffic noise levels were estimated for anticipated construction years and compared to measured daytime ambient noise levels along Redlands Boulevard and World Logistics Center Parkway. The results of the modeling are shown in **Table 12**, *Increase Over Ambient Along Local Roadways During Project Construction*. As shown in Table 12, Project construction traffic would not elevate existing ambient noise levels above the applied substantial temporary increase threshold of 10 dB.

Table 12
Increase Over Ambient Along Local Roadways During Project Construction

Project Construction Year	Construction Areas	Construction On-Road Traffic Noise from 100 feet L_{eq}	Range of Existing Daytime Ambient Noise Levels along Local Roadways (dBA L_{eq})	Project Construction Noise Plus Measured Existing Noise Levels (dBA L_{eq})

Notes:
Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.
1. Construction traffic noise levels were modeled using estimated work, vendor and haul trips from a distance of 100 feet from center of roadway. Construction traffic noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.
Source: ESA, 2018

As previously discussed, two of the loudest pieces of construction equipment running at the same time and place was used to model project-related construction noise levels at sensitive receptors nearest to on- and off-site construction areas. The modeled receptor locations for on- and off-site construction areas are shown in Figure 4 and **Figure 5**, *Offsite Construction Locations*, respectively. These modeled construction noise levels were compared to ambient noise measurements conducted by ESA in March 2018 to evaluate whether Project-related construction activities could elevate the existing ambient noise level above the applied 10 dB substantial temporary increase threshold. Table 8, and **Table 13**, *Increase Over Ambient at Nearest Sensitive Receptor During Off-Site Construction - Unmitigated,* compares the highest on-site and off-site, respectively, Project construction-related L_{eq} noise levels to which sensitive receptors could be exposed against the applicable temporary substantial increase in ambient noise threshold.

As shown in Table 8, construction activities within the Project area (i.e., plots 1 through 22) would elevate existing ambient noise levels by as much as 50 dB. The existing sensitive receptors that would be most affected by on-site construction activities are located within, to the west, and to the southwest of the Project area. The Project-related construction activities could also have the potential to expose wildlife located within the undeveloped land located south of the Project area to construction noise levels that would elevate the existing ambient level to above the applied 10 dB substantial temporary increase threshold. Transient construction noise consisting of worker trips and construction equipment and materials delivery would not occur along the southern boundary of the site, adjacent to the wildlife corridor. Therefore, noise generated during on-site construction activities would not result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

As shown in Table 13, off-site construction (e.g., roadway improvements, drainage improvements, etc.) in some areas, would elevate ambient noise levels by as much as 45 dB over existing ambient noise levels. The existing sensitive receptors located adjacent to Redlands Boulevard, Cactus Avenue, and near the intersections of World Logistics Center Parkway/Highway 60 and Redlands Boulevard/Highway 60 would be most affected by offsite construction activities. Therefore, noise generated during off-site construction activities would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

Notes:

Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.

1. Construction noise levels were modeled assuming two of the loudest construction equipment running at the same time and place nearest to a sensitive receptor. A distance of 25 feet was assumed between construction equipment and nearby receptors where plot boundaries abutted residential property boundaries. Construction noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.
2. Mitigation assumed a 10 dB reduction from a temporary noise barrier and equipment exhaust mufflers.

Source: ESA, 2018; FHWA, 2006

SECTION 6

Mitigation Measures

6.1 Construction Noise

The following mitigation measure would reduce construction-related noise:

MM-NOISE-1 Prior to issuance of any discretionary project approvals, a Noise Reduction Compliance Plan (NRCP) shall be submitted to and approved by the City. The NRCP shall be prepared by a qualified acoustical consultant describing how noise reduction measures shall be implemented to reduce the noise exposure on sensitive receptors adjacent to onsite and offsite construction areas. The noise reduction measures shall be implemented so that construction activities do not exceed the City's daytime and nighttime average hourly noise standard of 60 dBA L_{eq} and 55 dBA L_{eq}, respectively. The construction noise reduction measures shall include, but not be limited to, the following measures:

- All construction equipment, fixed or mobile, shall be equipped with operating and maintained mufflers consistent with manufacturers' standards.

- Construction vehicles shall be prohibited from using Redlands Boulevard south of Eucalyptus Avenue to access on-site construction for all phases of development of the project.

- No construction activity shall occur within 800 feet of residences between 8 p.m. and 7 a.m. on weekdays and weekends.

- A 12-foot tall temporary construction sound barrier blocking the line-of-sight of construction activity to any residential receptor located within 800 feet of active construction areas shall be installed prior to commencement of any construction activity. The temporary sound barrier shall be constructed of plywood with a total thickness of 1.5 inches, or a sound blanket wall may be used. If sound blankets are used, they must have a Sound Transmission Class (STC) rating of 27 or greater.

- Distribute to the potentially affected residences and other sensitive receptors within 500 feet of project construction boundary a "hotline" telephone number, which shall be attended during active construction working hours, for use by the public to register complaints. The distribution shall identify a noise disturbance coordinator who would be responsible for responding to any local complaints about construction noise. The disturbance coordinator would determine the cause of the noise complaints and institute feasible actions warranted to correct the problem. All complaints shall be logged noting date, time, complainant's name, nature of complaint, and any corrective action taken. The distribution shall also notify residents adjacent to the project site of the construction schedule. Records of any complaints and corrective action shall be stored at the site and available to the City upon request.

Level of Significance After Mitigation

Implementation of Mitigation Measure NOISE-1 would reduce construction noise levels at nearby sensitive receptors through implementation of a NRCP, which is expected to attenuate construction noise levels by a minimum of 10 dB. **Table 14,** *Increase Over Ambient at Nearest Sensitive Receptor During On-Site Construction – Mitigated* shows mitigated construction noise levels at sensitive receptors in the vicinity of on-site construction areas. In addition, Mitigation Measure NOISE-1 prohibits construction activity within 800 feet of any sensitive receptor outside of the allowable hours of 7:00 a.m. to 8:00 p.m. As shown in Table 14, at distances greater than 800 feet, construction noise would not exceed the City's nighttime exterior noise standard of 55 dBA L_{eq}. Therefore, impacts would be less than significant with mitigation incorporated for nighttime construction.

With regard to daytime construction, sensitive receptors located within and to the west of the project would continue to be exposed to construction noise levels that would exceed the City's daytime exterior noise standard of 60 dBA L_{eq} even with implementation of mitigation. Additionally, with a 10 dB reduction, off-site construction activity would continue to expose the sensitive receptors at 25 feet to noise levels up to 83 dBA L_{eq}. Therefore, this would result in a significant and unavoidable impact with mitigation with regard to City exterior noise standards.

As shown in Table 14 and **Table 15**, *Increase Over Ambient at Nearest Sensitive Receptor During Off-Site Construction - Mitigated*, even with implementation of Mitigation Measure NOISE-1, sensitive receptors located near on-site and off-site construction areas would be exposed to construction noise levels that would elevate the existing daytime ambient noise levels above the applied 10 dB substantial temporary increase threshold. Therefore, this would result in a significant and unavoidable daytime construction impact with mitigation. By prohibiting nighttime construction within 800 feet of sensitive uses, onsite construction would not result in temporary nighttime increases greater than 10 dB over ambient conditions.

Notes:
Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.
1. Construction noise levels were modeled assuming two of the loudest construction equipment running at the same time and place nearest to a sensitive receptor. A distance of 25 feet was assumed between construction equipment and nearby receptors where plot boundaries abutted residential property boundaries. Construction noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.

2. Mitigation assumed a 10 dB reduction from a temporary noise barrier and equipment exhaust mufflers.

3. Mitigation prohibits nighttime construction within 800 feet of sensitive uses. Where a mitigated construction noise level is listed, construction noise is calculated at 800 feet.
* Increases in nighttime ambient noise were not modeled for receptor locations 6 and 11 due to their distance from the project site and on-site activity. Nighttime impacts would be mitigated to less than significant levels for all other receptor locations, which are nearer to on-site construction activity than locations 6 and 11.

Table 14
Increase Over Ambient at Nearest Sensitive Receptor During On-Site Construction (dB) - Mitigated

Sensitive Receptor	Range of Distances to Nearest Plot	Existing Noise Level Day/Night (dBA Leq)	Project Only Unmitigated Attenuated Construction Noise Level (dBA Leq)	Project Only Mitigated Attenuated Construction Noise Level Day/Night [3] (where applicable) (dBA Leq)	Unmitigated Attenuated Construction Noise Level plus Ambient Day/Night (dBA Leq)	Mitigated Attenuated Construction Noise Level plus Ambient Day/Night (dBA Leq)	Unmitigated Increase Over Ambient Day/Night (dB)	Mitigated Increase Over Ambient Day/Night(dB)

13	6,000	47	33	23	47	47	0	0
14	6,065	51	33	23	51	51	0	0

Notes:
Bold Text = Exceed the applied 10 dB increase over ambient threshold. A 10 dB increase is considered a doubling of loudness to the average person.
1. Construction noise levels were modeled assuming two of the loudest construction equipment running at the same time and place nearest to a sensitive receptor. A distance of 25 feet was assumed between construction equipment and nearby receptors where plot boundaries abutted residential property boundaries. Construction noise levels were compared to daytime hourly Leqs obtained during a noise survey conducted in March 2018 by ESA.
2. Mitigation assumed a 10 dB reduction from a temporary noise barrier and equipment exhaust mufflers.

Source: ESA, 2018; FHWA, 2006

6.2 Operational Traffic Noise

The following mitigation measures would reduce potential project-related operational traffic noise:

MM-NOISE-2 When processing future individual buildings under the World Logistics Center Specific Plan, as part of the City's approval process, the City shall require the Applicant to take the following three actions for each building prior to approval of discretionary permits for individual plot plans for the requested development:

Action 1: Perform a building-specific noise study to ensure that the assumptions set forth in the Revised Sections of the FEIR remain valid. These procedures used to conduct these noise analyses shall be consistent with the noise analysis conducted in the Revised Sections of the FEIR and shall be used to impose building-specific mitigation on the individually-proposed buildings.

Action 2: If the building-specific analyses identify that the proposed development triggers the need for mitigation from the proposed building, including all preceding developments in the World Logistics Center site, the Applicant shall implement the appropriate level of mitigation, identified in the Revised Sections of the FEIR to reduce the identified impacts to comply with the Moreno Valley Municipal Code, which sets maximum sound levels reaching residential uses at 60 dBA Leq during the daytime hours (8:00 a.m. – 10:00 p.m.) and 55 dBA Leq during nighttime hours (10:01 p.m. – 7:59 a.m.). Prior to implementing the mitigation, the Applicant shall send letters by registered mail to all property owners and non-owner occupants of properties that would benefit from the proposed mitigation asking them to provide a position either in favor of or in opposition to the proposed noise abatement mitigation within 45 days. Each property shall be entitled to one vote on behalf of owners and one vote per dwelling on behalf of non-owner occupants.

If more than 50% of the votes from responding benefited receptors oppose the abatement, the abatement will not be considered reasonable. Additionally, for noise abatement to be located on private property, 100% of owners of property upon which the abatement is to be placed must support the proposed abatement. In the case of proposed noise abatement on private property, no response from a property owner, after three attempts by registered mail, is considered a no vote.

At the completion of the vote at the end of the 45-day period, the Applicant shall provide the tentative results of the vote to all property owners by registered mail. During the next 15 calendar days following the date of the mailing, property owners may change their vote. Following the 15-day period, the results of the vote will be finalized and made public.

Action 3: Upon consent from benefited receptors and property owners, the Applicant shall post a bond for the cost of the construction of the necessary mitigation as estimated by the City Engineer to ensure completion of the mitigation. The certificate of occupancy permits shall be issued upon posting of the bond or demonstration that 50% of the votes from responding benefited receptors oppose the abatement or, if the abatement is located on private property, any property owners oppose the abatement.

MM-NOISE-3 Prior to issuance/approval of any building permits, the centerline of Cactus Avenue Extension will be located no closer than 49 feet to the residential property lines along Merwin Street. An alternative is to locate the roadway closer to the residences and provide a soundwall along Cactus Avenue Extension. The soundwall location and height should be determined by a Registered Engineer, and the soundwall shall be designed to reduce noise levels to less than 65 CNEL at the residences. The Engineer shall provide calculations and supporting information in a report that will be required to be submitted to and approved by the City prior to issuing permits to construct the road.

MM-NOISE-4 Prior to the approval of any discretionary permits, cumulative impact areas shown in the WLC EIR Noise Study shall be included in the soundwall mitigation program outlined in Mitigation Measures NOISE-2 through NOISE-5.

MM-NOISE-5 Prior to issuance of a building permit, the applicant shall demonstrate that the development maintains a setback with soundwall for noise attenuation at residential/warehousing interface (i.e., western and southwestern boundaries of the project site). To keep the noise levels at nearby and on-site residential areas less than typical ambient conditions, the warehousing property line shall be located a minimum of 250 feet from the residential zone boundary, and a 12-foot noise barrier shall be located along the perimeter of the property that faces any residential areas. The 12-foot noise barrier may be a soundwall, berm, or combination of the two. The height shall be measured relative to the pad of the warehouse. This requirement shall be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (L_{eq}) will not be exceeded at the residential zone. This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, “All manufacturing and industrial uses adjacent to residential land uses shall include a setback zone and/or noise attenuation wall to reduce outside noise levels”.

Level of Significance After Mitigation

Within the WLC Specific Plan Area. For areas within the World Logistics Center site, noise levels at on-site residences may exceed the noise standard with the implementation of the project. The level of significance after mitigation is provided for each of the two areas for which a significant impact has been identified.

- *Street A/* World Logistics Center Parkway *(Street B/Eucalyptus Avenue to Street F).* Three residences are located along Street A (World Logistics Center Parkway) between the future Street B and Street F. These residences are anticipated to experience noise increases up to 18.5 dB due to the implementation of the project. As a result, existing noise levels at these residences will be changed significantly. The exact alignment of the roadway is to be determined, but the homes may be roughly 100 feet from the centerline on the roadway. Two residences front onto Street A (World Logistics Center Parkway), and the driveway access would make a soundwall ineffective. The other residence is on Street A (World Logistics Center Parkway) and it is difficult to determine where an outdoor living area is for this residence. However, since it is a single residence, a soundwall would have a limited effectiveness. Since mitigation is not feasible, impacts remain significant and unavoidable.

- *Street F/Dracaea Avenue (east of Street A/ World Logistics Center Parkway).* There is one residence in this area fronting onto the future alignment of Street F (currently Dracaea Avenue). Existing conditions identify low levels of traffic noise on Dracaea Avenue. The 65 CNEL contour is projected to lie 114 feet from the centerline of Street F and it is likely that the one residence would lie within this zone. With build out of the project, noise levels would reach as high as 68.3 CNEL, which exceeds the City's 65 CNEL threshold. Installation of a soundwall would not be effective in reducing noise levels due to the opening for the driveway. Since mitigation is not feasible, impacts remain significant and unavoidable.

Off-Site Areas Adjacent to the Specific Plan Area. For areas adjacent to the WLCSP area, three areas would experience noise increases that would be mitigated to a less than significant level with implementation of **Mitigation Measures NOISE-2** through **NOISE-5**. These areas are as follows:

- Cactus Avenue from Redlands Boulevard to Cactus Avenue Extension; and

- Cactus Avenue Extension from Alessandro Boulevard to Cactus Avenue.

  Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the World Logistics Center site parallel to Merwin Street and roughly 1,250 feet from Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. The noise forecast for buildout year 2040 shows that the 65 CNEL contour will lie 49 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than 49 feet to the residences, then a significant impact would occur. Outdoor living spaces for homes along Merwin Street would experience noise levels greater than 65 CNEL, and this would not be consistent with City criteria. Due to the distance currently envisioned between Merwin Street and Cactus Avenue Extension, it is most likely that no soundwall will be needed. If a soundwall was needed, a preliminary estimate indicates that the soundwall along Cactus Avenue Extension would need to be roughly 2,000 feet long. A soundwall shall reduce traffic noise to 65 dBA CNEL measured at the boundary of residences along Merwin Street.

For the remaining noise impact locations adjacent to the World Logistics Center site for which significant noise impacts have been identified, mitigation measures are not feasible or will not fully reduce the impact to less than significant levels. Each location that will remain significant and unavoidable is discussed below.

- *Redlands Boulevard (Eucalyptus Avenue to State Route 60).* There are scattered homes in this area that either face Redlands Boulevard (or Shubert Street) or are on Redlands Boulevard. The 2018 buildout scenario results in a significant noise increase for this area. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Cactus Avenue (west of Redlands Boulevard).* Existing residential uses are located along Redlands Boulevard with rear yards facing Cactus Avenue. Existing 6-foot high soundwalls are located along the rear yard areas. Soundwalls are already present on the west side of the roadway. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Ironwood Avenue (between Redlands Boulevard and Highland Boulevard).* There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway. Land uses that are widely separated from one another cannot be effectively mitigated with a soundwall. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Locust Avenue (between Moreno Beach Drive and Smiley Boulevard).* There are three single-family homes along this roadway and they front onto the roadway. Homes that are scattered and front onto a street cannot be effectively mitigated with a soundwall. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Locust Avenue (between Moreno Beach Drive and Redlands Boulevard).* There are single-family homes along this roadway with front, rear, and side yards facing Locust Avenue. The homes located on the north side of Locust Avenue mostly front onto the roadway, making erecting a soundwall infeasible. A majority of the homes on the south side of the street either already have soundwalls in place or front onto Locust Avenue. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *Kitching Street (between Krameria Avenue and Lurin Avenue).* There are single-family homes along this roadway with rear yards facing Kitching Street. Existing soundwalls are located along the rear years. Soundwalls are already present on the west side of the roadway. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 60 eastbound ramps (between SR-60 and Central Avenue).* Single-family homes are located south of SR-60 eastbound ramps. Although Mitigation Measure 4.12.6.2A could mitigate impacts related to increases in ambient noise, the construction of mitigation on private property not controlled by the project would be controlled by the property owner and not be guaranteed. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 60 (from Perris Boulevard to Nason Street).* Residential uses along this stretch of the freeway have soundwalls in place. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 60 (from Moreno Beach Drive to Redlands Boulevard).* Residential uses along this stretch of the freeway do not have soundwalls in place. Although Mitigation Measure 4.12.6.2A could mitigate impacts related to increases in ambient noise, the construction of mitigation on private property not controlled by the project would be controlled by the property owner and not be guaranteed. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 215 (from Mill Street to 2nd Street).* Residential uses along this stretch of the freeway do not have soundwalls in place. Although Mitigation Measure 4.12.6.2A could mitigate impacts related to increases in ambient noise, the construction of mitigation on private property not controlled by the project would be controlled by the property owner and not be guaranteed. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

- *State Route 215 (from Baseline Road to Highland Avenue/SR-210).* The freeway has soundwalls in place. Therefore, mitigation is not feasible and impacts will remain significant and unavoidable.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
    For hard ground, the propagation rate is 3 dB per doubling the distance.
    For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

- For hard ground, the propagation rate is 3 dB per doubling the distance.
- For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

33	SR-60	Moreno Beach Dr to Re	Hard	100	65	65	65	5765	55	220	78.2	10	67.3	68.3

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
  For hard ground, the propagation rate is 3 dB per doubling the distance.
  For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
Barrier attenuation methodology is based on ISO 9613.

EXECUTIVE SUMMARY

OVERVIEW

At the request of Highland Fairview, WSP has conducted a comparison of renewable energy technologies and energy efficiency strategies which could be incorporated into the World Logistics Center (WLC) project (“Project”) to reduce its energy use and energy-related environmental impacts.

The Project is a 40.6 million square foot logistics campus on the eastern side of the City of Moreno Valley. For the purposes of this analysis the project is assumed to be developed in two phases. Phase 1 consists of 15 buildings totaling 22,560,000 sf and is assumed to be completed in the year 2025. Phase 2 consists of 12 buildings totaling 18,040,000 sf and is assumed to be completed in 2040.

WSP’s approach involved first estimating the Project’s overall energy needs. This is known as the “Demand-Side Energy Analysis.” WSP then identified specific ways that these energy needs could be reduced through the incorporation of a variety of energy efficiency technologies into the project design. Once the Demand-Side Energy Analysis was complete, WSP evaluated various means for supplying renewable clean energy to meet the reduced energy needs. This is known as the “Supply-Side Energy Analysis”.

DEMAND-SIDE ENERGY ANALYSIS

The demand-side energy analysis was conducted using the IES hourly energy simulation software. To utilize the software, an accurate model of a typical Project building was developed, which included the details of a typical building such as the type of building construction material (concrete, wood, or metal), the amount of heating, ventilation and air-conditioning (HVAC) equipment, the type and extent of interior lighting, and the type and extent of material-handling equipment that would go into a typical WLC building. This established a prototype building that would be minimally compliant with the State of California’s Title 24 building code requirements.
The Title 24-compliant prototype was then modified to incorporate the energy conservation measures (ECMs) to which the Project has committed in the WLC Specific Plan. The adjusted model represented the baseline model against which the energy performance of several additional ECMs were compared, creating a Project Building Model that took the Project well beyond Title 24 compliance.

The Demand-Side Analysis showed the package of ECMs in the Project Building Model provided a 17% improvement in energy performance and an equally impressive 18% reduction in GHG emissions over the baseline model. Key ECMs assumed in the Project Building Model were variable refrigerant flow (VRF) heat pumps providing heating and cooling to the office spaces, direct evaporative cooling as the first cooling stage and VRF as the supplemental cooling stage for any potential air-conditioned warehouse spaces, LED lighting throughout the offices and warehouses, and LED exterior and parking lot lighting.

The estimated overall energy demand for the Project assumes that all WLC buildings will incorporate the features of the Project Building Model, and will also accommodate electric vehicle (EV) energy usage at WLC, as discussed herein. While EV usage is expected to increase substantially over time, EV energy usage was not included in the

Demand-Side Analysis to highlight the effectiveness of the ECM's, which do not have any effect or offer any benefits regarding EV energy usage. A Summary of the Overall Energy Analysis Results with EV usage included is below.

SUPPLY-SIDE ENERGY ANALYSIS

The Project Building Model incorporating the recommended ECMs provided the analytical baseline against which potential renewable clean energy options were measured. WSP evaluated the Project site, its land uses, the circulation plan and existing utilities, along with other constraints and opportunities, to compile a comprehensive list of potential energy supply options. A screening process was applied to narrow the comprehensive list down to those several options that held the greatest potential for being successfully implemented at the Project. Screening criteria that caused some of the energy supply options to be discarded involved safety considerations, regulatory barriers, air emissions concerns, and technical impracticalities. The following table summarizes the Energy Resources considered.

Energy Resources Screening Results

Supply Option	Screening Criteria				
	Carbon	Resiliency	Financial	Technical	Regulatory
Recommended for further investigation:					
Combined Cooling, Heat and Power (CCHP)	—	✓	✓	✓	—
Ground Source Heat Pump (GSHP)	✓	—	—	—	✓
Solar photovoltaic (PV)	✓	—	—	✓	✓
Solar PV + battery	✓	✓	—	✓	✓
Off-site procurement	—	—	✓	✓	—
Not recommended for further investigation:					
Biomass	✓	✓	—	✗	✗
Biogas/landfill gas	✓	✓	—	✗	—
District energy	✓	✓	✗	✗	—
In-line hydro	✓	✓	—	✗	—
Microgrid	✓	✓	✗	✓	✗
Natural gas pressure recovery	✓	✓	—	✗	—
Wind	✓	—	—	✗	✗

The energy supply options emerging from the screening process were then subjected to engineering analysis to develop a technical basis for identifying the single best supply-side option for use at the WLC project. Ground-source heat pumps (GSHPs); combined cooling, heat, and power (CCHP); and solar photovoltaics (PV) with and without battery storage were modeled with the HOMER Energy simulation tool and other specialized software. Purchasing of green power (offsite procurement) from renewable energy projects located away from the WLC site was also considered among the sustainable energy options.

SUPPLY-SIDE CONCLUSIONS

WSP concluded in its analysis that GSHPs are not recommended for the Project due to the cooling requirements within the building being much greater than the building heating needs as a result of year-round weather conditions at the WLC site. Such an imbalance would cause the geoexchange field (where excess heat removed from the building by the cooling process is transferred via piping into the ground) to grow increasingly warmer over time. This, in turn, would degrade GSHP performance in providing building space cooling.

CCHP produces air emissions, resulting from the combustion of fossil fuels, that exacerbate the poor air quality of Moreno Valley and the entire South Coast Air Quality Basin. Furthermore, CCHP increases the Project's GHG emissions since it produces more GHG emissions than California's increasingly green grid.

Moreno Valley Utilities (MVU) is the utility provider for the Project and while solar PV is a viable option, MVU has limitations in its Electric Service Rules on the amount of PV allowed for commercial and industrial projects. A system that combines PV with battery storage of excess solar generation was considered, but the MVU solar sizing limitations and the estimated WLC Project demands do not result in excess solar generation to charge a battery. In addition, MVU's Time-of-Use rate structure is not compatible with the Project's peak electrical usage (load curve) making the use of batteries to deliver any meaningful reduction an unviable option.

Considering the air emissions constraints, MVU rate structures, Project electric load curves, and MVU PV sizing rules, rooftop PV systems without energy storage were determined to be the Project's best sustainable clean energy supply option. To determine the specific allowable PV size, WSP analyzed the hourly electric loads simulated using the IES modeling software. Phase 1 building simulation produced a minimum daytime electric load of about 600 kW. The minimum daytime electric load for Phase 2 buildings was simulated to be about 1,600 kW. Thus, since MVU limits on-site PV size to one-half the minimum electric demand a building experiences during daytime hours, Phase 1 buildings can provide up to 300 kW of PV (one-half the 600 kW minimum daytime electric load) and Phase 2 buildings can provide up to 800 kW (one-half the 1,600 kW minimum daytime electric load). The combination of the recommended ECM package and allowed rooftop solar enables the Project to meet more than 50% of its annual energy requirements from renewable energy.

Utilizing the maximum permitted amount of rooftop PV would enable the Project office spaces to achieve effectively net-zero energy (NZE) operations. In Phase 1 this would amount to the equivalent of fifteen 60,000 square-foot NZE office buildings. At full build-out this would amount to the equivalent of twenty-seven 60,000 square-foot NZE office buildings. To put this in context, the entire state of California has about 30 NZE office buildings in operation, under construction, or publicly committed as of 2016.

WSP's IES computer model of the Project buildings established the following annual energy usage of the office spaces for each building and the PV generation for each building as follows. Note that advances over time in energy efficiency technologies are assumed to result in less energy usage by Phase 2 offices:

Office Demand and PV Generation per Building

Description	Phase 1		Phase 2	
	Annual Energy Use (kWh/yr)	Peak Demand (kW)	Annual Energy (kWh/yr)	Peak Demand (kW)
Office-only energy usage per building	474,120	280	417,230	270
PV generation per building	512,400	300	1,366,400	800
Total project office energy usage	7,111,800	4,200	5,006,707	3,240
Total project PV generation	7,686,000	4,500	16,396,800	9,600

As shown in the table above, the use of PV in each phase would cover both the peak electric load generated by the offices and the annual energy usage of the offices, thereby achieving effective NZE status for the offices. Due to the highly speculative nature of the EV penetration in Phase 2, project mitigation measures require the project to upgrade the structural integrity of the roof on each building to accommodate the possibility of future solar installation over the entire roof. At a minimum, the project will install enough solar power in both phases to meet energy needs of the Project's office spaces.

ELECTRIC VEHICLE CHARGING LOADS

The use of electric vehicles (EVs) by the motoring public and in industry is projected to increase substantially over the period of Project build-out. Title 24 currently requires 6% of on-site parking spaces be designed to accommodate EV charging of passenger and light-duty truck vehicle classes. These minimum Title 24 requirements were applied to estimate the additional Phase 1 electricity usage at the Project attributable to EV charging. Because Phase 2 build-out concludes in 2040, EV charging energy usage is highly speculative, but the Project analysis assumed EV projections consistent with California policy trends.

The projected EV electric needs are significant for Phase 1 of the Project, amounting to about 6% of the total energy usage. At full build-out of the Project, projected EV impact is substantial, accounting for more than one-third of total energy usage by the WLC project. The incremental EV charging needs determine the overall minimum daytime electric load on each building. This, in turn, defines MVU's allowable amount of PV on each building's roof, establishing 300 kW as the expected maximum amount of allowed PV on each Phase 1 building, and accounting for the increase to a maximum of 800 kW of PV expected to be allowed on each Phase 2 building.

OVERALL PROJECT ELECTRICITY NEEDS

The combination of the electricity consumed by the buildings and that used by on-site EV chargers will result in a significant new load to be met by MVU's system. The table below summarizes the megawatts of peak electric demand projected to be associated with each phase of WLC development.

Peak Electric Demand for WLC Development

Stage	Number of Buildings	Total Peak Demand (MW)
Phase 1	15	36.5
Full Build	27	83.3

SUMMARY OF ENERGY ANALYSIS RESULTS

A summary of the projected energy performance of the Project is presented in the following tables. Phase 1 results are multiplied by the 15 buildings that are planned for the initial phase of construction. Build-out results are multiplied by 27 buildings in the total Project (15 buildings in Phase 1 plus 12 buildings in Phase 2). The first table summarizes the impact of the recommended ECM package, relative to buildings that are minimally compliant with Title 24. Note that these figures *do not include EV electricity usage or PV generation* in order to paint a clear picture of the efficacy of the recommended ECM package. The results demonstrate that the recommended ECMs are expected to deliver energy savings of 16 – 17%.

Energy Efficiency Performance for WLC Development

Stage	Energy Savings (MWh/yr)	Energy Savings (%)	GHG Savings (tonnes CO_2e/yr)	GHG Savings (%)	Renewable Energy Supply (%)*
Phase 1	34,892	16.7%	6,019	10%	49%
Full Build	57,449	16.2%	9,085	18%	55%

The second table summarizes the impact of the allowed PV capacities, relative to buildings incorporating the recommended ECM package. Note that these figures *include EV electricity usage* in order to paint a clear picture of the efficacy of on-site electricity generation via PV. This explains the much smaller values for energy savings and GHG savings.

Solar PV Performance for WLC Development

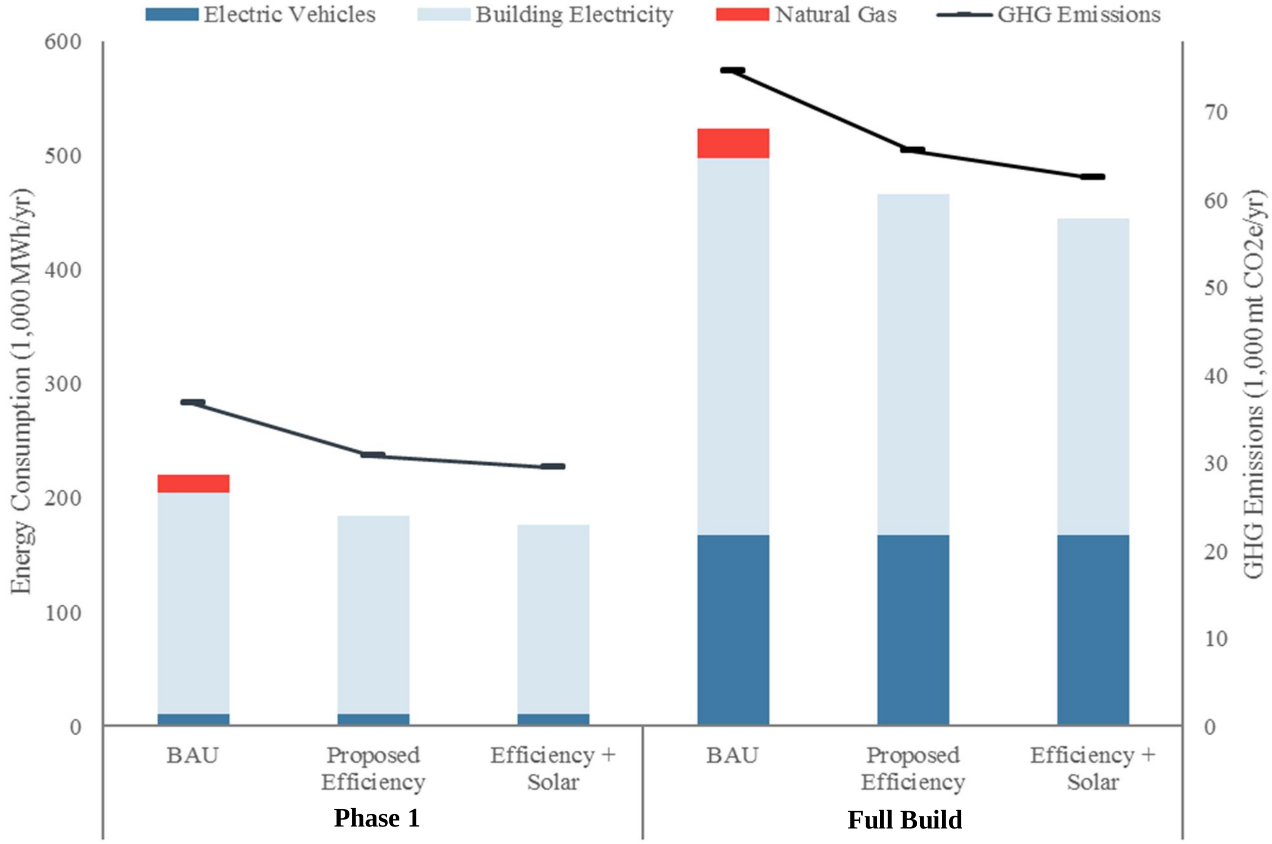
Stage	Energy Savings (MWh/yr)	Energy Savings (%)	GHG Savings (tonnesCO2e/yr)	GHG Savings (%)	Renewable Energy Supply (%)*
Phase 1	7,686	4%	1,276	4%	51%
Full Build	24,083	5%	3,386	5%	57%

*Renewable energy fraction takes account of renewables on the California grid

The bar chart below graphically presents the projected energy usage and GHG emissions for the entire Project at the end of Phase 1 and the end of Phase 2. The business-as-usual (BAU) bar reflects minimal compliance with Title 24;

the middle bar represents the recommended ECM package; and the third bar shows the combination of the ECM package and allowable PV.

Phase 1 and Full Build-Out Energy and GHG Results



OFF-SITE RENEWABLE ENERGY PROCUREMENT

Under current regulations, WLC tenants will be able to purchase electricity only from MVU. In the interest of completeness of the discussion on the topic of renewable energy, we herein describe multiple off-site renewable electricity procurement methods that are available in many other electric utility service territories. These include:

- Unbundled renewable energy certificates (RECs);
- Power purchase agreements (PPAs);
- Community choice aggregation (CCA);
- Green tariffs.

There is no one-size-fits-all recommendation for procurement of off-site renewable energy. Each customer's circumstances are likely to be unique, so the best off-site procurement option for one may very well not be the best option for another.

To meet the Project Objectives and the City's Economic Development Objectives (see Section 3.6 of the Project Final EIR and Section 1.3.1 of the WLC Specific Plan), WLC must establish and maintain a competitive position in meeting these objectives. The price premium associated with off-site renewable energy procurement would increase

WLC tenant utility costs and thus run counter to the Project Objectives and the City's Economic Development Objectives. Even if regulations allowed it, it would be counterproductive to require WLC tenants to procure renewable energy from off-site sources. For these reasons, the concept of requiring a tenant to procure off-site renewable energy was not considered a viable sustainable supply option to impose on the Project. Should electricity regulations change in the future to allow procurement of off-site renewable energy, and should WLC tenants elect for corporate, marketing, or other reasons to pursue procurement of off-site renewable energy, the means of doing so via one of the means presented in this report may become available to them.

TABLE OF CONTENTS

FIGURES

TABLES

1 INTRODUCTION

1.1 AUTHORIZATION

WSP has been engaged to undertake an analysis of feasible renewable energy technologies that make sense for the World Logistics Center (WLC).

1.2 PURPOSE

The objective of this analysis is to identify potential renewable energy options for the WLC that will improve energy performance and reduce greenhouse gas (GHG) emissions of the WLC. The analysis considers Phase 1 and Phase 2 of the WLC. This document reports on analytical outcomes including:

- High level screening of all potential demand-side options to maximize the energy efficiency of the buildings and therefore minimize WLC energy consumption,
- High level screening of all potential supply-side options to deliver sustainable energy to the buildings,
- More detailed analysis of the options that show the best potential.

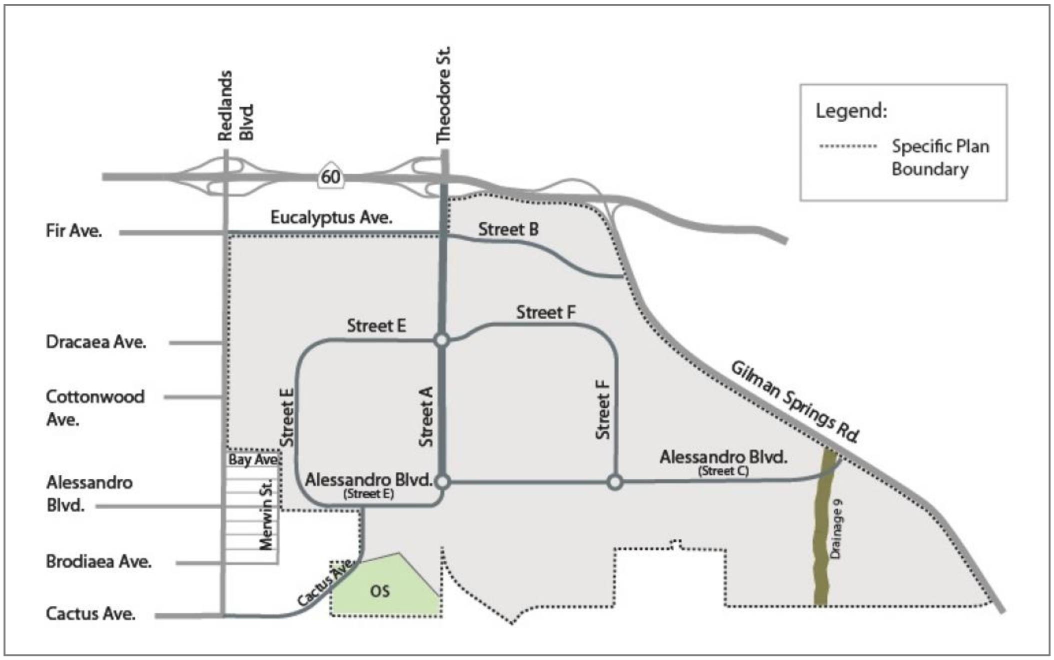
Evaluations considered the financial, energy, carbon, and technical feasibility of each option. Obviously infeasible options were screened out, including any supply-side options involving combustion of fossil fuels, due to Moreno Valley and the entire South Coast Air Quality Basin being out of compliance for NO_x and other air pollutants. This analysis includes electricity consumption of mobile energy end uses, including electric forklifts used in future WLC warehouses and electric passenger vehicles and electric light-duty trucks expected to be charged in future WLC parking lots.

2 BACKGROUND

2.1 WORLD LOGISTICS CENTER

The World Logistics Center (WLC) is a master-planned development encompassing 2,610 acres in Moreno Valley California, as shown in Figure 1. At full build-out the development will include up to 40.6 million square feet of building area. The vision for the World Logistics Center is to establish a world class corporate park specifically designed to support large-scale logistics operations.

Figure 1: WLC Map



WSP has undertaken an energy analysis the results of which are presented in this report. This report is intended to guide development of an updated EIR and help determine the best path forward to incorporate renewable energy into the development.

2.2 ENERGY CONTEXT

2.2.1 ELECTRIC UTILITIES

Moreno Valley Electric Utility (MVU) is expected to provide electric services to the WLC. A report developed by Utility Specialists determined that MVU will need to construct additional substation capacity beyond already planned expansions to meet the electric needs of the WLC. Therefore, reducing peak electricity demand from the WLC can also reduce the additional substation capacity required to serve the WLC.

Tenants of the WLC will contract for utility services directly with MVU. The rate structure for each account is determined by the monthly maximum demand. WSP expects that all proposed buildings in the WLC will exceed the 20 kW demand threshold specified by MVU and will therefore be subject to *Schedule C – Large General Service*. Tenants will also be eligible for *Schedule TOU-LGS – Time of Use – Large General Service* rates. However, analysis using energy models and

15-minute interval consumption data from five existing logistics buildings in the MVU service territory determined that a time-of-use rate is not advantageous to the customer. Therefore, the WSP analysis was conducted with the assumption that tenants at the WLC will be subject to the rates specified in *Schedule C – Large General Service* for primary voltage customers. The rate structure is such that customers can decrease their energy costs by reducing monthly peak electricity demand, reducing electricity consumption, or improving the power factor of their facility. Analysis of the renewable energy options within this report considers the impact of reducing monthly peak electricity demand and reducing electricity consumption.

MVU offers a solar net energy metering program to its customers. A successor rate to net energy metering, NEM 2.0, was adopted by the City Council on April 17, 2018. Under this new rate, customers will be paid for any excess generation at the end of each billing period, and will receive a dollar-denominated credit on their bill. However, based on conversation with MVU, WSP expects that this program will not be available to the WLC because of the expected size of each of the warehouses at the development. Furthermore, MVU imposes limits on the capacity of on-site solar PV generation that can be installed by their customers. Per *Resolution No. 2017-20* the “maximum solar generating capacity that will be approved to be connected to each meter is up to 50% of the meter minimum daytime load.” This dramatically limits the amount of on-site solar generation that can be installed at WLC buildings.

2.2.2 NATURAL GAS UTILITIES

Southern California Gas Company (SCG) provides natural gas services in the WLC area for space heating and service water in the business-as-usual scenario. It is assumed that the tenants of the WLC will contract for natural gas services directly with SCG and be subject to the *GN-10* rates. A new natural gas distribution network at the site is required to provide natural gas services to individual buildings. In an all-electric scenario where WLC buildings do not consume natural gas, there is no need for a natural gas distribution network and capital cost savings can be realized.

2.2.3 GHG EMISSIONS

Electricity emissions factors for both Phase 1 and Phase 2 were calculated using 2016 eGRID factors for California-Mexico Power Area (CAMX) and changes in the energy resource mix projected by U.S. Energy Information Administration (EIA). As discussed in Appendix A: Current and Future Energy Context, the EIA projects that the California grid’s emission factor will decline 31% from current levels by 2025 and 41% by 2040.

For natural gas, an emissions factor of 117 lb CO_2e/MMBTU (pounds of CO_2-equivalent per million BTU) was used to calculated GHG emissions per guidance from EPA’s mandatory reporting rule. This emissions factor was held constant for both Phase 1 and Phase 2.

Table 1: GHG emissions factors

Phasing	Grid Electricity (lb CO_2e /MWh)	Natural Gas (lb CO_2e /MMBTU)
Phase 1 (2025)	366	117
Phase 2 (2040)	310	117

2.2.4 CRITERIA POLLUTANTS

The Moreno Valley air shed within the South Coast Air Quality Management District (SCAQMD) currently exceeds allowable NO_x limits by a factor of three. Consequently, distributed energy resources that emit NO_x were excluded from further analysis.

3 BASELINE PERFORMANCE

3.1 PROJECT PHASING

The WLC project will be built out over a 20-year period. For purposes of this analysis, it was assumed that there will be a total of 27 distribution centers, each of approximately 1.5 M ft^2, planned for construction completion by 2040. Fifteen of the 27 buildings will be built during Phase 1 (2020-2025) with the remaining 12 buildings being constructed during Phase 2 (2025 – 2040). When complete, WLC will total approximately 40.6 M ft^2 of floor area.

Based on the distribution centers that currently exist within the MVU service territory, this analysis assumes that about 11% of the WLC buildings will feature air-conditioned warehouses. No refrigerated warehouses were included.

The complete phasing schedule is detailed in Table 2.

Table 2: WLC phasing schedule

		Unconditioned	Air-Conditioned	Total
Phase 1 **2020 - 2025**	**Number of Buildings**	13	2	15
	Floor Area (ft^2)	19.55 M	3.01 M	22.56 M
Phase 2 **2025 - 2040**	**Number of Buildings**	11	1	12
	Floor Area (ft^2)	16.54 M	1.5 M	18.04 M
Full Buildout	**Number of Buildings**	24	3	27
	Floor Area (ft^2)	36.09 M	4.51 M	40.6 M

3.2 PROTOTYPE BUILDINGS

WSP developed Title 24-compliant energy models for air-conditioned and unconditioned prototype buildings. Each model contains details about building construction; lighting systems and controls; heating, ventilating, and air-conditioning (HVAC) systems and controls; and office equipment. The prototype buildings were created based on the building space usages, floor areas, and operating schedules specified in Table 3.

Table 3: Prototype building characteristics

Primary Usage	Area Breakdown		Operating Schedule		
	Area (ft^2)	Percent	Weekdays	Saturday	Sunday/Holiday
Office	60,144	4%	8:00 AM – 6:00 PM	Not Operational	Not Operational
Warehouse	1,443,556	96%	8:00 AM – 12:00 AM	8:00 AM – 4:00 PM	Not Operational
Whole Building	**1,503,700**	**100%**			

As-built construction drawings and actual metered electricity usage data for the existing Skechers building and a sample of other distribution center buildings in the MVU territory were used to estimate the process loads (such as electric forklifts and conveyance systems) within the warehouses. The process loads were extracted from hourly metered data by subtracting the lighting and HVAC loads produced by the baseline building energy models. The resulting estimate of process equipment electricity usage was spot-checked against actual metered data collected by MVU on select Skechers forklift battery chargers and conveyance motors. This estimated process load data was adjusted to account for WLC's projected operating schedule and then used as inputs to the prototype models.

The air-conditioned and unconditioned prototype models were then driven with Moreno Valley long-term average weather data to produce the baseline annual hourly building energy loads against which the energy demand-side options and the energy supply-side options were evaluated (see Sections 4 and 5).

Figure 2 details monthly energy consumption for both the air-conditioned and unconditioned warehouses. Lighting and equipment is responsible for most of the energy consumption, even in the air-conditioned warehouses. Energy usage in the air-conditioned warehouses is highest during the winter months with natural gas representing 30% of the monthly energy consumption. In contrast, the unconditioned warehouse shows little seasonal variation. *Note that the Title 24-compliant buildings use natural gas for space heating and for domestic hot water.*

Figure 2: Baseline monthly energy consumption

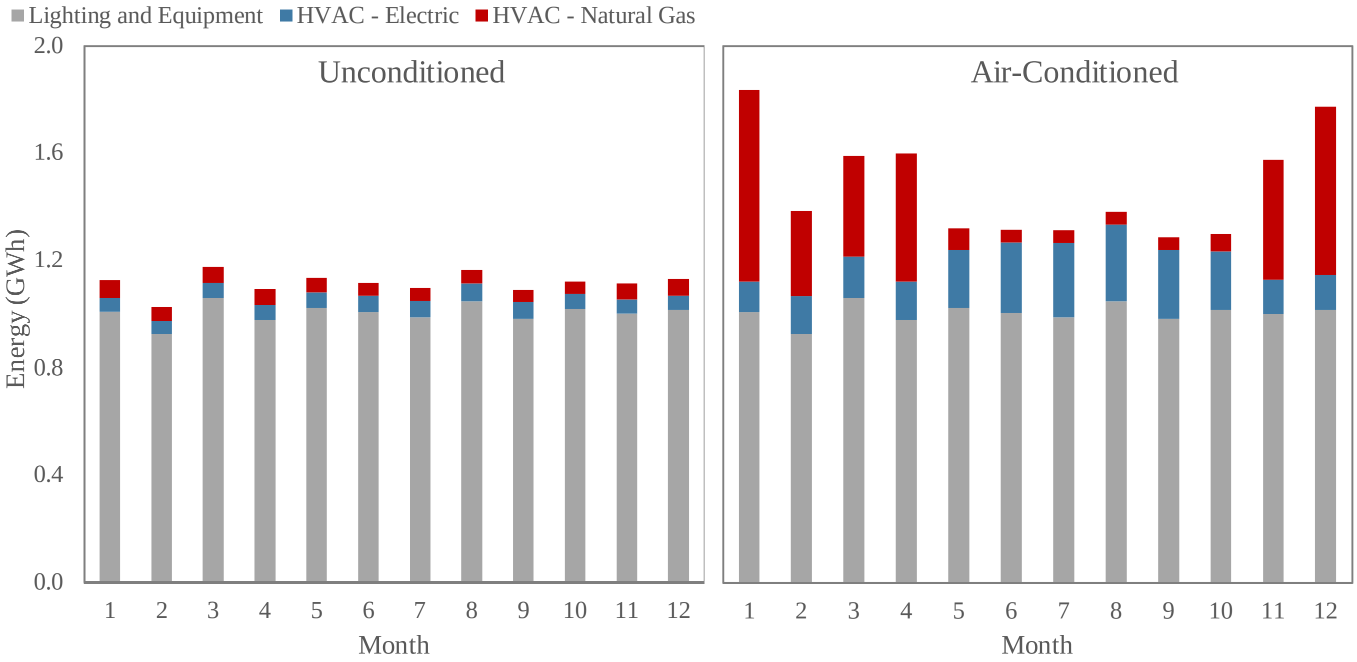


Figure 3 details an average weekday electric load profile projected for the Phase 1 unconditioned and air-conditioned WLC buildings during the summer and winter. As anticipated, the warehouse's operating schedule determines the shape of the load profiles. Demand quickly ramps up during the start of the 8:00 AM shifts and then remains relatively flat for the rest of the day. There is a small dip around 6:00 PM when the office schedule ends but the major drop happens at 12:00 AM when the warehouse shift ends. The need for air conditioning adds to the air-conditioned warehouse demand during the summer while there is little difference between the unconditioned and air-conditioned warehouses during the winter.

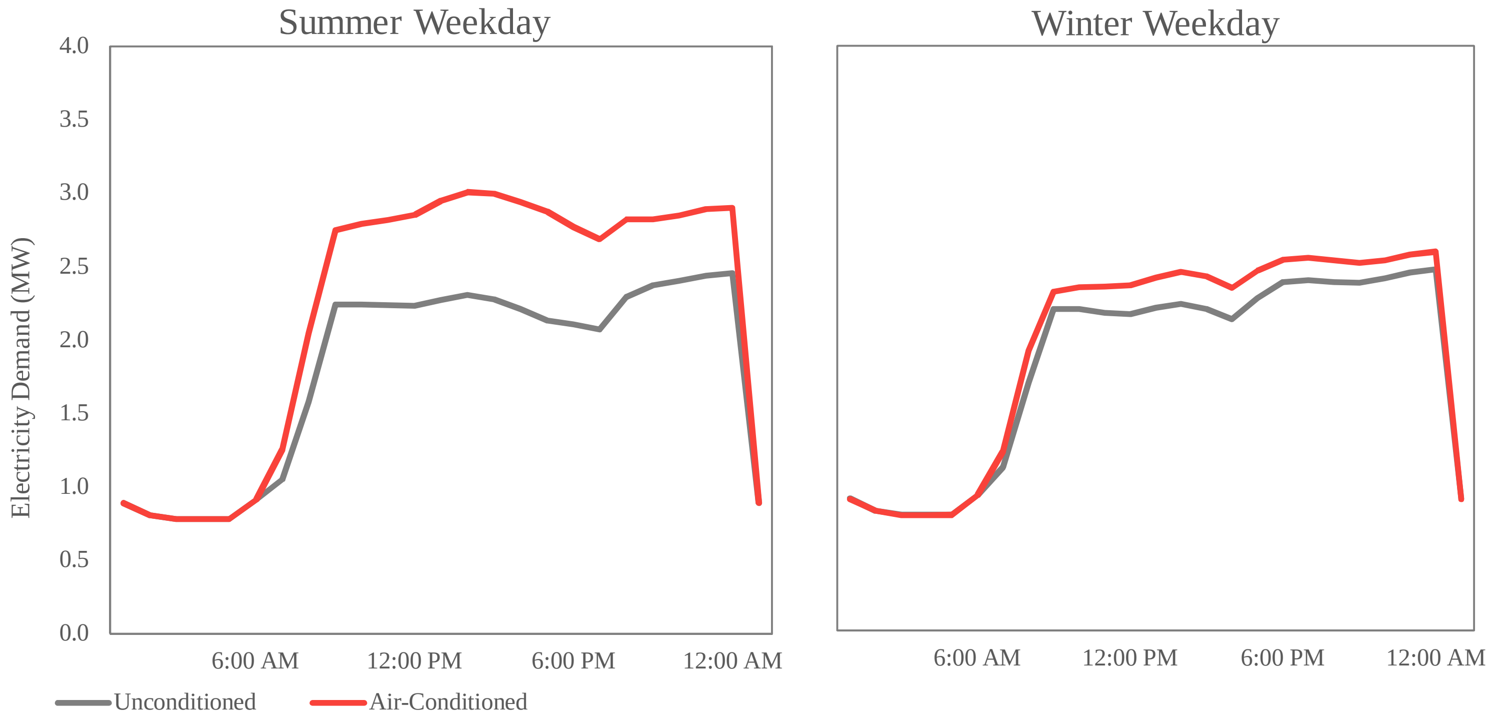
Figure 3: Average weekday electric load profiles for Phase 1 buildings



The peak electric demand for each of the 13 Phase 1 buildings with an unconditioned warehouse is projected to be about 2.1 MW, including estimated EV charging loads. The peak for each of the two Phase 1 buildings with air-conditioned warehouses is projected to be about 4.1 MW. Total aggregated peak demand at the end of Phase 1 construction is projected to be approximately 34.9 MW across 13 buildings with unconditioned warehouses and two buildings with air-conditioned warehouses. *Note that these are peak demand values as opposed to the average demand values depicted in Figure 3.*

For Phase 2, the peak electric demand for each of the 11 Phase 2 buildings with an unconditioned warehouse is projected to be about 3.7 MW, including the substantially greater EV charging loads that are projected for the 2025 – 2040 Phase 2 period. The peak for the one Phase 2 building with an air-conditioned warehouse is projected to be about 5.4 MW. Total aggregated peak demand at full build-out is projected to be approximately 58.2 MW across 24 buildings with unconditioned warehouses and three buildings with air-conditioned warehouses.

3.3 ELECTRIC VEHICLES

In addition to building energy consumption, electric vehicles are expected to contribute significantly to the electricity demand and consumption at the WLC. For this analysis, electric vehicle (EV) demand and consumption were calculated based on Title 24 code requirements, vehicle traffic, battery sizes, and anticipated charging requirements. Only passenger EVs and light-duty truck EVs were considered. No medium-duty or heavy-duty trucks were included since current code is silent on these vehicle classes. The resulting hourly data was then added to the building model outputs to create combined load profiles.

Peak EV charging rate was estimated by allocating the annual electricity consumption of EVs – the average daily consumption multiplied by 365 – on an hourly basis per the building operating schedules. Specifically, EV charging was assumed to follow the same hourly schedule as that of the building interior lighting and process loads. Logically, when the lights are on and the process equipment is operating, staff are on duty and the vehicles that brought them to the building are parked in the parking lot. The annual EV electricity usage was allocated across each week day and each weekend day such that the hourly EV load shape tracked the lighting and process load shape all year long.

The resulting peak electric load imposed by EV charging is about 25% of the aggregate nameplate capacity of all charging stations. This result is in line with industry expectations that charging blocks managed with automated 'smart' controls will reduce the coincident peak demand to 20-25% of the aggregate capacity of the individual charging stations. So for example, when all charging stations of a 100 kW-rated charging block are plugged into EVs, the block is expected to experience a maximum power draw of only about 25 kW at any point in time.

The incremental EV charging loads projected for WLC determine the peak and the minimum daytime electric loads on each building. The daytime minimum defines the maximum amount of PV that MVU's rules allow on each building's roof. See Section 5.4 for details.

3.4 BASELINE ENERGY PERFORMANCE

Because of the anticipated improvements in building energy performance and the expected rise of electric vehicles, Phase 2 models were adjusted to 2040 conditions. The electric vehicle load is expected to increase 20-fold during Phase 2 while the average Title 24-compliant building energy consumption is expected to decrease by about 13% in Phase 2. The breakdown of energy usage intensity (kWh/ft^2-yr) is shown in Table 4 for Phase 1 and Phase 2 buildings with unconditioned and air-conditioned warehouses.

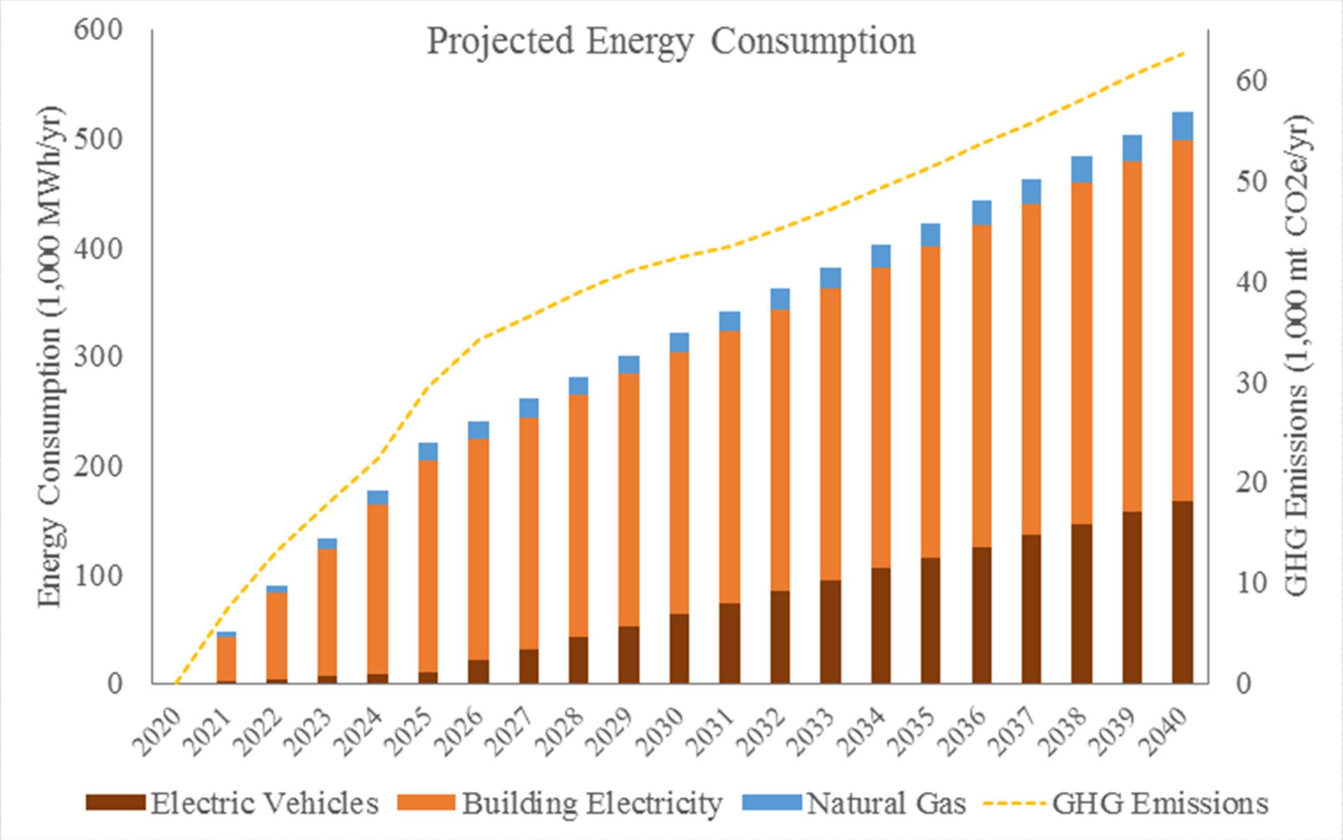
Table 4: Breakdown of energy usage intensity (kWh/ft^2-yr) for Title 24-compliant buildings

End Use	Phase 1		Phase 2	
	Unconditioned	Air-Conditioned	Unconditioned	Air-Conditioned
Equipment and Lighting	8.02	8.02	7.08	7.08
HVAC	0.88	3.73	0.81	3.43
Building Total	8.90	11.75	7.88	10.51
Electric Vehicles	0.48	0.48	9.66	9.66
TOTAL	**9.38**	**12.23**	**17.55**	**20.17**

3.5 WLC ENERGY PROJECTIONS

Based on the results of the energy modeling and electric vehicle load definitions, the Title 24-compliant annual energy consumption and GHG emissions profile shown in the following figure were derived for the WLC over the buildout of the project. This projection considers expected changes to California's electric grid (ever-increasing amounts of renewable electricity in the mix) as well as the estimated increased penetration of passenger EVs and light-duty truck EVs at WLC in future years.

Figure 4: Projected Title 24-compliant annual energy consumption and GHG emissions of WLC over build-out period



4 DEMAND-SIDE ENERGY ANALYSIS

4.1 RECOMMENDED MEASURES

Energy efficiency is often the most cost-effective method to reduce the energy and carbon impacts of a building. Regulatory constraints limiting the capacity of on-site renewables that can be implemented at the WLC, outlined further in Section 5: Supply-Side Energy Strategy, further highlight the importance of reducing energy consumption through demand-side measures.

Using the baseline energy models discussed in Section 3: Baseline Performance, WSP evaluated a wide range of energy conservation measures (ECMs) to identify the most cost-effective set for reducing building energy consumption and related emissions beyond Title 24 energy code. The engineering analysis underpinning this proposal led WSP to reject some of the evaluated demand-side options because they are duplicative with other more advantageous options or are incompatible with the most advantageous HVAC systems. The ECMs outlined in Table 5 are the best choice for the WLC based on maximizing environmental protections in the most cost-effective manner practical.

The ECMs address internal loads, such as lighting and equipment, as well as the energy required to provide heating, cooling, and domestic hot water. While most energy consumption is due to lighting and equipment loads, there is still an opportunity to reduce the amount of energy required to provide heating and cooling for the buildings. For the office space, the recommended system is underfloor air distribution coupled with water-cooled variable refrigerant flow (VRF) technology that is served by a shared water loop. The shared water loop allows for sharing of energy among zones so that if one zone requires heating while another requires cooling, energy can be transferred between zones resulting in built-in energy recovery. If additional cooling is needed during extremely warm weather, a cooling tower provides supplemental heat rejection to the atmosphere.

Air-conditioned warehouse spaces are recommended to be served by displacement ventilation whereby conditioned air is delivered at low velocity from air diffusers near floor level. Cooling of supply air is achieved via direct evaporative cooling sections that deliver sufficiently cool air at required warehouse conditions for most hours during the typical weather year. During hours that evaporative cooling doesn’t meet the cooling load or doesn’t maintain acceptable relative humidity in the warehouse, VRF systems are utilized for supplemental space cooling. The shared water loop of the warehouse VRF systems is connected to an air-to-water heat pump to provide supplemental cooling via heat rejection to the atmosphere. When heating requirements exceed the heat recovered within the shared water loop by the VRF units, supplemental heat for the water loop is extracted from the atmosphere by the same air-to-water heat pump running in reverse.

Because all heating and cooling in the buildings is provided via direct evaporative cooling and heat pumps, natural gas is not required. This allows the WLC to eliminate on-site fossil fuel combustion that would normally be associated with service water and space heating, thereby eliminating associated air emissions. Additionally, in all-electric buildings there is not a need for natural gas distribution infrastructure. Cleaner options could be considered by WLC tenants to fuel back-up generators, including E85 (85% ethanol, 15% gasoline), biodiesel, propane, and batteries. SCAQMD discusses permitted emergency generation at http://www.aqmd.gov/home/permits/emergency-generators#Fact1.

The WLC Specific Plan has previously publicly committed to certain energy efficiency features that will appear in the WLC buildings. The ECMs in Table 5 go substantially beyond that previous commitment in terms of the features of the buildings. They individually and collectively, in addition to the HVAC systems recommended above, reduce the amount of energy consumed by the various equipment that the buildings will contain. This package of ECMs delivers energy performance that exceeds minimal compliance with current Title 24 requirements by 16-17%. Table 6 summarizes the energy performance of the ECM package.

Table 5: ECM Descriptions

Category	ECM Description	Application Area
Envelope	Optimal Choice of Vertical Fenestration Construction	All
	Optimal Choice of Skylight Construction	Warehouse
	Optimal Window to Wall Ratio	All
	Optimal Skylight to Roof Ratio	Warehouse

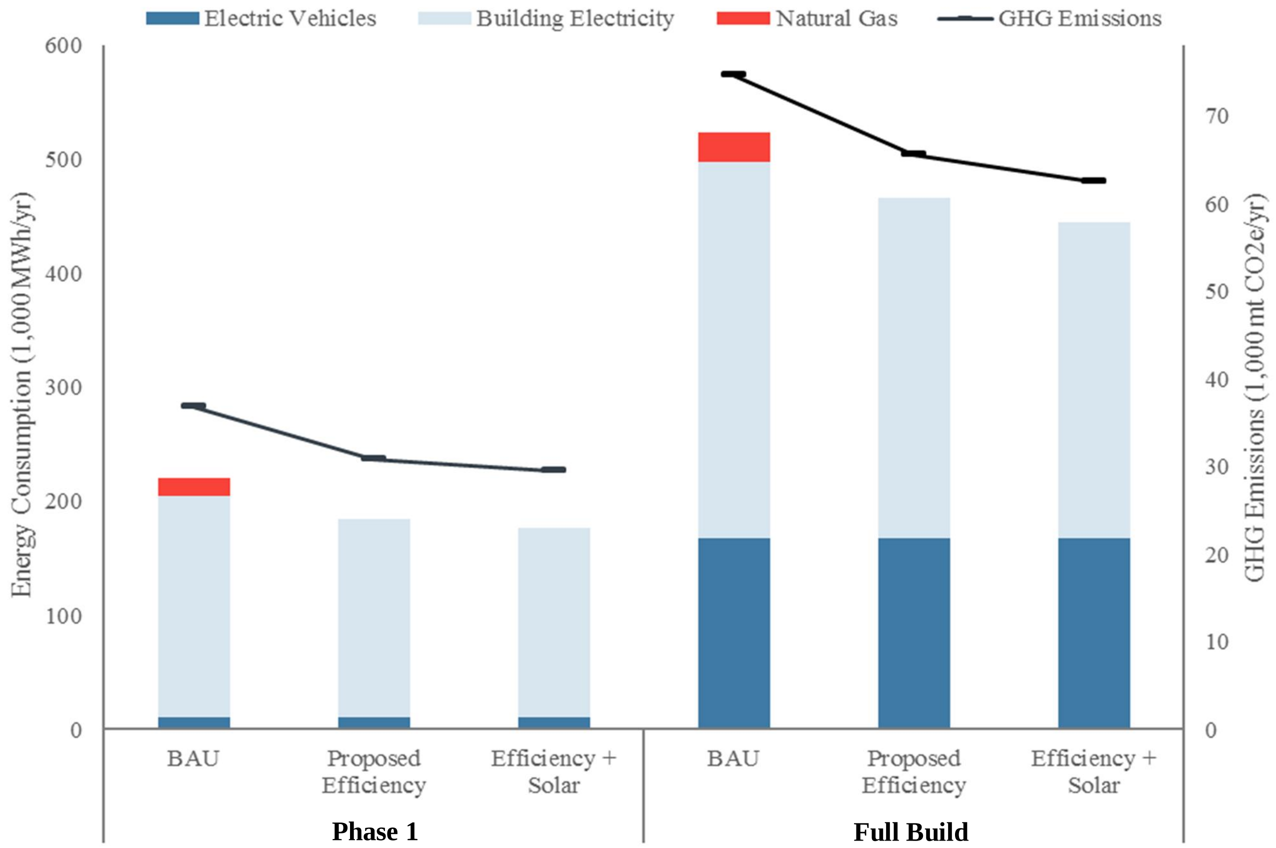
Stage	Energy Savings (MWh/yr)	Energy Savings (%)	GHG Savings (tonnes CO_2e/yr)	GHG Savings (%)	Renewable Energy Supply (%)*
Phase 1	34,892	16.7%	6,019	10%	49%
Full build	57,449	16.2%	9,085	18%	55%

*Renewable energy fraction takes account of renewables on the California grid

The impact of the recommended ECMs on the annual energy consumption and GHG emissions of the WLC at the end of Phase 1 is shown in Figure 5.

Figure 5: Phase 1 and Full Build-Out Energy and GHG Results



4.2 TENANT LOADS

It is unknown at this time who will be the tenants within the WLC buildings. Warehouse operations could vary widely, from relatively low-energy operations featuring high-pile goods storage and materials to relatively high-energy operations featuring highly automated facilities with extensive material handling equipment. WSP's analysis assumes the typical WLC tenant will have highly automated warehouse operations. Because the WLC developer has no direct control over warehouse equipment and operations, the ECM analysis did not consider any opportunities to reduce energy usage by warehouse equipment.

5 SUPPLY-SIDE ENERGY STRATEGY

5.1 ENERGY SUPPLY SCREENING

As a preliminary step in developing a sustainable energy strategy for WLC, WSP has undertaken a high-level screening analysis of renewable energy technologies. The purpose is to identify feasible supply options. The screening criteria used in this exercise are categorized in the matrix below as Carbon, Resiliency, Financial, Technical, and Regulatory:

Table 7: Screening Criteria Matrix

Screening Criteria	✓	✗	—
Carbon	Net carbon emissions will be reduced	Net carbon emissions will not be reduced	Effect on net carbon emissions is unclear without analysis
Resiliency	Energy resiliency will be enhanced	Energy resiliency will not be enhanced	Effect on energy resiliency is unclear without analysis
Financial	Financial performance will likely be attractive	Financial performance will likely be unattractive	Financial performance is unclear without analysis
Technical	No anticipated technical challenges	Technical challenges are expected	Existence of technical challenges is unclear without analysis
Regulatory	No anticipated regulatory challenges	Regulatory challenges are expected	Existence of regulatory challenges is unclear without analysis

Incorporating high-performance energy efficiency into the WLC is the least-cost sustainable energy resource available and, thus, should be the first step in reducing energy demand and greenhouse gas (GHG) emissions. Furthermore, improving the energy efficiency of the buildings will reduce the additional electrical distribution capacity that must be built to supply the WLC, and MVU may be able to avoid associated substation, transformer, and local distribution capital costs. WLC has committed to achieve energy efficiency 10% better than 2008 Title 24 code or the most current code at the time of construction, whichever is more efficient. Additional, cost effective efficiency improvements are possible through adoption of additional available energy efficiency opportunities identified by the Energy Demand Side Analysis task (see Section 5 of this report).

In the business-as-usual (BAU) scenario, each warehouse will be served by 12 kV service from the Moreno Valley Electric Utility (MVU). Currently the WLC developer intends to own the buildings. However, under certain circumstance, the developer may wish to sell portions of an individual building or an entire building. In any case, the developer expects that the building occupants will be responsible for paying utility bills.

The figure below shows the results of the high-level qualitative screening analysis.

Table 8: Energy Resources Screening Results

Supply Option	Screening Criteria

In-line hydro	✓	✓	—	✗	—
Microgrid	✓	✓	✗	✓	✗
Natural gas pressure recovery	✓	✓	—	✗	—
Wind	✓	—	—	✗	✗

The WLC build-out cycle will occur over 20 years. The evident trends in the decreasing capital cost and the increasing efficiency over time of PV, batteries, lighting technology, and controls technology have been considered and are reflected in the analyses underpinning the comparison of renewable energy technologies.

Energy supply options that warrant further investigation are discussed in sections 5.3 – 5.6. These investigations were conducted using the HOMER energy modeling software. Several supply options were removed from consideration and are discussed briefly described below.

Biomass:

Biomass systems replace conventional fuel boilers with boilers that burn biofuels, such as agricultural residues, forest and mill residues, and urban wood waste. Biomass systems can be used to generate heat only, or, generate both heat and electricity. Because WLC is expected to have minimal heating loads, the most advantageous configuration would be to use biomass to generate electricity and potentially heat for use in an absorption chiller.

An analysis using National Renewable Energy Lab's System Advisor Model found that there are limited biomass resources available within a 50-mile radius of WLC, enough for roughly 11 MW of generating capacity, and that these resources primarily consist of urban wood waste. Due to the logistical complexity of obtaining and ensuring sufficient feedstock and concerns about criteria pollutant emissions, specifically NO_x in this SCAQMD air shed, WSP has not given biomass further consideration.

Biogas/landfill gas:

Biogas is a methane-rich gas, similar to natural gas, that can be generated from wastewater treatment plants, landfills, and anaerobic digesters. Biogas could potentially be sourced from the Badlands Landfill, which is less than a mile north of the planned site of WLC. However, the amount of gas presently being captured at the landfill is relatively small – 1.3 million cubic feet per day, which is sufficient to generate roughly 2 MW of electricity. Much of the gas is already being used to generate electricity at the Badlands Landfill[1]. Therefore, WSP has not given further consideration to the direct use of biogas.

District energy:

District energy distribution is a common approach for supplying both heating and cooling energy to universities, medical and military campuses, and urban areas. District energy can be a tool for achieving GHG and energy use reductions by serving buildings with centralized, high-efficiency equipment instead of distributed, less efficient systems. District energy systems can open the opportunity to recover heat rejection from one building to be used as a heat source in another building. Lastly, district energy systems can reduce the overall plant equipment installed in the district, since diversity (not all buildings peak at the same time) and back-up systems can be centralized.

However, the benefits mentioned above are best realized by dense development with a large building diversity, i.e. a mixture of commercial, community, residential, and retail space. In the WLC, it is expected that the buildings will have similar loads, therefore reducing the potential for capital savings to be unlocked by a district energy system's ability to exploit high demand diversity on the customer side. While there are no technical constraints to district energy, most of the warehouses are unconditioned and so the distance between air-conditioned spaces in the WLC makes the cost of installing a district energy distribution system prohibitively expensive.

In addition, SCAQMD air quality standards are greatly exceeded by current air pollution levels in the WLC air shed. District energy systems that are energized by the combustion of fuels will exacerbate the already untenable local air quality and so are not given further consideration. District energy energized by electrically driven heat pumps are discussed in Section 5.2 below.

In-line hydro:

WSP understands that a 145-inch diameter water transmission pipeline, owned by the California Aqueduct/Metropolitan Water District, crosses the project area. In-line turbines can be used to generate electricity from water flowing through transmission pipelines. While this offers the opportunity for zero-carbon electricity to be generated at WLC, the generation potential is expected to be small and complexity relatively high. Therefore, WSP did not give further consideration to in-line hydro.

Microgrid:

Microgrids are local electricity distribution systems that can be "islanded", ie, they can operate independently of the regional grid when the latter experiences a failure. The resiliency provided by microgrids can sustain operations that are mission-critical. Such resilience can also greatly benefit operations that value the ability to continue operating in the face of a grid interruption. However, electricity distribution regulations preclude delivery of electric power across public rights-of-way by any entity besides the utility. Furthermore, MVU is currently precluded from owning/operating generation assets. Finally, the extra expense of the specialized microgrid equipment causes microgrid economics to favor high-density collections of buildings, such as urban districts and campuses. The layout of WLC and MVU restrictions only accommodate small clusters of buildings, perhaps two or three buildings. At this scale, a microgrid is impractical and so WSP has not given microgrids further consideration.

Natural gas pressure recovery:

Several high-pressure natural gas pipelines cross the property. These can be used to generate electricity by dropping the high pressure in the pipes down to local distribution pressure through expansion turbines. There are strict rules and safety standards governing the natural gas transmission facilities. While this offers the opportunity for zero-carbon electricity to be

---

[1] EPA's LMOP database, *Landfill- and project-level data (2018).xlsx*, February 2018.

generated at WLC, the generation potential is expected to be small and complexity relatively high. Therefore, WSP has not given further consideration to natural gas pressure recovery.

Wind:

The annual average wind speed in Moreno Valley is relatively low[2]. In addition, while utility-scale wind farms are very cost competitive, smaller-scale wind technology deployments are less so. Furthermore, on-site deployment of wind turbines would likely face opposition by regulators and the public over safety and noise concerns. For these reasons, WSP has not given further consideration to on-site wind.

5.2 GROUND-SOURCE HEAT PUMP

A ground-source heat pump (GSHP) plant uses a reversible chiller (heat pump) to provide both heating and cooling to the building(s) being served. Typically, a ground loop consisting of a field of vertical geo-exchange boreholes (300-600 ft deep) is drilled below the lowest parking level of the site. Other configurations, such as foundation- and slab-integrated exchange fields, have been used successfully in numerous locations.

Under the right conditions, these systems can provide improved heating and cooling performance seasonally compared to an air-source heat pump or traditional natural gas or electric resistance heating. Furthermore, they can eliminate noise, rooftop equipment, and cooling towers and associated water use. GSHP heating and cooling is one means to make the transition to an all-electric energy profile, thereby creating a possible pathway for WLC to eventually offer buildings with the potential to be powered by 100% renewable energy.

However, GSHP is not recommended in the WLC location due to building space cooling requirements being much greater than space heating needs. Such an imbalance would cause the geo-exchange field to grow increasingly warmer over time. This, in turn, would degrade GSHP performance in providing building space cooling. For this reason, VRF reversible heat pumps are recommended for offices and air-conditioned warehouses. These systems also create a possible pathway for WLC to eventually offer buildings with the potential to be powered by 100% renewable energy.

5.3 FUEL CELL COMBINED COOLING, HEAT, AND POWER

CCHP plants generate electricity and useful thermal energy through the capture of waste heat. Combined heat and power plants (CHP) supply thermal energy as heat and combined cooling heat and power plants (CCHP) provide thermal energy as both heating and cooling, the latter by means of an absorption chiller. Making use of waste heat from electricity generation increases the overall efficiency of the plant.

WSP evaluated the suitability for CCHP – using a fuel cell as primary plant equipment – to reduce lifetime GHG emissions from the WLC. While fuel cells are costlier than combustion turbines and reciprocating engines (the CCHP primary equipment alternatives), they have the advantage of dramatically lowering NO_x emissions, which is an important criterion in this SCAQMD air shed.

Because the California electricity grid features so much renewable energy and is therefore so clean, and getting cleaner every year, on-site electricity generation by CCHP, energized by natural gas-fed fuel cells, actually produces more GHG emissions and requires more overall energy consumption when compared to WLC receiving all required energy from the grid.

While fuel cells offer an advantage through shifting energy usage from electricity to cheaper natural gas, they would increase site energy consumption and GHG emissions compared to the base case while decreasing the percentage of renewables in the WLC’s energy supply due to decreased use of cleaner grid electricity. Because California’s grid electricity already contains a high percentage of renewable electricity, it is less carbon intensive than the electricity generated by a fuel cell. While fuel cells are more efficient than the natural gas-fired power plants that operate during periods of peak power demand on the

[2] Wind resource estimates developed by AWS Truepower, LLC for windNavigator . Web: http://www.windnavigator.com | http://www.awstruepower.com. Spatial resolution of wind resource data: 2.5 km. Projection: UTM Zone 11 WGS84.

California grid, the long-term expectation of the California Energy Commission and EIA is that the majority of new capacity in California will come from renewables, not from gas-fired plants. Considering this, using generating capacity at WLC that relies on natural gas, even if it is efficient fuel cells, will increase WLC emissions.

Table 9 summarizes the performance of fuel cell CCHP at WLC. Negative values indicate net increases compared to baseline.

Table 9: Fuel Cell CCHP Performance

Stage	Energy Savings (MWh/yr)	Energy Savings (%)	GHG Savings (tonnes CO_2e/yr)	GHG Savings (%)	Renewable Energy Supply (%)*
Phase 1	-95,739	-52%	-18,425	-60%	19%
Full build	-240,849	-52%	-50,888	-78%	21%

*Renewable energy fraction takes account of renewables on the California grid

5.4 SOLAR PV

On-site solar PV generation is scalable, becoming more cost competitive as project size increases, and can thus be a foundational component of WLC's sustainable energy strategy. Understanding available options and trade-offs is important to optimize the use of solar at WLC. WSP has analyzed the feasibility and impact of on-site solar at the WLC, considering the trade-offs between roof- and ground-mounted solar and current and future electric rate structures.

As pointed out in Section 2.2.1, MVU limits on-site PV size to one-half the minimum electric demand a building experiences during daytime hours. To determine the specific allowable PV size, WSP analyzed the hourly electric loads simulated using the IES modeling software. Phase 1 building simulation produced a minimum daytime electric load of about 600 kW. The minimum daytime electric load for Phase 2 buildings was simulated to be about 1,600 kW. Thus, to stay within all the constraints facing the WLC project, Phase 1 buildings can feature 300 kW of PV (one-half the 600 kW minimum daytime electric load) and Phase 2 buildings can feature 800 kW. At these PV system sizes, a total of 4.5 MW of PV capacity would exist at WLC at the end of Phase 1 and a total of 14.1 MW of PV capacity would exist at WLC at full build-out.

The WLC Specific Plan commits to meet the annual energy requirements of all office spaces with PV, thereby effectively achieving net-zero energy (NZE) office operations. Since each individual WLC building is expected to feature about 60,000 sqft of office space, this is the equivalent of fifteen 60,000 square-foot office buildings at WLC achieving NZE consumption by 2025. The entire state of California has about 30 NZE office buildings in operation, under construction, or publicly committed as of 2016[3]. Thus, the WLC Specific Plan will grow California's NZE office population by about 50% by 2025. At full WLC build-out there will be the equivalent of twenty seven 60,000 square-foot office buildings achieving NZE status.

WSP estimates that the offices in each typical WLC building will consume about 474,120 kWh/yr and experience peak electric demand of about 280 kW. The maximum allowed amount of PV capacity/building in Phase 1 (300 kW) will generate about 512,275 kWh/yr at the WLC location. The maximum allowed amount of PV capacity/building in Phase 2 (800 kW) will generate about 1,366,400 kWh/yr. Thus, in all cases, the maximum allowed PV capacities are sufficient in both Phase 1 and Phase 2 to satisfy 100% of the office energy needs, thereby meeting the NZE objective for WLC office space.

---

Table 10 summarizes the performance of solar PV at WLC in the amounts allowed by MVU.

Table 10: Solar PV Performance

Stage	Energy Savings (MWh/yr)	Energy Savings (%)	GHG Savings (tonnes CO_2e/yr)	GHG Savings (%)	Renewable Energy Supply (%)*
Phase 1	7,686	4%	1,276	4%	51%
Full build	24,083	5%	3,386	5%	57%

*Renewable energy fraction takes account of renewables on the California grid

5.5 ENERGY STORAGE

Energy storage using either Lithium-ion batteries or Vehicle-to-Grid technology (see below) is not viable under current regulatory and economic conditions. For example, MVU currently has no policies or rules that would allow WLC to use battery storage to increase usage of solar electricity. However, these conditions may change. In the future, energy storage may help:

- maximize direct use of on-site renewable electricity generation,
- optimize the building's demand curve ("peak shaving") to reduce strain on the electric grid and lower WLC tenant demand charges,
- shift WLC on-site electricity generation to time-of-use periods with lower electricity rates ("load shifting").

5.5.1 LITHIUM-ION BATTERIES

Lithium-ion (Li-ion) batteries can connect to electrical systems and store electricity. Because of the MVU solar sizing limit, there is no excess solar generation available to charge a battery with the Phase 1 and Phase 2 300 kW and 800 kW solar systems. In addition, MVU currently disallows the use of batteries to get around the PV size limits by enabling the generation and storage of excess solar output without feeding power to MVU's system.   Consequently, greater renewable energy penetration at WLC is not currently possible. Further, MVU's rate structures, combined with WLC's load characteristics, make battery integration unviable – MVU's Time-of-Use rates do not match up with WLC's peak electric usage and WLC's electric load profiles are not 'spikey' enough for batteries to deliver meaningful reductions in the electric demand charge.

5.5.2 VEHICLE-TO-GRID

This section is included in the report for completeness of the energy storage discussion. Vehicle-to-grid (V2G) technology is not currently available but is expected to become available at some point during WLC build-out period.

A V2G system uses the on-board battery packs of parked electric vehicles as distributed energy resources to store electricity for use during peak electricity demand periods. Smart controls on EV charging stations will enable each EV owner to decide whether or not to allow V2G charging and discharging of the EV's battery pack. MVU rules and rate structures would need to change to accommodate V2G technology and to incentivize EV owners to make their vehicle's batteries available while the vehicle is parked.

Vehicle manufactures currently do not enable 2-way V2G exchanges of electricity, but this is expected to change in the coming years. Like stationary Li-ion batteries, V2G could be used by WLC in the future to maximize use of on-site renewable electricity and perform peak-shaving and load-shifting functions if MVU's rules and rate structures were to change. Electric vehicle population estimates for WLC suggest that significant amounts of potential V2G storage would be available for Phase 1 if electricity exchanges were enabled. With the anticipated proliferation of electric vehicles, V2G storage potential will increase substantially for Phase 2. Should V2G technology be enabled in the future, it should be investigated.

5.6 OFF-SITE RENEWABLE ENERGY PROCUREMENT

Various mechanisms exist for many electricity customers to procure renewable energy from off-site projects, including renewable energy certificates, green tariffs, power purchase agreements, virtual power purchase agreements, community choice aggregation, and directed biogas. Procurement of off-site renewable energy can hedge against energy cost fluctuations, support the development of new renewable energy projects, and allow electricity consumers to claim the environmental benefits associated with the renewable energy generation. However, off-site procurement of renewable energy does not reduce the consumers' reliance on the electric grid to transport electricity nor the natural gas grid to transport biogas. Furthermore, off-site renewable energy procurement is likely to come at a cost premium to the energy end-user.

Under current regulations, WLC tenants will be able to purchase electricity only from MVU. Should electricity regulations change in the future to allow procurement of off-site renewable energy, and should WLC tenants elect for corporate, marketing, or other reasons to pursue procurement of off-site renewable energy, the means of doing so via one of the means presented in this report may become available to them.

The price premium associated with off-site renewable energy procurement would increase WLC tenant utility costs and thus run counter to the Project Objectives and the City's Economic Development Objectives (see Section 3.6 of the Project Final EIR and Section 1.3.1 of the WLC Specific Plan). Even if regulations allowed it, it would be counterproductive to require WLC tenants to procure renewable energy from off-site sources. Rather, WLC must establish and maintain a competitive position that supports achievement of the Project and City objectives. For these reasons, the concept of requiring a tenant to procure off-site renewable energy was not considered a viable sustainable supply option to impose on the Project. However, for the sake of completeness, WSP has evaluated the means for off-site procurement of renewable energy at WLC. We herein describe multiple off-site renewable electricity procurement methods that are available in many other electric utility service territories. These include:

- Unbundled renewable energy certificates (RECs);
- Power purchase agreements (PPAs);
- Community choice aggregation (CCA);
- Green tariffs.

Each option is evaluated on the following criteria:

- Market credibility;
- Relevance to future zero net energy regulations expected to be implemented in California;
- Risk profile;
- Impact on lifetime energy costs of the development.

Pricing of green power is highly variable depending on the particular circumstances surrounding each individual project or the current pricing offered by commodities markets. Thus, it is impossible to estimate with any accuracy what might be the impact on overall WLC energy costs if green power were part of the equation. The discussions below present some limited indications of possible cost considerations. It would be prudent to assume that some amount of cost premium would come with green power. To the extent this is the case, the resulting higher electricity costs would run counter to the strategic objective of the City of Moreno Valley to use low-cost electricity as an economic development tool.

5.6.1 BACKGROUND INFORMATION

RENEWABLE ENERGY CLAIMS

Renewable electricity generation projects produce two products of interest; physical electricity and RECs. RECs are an important characteristic of green power to understand, because they are the mechanism that allows an organization to claim the renewable benefits of a green power project. The Environmental Protection Agency (EPA) defines a REC as the representation of the property rights to the environmental, social, and other non-power qualities of one MWh of renewable electricity generation, which can be sold as a separate commodity from the electricity being produced by the renewable energy system.[4]

If RECs are sold together with their associated electricity, they are known as bundled RECs. If they are sold separately, they are known as unbundled RECs.

To be able to claim and communicate the renewable energy benefits from any green power, an organization must own and retire the RECs associated with the green power, or have the RECs retired on its behalf per the Federal Trade Commission's Green Guides.[5]

For all options evaluated herein other than unbundled RECs and Community Choice Aggregation, it is assumed the end purchaser of off-site renewable energy can claim ownership to the associated RECs per the FTC's guidelines.

ZERO ENERGY BUILDINGS IN CALIFORNIA

Relevant to this project, the California Energy Efficiency Strategic Plan indicates that "50% of commercial buildings will be retrofit to Zero Net Energy by 2030."[6] Zero Net Energy for the commercial sector being defined as "an energy-efficient building where, on a source-energy basis, the actual annual consumed energy is less than or equal to the on-site renewable generated energy." Source energy is all energy consumed on-site "plus the energy consumed in the extraction, processing and transport of primary fuels such as coal, oil and natural gas; energy losses in thermal combustion in power generation plants; and energy losses in transmission and distribution to the building site."[7]

For the purposes of this analysis, it is assumed that the California Energy Efficiency Strategic Plan is aligned with the U.S. Department of Energy (USDOE) definition of Zero Energy Buildings and the associated guidance in relation to the use of off-site energy in achieving zero energy status. USDOE guidance indicates that net zero energy status can be achieved through the purchase of off-site renewable electricity for energy efficient buildings that have maximized the installation of on-site renewable energy. The USDOE Zero Energy Building definition does not include specific guidance on what off-site renewable energy procurement mechanisms can be used toward net zero energy status.

5.6.2 UNBUNDLED RENEWABLE ENERGY CERTIFICATES (RECS)

An organization can directly purchase RECs that are unbundled from the electricity supply. When purchased as unbundled commodities, RECs provide no physical electricity to the purchaser. Instead, the purchaser will continue to contract with their utility for electricity generated by the region's grid mix (including non-renewable fuel sources), but purchase the environmental attributes from individual green power projects.

RECs may be purchased in regulated or deregulated markets, and across markets, providing renewable attributes to electricity use at facilities of choice, regardless of geography or local green power resources. However, because unbundled RECs are typically purchased from existing renewable energy projects, their impact on the development of new green power projects is not as direct or significant as with other green power procurement options. Unbundled RECs are typically available for a price premium of about 1% of the cost of physical power.

Table 11: Unbundled RECs.

CRITERIA	EVALUATION
Market credibility	Based on WSP's experience in the renewable energy marketplace through memberships such as Rocky Mountain Institute's (RMI's) Business Renewable Center, corporate renewable energy buyers are evolving their renewable energy procurement strategies to go beyond unbundled RECs. This evolution is due to the desire to have more of an impact on development of new renewable energy generation. Unbundled RECs typically come from renewable energy generation already in operation, and thus are perceived to have a lower impact on new generation.
Relevance to future zero net energy regulations expected to be implemented in California	Per USDOE, energy efficient buildings can achieve net-zero energy status using RECs if physical limitations preclude the building from fully meeting its energy demand with on-site renewables. These buildings can achieve net zero energy status with the "REC-ZEB" qualifier.WSP's opinion is that unbundled RECs would qualify under the current forecasted regulation only after the demand and supply side options outlined herein are implemented. It is uncertain whether the limitations on the size of on-site solar imposed by MVU would qualify the buildings in the WLC to achieve net zero status using RECs. Importantly, unbundled RECs are increasingly being considered low impact, and the leading governing bodies in the net zero energy space may require long-term contracts for such procurement. WSP is aware that market credibility is shifting away from unbundled RECs.
Risk profile	Purchasers of unbundled RECs are subject to spot pricing on an ongoing (e.g., annual) procurement cycle. There is no physical power risk associated with unbundled purchases.
Impact on lifetime energy costs of the project	There is no direct financial return on investment in purchasing unbundled RECs, nor does the purchase reduce vulnerability to future increases in electricity prices. Regardless if WLC tenants purchase unbundled RECs, there will be an increase to the energy costs of the project. Unbundled RECs are typically available for about 1% of the cost of physical power.

5.6.3 POWER PURCHASER AGREEMENTS (PPAs)

PPAs are contractual agreements used in the utility power sector for the long-term purchase of electricity produced by a specific project. For electricity producers, PPAs offer long-term revenue certainty with a credit-worthy purchaser that allows the project to attract capital investment. For electricity purchasers, PPAs offer a long-term supply of green power with price stability. In California, "Direct Access" agreements offer an alternative similar to a PPA, but using the utility as an intermediary. However, the program is currently at capacity and therefore not available to WLC tenants.[8]

Alternatively, WLC tenants may consider a virtual power purchase agreement (VPPA), also known as a synthetic PPA or "contract for differences." A VPPA is a financial swap that allows an electricity purchaser to provide financial and credit support to a project developer by setting a floor price for electricity sold by the project to the wholesale electricity market. If the wholesale price is below the floor price, the purchaser pays the developer the difference. If the wholesale price exceeds

---

[8] http://www.cpuc.ca.gov/General.aspx?id=7881

the floor price, the developer pays the purchaser. In return for guaranteeing a floor price, the purchaser may receive RECs from the project.

This option is a potential solution for customers that have electricity load distributed over many facilities or with loads in regulated electricity markets, like California. Unlike a physical PPA, synthetic PPAs do not include the physical consumption of electricity and therefore, there is no need for a purchaser's facilities to be in the same power market as the project. The combination of wholesale electricity market revenues and the floor price provides financial and credit support to the project owner sufficient to proceed with project financing and construction, thereby providing the critical support necessary for a new project to be implemented.

From an electricity purchaser's perspective, a VPPA can provide a long-term fixed supply of RECs along with potential for annual revenues on the contract. The purchaser, in a sense, is making a bet that market prices will continue to rise and that revenue from increasing prices will flow through the project to the purchaser. If properly structured, this contract can hedge against future electricity price increases or volatility. Purchasers must also understand the risk and financial exposure they face if market prices decline over the term of the agreement.

PPA pricing is highly dependent on the deal, and given the confidential, bilateral nature of the deals, pricing details are not publicly available. Moreover, VPPA deals discussed in the report, beyond a long-term contract for RECs, are often structured to be a hedge against of the price of electricity being procured by the offtaker (e.g., WLC tenants from MVU). VPPA pricing has fallen considerably over the past several years. Current publicly available estimates have VPPA prices at $22/MWh. As to whether this would represent a price premium, be cost-neutral, or result in increased income is dependent on the deal structure and electricity market pricing forecasts. The VPPA imposes an incremental cost on top of the cost WLC tenants pay to MVU for electricity. If the VPPA yields a cost savings, this benefit would effectively reduce the net cost paid to MVU for delivered electricity. However, if the VPPA yields a cost adder, it would effectively raise the net cost of delivered electricity. See https://www.epa.gov/greenpower/green-power-pricing for more details.

Table 12: VPPA Evaluation

CRITERIA	EVALUATION
Market credibility	PPA and VPPA transactions are viewed as having a higher impact relative to development of new renewable energy generation sources when compared to purchasing unbundled RECs. Net zero energy certification through voluntary programs such as the International Future Living Institute may require the project to be located physically close to the WLC.[9]
Relevance to future zero net energy regulations expected to be rolled out in California	The previously referenced Department of Energy paper titled "A Common Definition for Zero Energy Buildings" dated 2015 does not specifically address PPAs or VPPAs in the context contemplated in this report. However, if the RECs are obtained through the PPA or VPPA, WSP expects that these procurement methods will qualify for achieving zero net energy status per the Department of Energy Guidance, once efficiency and on-site renewables have been maximized.
Risk profile	There are several risk factors to evaluate when completing investment-grade due diligence on a PPA or VPPA contract, many of which are beyond the scope of this analysis. However, two risks germane to WLC are the typical contract length and price risk. Both are addressed just below. - Contract length: While the market is currently grappling with overcoming the length of typical deals, current structures are long-term commitments of 10-20 years. If WLC tenants are party to a PPA or VPPA, assuming the transactional complexity due to multi-party offtakers could be overcome, they would be contracting for a length of time (again, 10-20 years) that many businesses are not comfortable with. For example, this term may in fact be longer than the lease agreement at WLC. - Price risk: In PPAs and VPPAs, the purchaser can be exposed if future electricity prices drop below contract pricing. Contracts are typically for an electricity price forecast believed to outperform escalation of their current utility's forecasted rate. Some purchasers find value in having price certainty, which a PPA or VPPA could provide depending on the details of the contract.
Impact on lifetime energy costs of the project	PPAs and VPPAs can provide a hedge or "price stability" mechanism for electricity. If structured well, there should be either minimal or, at best, an improvement on the lifetime energy costs of the project. The discussion on price brings up the issue of the parties at the WLC that would enter into the PPA or VPPA. There are two options: the developer of the WLC or the tenants. Due to transaction costs and complexity, it is likely the only applicable party to execute a PPA or VPPA would be the developer. However, since the developer is not responsible for purchasing electricity – the tenants are – the transaction costs and any reconciliation of the price of the energy delivered to WLC and the price of the PPA or VPPA would likely have to be incorporated into the lease agreements.

5.6.4 COMMUNITY CHOICE AGGREGATION (CCA)

Community Choice Aggregation (CCA) is a program that allows cities and counties to buy and/or generate electricity for residents and businesses within their areas."[10] Basically, CCA is intended to provide utility rate payers with more options, which are increasingly providing green power procurement options.

CCA options are not currently available in Moreno Valley.[11] The below evaluation is provided in the circumstance that CCA options become available to WLC in the future. CCAs in California have shown they can be competitive with local utility pricing.

Table 13: CCA Evaluation

CRITERIA	EVALUATION
Market credibility	Purchasing from a CCA who has a higher than the required renewable energy fuel mix by actively bringing new renewable energy projects on line as opposed to procuring unbundled RECs would be viewed as credibly procuring renewable energy.
Relevance to future zero net energy regulations expected to be rolled out in California	As highlighted in the unbundled REC section above, the current DOE definition for zero energy buildings is not clear on certain emerging renewable energy procurement options such as PPAs, CCA, and green tariffs. Based on a New Building Institute paper titled "ZNE Project Guide for State Buildings", co-sponsored by California utilities PG&E and Southern California Edison, procurement from a CCA would qualify towards a zero energy build status.[12]
Risk profile	CCA procurement has a similar risk profile to conventional procurement from the local utility.
Impact on lifetime energy costs of the project	CCAs in California have shown to be competitive with local utility pricing.

5.6.5 GREEN TARIFF

Electricity markets in a growing number of states offer customers the ability to purchase green power directly from a local utility. These agreements allow the customer to contract for some or all of their purchased electricity to be attributed to existing green power projects feeding into the local grid. The utility will then retire the coinciding RECs on the customer's behalf, allowing the customer to claim the environmental benefits associated with the purchase of green power. Variations of this mechanism are available in regulated and deregulated markets. In deregulated markets, a customer may directly choose their electricity provider (e.g., CCA programs discussed above), while customers in regulated markets may have the option to pay a premium on their electric bill to claim energy generated from the utility's renewable portfolio.

---

[10] https://www.pge.com/en_US/residential/customer-service/other-services/alternative-energy-providers/community-choice-aggregation/community-choice-aggregation.page

[11] https://cal-cca.org/

[12] https://newbuildings.org/wp-content/uploads/2018/04/ZneProjectGuideForStateBuildings.pdf

Because utility products and green tariffs are typically based on existing renewable energy projects, their impact on the development of new green power projects is not as direct or significant as with other green power procurement options. MVU currently does not have a green tariff option. However, there may be an opportunity for Highland Fairview to work with MVU to develop such a tariff.

Per MVU's Integrated Resource Plan (IRP; 2015-2016), the utility indicates a desire to contract for new renewable energy.[13]

"*It is important to note that, due to typical project development timelines associated with renewable generator development, most of MVU's near-term incremental renewable energy requirements will need to be served by existing generators that have already qualified for California RPS eligibility. Looking forward, MVU may choose to contract with yet-to-be developed resources for renewable energy needs that have been identified in the medium- and long-term planning horizons. These planning horizons will allow sufficient time for necessary solicitation and contracting activities (to be completed by MVU) as well as new resource development. Based on recently completed renewable energy solicitations throughout the market, there appears to be ample renewable energy supply available for interested buyers, although prices are above the cost of conventional energy purchases. As discussed in this Plan, before making firm purchase commitments for additional renewable energy supply, MVU will continue to evaluate the cost/rate impacts that would result from additional renewable energy procurement.*"

Due to the large energy demands WLC will put on MVU, the developer of WLC may consider exploring working with MVU on the development of a green tariff similar to recent projects in regulated markets.[14] For example, Facebook recently worked to deliver two green tariffs with their local utilities in New Mexico and Nebraska.[15]

Pricing analysis for a green tariff (which is distinguished from utility green pricing products which could be the utility simply delivering unbundled RECs as part of the rate) is highly subjective to the structure of the rate. They may be cost competitive with current utility rates. See https://www.nrel.gov/docs/fy17osti/68179.pdf for more details.

Table 14: Green Tariff Evaluation

CRITERIA	EVALUATION
Market credibility	Development of a green tariff by MVU that is delivering renewable energy through an owned asset or a contract with an independent power provider would be perceived as being highly credible.
Relevance to future zero net energy regulations expected to be rolled out in California	As highlighted in the unbundled REC section above, the current DOE definition for zero energy buildings is not clear on some of emerging renewable energy procurement options such as PPAs, CCA, and green tariffs. Provided the rate payer has claim to the environmental attributes of the electricity they are procuring, it is WSP's opinion that such purchases would qualify the building as zero net energy in that it's a similar argument to that made by the New Buildings Institute in the aforementioned paper.
Risk profile	Given MVU would be the offtaker or owner of the renewable energy generation, this option has a similar risk profile to conventional procurement from the local utility.
Impact on lifetime energy costs of the project	Unknown at this time. The rate would be dependent on MVU's agreements or assets. Per their IRP, MVU states "*Based on recently completed renewable energy solicitations throughout the market, there appears to be ample renewable energy supply available for interested buyers, although prices are above the cost of conventional energy purchases.*"

5.7 RECOMMENDED PATH FORWARD

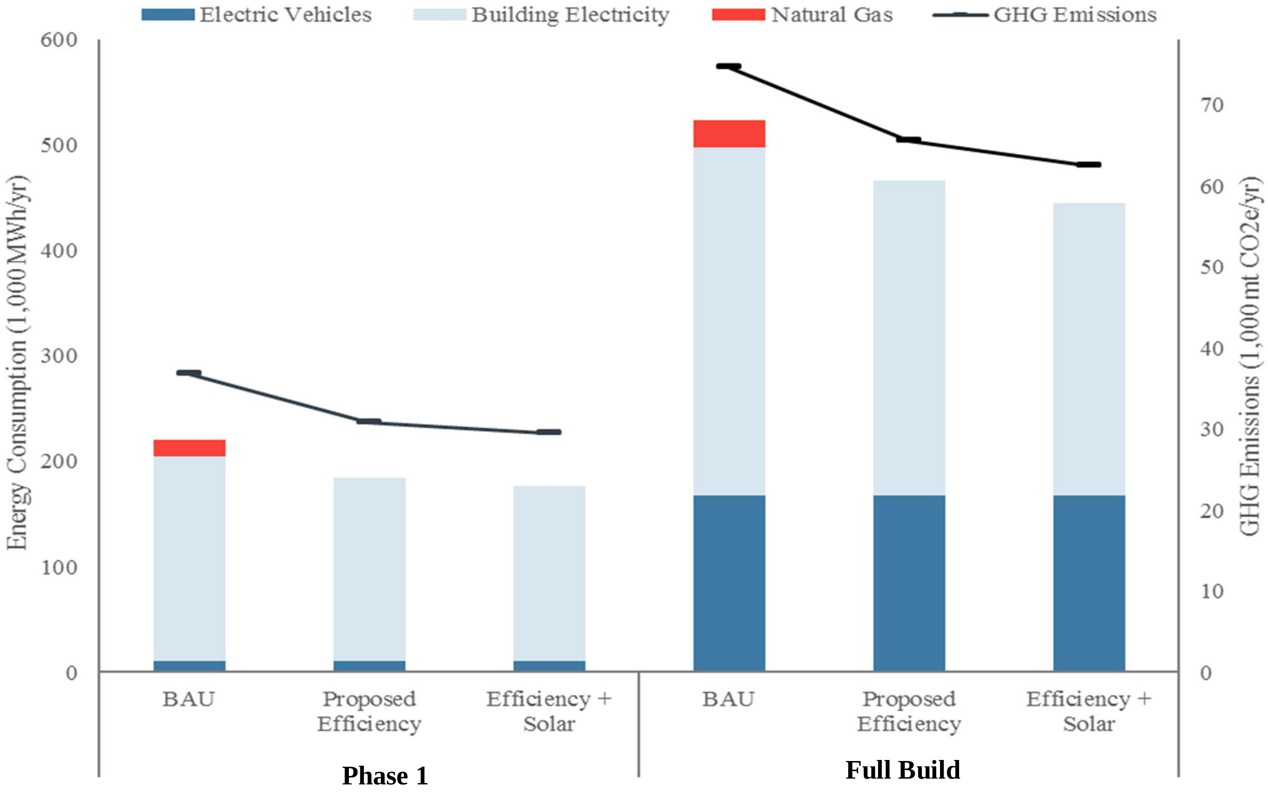
The recommended pathway does not include any on-site combustion or conversion of natural gas to electricity. Any CCHP configuration involving combustion is immediately disqualified due to the significant NO_x emissions it would contribute to an air shed that is already three times over the allowed NO_x limit. While fuel cells emit minimal NO_x and exploit the relatively low cost of natural gas compared to electricity, they result in a net increase in site energy consumption and GHG emissions and are therefore not recommended.

The recommended path forward also does not include requiring WLC tenants to procure renewable energy from off-site sources. The price premium associated with off-site renewable energy procurement would increase WLC tenant utility costs and thus run counter to the Project Objectives and the City's Economic Development Objectives.

The recommended path includes all-electric building systems which eliminates the need for on-site natural gas usage. WLC is then positioned with the future potential to operate 100% on renewable energy. However, PV capacity of 300 kW per building in Phase 1 is the maximum allowed by MVU rules.

The impact of the recommended ECMs and the proposed on-site PV on the annual energy consumption and GHG emissions of the WLC is shown in Figure 6.

Figure 6: Energy and GHG impact of proposed ECMs + PV for Phase 1 and Full Build-Out



6 CONCLUSION

6.1 SUMMARY OF OPPORTUNITIES

The State of California is expected to implement regulations to promote net-zero energy buildings. WLC has the opportunity to proactively embrace all-electric design standards at the outset of project construction. Doing so in advance of these regulations would make WLC net-zero-ready and position it to comply with future net-zero regulations. This, combined with WLC's commitment to solar-ready roof construction, positions the development to achieve its environmental stewardship and sustainability goals.

6.2 SUMMARY OF RECOMMENDATIONS

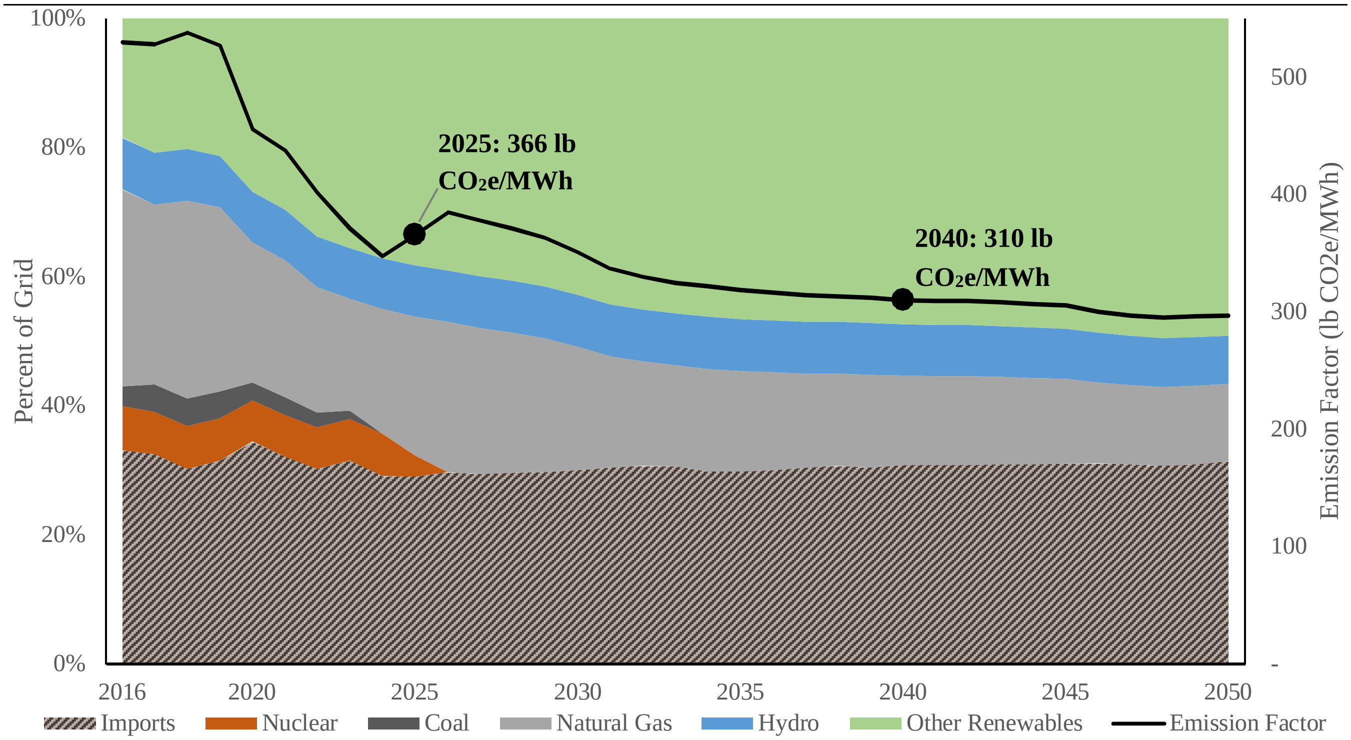
- Establish the ability of WLC to achieve net-zero energy over time by embracing all-electric design standards at the outset of project construction.
- Adopt maximum allowable solar PV capacity of 300 kW per building as a component of the Phase 1 design standards.
- Revisit this analysis with some frequency to capture inevitable changes over time in the MVU solar limit, MVU rate structures, Title 24 requirements, net-zero regulations, and changes in sustainable energy equipment costs.
- Implement recommended ECMs and maximum allowable solar PV capacity in Phase 1.

7 APPENDIX A: CURRENT AND FUTURE ENERGY CONTEXT

7.1 ELECTRIC GRID PROJECTIONS

Driven by an aggressive Renewable Portfolio Standard (RPS)[16] and a decreased reliance on coal, California's grid is one of the cleanest in the country. In 2017, 25% of its electricity was derived from renewable sources and the resulting carbon intensity of 529 lb $CO2_e$/MWh is nearly 50% below the national average of 1,000 lb $CO2_e$ /MWh. As highlighted in the graph below, rapid decarbonization of the California grid is expected to continue. The U.S. Energy Information Administration projects that that the grid's emissions factor will decline 31% from current levels by 2025 and 41% by 2040.

Figure 7: CAMX Emissions Factor Projection



---

[16] California's RPS requires retail sellers and publicly owned utilities to procure 50% of their electricity from eligible renewable sources by 2030

1. INTRODUCTION

A. PURPOSE OF THE TRAFFIC IMPACT ANALYSIS

The purpose of this Traffic Impact Analysis (TIA) is to fully analyze the local and regional traffic impacts of the proposed World Logistics Center (WLC) located in Moreno Valley, California. The TIA identifies the specific near-term and longer-term circulation improvements that would be required to mitigate project impacts and maintain acceptable peak hour and daily levels of service (LOS) on surface streets and freeways affected by the project. As part of this comprehensive analysis special attention was paid to analyzing truck access routes, safety issues relating to trucks, and the effects of truck traffic on traffic operations.

B. SCOPE OF STUDY

The study considers seven development scenarios, namely:

1) Existing baseline conditions (2018) without the WLC project
2) Existing baseline conditions plus Phase 1 (only) of the WLC project
3) Existing baseline conditions plus the Full Build-out of the WLC project
4) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2025, without the WLC project
5) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2025, plus Phase 1 (only) of the WLC project
6) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2040, including full build-out of the City of Moreno Valley General Plan, except that existing conditions remain on the site of the WLC project. The horizon year 2040 corresponds with the long-term planning horizon in the Southern California Association of Governments (SCAG) regional forecasts.
7) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2040, including full build-out of the City of Moreno Valley General Plan except for the WLC site, where full build-out of the WLC project was assumed.

2040 was selected for the horizon year because it corresponds to the horizon year used by agencies in the SCAG region for the most recent Sustainable Communities Strategy. The interim year analysis shows the Project when it is approximately half built out. 2025 was selected for the interim year based on SCAG's projection that 222 million square feet of logistics warehouses would be built in the region between 2016 and 2025[1], and the assumption that the WLC would attract approximately 10% of the regional total (around 22 million square feet).

Most of the LOS analyses focused on the morning and evening peak hours because that is when capacity problems most frequently occur. An analysis was performed using daily traffic volumes to determine if the proposed circulation element amendment would achieve City LOS goals.

The study area for surface streets covered all intersections in Moreno Valley of collector or higher functional classification with another collector or higher classification street, at which the proposed project would add 50 or more peak hour trips[2]. The study area also included the main routes between the project and the neighboring communities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area also extended west to the nearest ramps to SR-91 and as far south as the I-215 ramps at Redlands Ave. in

---

[1] See Table 3.2 in *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities (Task Report 5)*, SCAG, June 2010

[2] City of Moreno Valley Traffic Impact Preparation Guide, 2007

Perris. These limits represent the extreme range of the RIVTAM model's capacity to accurately predict real differences between the No-Project and Plus-Project scenarios. Figure 1 shows the study area for surface street intersections.

The study area for freeways was selected to encompass the freeway routes extending from the project site to the north, south, east, and west. The analysis covered SR-60 from I-10 in the east to SR-71 in the west, SR-91/I-215 from I-210 in the east to I-15 in the west, I-215 from Redlands Ave. in the north to the Scott Rd. interchange in the south, and I-10 from SR-62 in the east to SR-60 in the west. (see Figure 2). These limits represent the extreme range of the RIVTAM model's capacity to accurately predict differences between No-Project and Plus-Project scenarios. In addition, the two main routes to the ports of Los Angeles and Long Beach were studied (see Figure 3). For these corridors, trips from the WLC were manually added to forecasts for the No-Project scenario taken from the SCAG model[3].

Any freeway ramp where the project added 100 or more peak-hour trips was also studied. These included:

- All ramps of the SR-60/Theodore Interchange
- All ramps of the SR-60/Gilman Springs Rd. Interchange
- All ramps of the SR-60/Redlands Blvd. Interchange
- Westbound off- and eastbound on-ramps to the SR-60/Central Ave. Interchange, and
- Westbound off- and eastbound on-ramps to the SR-60/Martin Luther King Blvd. interchange.

---

[3] The modeling data in the SCAG model is based upon modeling information originally developed by the Southern California Association of Governments (SCAG), which has been modified by WSP. The modeling data used in this study does not necessarily reflect the official views or policies of SCAG. WSP is wholly responsible for the modeling results and the content of the documentation.

C. CHANGES SINCE 2014

In 2012 an application was made to the City of Moreno Valley for the World Logistics Center (WLC), a new plan for the area that had been subject to the Moreno Highlands Specific Plan. A notice of preparation for the WLC environmental impact report (EIR) was issued in February 2012. A traffic impact analysis (TIA) was prepared as one of several technical studies in support of the EIR and submitted to the City in September 2014. The full Draft EIR, including traffic sections based on the TIA, was submitted for public comment in February 2013 and was the subject of public hearings held in June 2015. The General Plan Amendment, zoning change, and the WLC Specific Plan, were adopted by the City Council in August 2015 and adopted again by ballot initiative in November 2015.

In the time since the 2014TIA, a number of developments have occurred that effect the forecast of traffic impacts from the WLC. These changes include:

- The most important new development was the completion in October 2016 of *High-Cube Warehouse Vehicle Trip Generation Analysis*, a major trip generation study for high-cube warehouses, the predominant form of land use in the WLC. This study was jointly sponsored by the South Coast Air Quality Management District (SCAQMD) and the National Association of Industrial and Office Properties (NAIOP), and was conducted by the Institute of Transportation Engineers (ITE). The results were incorporated into the 10th edition of ITE's *Trip Generation Manual*.

  This study replaces the multitude of earlier, smaller studies that produced conflicting results and created uncertainty regarding the amount of traffic generated by the newer, more automated type of high-cube warehouse proposed for the WLC. The 2016 study found that on average, warehouses generate fewer trips than had been assumed in the previous TIA for every analysis period (24% fewer in the AM peak period, 14% fewer in the PM peak hour, and 15% fewer on a daily basis). However, the volume of truck trips being generated in off-peak periods was higher than had been previously assumed.

- The trip generation rates for other land uses (light logistics, convenience market, etc.) were also updated to those in the 10th edition of ITE's *Trip Generation Manual*.

- The study analysis years were updated so that 2018 is used for Existing Conditions, 2025 is used for Phase 1, and 2040 is used for the Cumulative Scenarios.

- The assumptions regarding background (i.e. non-WLC) land development have been updated to reflect the Sustainable Community Strategy adopted by SCAG in 2016. The list of reasonably foreseeable projects was also updated to account for projects that have been completed or have dropped out, and for proposed projects that have been added to the pipeline.

- The assumptions regarding changes to the transportation network have been updated to reflect the Regional Transportation Plan adopted by SCAG in 2016. The existing conditions network was also updated to account for projects completed since the base year of the previous TIA (2012).

- New traffic counts were performed for all study intersections and roadway segments, and new data was collected for volumes on the study freeway segments.

- An analysis of the effect of the Project on regional vehicle-miles of travel (VMT) has been added. This analysis was done primarily to provide data needed for the air quality analysis. Readers may be aware that, as a result of Senate Bill 743 (Steinberg, 2013), CEQA analysis of traffic impacts is likely to change at some point in the future from LOS-based to VMT-based. This change will not take effect before January 1st 2020 at the earliest, so the LOS approach that is the primary focus of the current study accords with current state law. The VMT analysis is therefore included in this traffic study for informational purposes only.

Please note one other change that has no effect on the analysis, which is that Parsons Brinckerhoff Inc. was acquired by WSP USA Inc. So although the company name on the cover of this report is different from that on the previous report, lead traffic engineer and key staff from the previous study also conducted the current study.

2. METHODOLOGY

This chapter describes the methodology used in the traffic impact analysis.

A. ASSUMPTIONS

Land Use Assumptions

The Existing Conditions scenario was based on the land uses as they existed at the time when this study was initiated (February 2018). The Existing Plus Build-out scenarios were also based on the land uses as they existed at that time and with either Phase 1 or the full build-out of the WLC added.

The scenarios analyzing future conditions required the use of forecasts for land use in the Inland Empire. The most well-researched and officially accepted source of longer-term land use forecasts is the Southern California Association of Governments (SCAG), which is the designated Regional Transportation Planning Agency under state law. In April 2016, SCAG adopted its 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for use in regional planning. The RTP/SCS was the result of a multi-year effort involving consultation with numerous agencies including work through the Transportation Conformity Working Group[4] as well as input from members of the public. The RTP/SCS forecasts include the effects of the recent recession and subsequent recovery on employment and residential uses. The forecasts reflect regional birth, death, and migration rates, household formation, and expected changes in employment by economic sector.

The land use assumptions for the 2025 scenarios were derived through interpolation of the 2016 and 2040 RTP/SCS regional population and employment forecasts[5]. In addition, other past, present, and reasonably foreseeable projects in the study area were added to the 2025 scenarios based on their likely timeline for development. The land use assumptions for the cumulative (2040) scenarios were taken from the RTP/SCS 2040 regional population and employment forecasts for all areas outside of the City of Moreno Valley. In traffic analysis zones where there were both growth in the SCS and other past, present, and reasonably foreseeable projects of the same land use type, the higher figure was taken. Within Moreno Valley, the cumulative-year analysis assumed build-out of the City's General Plan except for locations where other past, present, and reasonably foreseeable projects were identified, in which case those were used instead. Because it is unlikely that the city will fully build out by 2040, the cumulative impact analysis set forth in this TIA assumes worse background traffic than is likely to occur and is therefore conservative in the sense that it would tend to over-state project impacts.

The other past, present, and reasonably foreseeable projects are listed in Table 1 with their locations shown in Figure 4 (the numbers on the figure corresponds with the identifying numbers in the table). In some cases there are plans that, while not being development projects in themselves, that may affect one or more of the listed projects. For example, the *Draft Land Management Plan for the San Jacinto Wildlife Area*[6] could, if adopted, affect land developments in Moreno Valley, Beaumont unincorporated Riverside County.

---

[4] A forum for implementing the interagency consultation requirements. Membership includes federal (US EPA, FHWA, FTA), state (ARB, Caltrans), regional (Air Quality Management Districts, SCAG, etc.), and sub-regional (County Transportation Commissions) agencies and other stakeholders.

[5] In other words, the amounts of each type of land use in each TAZ were interpolated between the values in the 2016 scenario and those in the 2040 scenario.

Network Assumptions

The scenarios analyzing future conditions required the use of assumptions regarding changes in the road network that may occur between now and the study year. The most well-researched and officially accepted source of longer-term land use forecasts is the SCAG 2016-2040 Regional Transportation Plan (RTP), which was adopted in April 2016 along with the SCS land use forecasts. The RTP was developed through a bottom-up process where agency projects were reviewed, prioritized, and matched against federal, state, and local funding sources. The result was three lists of approved projects, namely:

- The Federal Transportation Improvement Program, which covers the first four years of the program including projects that are already funded and are either already under construction or are in an advanced stage of development.
- A second project list for 2016-2040, the financially constrained project list, that includes only transportation projects that have committed, available, or reasonably available revenue sources, and thus are probable for implementation.
- The Strategic Plan, which is an illustrative list of additional transportation investments that the region would pursue if additional funding and regional commitment were secured. Such investments are potential candidates for inclusion in the constrained RTP/SCS through future amendments or updates.

For this study, only the projects in the Federal Transportation Improvement Program and the financially constrained[7] project list were assumed to be completed (see Figure 5). The projects in the Strategic Plan were not assumed completed because funding for them was considered to be too uncertain.

The network for the 2040 study year was also based on the RTP. However, within the City of Moreno Valley the General Plan road network was incorporated into the study (see Figure 6). The General Plan network includes future planned improvements that are funded through the City's Development Impact Fee (DIF), Western Riverside Council of Governments' Transportation Uniform Mitigation Fee (TUMF), and improvements made directly by developers. The expectation that these improvements will be in place is therefore consistent with and based upon the assumption of build-out of the General Plan land uses, since most of the improvements will be funded through fees on the new developments. If other sites do not fully build out per the General Plan, then less traffic will be generated and the LOS on the study streets and intersection would likely be better than shown in this report.

The truck routes assumed for roads in Moreno Valley were based on the current Municipal Code. Within the project site all roads would be truck routes, but trucks would not be permitted to enter or leave the site through the Cactus Ave. Extension.

---

[7] These are the projects for which funds are committed or reasonably available.

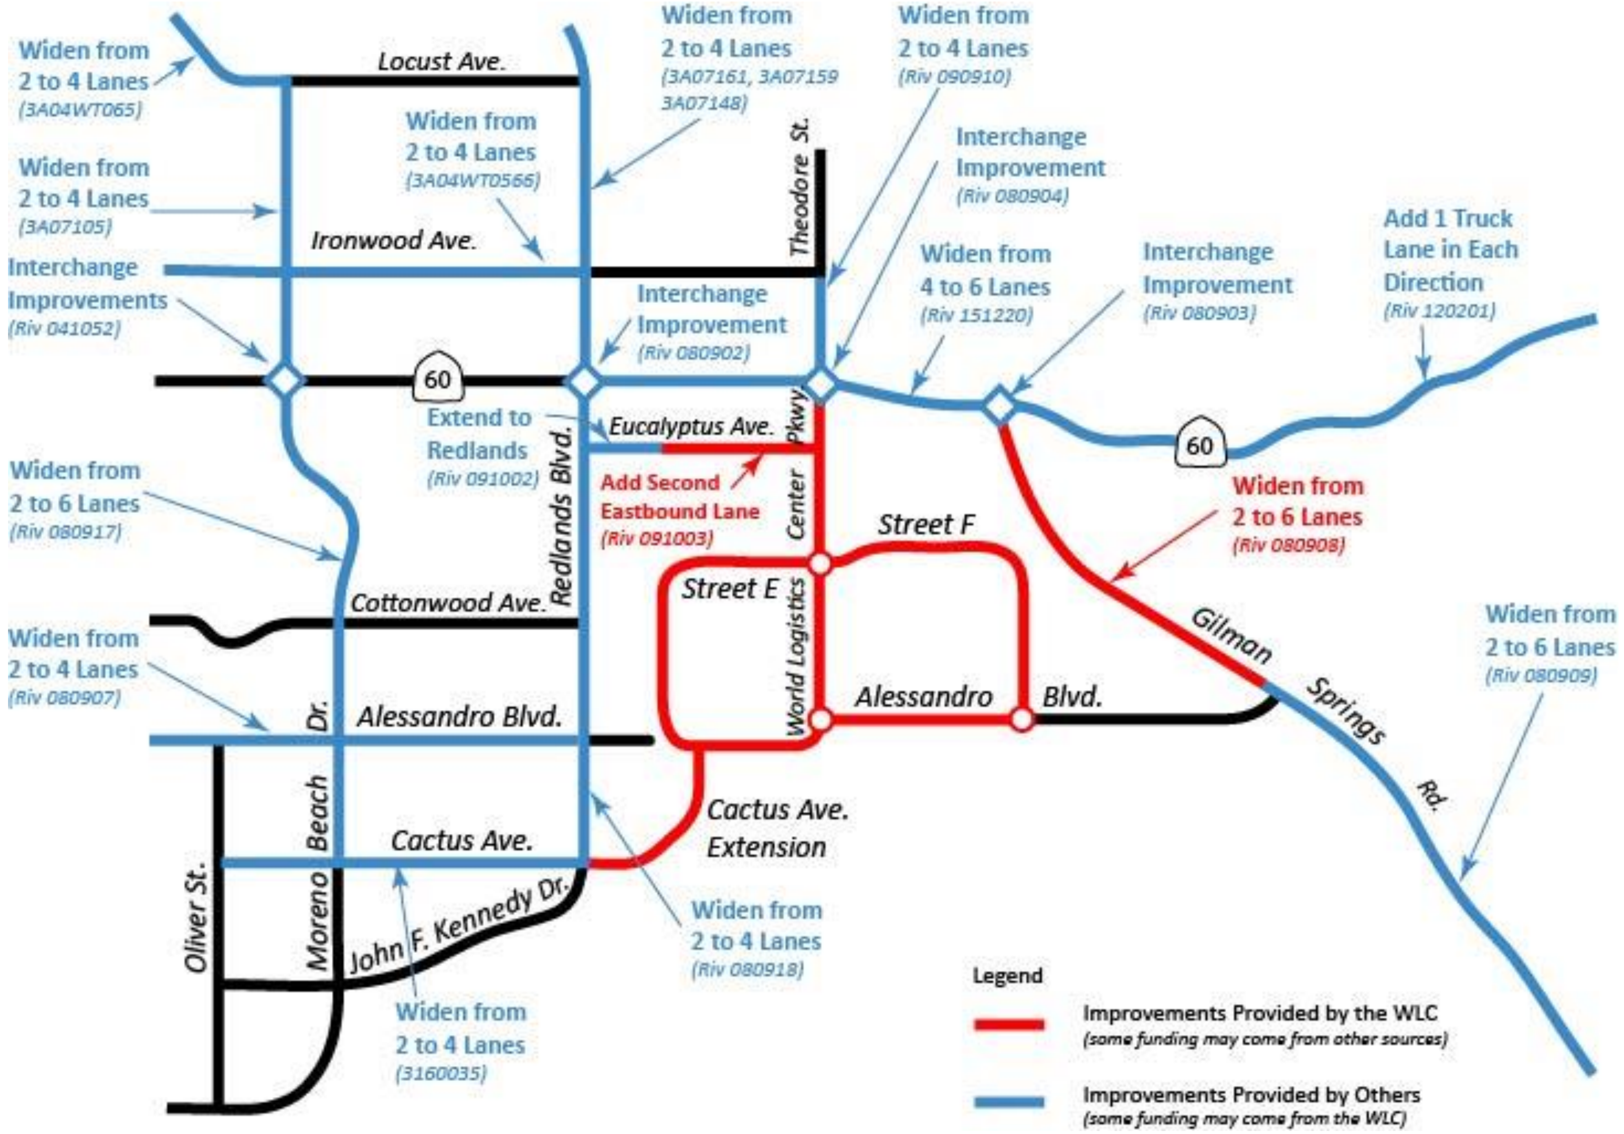

Figure 5: Roadway Improvements Assumed for 2025

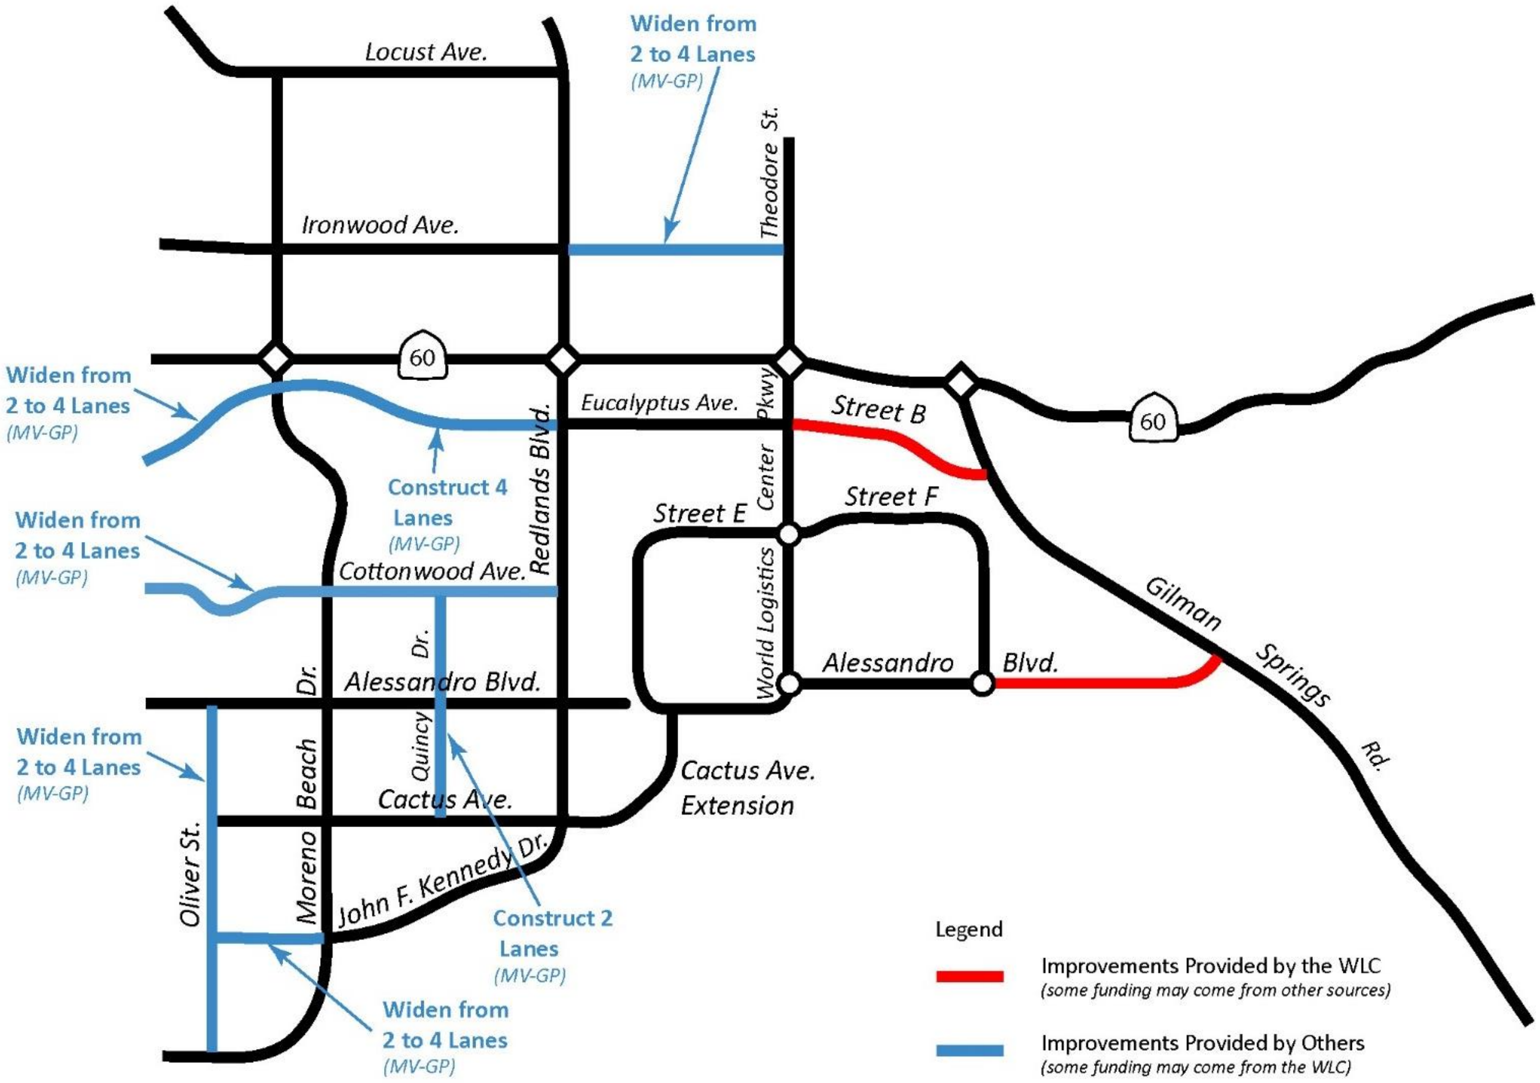

Figure 6: Roadway Improvements Assumed for 2040

Trip Generation Assumptions for High-Cube Warehouses

Based on the proposed WLC Specific Plan, high-cube logistics warehousing would comprise 99.4% of the floor space of the WLC, so a considerable amount of deliberation and study went into the selection of the most appropriate trip generation rate for this particular type of building. In the 2014 TIA four possible sources of trip generation rates were identified and evaluated, with a combination of two sources eventually being used. These were ITE's *Trip Generation Manual 9th Edition* being the source of the overall trip generation rate and the City of Fontana *Truck Trip Generation Study* being the source of the vehicle mix percentages.

Given the growing importance of high-cube logistics to southern California and plethora of small, conflicting studies of trip-generation rates for that type of building, a consensus formed on the need for a single, comprehensive survey that would provide definitive trip-gen rates for use in TIAs going forward. Accordingly, the South Coast Air Quality Management District (SCAQMD), a leading environmental agency for Riverside County, and the National Association of Industrial and Office Properties (NAIOP), representing developers, jointly sponsored a study to be conducted by a highly respected neutral party, ITE. The findings of this very large[8] study were released in October 2016 as a report entitled *High-Cube Warehouse Vehicle Trip Generation Analysis*.

The 2016 ITE study found that on average high-cube transload and short-term storage warehouses, the type of warehouse proposed for the WLC, generate fewer trips than had been assumed in the previous TIA for every analysis period (24% fewer in the AM peak period, 14% fewer in the PM peak hour, and 15% fewer on a daily basis). However, the volume of truck trips being generated in off-peak periods was higher than had been previously assumed. These results have been incorporated into the 10th edition of ITE's *Trip Generation Manual* in a new land use code (Code 154). SCAQMD has indicated its acceptance of these results on its website[9],

> "*Draft final results for the Warehouse Truck Trip Study were completed and were lower than SCAQMD recommended truck trip rates in the California Emissions Estimator Model (CalEEMod). Staff recommends truck trip rates from the Institute of Transportation Engineers (ITE) for high cube warehouse projects located in SCAQMD. Consistent with CEQA Guidelines, a CEQA document may use a non-default trip rate if there is substantial evidence in the recording supporting another rate is more appropriate for the air quality analysis.*"

Based on the substantial evidence collected by ITE and presented in the 10th edition of ITE's *Trip Generation Manual* and in *High-Cube Warehouse Vehicle Trip Generation Analysis*, the data from these two sources were used in the current analysis of WLC traffic impacts. Specifically, the trip generation rates and directionality (percent of vehicle entering and leaving the site) were taken from the 10th edition of *Trip Generation Manual*, while the percentage of vehicles in each vehicle class was taken from *High-Cube Warehouse Vehicle Trip Generation Analysis*. A mixture was required because Trip Generation Manual reported the directional split but not the vehicle mix while High-Cube Warehouse Vehicle Trip Generation Analysis reported the vehicle mix but not the directional mix.

High-Cube Warehouse Vehicle Trip Generation Analysis classified vehicles into three classes, namely passenger vehicles, 2- to 4-axle trucks, and 5+ axle trucks. The "passenger vehicles" category corresponds directly with the "passenger vehicle" category used in the RIVTAM model, and all of the vehicles in the "5+ axle trucks" fall within RIVTAM's "Heavy Truck" category. However, ITE's middle category, 2- to 4-axle trucks, covers three different categories used in RIVTAM. Specifically, 2-axle trucks correspond with RIVTAM's "Light Truck" category, 3-axle trucks correspond with RIVTAM's "Medium Truck" category, and 4-axle trucks fall within RIVTAM's "Heavy Truck" category along with 5+ axle trucks. Vehicle mix data from NAIOP's survey of 31 southern California warehouses was used to disaggregate ITE's middle category into the corresponding RIVTAM vehicle classes.

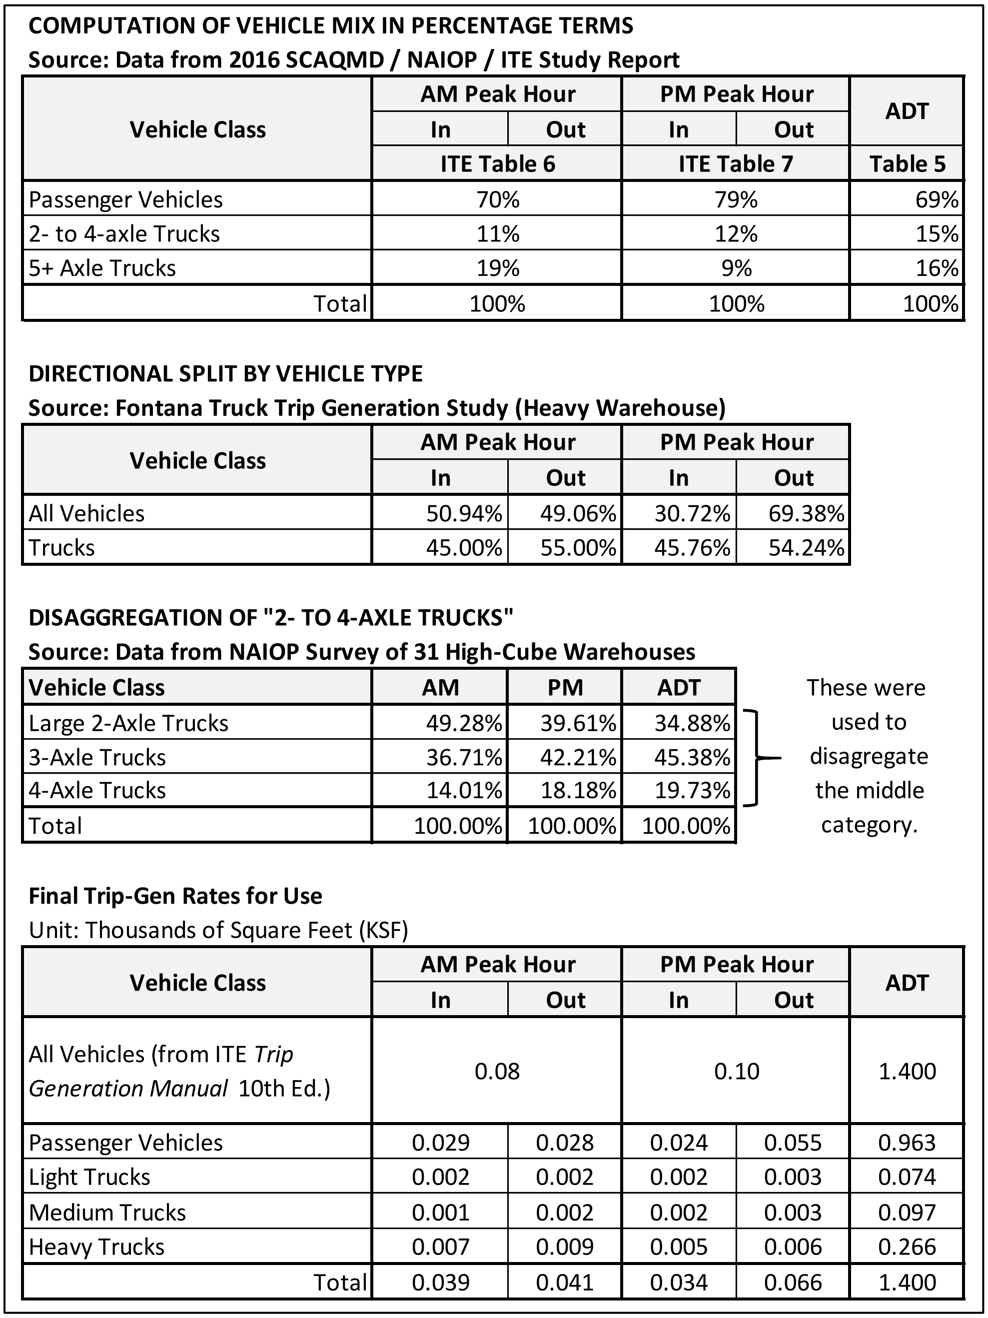
---

[8] Counts were taken at 107 sites

[9] http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/high-cube-warehouse accessed 2/16/2018

The final derivation of the trip generation rates used for high-cube logistics warehouse is shown in Table 2.

Table 2: Derivation of Trip Generation Rates for High-Cube Warehouses



COMPUTATION OF VEHICLE MIX IN PERCENTAGE TERMS

Total	0.039	0.041	0.034	0.066	1.400

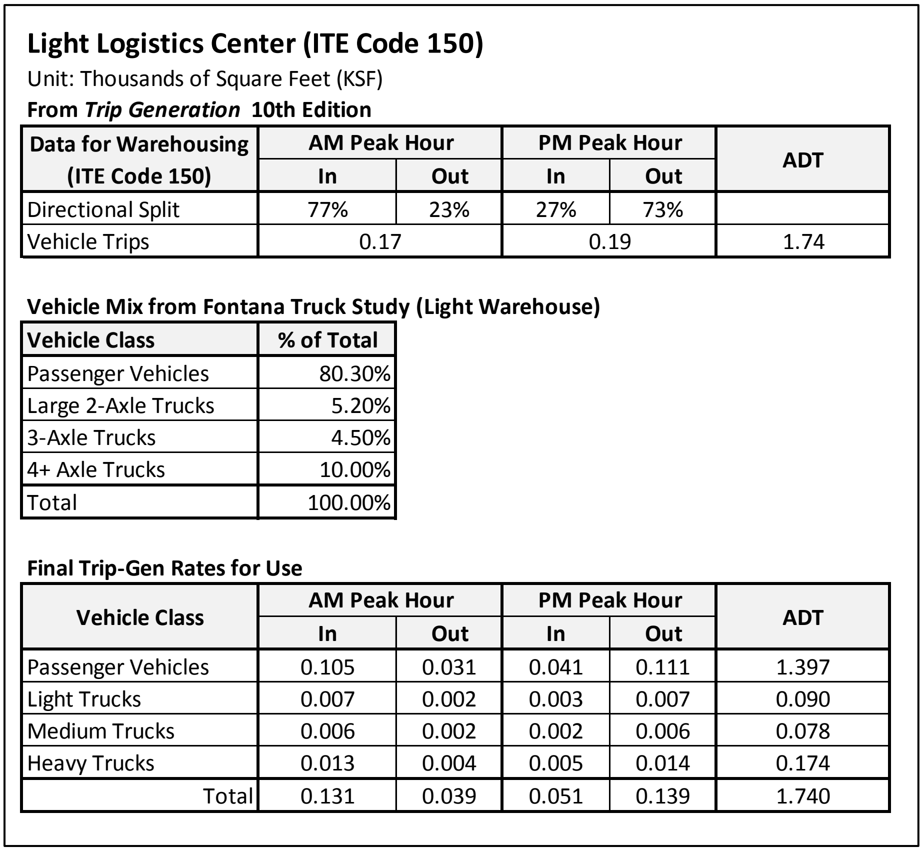
Trip Generation Assumptions for Other WLC Land Uses

The 10th edition of the ITE *Trip Generation Manual* was the main source used for trip generation rates for other land uses on the WLC site. Other data sources and assumptions were used to supplement this source as follows:

Light Logistics

The 10th edition of the ITE *Trip Generation Manual* was the source for the overall trip generation rates and directional split. No vehicle mix for this type of land use was available from the ITE study, so the vehicle mix was taken from the City of Fontana Truck Trip Generation Study per the City of Moreno Valley's TIA guidelines. The derivation of the trip generation rates for this category of land use is shown in Table 3.

Table 3: Derivation of Trip Generation Rates for Light Logistics



Light Logistics Center (ITE Code 150)

Unit: Thousands of Square Feet (KSF)

From *Trip Generation* 10th Edition

Data for Warehousing (ITE Code 150)	AM Peak Hour		PM Peak Hour		ADT
	In	Out	In	Out	
Directional Split	77%	23%	27%	73%	
Vehicle Trips	0.17		0.19		1.74

Vehicle Mix from Fontana Truck Study (Light Warehouse)

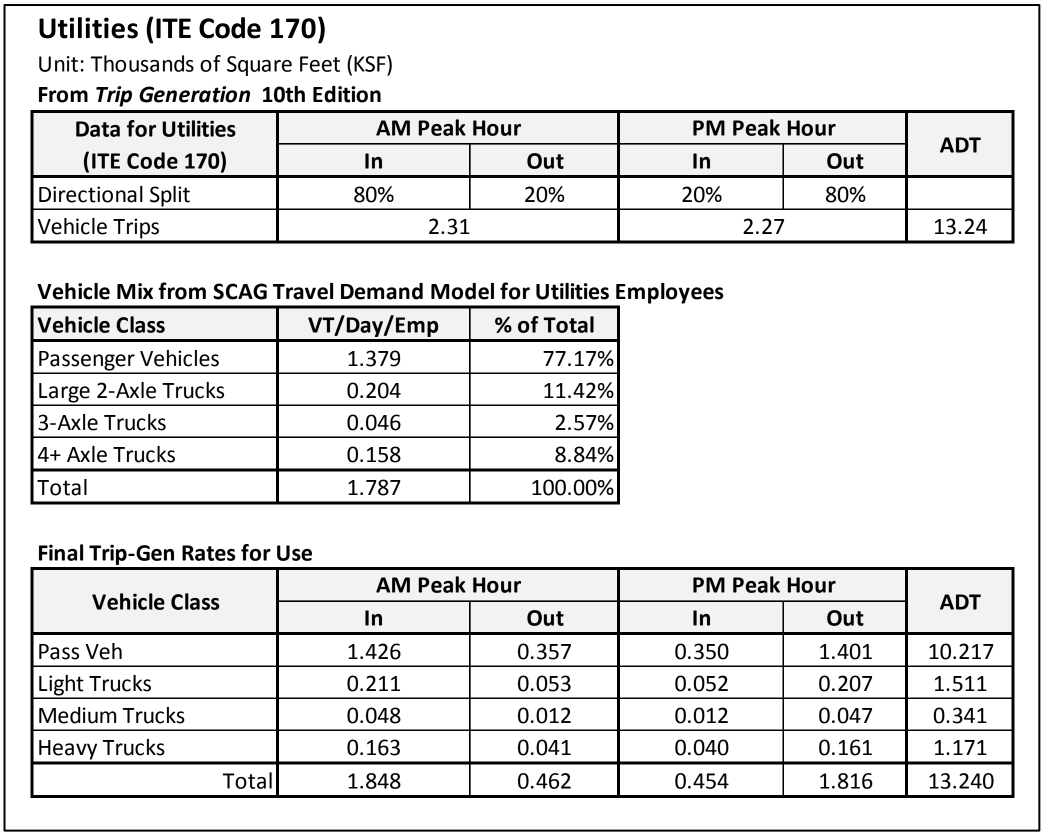
Utilities

San Diego Gas & Electric operates a natural gas compressor station, known as the Moreno Compressor Station, on 19 acres in the southern portion of the project area. Southern California Gas Company operates a valving, metering, and pipe cleaning station on a one-acre parcel in the south-central portion of the project area. The 10th edition of the ITE *Trip Generation Manual* was the source for the overall trip generation rates and directional split. No vehicle mix for this type of land use was available from the ITE study or the Fontana study, so the vehicle mix was taken from the SCAG travel demand model. The derivation of the trip generation rates for this category of land use is shown in Table 4.

Table 4: Derivation of Trip Generation Rates for Utilities



Utilities (ITE Code 170)

Unit: Thousands of Square Feet (KSF)

From *Trip Generation* 10th Edition

Data for Utilities (ITE Code 170)	AM Peak Hour		PM Peak Hour		ADT
	In	Out	In	Out	
Directional Split	80%	20%	20%	80%	
Vehicle Trips	2.31		2.27		13.24

Vehicle Mix from SCAG Travel Demand Model for Utilities Employees

Total	1.848	0.462	0.454	1.816	13.240

Alternative Fueling Station and Convenience Store

The project includes a fueling station and convenience store intended to serve the needs of truckers picking up or delivering cargos at the WLC site. Traffic to the fueling station/convenience store was estimated using the ITE trip generation rates separately for the refueling function (ITE code 945, Gas Station with Convenience Store, measured in pumps) and the convenience store function (ITE code 851, Convenience Store, measured in square feet). In accordance with industry practice, a reduction was made for trips categorized as either pass-by trips or diverted linked trips. These are trips that stop at the fueling station as a side trip during the course of a primary trip or from their primary destination in the WLC. Figure 7 shows examples of diverted linked trip paths for inbound trucks going to WLC destinations at the north and south end of the WLC site. The percentage of trips reduced was based on the function and time of day, per ITE *Trip Generation Handbook 3rd Edition.*

The derivation of the trip generation rates for the fueling stations is shown in Table 5, and for the convenience store is shown in Table 6 .

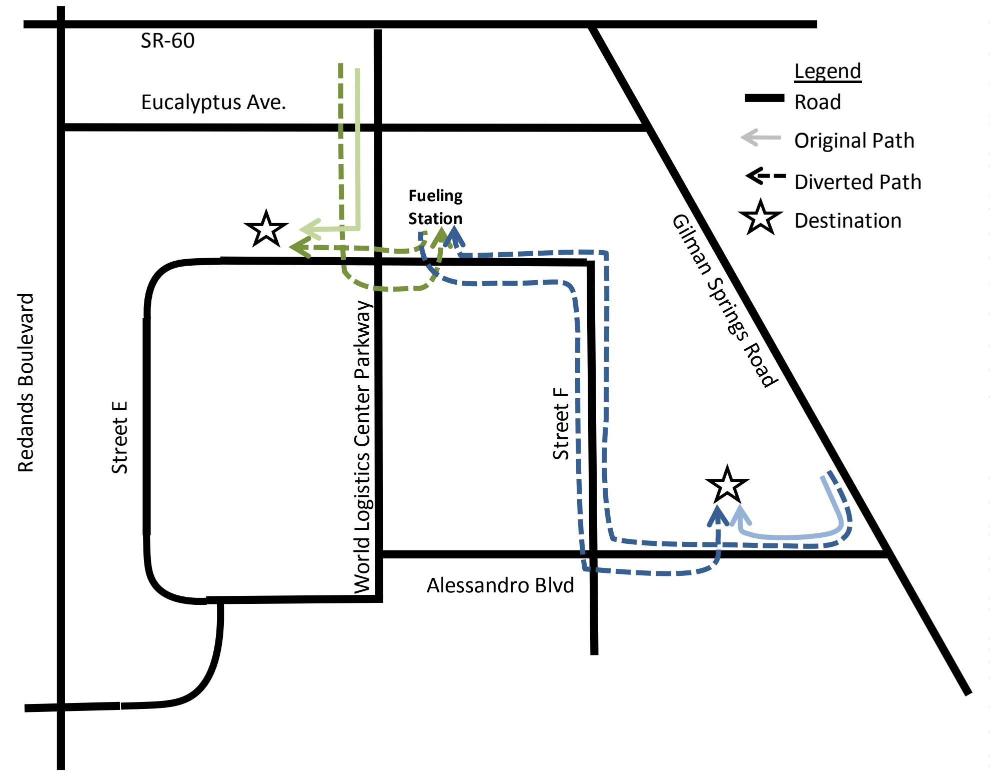

Figure 7: Examples of Routes Taken by Diverted Linked Trips

For ITE Code 851	AM Peak Hour	PM Peak Hour	Daily
Pass-By & Diverted	58%	58%	58%

(trips made by vehicles that would be on the WLC site anyway)

Final Trip-Gen Rates for Use (net after reduction for pass-by trips)

Vehicle Class	AM Peak Hour		PM Peak Hour		ADT
	In	Out	In	Out	
Pass Veh	13.209	13.209	10.580	10.165	321.873

Fire Station

There is little data available for trip generation from fire stations. The 10th edition of the ITE *Trip Generation Manual* introduced a new land use code, 575 Fire and Rescue Station. However, the manual cautioned against its use due to the small sample size. Moreover, it offered no data at all for the AM peak hour and daily analysis periods. For that reason, we instead used the average trip-gen rate from three previous studies of fire stations[10].

Passenger Car Equivalents (PCEs)

The analytical methods used to forecast traffic impacts must take into account the driving characteristics of different classes of vehicles. This is typically done through the use of Passenger Car Equivalents (PCE) factors, which convert the number of heavy vehicles in the traffic stream into an equivalent number of passenger cars. The term PCE was first used in the 1965 *Highway Capacity Manual* (HCM), and was determined by comparing the number of times cars passed trucks to the number of times trucks pass cars. According to the *HCM 2000*:

> *"The entry of heavy vehicles-that is, vehicles other than passenger cars (a category that includes small trucks and vans)-into the traffic stream affects the number of vehicles that can be served. Heavy vehicles are vehicles that have more than four tires touching the pavement.*
>
> *Trucks, buses, and recreational vehicles (RVs) are the three groups of heavy vehicles addressed by the methods in this manual. Heavy vehicles adversely affect traffic in two ways:*
>
> - *They are larger than passenger cars and occupy more roadway space; and*
> - *They have poorer operating capabilities than passenger cars, particularly with respect to acceleration, deceleration, and the ability to maintain speed on upgrades.*

---

[10] LLG Engineers, *Peaceful Valley Ranch*, County of San Diego, 2007. Fehr and Peers, *Loyola Marymount University Master Plan Project*, City of Los Angeles Department of Transportation, 2009. McMahon, *Upper Dublin Fire House*, Montgomery County, Pennsylvania, 2010.

> *The second impact is more critical. The inability of heavy vehicles to keep pace with passenger cars in many situations creates large gaps in the traffic stream, which are difficult to fill by passing maneuvers. The resulting inefficiencies in the use of roadway space cannot be completely overcome. This effect is particularly harmful on sustained, steep upgrades, where the difference in operating capabilities is most pronounced, and on two-lane highways, where passing requires use of the opposing travel lane." (*Transportation Research Board, *Highway Capacity Manual 2000*, page 2-5)

Grade is by far the most important determinant in the PCE factor to be used. The HCM's recommended PCE for trucks ranges from 1.5 for places with slopes of less than 2% up to 7.0 for places with steep grades more than a mile long[11]. HCM's recommended PCE factors were used for the WLC freeway analysis.

For the analysis of surface streets, the City's TIA guidelines mandate the use of PCE factors taken from the San Bernardino County CMP, 2003 Update. These are more precise and on average somewhat higher than the HCM rates, because HCM recommends two PCEs per heavy truck while the San Bernardino County CMP uses three (see Table 7). This means that the San Bernardino County CMP PCE rates used in the WLC analysis represent a deliberately conservative approach in the sense that the analysis will tend to over-state the impact of trucks on traffic conditions.

Table 7: PCE Factors for Surface Streets

Vehicle Class	HCM	San Bernardino CMP
Passenger Cars	1.0	1.0
2-Axle Trucks	2.0	1.5
3-Axle Trucks		2.0
4 or more-Axle Trucks		3.0

B. ANALYTICAL TOOLS

Regional Model

The macro-level traffic forecasting was conducted using the Riverside County Transportation and Analysis Model (RIVTAM). RIVTAM is a version of SCAG six-county model with additional detail (traffic analysis zones and local roads) added within Riverside County. It was developed for TIAs in Riverside County as a replacement for several older models that covered different portions of the county. RIVTAM has both the geographic scope needed to capture all likely impacts and conformity with regional planning assumptions. There is a memorandum of understanding[12] among the jurisdictions of Riverside County that encourages the use of the RIVTAM model for TIAs. The MOU reads, in part,

> *"RIVTAM was designed to address most city and county level modeling needs in Riverside County. The model inputs and zone system were designed with sufficient detail to support most city/county planning applications. The modeling methodology can support evaluation of a range of highway, HOV, and transit scenarios. The Agencies encourage the use of RIVTAM by Cities, other governmental jurisdictions, and private entities for their own transportation planning purposes.*

---

[11] A PCE factor of 7.0 means that under the stated conditions each truck takes up 7 times as much road capacity as a car would use in level terrain.

[12] *MOU for RIVTAM Model Maintenance, Update, and Usage*. Not dated, but signed by various parties between June and September, 2010. The signatories were Riverside County Transportation Department, Riverside County Transportation Commission, Western Riverside Council of Governments, Coachella Valley Association of Governments, Southern California Association of Governments, and Caltrans.

> *Universal use of RIVTAM by the Agencies, Cities, other governmental jurisdictions, and private entities, and their consultants will ensure that planning decisions in Riverside County are made on accurate and consistent travel forecasts."* (*MOU for RIVTAM Model Maintenance, Update, and Usage*, page 4)

The use of RIVTAM for the analysis in this TIA[13] included the following refinements:

- The traffic analysis zones (TAZs) within the project site were subdivided to allow for a detailed analysis of internal traffic patterns, and the proposed internal road network was substituted for the existing road network for all "with-project" scenarios.
- RIVTAM forecasts traffic for two peak periods; a three-hour period in the morning and a four-hour period in the evening. These were converted into forecasts for single peak hours using conversion factors in the *San Bernardino County CMP Appendix H – Post Processed Traffic Volume Guidelines* in accordance with the City's TIA guidelines.
- RIVTAM quantifies non-residential developments in units of employees rather than acres or square feet of building space. For developments in the City of Moreno Valley, future developments' acreage was converted into square feet of development using the existing developmental densities in Moreno Valley, and then the square footage was used to estimate the number of employees using the conversion factors in the City's General Plan. For areas outside Moreno Valley the conversion factors used in the Riverside County General Plan were used.
- In the trip distribution stage of RIVTAM the model assigns destinations to the trucks trips originating in the WLC warehouses. Since WLC warehouses are attractors of truck trips as well as generators of truck trips, the model assigns approximately 10% of WLC truck trips to destinations that are other warehouses within the project site. As this does not reflect the WLC's expected operations and might result in an under-estimation of truck trips entering and leaving the WLC site, these internal trips were replaced with an equal number of external trips that were distributed among the routes available to trucks leaving the site. Since some trucks may in fact have deliveries or pick-ups at more than one warehouse within the WLC site this represents a conservative assumption.
- Like other regional travel demand models, RIVTAM is designed to forecast movements along paths consisting of links between trip origins and destinations. Therefore post-processing is required to convert the link-level forecasts from RIVTAM into turning movements for the intersection-level analysis. The Furness method[14] was used to allocate approach volumes among the possible turning movements based on traffic counts of existing traffic patterns.
- The RIVTAM model was calibrated to ensure that its forecasts are reasonable. Nevertheless, a model covering a six-county area cannot be expected to be perfectly accurate on each of the hundreds of thousands of links in the model. For that reason, best industry practice is to use the model to forecast the change in traffic volumes and add this change to existing traffic volumes, rather than using the forecast volumes directly from the model. This technique, called the "difference method", was used in this TIA[15]. The difference method eliminates certain types of imperfections in the forecast of background traffic and so improves the accuracy of traffic forecasts.
- To ensure that vehicle trips were not under-estimated, it was also assumed that no trips would be taken by transit. This is another conservative assumption since the WLC would be designed to

---

[13] The modeling data in RIVTAM is based upon modeling information originally developed by the Southern California Association of Governments (SCAG), which has been modified by WSP. The modeling data used in this study does not necessarily reflect the official views or policies of SCAG. WSP is wholly responsible for the modeling results and the content of the documentation.

[14] The Furness method is a technique for balancing the forecast turning movements in such a way as to match both the total approach volume and the total departure volume for each leg predicted in the traffic model. Furness K.P. *Time Function Interaction*. Traffic Engineering and Control, Vol. 7, No. 7, 1970, pp. 19-36

[15] This is the "difference method" described in NCHRP Report 255 *Highway Traffic Data for Urbanized Area Project Planning and Design*, Transportation Research Board, 1982.

accommodate bus routes and it is expected that transit service would be provided once the project reaches a transit-supportable level of development.

In summary, RIVTAM was used to provide accurate forecasts of project impacts on the regional road network. Several highly conservative assumptions were used to ensure that the TIA over-estimated rather than under-estimated impacts.

Definition of LOS

The HCM defines level of service as a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. Six LOS are defined for each type of facility, ranging from “A” for the best operating conditions to “F” for the worst, based on driver’s perceptions of those conditions. Most jurisdictions have adopted policies that set target levels of LOS for road facilities under their control.

Daily Roadway LOS

For the road segments affected by the proposed General Plan amendment, a roadway segment analysis was performed consistent with the City of Moreno Valley *Traffic Impact Analysis Preparation Guide* using the daily capacity standards identified in the Guide and shown in Table 8.

Table 8: Level of Service (LOS) Thresholds for Surface Streets in Moreno Valley

Type of Roadway	Level of Service*				
	LOS A	LOS B	LOS C	LOS D	LOS E
6-Lane Divided Arterial	33,900	39,400	45,000	50,600	56,300
4-Lane Divided Arterial	22,500	26,300	30,000	33,800	37,500
4-Lane Undivided Arterial	15,000	17,500	20,000	22,500	25,000
2-Lane Industrial Collector	7,500	8,800	10,000	11,300	12,500
2-Lane Undivided Residential	N/A	N/A	N/A	N/A	2,000

* Maximum Average Daily Traffic (ADT)

Source: City of Moreno Valley *Traffic Impact Analysis Preparation Guide* , 2007

Note: These roadway capacities are "rule of thumb" estimates for planning purposes. The LOS "E" service volumes are estimated maximum daily capacity for respective classifications. Capacity is affected by such factors as intersections (spacing, configuration, and control features), degree of access control, roadway grades, design geometrics (horizontal and vertical alignment standards), sight distance, vehicle mix (truck and bus traffic), and pedestrian and bicycle traffic.

Gilman Springs Road is a Riverside County facility and so the County LOS thresholds would apply for this study road segment. These thresholds are shown on Table 9[16].

---

[16] Road types not relevant to this study are not shown.

Table 9: Riverside County LOS Thresholds for Surface Streets

Type of Roadway	Level of Service(1)		
	LOS C	LOS D	LOS E
8-Lane Urban Arterial	57,400	64,600	71,800
6-Lane Urban Arterial	43,100	48,500	53,900
4-Lane Urban Arterial	28,700	32,300	35,900
2-Lane Collector	10400	11700	13,000

Notes: All capacity figures are based on optimum conditions and are intended as guidelines for planning purpose only.
(1) Maximum two-way ADT values are based on the 1999 Modified Highway Capacity Manual Level of Service Tables as defined in the Riverside County Congestion Management Program.

Source: County of Riverside General Plan, Circulation Element, 2008

Intersection LOS

The LOS analysis of study intersections was performed using the methodology described in the Highway Capacity Manual (HCM) 2010 Chapter 16, for signalized intersections, and Chapter 17 for unsignalized intersections. The computations were performed using Synchro computer software with the settings specified in the City's *Traffic Impact Analysis Preparation Guide*[17]. Synchro defaults were used as appropriate with the standard saturation flow rate of 1900 vehicles/hour and zero percent grade for the signalized intersections. Signal timings were optimized within Synchro and considered uncoordinated except for the following corridors which were identified by the City of Moreno Valley to be coordinated:

- Alessandro Blvd. from Old 215 Frontage Rd. to Kitching St.
- Cactus Ave. from SR 215 Ramps to Lasselle St.
- Ironwood Ave. from Moreno Beach Dr to Redland Blvd.
- Perris Blvd. from Iris Ave. to Krameria Ave.
- Arlington Blvd. from SR-91 WB Ramps to Victoria Ave
- Alessandro Blvd from Sycamore Canyon Blvd to SR-215 NB Ramps
- Martin Luther King Jr. Blvd. from Canyon Crest Dr to SR-60 EB Ramp
- Central Ave. from Lochmoor Dr to SR-60 WB Ramps
- The Ramona Expressway in the City of Perris
- Perris Blvd. in the City of Perris

A cycle length of 120 seconds was used for all coordinated signals. Cycle lengths were maintained at 120 seconds or less with a 3 second yellow and a one-second all red for consistency. Except for the existing conditions scenario which uses actual traffic and truck counts, all future scenario volumes were calculated in PCEs therefore the heavy truck percentage in Synchro was set to zero to avoid double-counting truck trips.

The HCM LOS thresholds for signalized and unsignalized intersections are shown in Table 10. Note that a lower boundary is defined for LOS "F" but no upper boundary is defined. In cases where the forecast delay is greater than 180 seconds drivers would tend to divert to other routes, change their time of travel, select an alternate destination (for example choose to shop at a different store) or change their behavior in other ways that are not well represented in the HCM methodology. For that reason results over 180 seconds are not meaningful and so the results are shown simply as ">180".

---

[17] Although HCM 2010 does not account for right-turn-on-red (RTOR), Synchro 9 has an algorithm that adjusts to account for RTOR.

Table 10: LOS Thresholds for Signalized and Unsignalized Intersections

Level of Service	Description	Average Control Delay (seconds/vehicle)	
		Signalized	Unsignalized & Roundabouts
A	Volume-to-capacity ratio is low and either the progression is exceptionally favorable or the cycle length is short. If due to favourable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.	≤ 10	≤ 10
B	Volume-to-capacity ratio is low and either the progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.	> 10 to 20	> 10 to 15
C	Progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e. one or more queued vehicles are not able to depart as a result of insuffucient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.	> 20 to 35	> 15 to 25
D	Volume-to-capacity ratio is high and either progression is ineffective or cycle length is long. Most vehicles stop and individual cycle failures are noticeable.	> 35 to 55	> 25 to 35
E	Volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.	> 55 to 80	> 35 to 50
F	Volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.	> 80	> 50

Source: *Highway Capacity Manual 2010* , Transportation Research Board

Note: The description is from the HCM 2010 chapter on signalized intersections. For signalized intersections and roundabouts the LOS is based on the average for all vehicles entering the intersection. For unsignalized intersections the LOS is based on the delay for the worst-performing approach.

Freeway LOS

The freeway LOS was determined using the density analysis methodology in the HCM. The capacities are based on information contained in the HCM and the Caltrans Ramp Meter Design Manual. Freeway terrains were determined by comparing the grades found in Google Earth Pro to the HCM definitions for level, rolling and mountainous terrain. Existing count data were obtained from Caltrans for the freeway mainline volumes. Three types of freeway facilities were analyzed, namely:

- Freeway mainline levels of service are determined from segment density.
- Freeway weaving is defined as the crossing of two streams of traffic traveling in the same direction along a significant length of highway without the aid of traffic control devices. The weaving analysis used the most current version of the HCM to find the density for the weaving area within the freeway segment and the corresponding LOS.
- The ramp merge and diverge analysis was performed by applying Highway Capacity Software (HCS), the electronic version of the HCM for freeway-to-arterial interchanges. The HCM

methodology for ramp areas focused on an influence area of 1,500 feet, including the acceleration or deceleration lane and adjacent freeway lanes.

Table 11 presents the correlation between LOS and density in terms of passenger cars per mile per lane (pc/mi/ln) for various types of freeway facilities.

Table 11: Caltrans Freeway LOS Criteria

LOS	Basic Freeway Segment Denstiy	Freeway Weaving Segment Density	Freeway Ramp Density
	(pc/mi/ln)	(pc/mi/ln)	(pc/mi/ln)
A	0-11.0	≤ 10.0	≤ 10.0
B	11.0 – 18.0	> 10.0 and ≤ 20.0	> 10.0 and ≤ 20.0
C	18.0 – 26.0	> 20.0 and ≤ 28.0	> 20.0 and ≤ 28.0
D	26.0 – 35.0	> 28.0 and ≤ 35.0	> 28.0 and ≤ 35.0
E	35.0 – 45.0	>35.0 and ≤ 43.0	> 35.0
F	> 45.0	> 43.0	Demand Exceeds Capacity

C. PERFORMANCE CRITERIA

The study area for surface streets includes intersections located in seven jurisdictions. Each of these jurisdictions has established a target level of service for use in traffic impact studies, which are shown in Table 12.

Table 12: Intersection LOS Standards by Jurisdiction

Jurisdiction	Type of Facility	# of Study Intersections	LOS Standard	Source
Moreno Valley	Intersections adjacent to freeways or employment centers	57	D	Moreno Valley General Plan, Chapter 5: Circulation element; Adopted July 2006
	All other intersections	14	C	
Beaumont	Intersections (during peak hours)	4	D	City of Beaumont General Plan; Section 3.0: Circulation Element; Approved March 2007
Perris	Intersections with SR-74, Ramona Exp, or I-215	5	E	City of Perris General Plan, Circulation Element; Amended August 2008
	All other intersections	16	D	
Redlands	Intersections currently operating at "D" or worse	1	Existing LOS	City of Redlands General Plan 2035, Chapter 5: Connected City; Adopted December 2017
	All other intersections	2	C	
Riverside (County)	Intersections in area plans near WLC*	9	D	County of Riverside General Plan, Chapter 4: Circulation Element; Revised December 2016
Riverside (City)	Intersections of collectors or higher roads	27	D	
San Jacinto	Arterial intersections	1	D	San Jacinto General Plan, Circulation Element; Adopted May 2006
Caltrans	State highway facilities currently operating at LOS "E" or "F"		Existing Density	Guide for the Preparation of Traffic Impact Studies, Chapter I; December 2002
	State highway facilities		D	

* LOS D applies to all development proposals located within any of the following Area Plans: Eastvale, Jurupa, Highgrove, Reche Canyon/Badlands, Lakeview/Nuevo, Sun City/Menifee Valley, Harvest Valley/Winchester, Southwest Area, The Pass, San Jacinto Valley, Western Coachella Valley and those Community Development Areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans. LOS C applies at all other locations in unincorporated Riverside County.

A project's impact on an intersection is considered significant if the project adds more than 50 peak-hour trips to a surface street or 100 peak-hour trips to a freeway and it would either cause the LOS to exceed the target level set by the jurisdiction or, if the LOS in the no-project scenario would already exceed the target LOS level, if the project causes an increase in traffic delay beyond the no-project condition.

Caltrans has established LOS D as the threshold of significance for freeway mainline segments and freeway ramps in the corridors relevant to this study. It is Caltrans policy that if an existing state facility is operating at less than the appropriate target LOS, the existing measure of effectiveness should be maintained. Caltrans uses traffic density (passenger-cars per mile per lane) as the measure of effectiveness for freeways, so if a freeway facility currently operates at LOS "E" or "F" then a project that would increase the traffic density on that facility would be deemed to have a significant impact.

3. TRANSPORTATION SETTING

A. PROJECT SITE

The World Logistics Center (WLC) project area is located in the northwestern Riverside County in the Rancho Belago area, within the eastern portion of the City of Moreno Valley. The proposed project is situated south of State Route 60 (SR-60), between Redlands Blvd. and Gilman Springs Rd. (the easterly City limit), extending to the southerly City limit. Figure 8 depicts the location of the proposed project within the region.

Existing Land Uses

At the present time, the project area is largely undeveloped land. There are seven single-family homes in various locations along with associated ranch/farm buildings within the area. Most of the area has been used intermittently for dry farming since the early 1900s, and much of it continues to be used for dry farming. San Diego Gas & Electric operates a natural gas compressor station, known as the Moreno Compressor Station, on 19 acres in the southern portion of the project area. Southern California Gas Company operates a valving, metering, and pipe cleaning station on a one-acre parcel in the south-central portion of the project area.

The major roadways that currently provide access to the project area are SR-60, Redlands Blvd., Alessandro Blvd., Gilman Springs Rd., Theodore St., and World Logistics Center Parkway[18]. SR-60 is a highway running in a 70-mile-long east-west alignment from Beaumont to Los Angeles. The portion of SR-60 that forms the northern boundary of the project currently has two lanes in each direction of travel. Redlands Blvd. and Theodore St. and World Logistics Center Parkway are north-south collector roadways that intersect with SR-60. Alessandro Blvd. is an east-west thoroughfare that runs through Moreno Valley from Interstate-215 on the west end to Gilman Springs Rd. on the east end. Gilman Springs Rd. runs in a northwesterly-southeasterly direction connecting SR-60 to the Hemet-San Jacinto area and beyond. Redlands Blvd., Theodore St., World Logistics Center Parkway, Alessandro Blvd., and Gilman Springs Rd. all currently have one lane for each direction of travel.

The areas adjacent to the east and south boundaries of the project area are mostly undeveloped. The area east of the project, commonly referred to as the Badlands, is a rugged area that separates the City of Moreno Valley from San Timoteo Canyon and the City of Beaumont. Due to its steep slopes and canyons, the Badlands area has had little development; however there are several single-family homes in this area east of Gilman Springs Rd. The Badlands Sanitary Landfill, operated by the County of Riverside Waste Management Department, is located approximately 1.5 miles northeast of the project area.

---

[18] The City of Moreno Valley re-named the portion of Theodore Street south of the SR-60 interchange, “World Logistics Center Parkway” in February 2018.

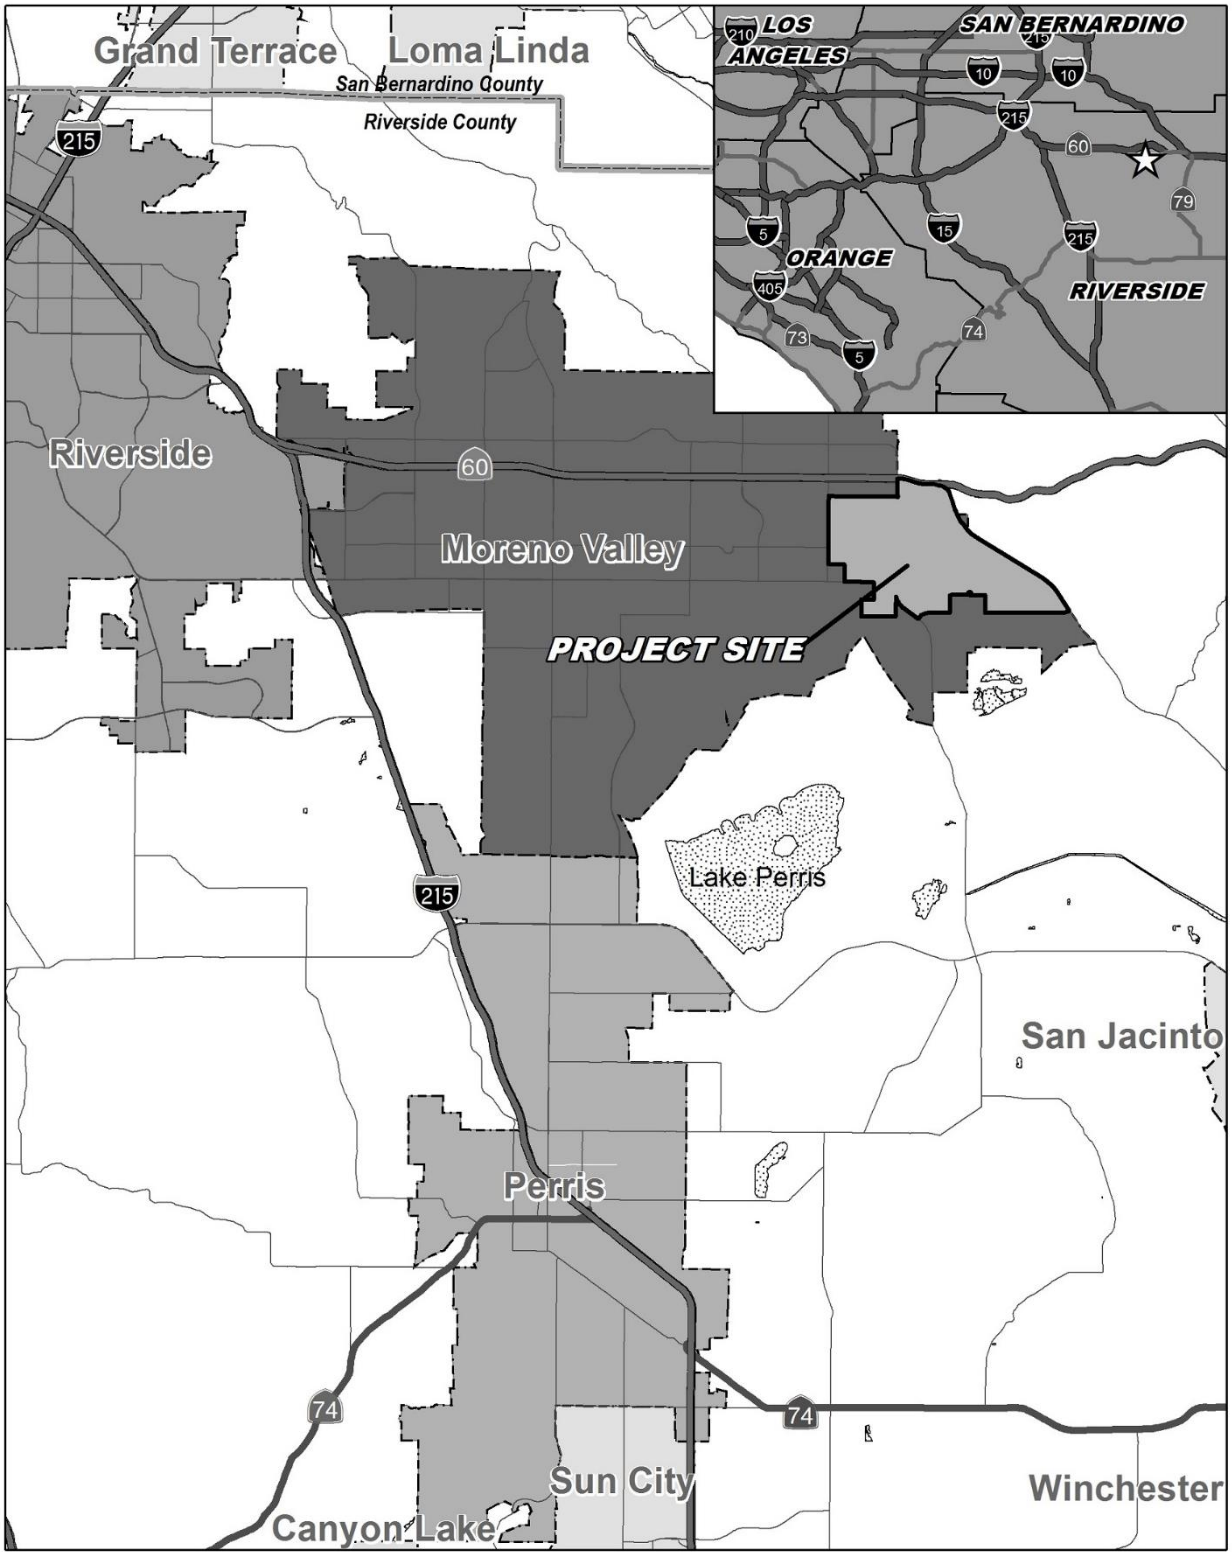

Figure 8: Project Location

Directly south of the proposed project is the San Jacinto Wildlife Area (SJWA), which includes the Upland Game Hunting Area and the Lake Perris State Recreation Area. These are state-owned lands and access to these areas is restricted. The SJWA is owned and operated by the California Department of Fish and Wildlife and comprises approximately 20,000 acres of restored wetland and ponds. The Lake Perris State Recreation Area is owned and operated by the California State Parks Department and comprises approximately 9,000 acres of open space land, which is used both for recreation and for the preservation of the native southern California landscape.

Highland Fairview Corporate Park (HFCP), located north and west of the project area between Redlands Blvd. and World Logistics Center Parkway, is currently under development, with the first phase (the Skechers building) completed in late 2011. The area north of SR-60 is largely undeveloped, with clusters of low density residential uses within the Moreno Valley city limits.

To the west of the proposed project is the more developed portion of the City of Moreno Valley. There are existing single family homes located west of Redlands Blvd. Near the southwest corner of the proposed project there is an existing residential neighborhood at the intersection of Redlands Blvd. and Alessandro Blvd.; a small market and a post office are also located near this intersection. The Moreno Valley Ranch and Golf Club residential community is approximately one mile southwest of the project area.

B. EXISTING TRANSPORTATION FACILITIES

The analysis of existing conditions provides a basis for comparison with the forecasted future scenarios with the proposed project.

The existing road system serving the project site consists of:

- World Logistics Center Parkway, a 2-lane undivided arterial running in a north-south direction through the center of the project.
- Alessandro Blvd., a 2-lane undivided arterial running in an east-west direction through the southern half of the project. Alessandro Blvd. has a discontinuity at World Logistics Center Parkway, with its eastern portion intersecting World Logistics Center Parkway approximately 600 feet north of where the western section intersects World Logistics Center Parkway.
- State Route 60 (SR-60), which runs in a generally east-west alignment from the I-110 in Los Angeles to I-10 in Beaumont. The portion of SR-60 running along the northern edge of the project has two travel lanes per direction.
- Eucalyptus Ave. is part-way through the process of conversion from a 2-lane minor arterial into a 4-lane arterial. The westbound direction along the HFCP (Skechers) site currently has two lanes while the eastbound direction has one. Eucalyptus is closed between HFCP and Redlands Blvd. with a gate allowing only emergency vehicles to pass.
- Redlands Blvd. is a 2-lane minor arterial running in a north-south direction along a portion of the western edge of the project.
- Gilman Springs Rd. is a 2-lane undivided arterial running in a northwest-southeast direction alongside the eastern edge of the project.
- Dracaea Ave. is a discontinuous east-west residential street providing access to several existing houses on the project site.
- Cottonwood Ave. is a short east-west residential street providing access to several houses on the project site.
- Virginia St. is a north-south access road serving a utilities site. The portion south of Alessandro Blvd. is paved while the portion north of Alessandro Blvd. is unpaved.
- Eucalyptus Ave. is an unpaved service road running east-west between World Logistics Center Parkway and Gilman Springs Rd.

- Sinclair St. is currently an unimproved right-of-way running north-south between World Logistics Center Parkway and Redlands Blvd.

A short section of Redlands Blvd. from Dracaea Ave. to McAbee Ave. has sidewalks and a bicycle lane, as does the westbound portion of Eucalyptus Ave. fronting HFCP. A class 1 mixed-use trail runs along the east side of Redlands Blvd. from McAbee Ave. to Dracaea Ave. These are the only roads with sidewalks or bicycle lanes. At the present time there is no bus or other transit service to the project site.

Truck Routes

Cities and counties in California have the authority to adopt codes that restrict the use of trucks on public roadways, though not all jurisdictions choose to do so. Figure 9 shows the designated truck routes in the vicinity of the WLC. The Cities of Moreno Valley and Perris have designated specific routes while the County of Riverside does not (i.e. trucks may use any County road, though truck parking restrictions may apply). The City of Riverside does not designate truck routes but instead identifies roadways where trucks are not allowed (mostly residential streets). There are no restrictions on truck usage of the state highway system.

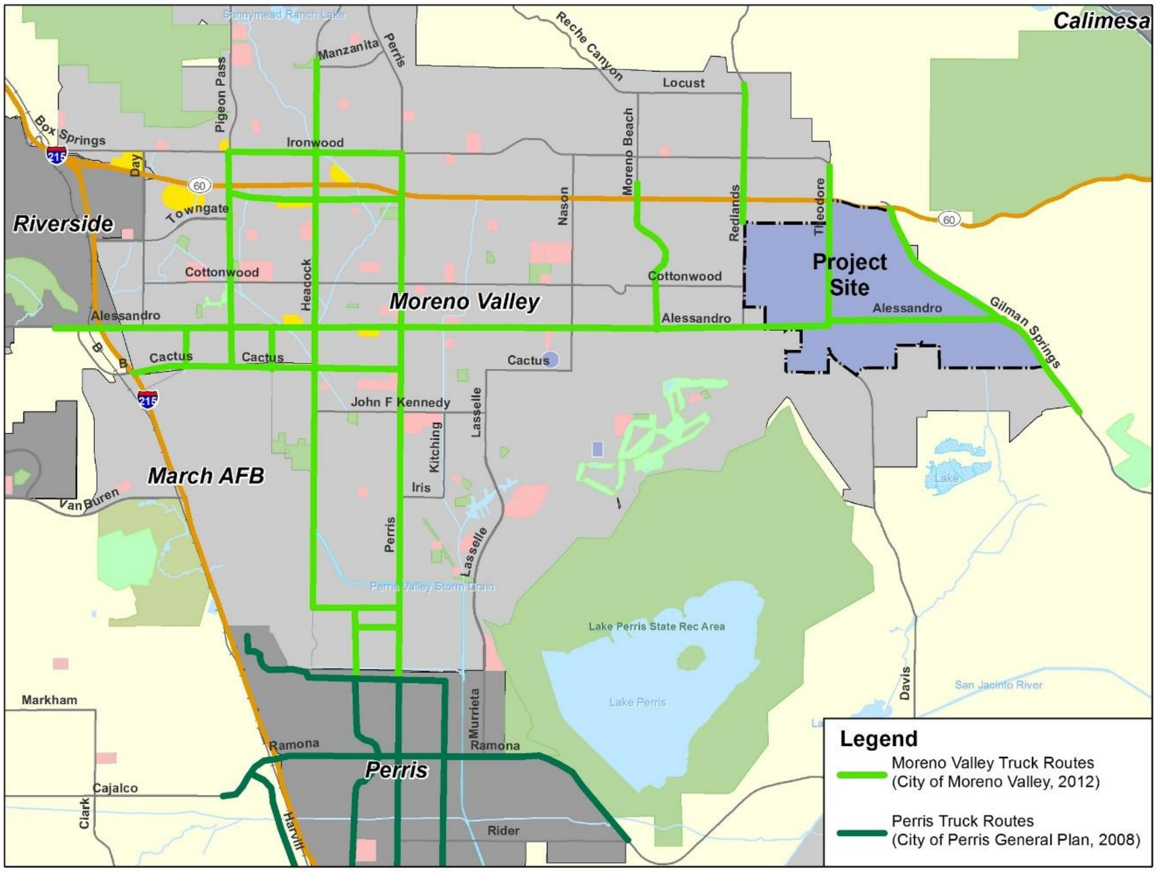

Figure 9: Existing Designated Truck Routes

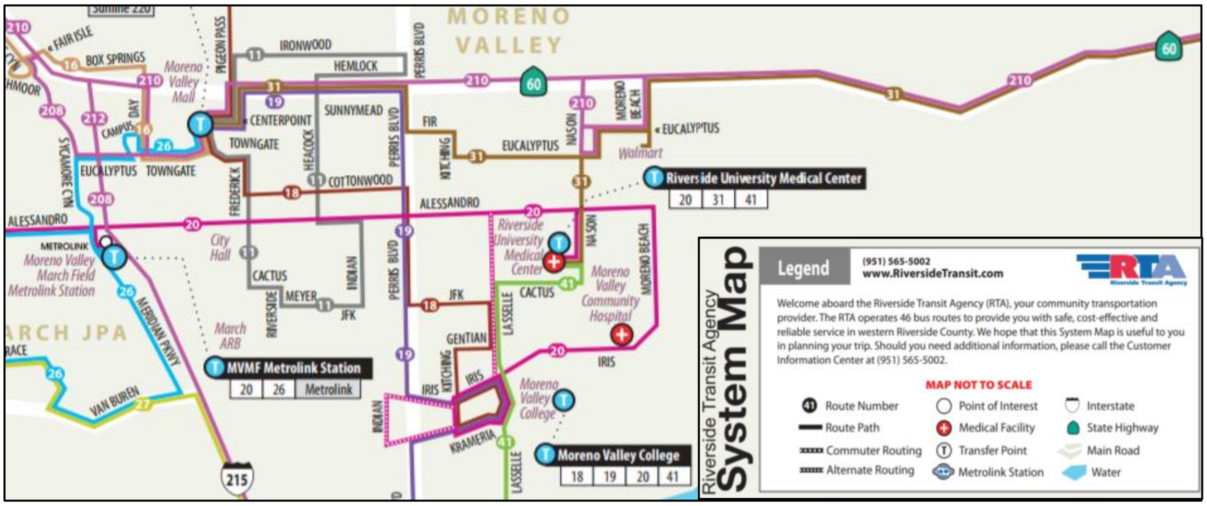
Transit Services

Transit services in the area are provided by the Riverside Transit Agency, which operates several bus routes in the City of Moreno Valley. Figure 10 displays the Riverside Transit Agency's existing routes in the area. The bus routes do not currently provide service in the vicinity of the project site.



Welcome aboard the Riverside Transit Agency (RTA), your community transportation provider. The RTA operates 46 bus routes to provide you with safe, cost-effective and reliable service in western Riverside County. We hope that this System Map is useful to you in planning your trip. Should you need additional information, please call the Customer Information Center at (951) 565-5002.

Figure 10: Existing Transit Services in Moreno Valley
(Source: Riverside Transit Agency System Map)

C. EXISTING TRAFFIC VOLUMES

Traffic counts for turning movements in the AM and PM peak hours were collected for study intersections during typical workdays in 2018. Figure 11 provides a key diagram for the location of each study intersection in the intersection turning volume graphics, including Figure 12 (and similar figures for other scenarios) which shows the turning movement volumes under Existing Conditions. The traffic counts are reported in detail in Appendix A. In situations where an intersection does not exist in the scenario the intersection is marked “Future”, if it will be built later, or “Non-Existent” if had existed but has been replaced by an intersection in a different location.

When counts were taken in early 2018, the intersection of Cactus Ave, and Quincy St. (Intersection 26) was under construction. However, this construction has been completed and the intersection has since opened. The existing analysis reflects the counts which did not include this intersection while all future years assume this intersection has been built.

D. EXISTING LEVELS OF SERVICE

Roadway Segment Analysis

Part of the project involves building a new road network on the Project site in accordance with the General Plan amendment adopted last year. The roads that would be affected by the change are shown in Figure 13, which is the key map for the tables reporting sectional traffic volumes.

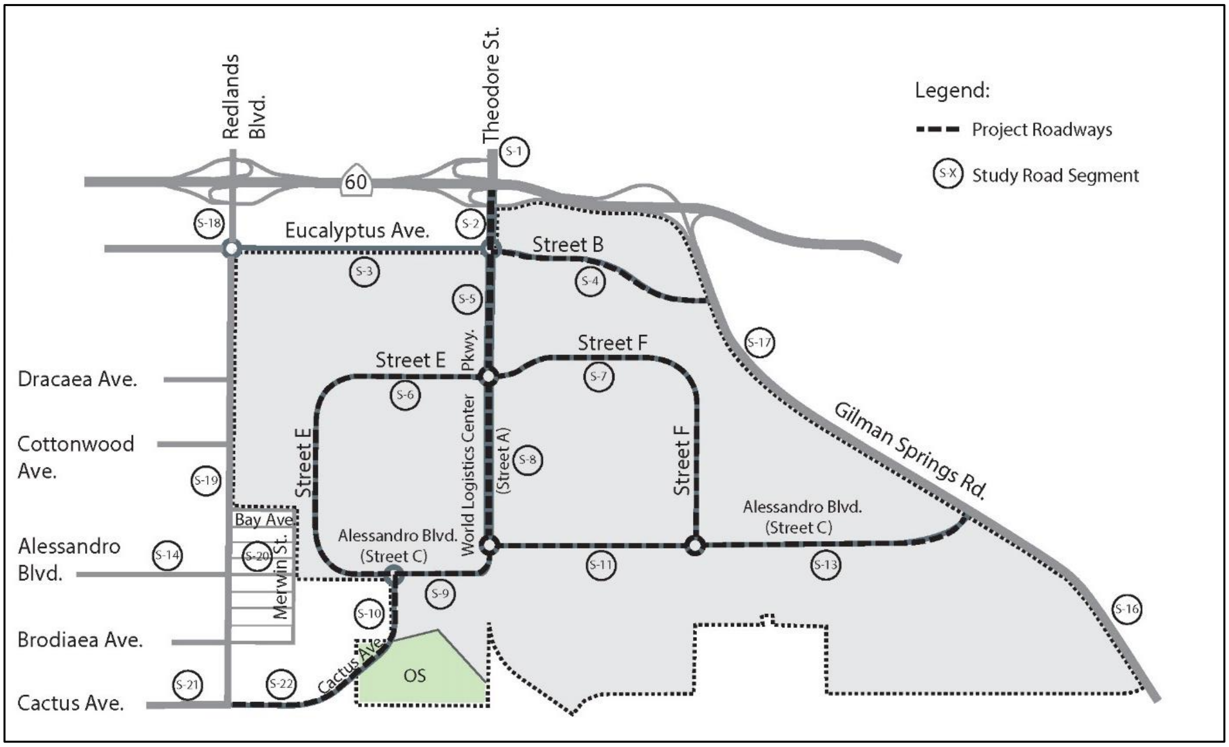

Figure 13: Study Road Segments

24-Hour traffic counts were collected on the study road segments. Table 13 shows the existing LOS for the study road segments. As shown in the table, Gilman Springs Rd. north and south of Alessandro Blvd. (road segments S-16 and S-17) and Redland Boulevard between Eucalyptus and the SR-60 eastbound ramps currently exceed the target LOS established in the General Plan. The existing traffic volumes on all other study roadway segments meet the LOS target in the General Plan.

Table 13: LOS of Study Road Segments under Existing Conditions

Roadway		From	To	LOS Standard*	Roadway Section**	Daily Volume	LOS
S-1	Theodore St	SR-60 WB Ramps	Ironwood Ave	D	2U	1,174	A

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

▨ Indicates LOS exceeds the target level

Intersection Level of Service (LOS)

Table 14 shows the existing LOS for the study intersections in the AM and PM peak hours. Detailed worksheets are presented in Appendix B. Of the 136 study intersections that were studied, 21 intersections failed to meet the General Plan target under Existing Conditions in the AM peak hour, the PM peak hour, or both. These intersections were:

- IN-10 Redlands Blvd./Locust Ave. (AM, PM)
- IN-20 Oliver St./Alessandro Blvd. (AM)
- IN-23 Redlands Blvd./Alessandro Str. (PM)
- IN-37 Moreno Beach Dr./SR-60 EB Ramps (PM)
- IN-39 Iris Ave./Perris Blvd. (PM)
- IN-65 Perris Blvd./Cactus Ave. (AM)
- IN-83 Martin Luther King Blvd./Canyon Crest Dr. (AM)
- IN-85 Martin Luther King Blvd./I-215 NB Ramps (AM, PM)
- IN-86 Central Ave./Chicago Ave. (PM)
- IN-94 Arlington Ave./Victoria Ave. (AM)
- IN-95 Alessandro Blvd./Chicago Ave. (PM)
- IN-107 Evans Rd./Rider St. (AM)
- IN-114 Evans Rd./Orange Ave. (AM, PM)
- IN-115 Evans Rd./Nuevo Rd. (AM)
- IN-122 Bridge St./Ramona Expy. (AM, PM)
- IN-123 Gilman Springs Rd./Bridge St. (AM, PM)
- IN-124 SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (AM)
- IN-125 SR-79 (Sanderson Ave) SB/Gilman Springs Rd. (AM, PM)
- IN-132 San Timoteo Canyon Rd./Alessandro Rd. (AM)
- IN-133 San Timoteo Canyon Rd./Live Oak Canyon Rd. (AM, PM)
- IN-134 Redlands Blvd./San Timoteo Canyon Rd. (AM, PM)

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

Freeway Mainline Basic Sections LOS

The LOS for freeway mainline sections under existing conditions is shown in Table 15 (for basic freeway sections[19])[20]. The target LOS is currently exceeded in 34 mainline sections as follows:

North or Eastbound

- SR-60 Ramona Ave. to Central Ave. (AM, PM)
- SR-60 Central Ave. to Mountain Ave. (PM)
- SR-60 Mountain Ave. to Euclid Ave. (PM)
- SR-60 Euclid Ave. to Grove Ave. (PM)
- SR-60 Grove Ave. to Vineyard Ave. (PM)
- SR-60 Vineyard Ave. to Archibald Ave. (PM)
- SR-60 Market St. to Main St. (PM)
- SR-60 Martin Luther King Blvd. to Central Ave. (AM, PM)
- SR-60 Pigeon Pass Rd. to Heacock St. (PM)
- SR-91 Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 Tyler St. to Van Buren Blvd. (PM)
- SR-91 Adams St. to Madison St. (AM, PM)
- SR-91 Central Ave. to 14th St. (AM, PM)
- I-215 Barton Rd. to Mt. Vernon Ave./Washington St. (AM)
- I-215 Auto Plaza Dr. to Mill St. (PM)

Southbound or Westbound

- SR-60 Grove Ave. to Vineyard Ave. (PM)
- SR-60 Vineyard Ave. to Archibald Ave. (PM)
- SR-60 Market St. to Main St. (AM)
- SR-60 Main St. to SR-91 (AM)
- SR-60 Fair Isle Dr./Box Springs Rd. to I-215 (PM)
- SR-60 I-215 to Day St. (AM)
- SR-60 Pigeon Pass Rd. to Heacock St. (AM)
- SR-91 McKinley St. to Pierce St. (AM, PM)
- SR-91 Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 Magnolia Ave. to La Sierra Ave. (AM, PM)
- SR-91 La Sierra Ave. to Tyler St. (PM)
- SR-91 Tyler St. to Van Buren Blvd. (PM)
- SR-91 Van Buren Blvd. to Adams St. (PM)
- SR-91 Madison St. to Arlington Ave. (AM, PM)
- I-215 Harley Knox Blvd. to Van Buren Blvd. (PM)
- I-215 Alessandro Blvd. to Eucalyptus Ave. (PM)
- I-215 Center St. to La Cadena Dr. (AM, PM)
- I-215 La Cadena Dr. to Barton Rd. (AM, PM)
- I-215 Barton Rd. to Mt. Vernon Ave. (PM)

Most of the freeway basic sections currently exceeding the target LOS involve congestion in the peak direction. That is why regional agencies stress the importance of promoting reverse commuting; to move some traffic from the congested side of the freeway to the uncongested side. To the extent that the WLC can encourage this shift, it can help reduce congestion for all travelers, including those not directly associated with the WLC. This is discussed further in Section D of the next chapter.

---

[19] A basic freeway segment is one that is outside the influence of ramps and weaving areas. Basic freeway segments exist between interchanges that are not closely spaced. Note that segment numbers are not always consecutive in the table because weaving sections may occur between basic freeway segments, and because the two directions of travel may be different in terms of where ramps are provided.

[20] In addition to the analysis shown here, there is a supplemental analysis of truck trips to the Ports of Los Angeles and Long Beach found in Chapter 12, Section F of this report.

▨ Indicates that the LOS exceeds the target level

Freeway Weaving Sections LOS

Table 16 shows the existing LOS for the study weaving sections[21]. The target LOS is currently exceeded in 7 weave sections as follows:

North or Eastbound

- SR-60 from SR-91 to Blaine St./3rd St. (PM)
- SR-60 from I-215 to Day St. (PM)
- I-215 from SR-60 to Columbia Ave. (AM)

South or Westbound

- SR-60 from University Ave. to Martin Luther King Blvd. (AM, PM)
- SR-91 from Arlington Ave. to Central Ave. (PM)
- SR-91 from SR-60 to Mission Inn Ave./University Ave. (PM)
- I-215 from SR-60 to Columbia Ave. (AM)

Freeway Ramps LOS

Table 17 shows the existing level of service (LOS) at the study freeway ramps. One study ramp currently operates below the LOS “D” target, namely the SR-60 eastbound on-ramp from Martin Luther King Boulevard in the AM and PM peak hours.

Details of the LOS calculations for freeways under Existing Conditions can be found in Appendix I.

---

[21] A weaving section occurs when one traffic movement must cross the path of another along a relatively short length of roadway without the aid of signals or other traffic control devices. Such cases typically occur where merge junction is followed closely by a diverge junction.

E. REGIONAL CONTEXT

This chapter discusses the regional context of the proposed World Logistics Center (WLC) project.

Moreno Valley's Economy

Moreno Valley is a predominantly residential community, with one of the lowest jobs-to-housing ratios in the six-county SCAG region[22]. More than three-quarters[23] of jobs in the city are in education, retail, public administration and other services with local client bases. Moreno Valley has relatively few jobs that bring in revenue from outside the city. For example, the manufacturing sector is both quite small (2.6% of jobs in Moreno Valley) and shrinking[24].

One consequence of the existing imbalance between jobs and housing is that a large majority (87%[25]) of Moreno Valley workers commute to jobs outside the city, and in many cases far outside the city. According to the U.S. Census Bureau[26], 19.5% of Moreno Valley workers commute more than 50 miles one way to work, and another 20.1% drive 25 to 50 miles one way. Eighty percent of Moreno Valley workers drive to work alone[27]. Since other Inland Empire cities have similar commute characteristics, the resulting transportation pattern is one of heavy westbound flows in the morning and eastbound flows in the evening, overwhelming the freeway system during peak commuting hours. Another consequence is the high cost of commuting both in terms of out-of-pocket expenses and reduced quality of life for the commuters and their families.

Policy Updates

An updated Housing Element, adopted by the City in February 2011, identified the Moreno Highlands area as a potential location for future jobs-producing land uses[28]. In April 2011, the City adopted its Economic Development Action Plan which identified eastern Moreno Valley as a potential area for major job-producing land uses[29]. The proposed World Logistics Center project is consistent with this planning objective, as it provides a comprehensive plan for jobs-producing land uses.

Regional Truck Traffic Patterns

Truck traffic in the SCAG region is comprised of five major components. These are:

- Internal Trips – Truck trips that begin and end within the SCAG region. These include trips between industries, warehouses, and retail businesses within the region, excluding port-related cargo trips.
- External Trips – Truck trips with either the origin or destination in the SCAG region, and the other end of the trips outside the region, excluding port-related cargo trips. These include agricultural

[29] *Economic Development Action Plan, April 2011*, page 10

products brought into the region and industrial goods made in southern California and shipped to other parts of the U.S.

- Port Trips – Truck trips that begin or end at the Ports of Los Angeles or Long Beach
- Secondary Port Truck Trips - These are truck trips with an initial origin or destination at the San Pedro Bay Ports that are moved a second time after the first trip to or from the San Pedro Bay Ports. Transloading trips are in this category, or secondary trips involving cargos transloaded from trucks from the port.
- Intermodal Trips – Truck trips involving cargos transferred to or from trains that are not port-related.

Table 18 shows the relative sizes of these components[30]. In Riverside County, 94.5% of the truck trips are internal to the region, and another 4.4% are external trips. Port-related trips account for less than 1% of truck traffic to or from Riverside County.

Table 18: Daily Truck Trips by Major Category

Type of Truck Trip	SCAG Region		Riverside County	
	Truck Trips	% of Truck Trips	Truck Trips	% of Truck Trips
Internal	982,965	87.4%	89,910	94.5%
External	72,278	6.4%	4,231	4.4%
Intermodal	7,571	0.7%	197	0.2%
Port-Related	54,719	4.9%	659	0.7%
Secondary Port Trips	7,648	0.7%	128	0.1%
Total	1,125,181	100.0%	95,125	100.0%

The truck traffic associated with the WLC and other logistics centers is expected to follow this general pattern. Most of the warehouse occupants in the NAIOP survey of logistics centers in southern California (Lowe's, Target, Big5, Walgreen's, Home Depot, Costco, Toys "R" Us, Staples, etc.) have extensive business interests in southern California. Thus, it is reasonable to assume that a future warehouse logistics center located in this region would be used in part to support operations within the region; i.e. some of the truck trips they generate would be internal to the region. It is also reasonable to assume that the external trips would follow the overall regional pattern, which is as follows (also see Figure 14)[31]:

- I-5 and US-101 are the main truck routes for cargos transported north of the SCAG region, accounting for 38% of external truck trips
- I-15 is the main route for cargos going northeast (Salt Lake City, Chicago, etc.), accounting for 10% of external truck trips
- I-40 is the main route for cargos going east (Albuquerque, St. Louis, Atlanta, New York, etc.), accounting for 11% of external truck trips
- I-10 is the main route for cargos going southeast (Phoenix, Houston, New Orleans, etc.), accounting for 12% of external truck trips

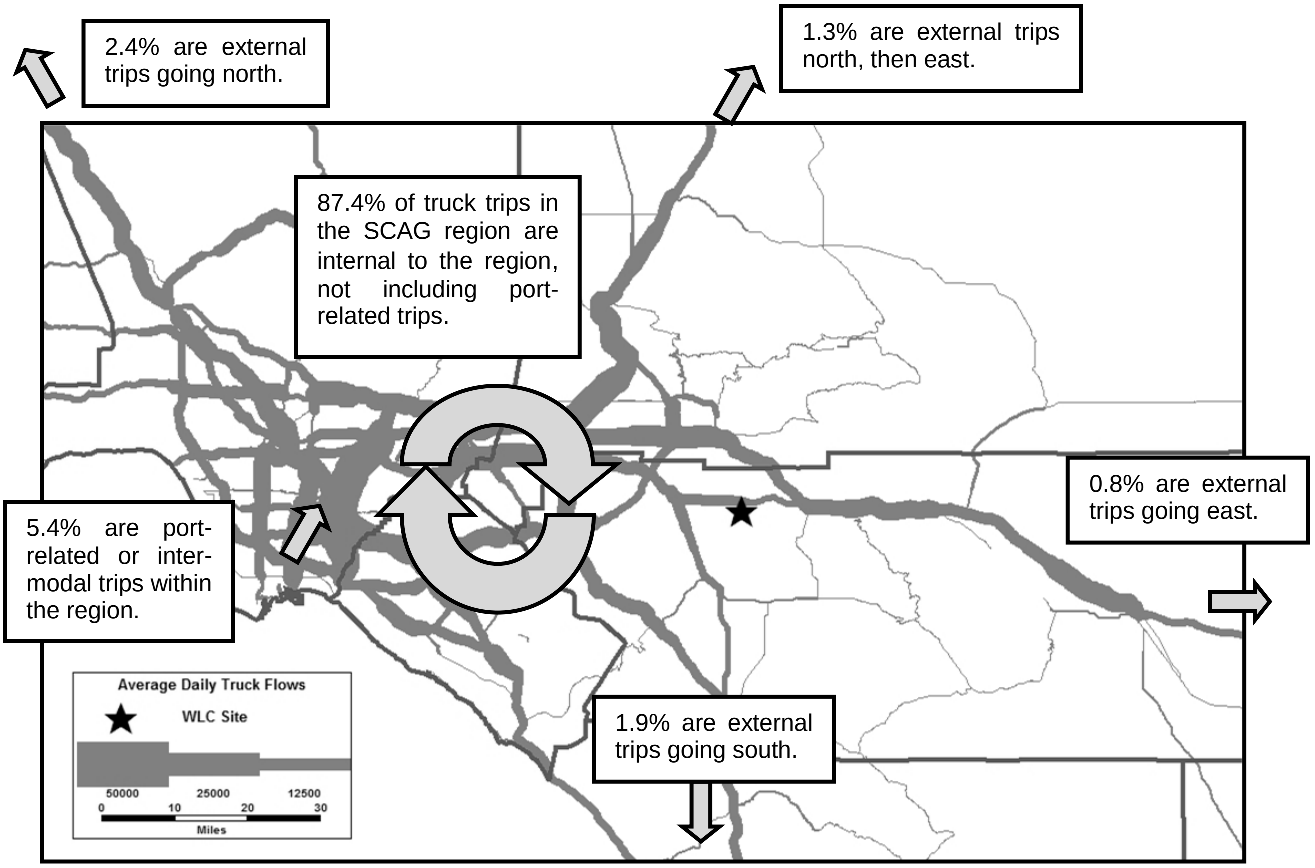
[31] Data Source: Federal Highway Administration, Office of Freight Management and Operations, Freight Analysis Framework (FAF^3), March 2010.

- I-5 and I-215 are the major routes going south (San Diego, Mexico), accounting for 29% of external truck trips.



2.4% are external trips going north.

1.3% are external trips north, then east.

87.4% of truck trips in the SCAG region are internal to the region, not including port-related trips.

5.4% are port-related or inter-modal trips within the region.

0.8% are external trips going east.

1.9% are external trips going south.

Figure 14: Major Truck Flows in the SCAG Region, 2012

4. PROPOSED PROJECT

A. POTENTIAL ROLE OF LOGISTICS

The mixed-use and business park type of development envisioned in the Moreno Highland Specific Plan (the previous specific plan for the WLC area) has proven to be infeasible at this location; between the plan's approval in 1992 until its repeal in 2015 no development occurred on the site. This raises the question of whether a different type of development would be more feasible and so would provide more scope for benefits to Moreno Valley. SCAG has studied this issue in the larger context of the region's relative standard of living. In the period from 1987 to 2001, the SCAG region slipped from 4th place to 17th (last) place in per capita income among the 17 consolidated metropolitan areas in the United States[32]. Among the chief reasons for this decline was the loss in manufacturing jobs, which reduced the earning potential for the region's large and growing number of workers who lack a college education. One possibility for replacing these lost jobs is the logistics sector, since:

- Logistics has shown steady growth due to the adoption of "just-in-time" inventory systems, which rely on rapid-response warehouses as a substitute for goods stored on-site.
- The growth in trade with Asia has increased the volume of cargos while the introduction of post-Panamax container ships[33] limits the choice of west coast ports to L.A./Long Beach, Seattle/Tacoma, and Vancouver. Consequently they all have good prospects for continuing long-term growth.
- Logistics jobs offer better-than-average wages. These wages are better than the wages of the blue-collar jobs in the declining sectors of manufacturing and construction[34].

Within the Inland Empire context, logistics development would bring high-paying blue collar jobs into an area with an under-employed labor force, including many workers lacking a college education[35]. Also, since modern logistics warehouses are very large buildings requiring large vacant parcels of land near freeways, it gives the Inland Empire region a comparative advantage over the coastal counties that do not have such parcels readily available or regions further inland that are not as easily accessible from the Ports of Los Angeles and Long Beach. Forecasts suggest that the regional demand for warehouse space will triple over the next 25 years, from approximately 1.5 billion square feet to 4.5 billion square feet, and that half of this space will be built in the Inland Empire[36].

B. PROJECT DESCRIPTION

The proposed World Logistics Center is a plan for the development of modern high-cube logistics warehouse distribution facilities on land in eastern Moreno Valley. The project includes the development of up to 40.6 million square feet of modern high-cube logistics facilities within the 2,610-acre World Logistics Center Specific Plan.

---

[32] *Logistics & Distribution: An Answer to Regional Upward Social Mobility*, Dr. John Husing for SCAG, June 2004, page 1.

[33] Post-Panamax vessels are too large to go through the Panama Canal.

[34] In 2003 the average pay was $45,314/yr for logistics jobs compared to $43,871 for manufacturing and $40,439 for construction (from *Logistics & Distribution: An Answer to Regional Upward Social Mobility*, Dr. John Husing for SCAG, June 2004, page 12.)

[35] In 2016 only 15% of adults aged 25 or older in Moreno Valley had a bachelor's degree or higher. This compares to 37% in Orange County. Sources: *Profile of the City of Moreno Valley*, SCAG, May 2017, *Profile of the Orange County*, SCAG, May 2017.

[36] Source: *Multi-County Goods Movement Action Plan*, Wilbur Smith Associates, August 2008.

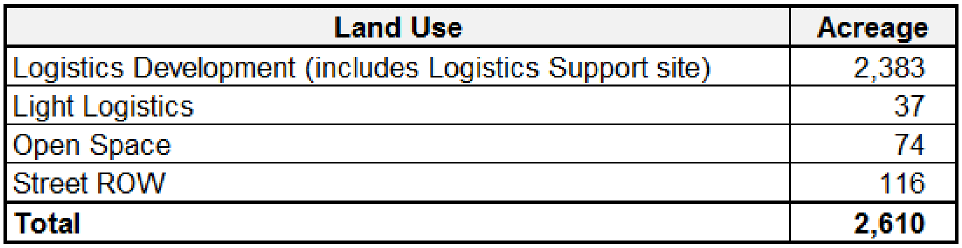
Proposed Land Uses

The project includes development of the buildings and infrastructure consistent with the adopted World Logistics Center Specific Plan. The Specific Plan provides for a master planned development of up to 40.6 million square feet of modern high-cube logistics warehouse distribution facilities.

The Specific Plan includes development standards and use regulations, a master plan for circulation and infrastructure, architectural, landscape and design guidelines, and sustainability goals which would be applicable to all future development within the project area.

Table 19 lists the acreage associated with the proposed Logistics Development, Light Logistics, and Open Space uses within the project site.

Table 19: The World Logistics Center Land Use Summary



Land Use	Acreage
Logistics Development (includes Logistics Support site)	2,383
Light Logistics	37
Open Space	74
Street ROW	116
Total	**2,610**

Within the Specific Plan, the primary land use category is Logistics Development. This land use designation would provide for development of high-cube logistics warehouse uses consisting of warehouse buildings at least 500,000 square feet in size. Warehousing and logistics activities, consistent with the storage and processing of manufactured goods and materials prior to their distribution to other facilities and retail outlets, would be permitted within this category. Ancillary office and maintenance space would be permitted, along with the outdoor storage of trucks, trailers, and shipping containers.

A smaller area would be devoted to Light Logistics. The light logistics land use designation is for conventional warehouse buildings smaller than 500,000 square feet in floor area.

In consultation with the South Coast Air Quality Management District (SCAQMD) a combined fueling station and convenience store was been added to the plans for the WLC which would be developed within the Logistics Support (LS) land use area. The purpose of the fueling station/convenience store is to provide an on-site location to purchase alternative fuels such as compressed/liquefied natural gas (CNG) / (LNG), diesel fuel, snacks, soft drinks, toiletries, cigarettes, etc. for WLC truck drivers. The station is not intended to attract customers from outside of the WLC and would only have driveway access onto a side street in the WLC; no driveway access to external roads would be provided. The facility would have restrooms and operate on a 24/7 basis. There would be no shower facilities, stand-alone food uses, drive-through food operations, alcohol products, vehicle maintenance, vehicle washing, or long-term parking.

Proposed Road Network

The proposed network, which follows the adopted WLC Specific Plan, is shown in Figure 15 and the lane configurations are summarized in Table 20. The proposed road network would feature two major east-west connections for through traffic between Redlands Blvd. and Gilman Springs Rd. World Logistics Center Parkway would remain the main north-south road but would be changed from a minor arterial (in the current plan) to a major arterial. The other project streets are designed to provide internal access to project buildings and are not expected to serve external traffic. The overall density of streets is low because the very large size of the WLC buildings can only be accommodated in large blocks.

Table 20: Lane Configurations for WLC Internal Roads

Road	Lane Configuration
Street A (World Logistics Center Pkwy.)	6 lanes and 4 lanes, wide median
Street B (Eucalyptus Ave.)	4 lanes, standard median
Street C (Alessandro Blvd.)	4 lanes, undivided
Cactus Ave. Extension	4 lanes, undivided
Street E (Alessandro Blvd.)	4 lanes, undivided
Street F	2 lanes, undivided

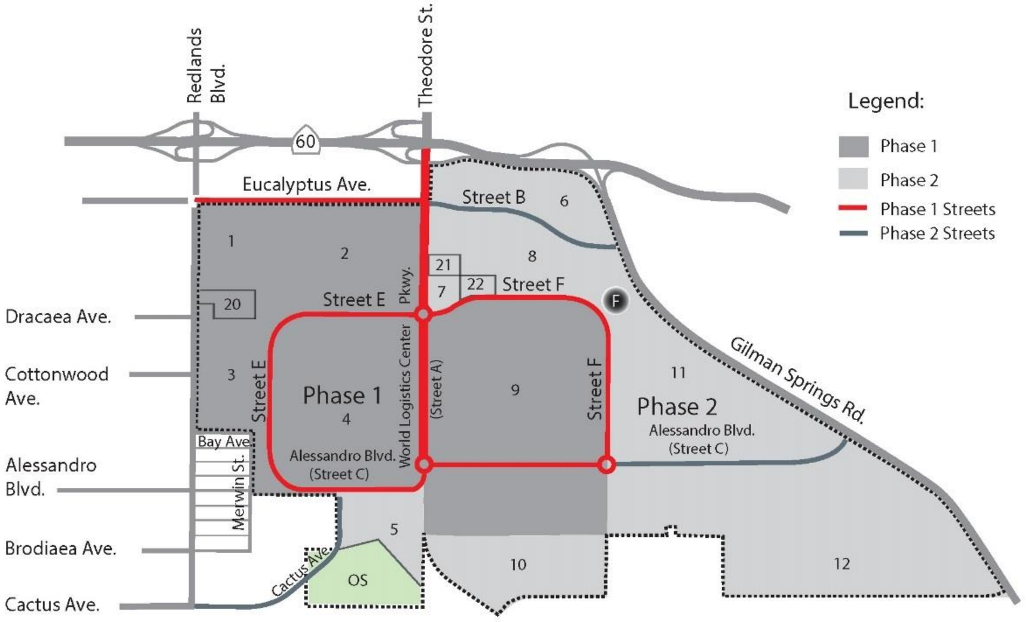


Figure 15: Proposed Roadways and Phasing

The WLC's internal streets are proposed as follows:

World Logistics Center Parkway would run on its present alignment north-south through the World Logistics Center. It is planned to be a 6-lane divided roadway north of Street E/F (see Figure 16) and 4-lane divided roadway south of Street E/F (see Figure 17), with additional widening and lane improvements at its intersections with SR-60, Eucalyptus Ave. and local interior collector streets. Three interior intersections would be roundabouts to provide for efficient traffic flow.

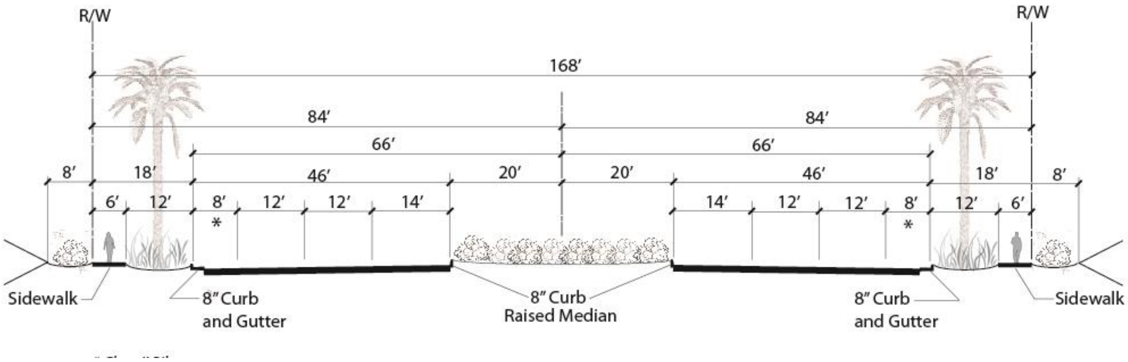

Figure 16: World Logistics Center Parkway Typical 6-Lane Section

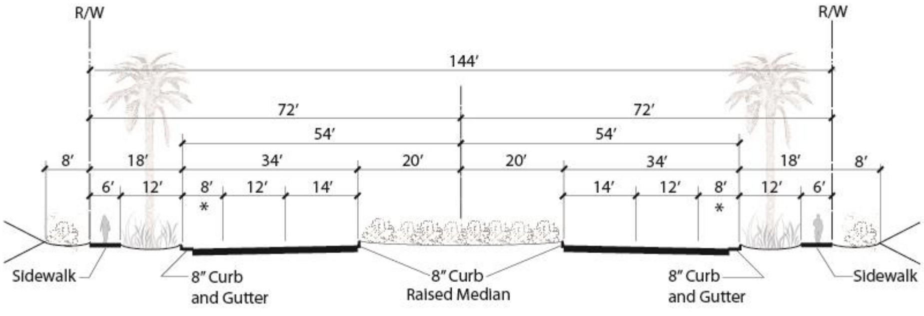
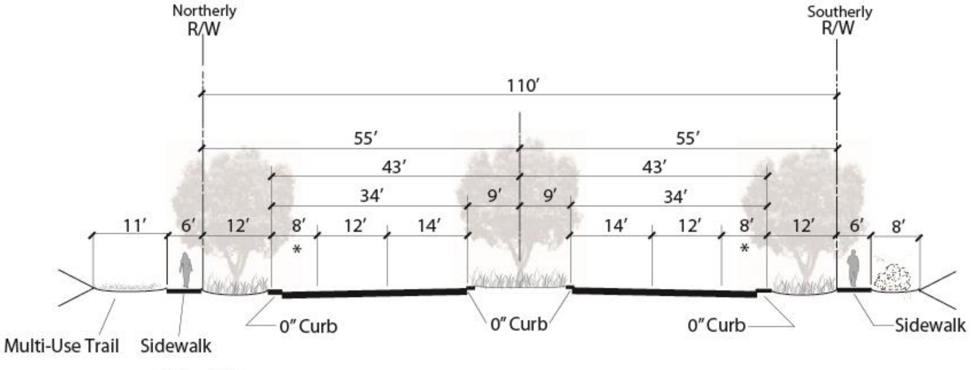


* Class II Bikeway

Figure 17: World Logistics Center Parkway Typical 4-Lane Section

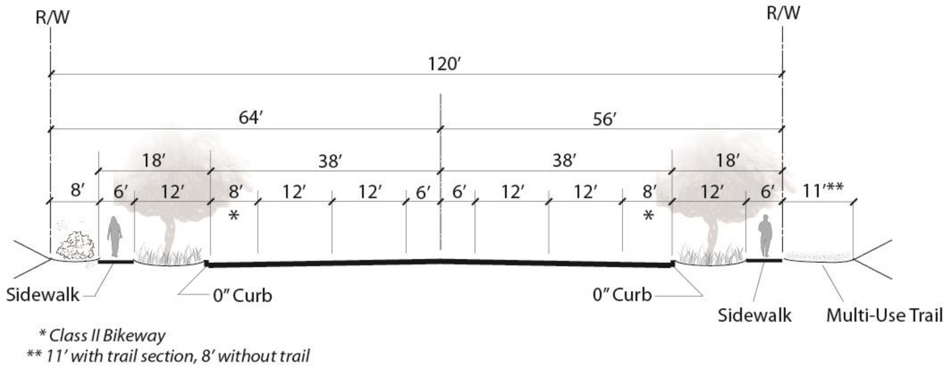
Street "B" is proposed to be a 4-lane divided roadway running east-west through the northerly portion of the World Logistics Center from Gilman Springs Rd. on the east to existing Eucalyptus Ave. at Street "A" on the west (see Figure 18). The City's General Plan shows this street ultimately extending westerly across the City.



* Class II Bikeway

Figure 18: Street B Typical Section

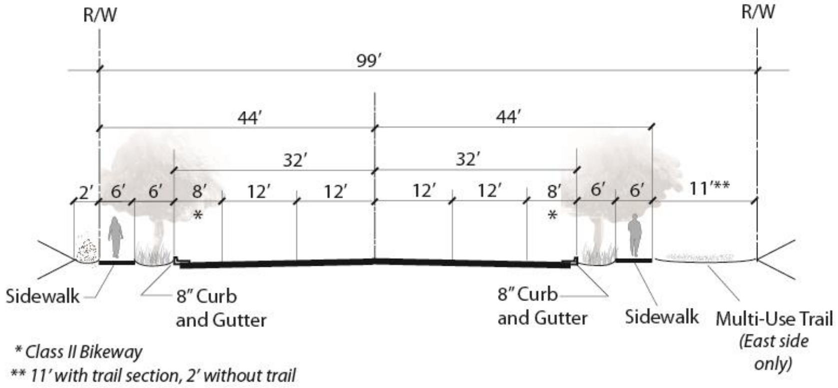
Alessandro Boulevard[37] would retain its name. ROW width, and current alignment as an undivided roadway running east-west through the World Logistics Center, intersecting with Gilman Springs Rd. on the east (see Figure 19) and the Cactus Avenue Extension on the west. An existing section of Alessandro Blvd. between Merwin Street and the Cactus Avenue Extension would be closed to vehicular traffic except for emergency vehicles and bicycles and pedestrians. This is to prevent project traffic from traveling through existing residential neighborhoods. Passenger cars and light trucks heading west through the site would use Cactus Ave. Extension.



** Class II Bikeway*
*** 11′ with trail section, 8′ without trail*

Figure 19: Alessandro Boulevard Typical Section

Cactus Avenue Extension is proposed to be a 4-lane undivided north-south roadway (see Figure 20) connecting existing Cactus Ave. with the westerly internal loop street (Street "E"). The intersection with Street "E" would be designed to prohibit large trucks from using Cactus Ave. Extension to prevent their travel through adjacent residential neighborhoods. Special design features and signage will reinforce this restriction.



** Class II Bikeway*
*** 11′ with trail section, 2′ without trail*

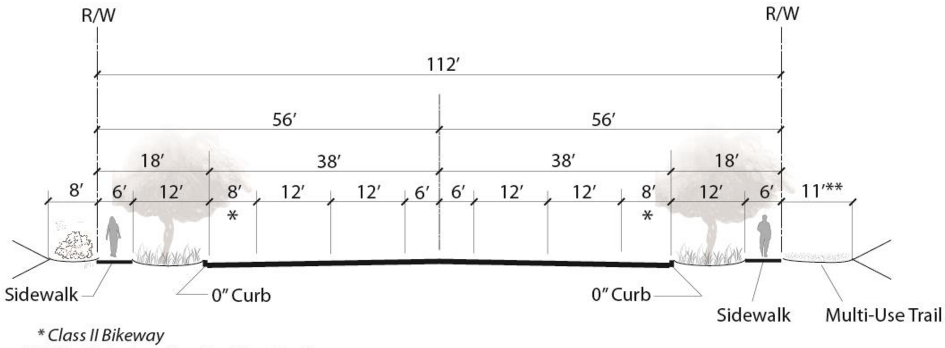
Figure 20: Cactus Boulevard Extension Typical Section

Street "E" is proposed to be a 4-lane undivided internal collector loop (see Figure 21) road providing direct access to development areas in the westerly portion of the project. Design details of this roadway will be

---

[37] Alessandro Boulevard was labeled “Street C” and “Street E” (the western portion) in some draft reports discussing the WLC internal road network.

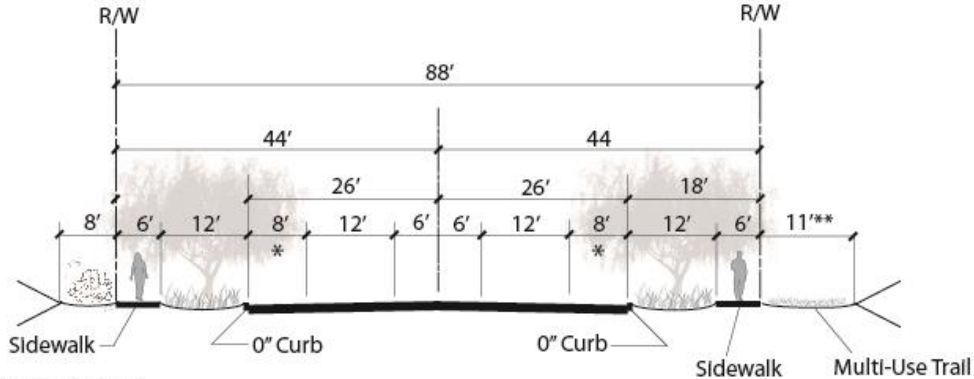
determined by subsequent subdivision and site development approvals.



* Class II Bikeway
** 11’ with trail section, 8’ without trail

Figure 21: Street E Typical Section

Street "F" is proposed to be a 2-lane internal collector road providing direct access to development areas in the central portion of the project (see Figure 22). It would intersect with Street "A" at its northerly end and with Alessandro Boulevard at its southerly end. A roundabout is planned at its intersection with Alessandro Boulevard. Specific design details of this roadway will be determined by subsequent subdivision and site development approvals.



* Class II Bikeway
** 11’ with trail section, 8’ without trail

Figure 22: Street F Typical Section

Eucalyptus Avenue is proposed to be a 4-lane divided roadway running east-west through the northerly portion of the World Logistics Center from Street “B” on the east to Eucalyptus Ave. west of Redlands Blvd. (see Figure 23). The City's General Plan shows this street ultimately extending westerly across the City.

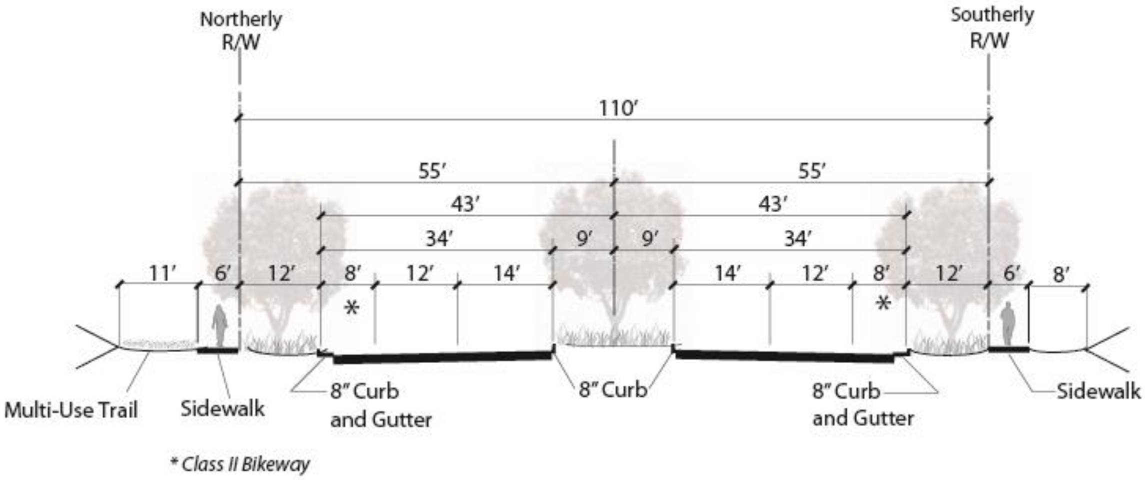


Figure 23: Eucalyptus Avenue Typical Section

The project would change a number of existing intersections in or adjacent to the project site, including:

- **Alessandro Blvd./Gilman Springs Rd. (IN-6)** would be signalized in Phase 1, and the eastbound approach changed from a shared left-turn/right-turn lane to dedicated left-turn lane and right-turn lanes. The northbound approach would have a left-turn pocket and two through lanes while the southbound approach would have a right-turn pocket and two through lanes. In Phase 2 an additional through lane would be added to the northbound and southbound approaches.
- **Theodore St./SR-60 WB ramps (IN-15)** would be signalized in Phase 1, one westbound and two northbound right-turn pockets would be added along with a southbound left-turn pocket. In Phase 2 this intersection would be replaced as part of the re-configuration of the interchange that will be described later in this section.
- **Theodore St./SR-60 EB ramps (IN-16)** would be signalized in Phase 1, eastbound and southbound right-turn pockets would be added, a northbound through lane would be added, and the existing left-turn pocket would be extended south to the adjacent intersection (IN-19). In Phase 2 this intersection would be eliminated and replaced with a new intersection to the north as part of the re-configuration of the interchange that will be described later in this section.
- **World Logistics Center Parkway/Eucalyptus Ave. (IN-19)** would be signalized in Phase 1 and two northbound and southbound lanes added as part of the widening of World Logistics Center Parkway. In Phase 2 right-turn pockets would be added in the northbound, southbound, and eastbound directions, and an eastbound through lane added. A new westbound approach would be added with a left-turn pocket and a shared through/right turn lane.

Three roundabouts would be created, namely:

- **Alessandro Blvd. (Streets C and E)/World Logistics Center Parkway (IN-3)** is currently two closely-spaced offset intersections. These would be replaced with a 3-legged roundabout as shown in Figure 24.

-

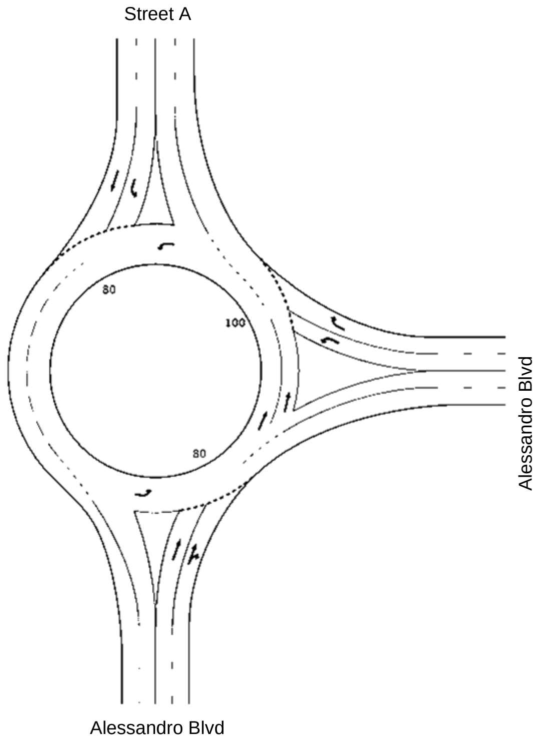

Figure 24: Alessandro Blvd. (Streets C and E)/ World Logistics Center Parkway Roundabout

- **Streets E and F/World Logistics Center Parkway (IN-1)** would be created as a 4-leg roundabout in Phase 1 as shown in Figure 25.

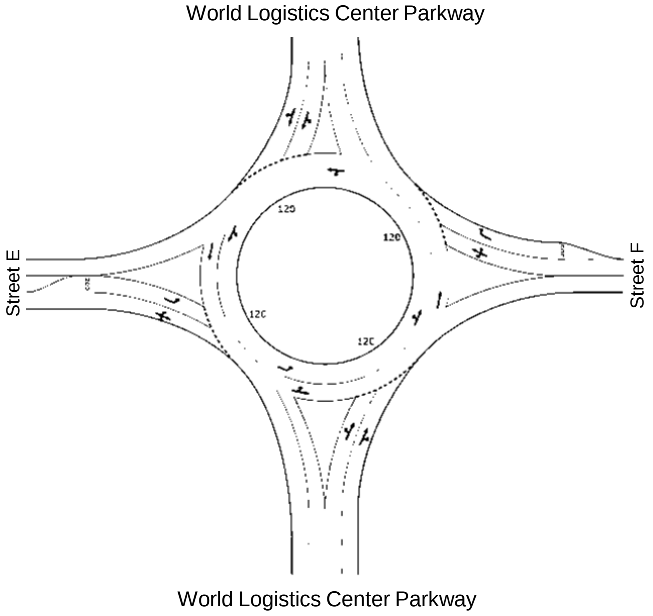

Figure 25: Roundabout at Intersection of World Logistics Center Parkway, E, and F

- **Streets C/Street F (IN-4)** would be created as a 4-leg roundabout as shown in Figure 26.

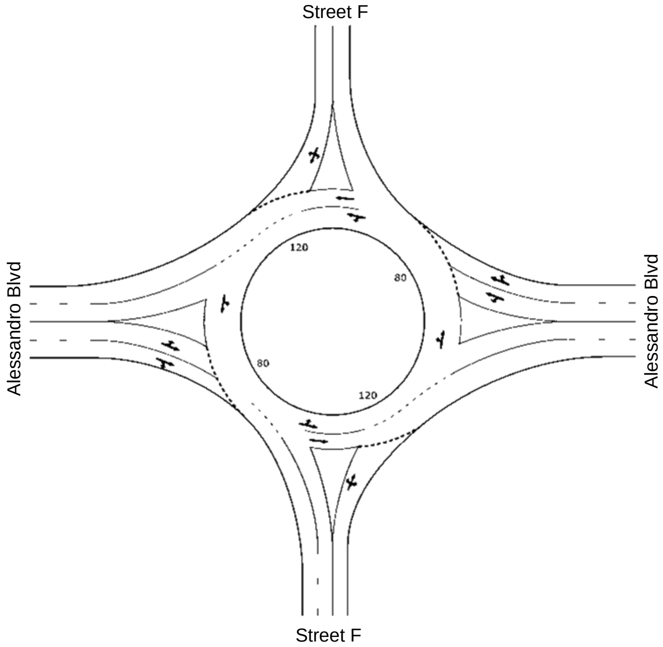

Figure 26: Roundabout at Intersection of Streets F and C (Alessandro Blvd.)

Another change that the adopted WLC Specific Plan made to the General Plan is that Alessandro Blvd. would be severed east of Merwin St. and connected to Cactus Ave. via Cactus Ave. Extension. This re-configuration is intended to avoid impacts to the existing residential community west of the project area that would occur if Alessandro Blvd. were not severed and was widened into a 6-lane arterial as shown in earlier versions of the General Plan.

The current circulation plan for the General Plan is shown in Figure 27.

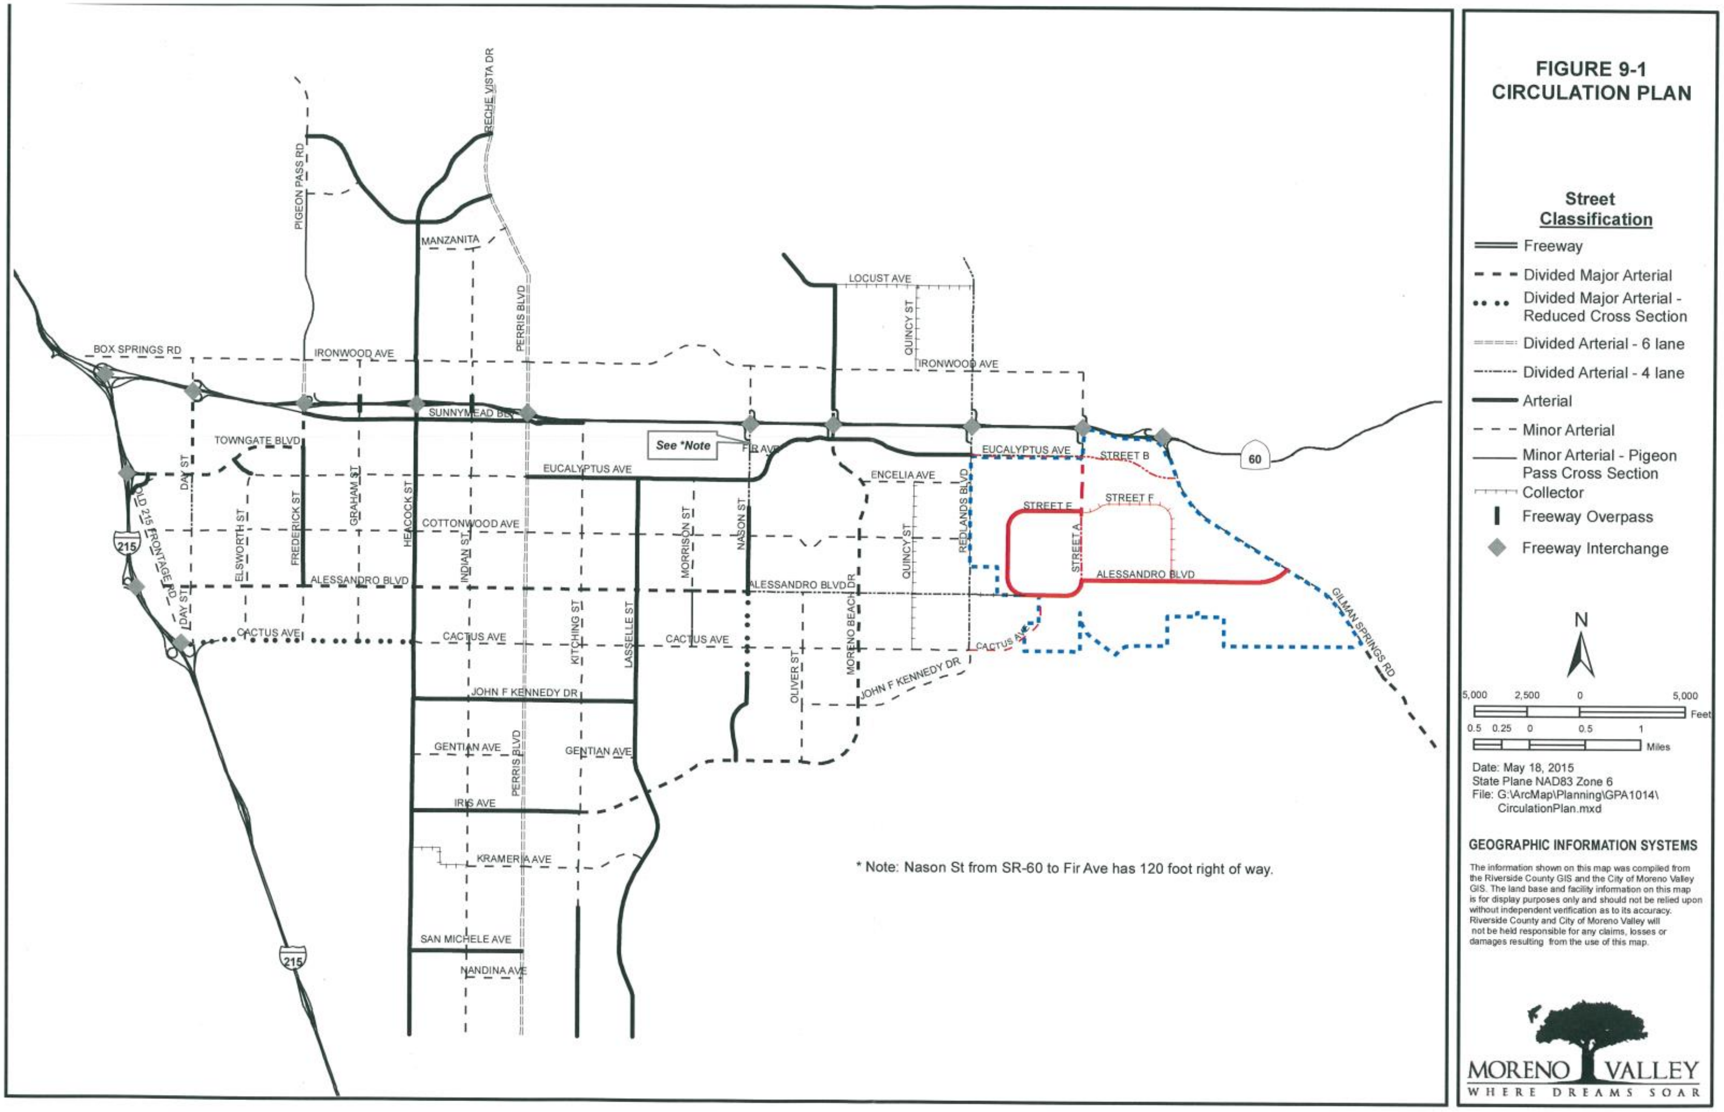

Figure 27: Circulation Plan After Adoption of the WLC Specific Plan

A closely-related project that would serve the WLC is the reconfiguration of the SR-60 interchange at Theodore St./WLC Parkway. One of the new configurations being considered is shown in Figure 28. This project is included in the financially-constrained RTP project list and was assumed to be completed prior to Phase 2 of the WLC.

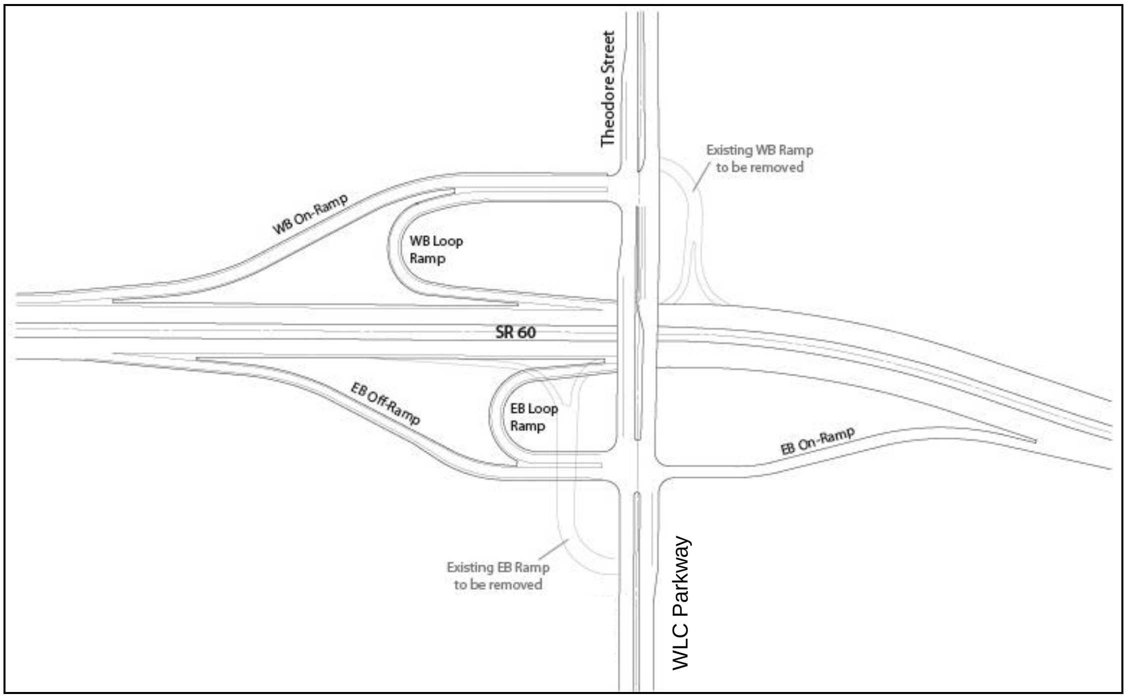

Figure 28: Possible Future Configuration for the SR-60 Interchange at Theodore St.

The developer of the WLC has discussed the interchange project with the City and has also entered into discussions with Caltrans and other agencies regarding this interchange project. The planning and design of this interchange is currently underway. For the purposes of this report, the improvements to the SR-60/Theodore/WLC Parkway interchange have been analyzed as part of the WLC project and have been studied in the same manner as the proposed project’s internal roadways.

Truck Routes

The truck routes near the project site is shown in Figure 29. These routes include changes made as part of the WLC Specific Plan.

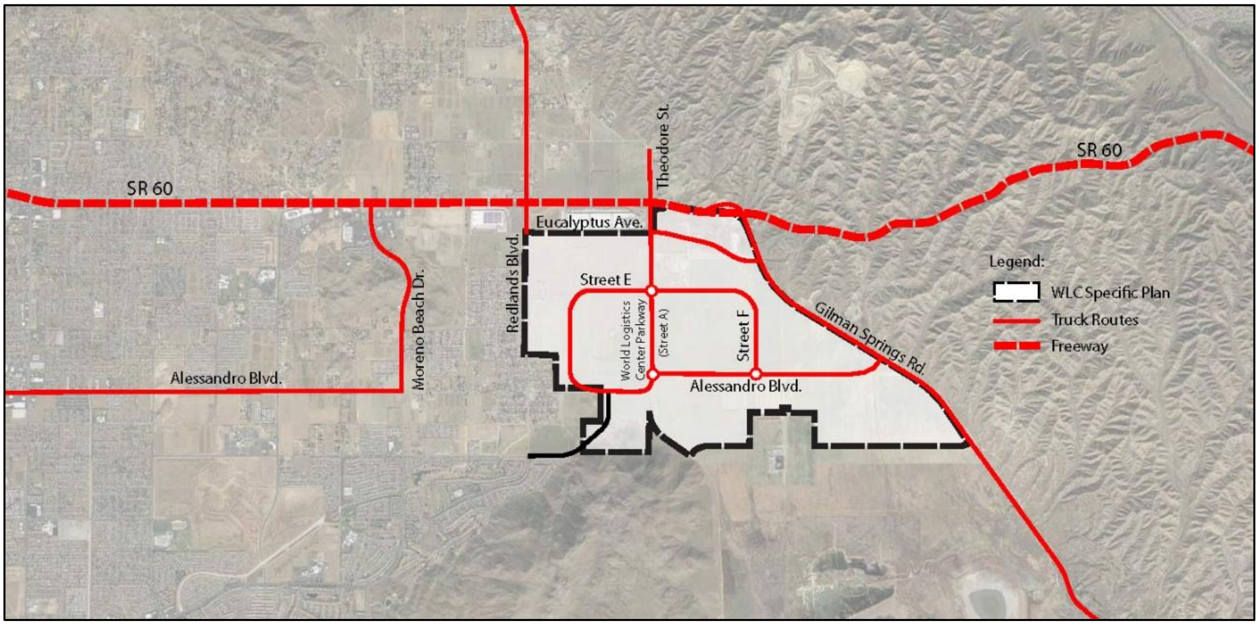

Figure 29: Truck Routes Near Project Site

Bicycle and Pedestrian Facilities

The WLC proposes Class II bike routes on all of its internal streets, thus providing safe access to all WLC buildings for employees wishing to commute by bicycle, as well as creating north-south and east-west paths through the site for bicycle through trips (see Figure 30).

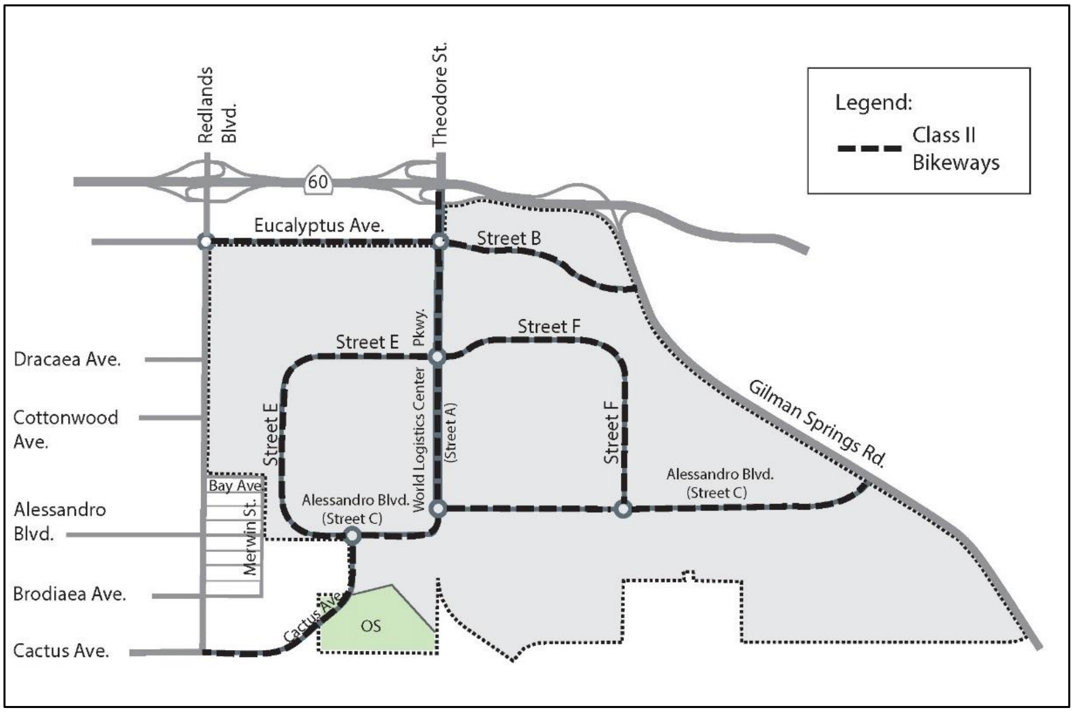

Figure 30: Proposed WLC Bikeways

The World Logistics Center proposes a network of pedestrian ways on project streets, as required to comply with ADA and other applicable codes, to connect all areas of the project to surrounding areas and to interconnect all buildings within the project.

An extension of the City's Redlands Blvd multi-use trail is proposed to be routed along the eastside of Redlands Blvd., and extend southerly through the project connecting to the existing trail along the south side of Cactus Ave., and to the San Jacinto Wildlife Area at the former Davis Rd. alignment (see Figure 31). Details of this trail alignment would be established with site-specific development proposals. The multi-use trails within the World Logistics Center would comply with existing City standards.

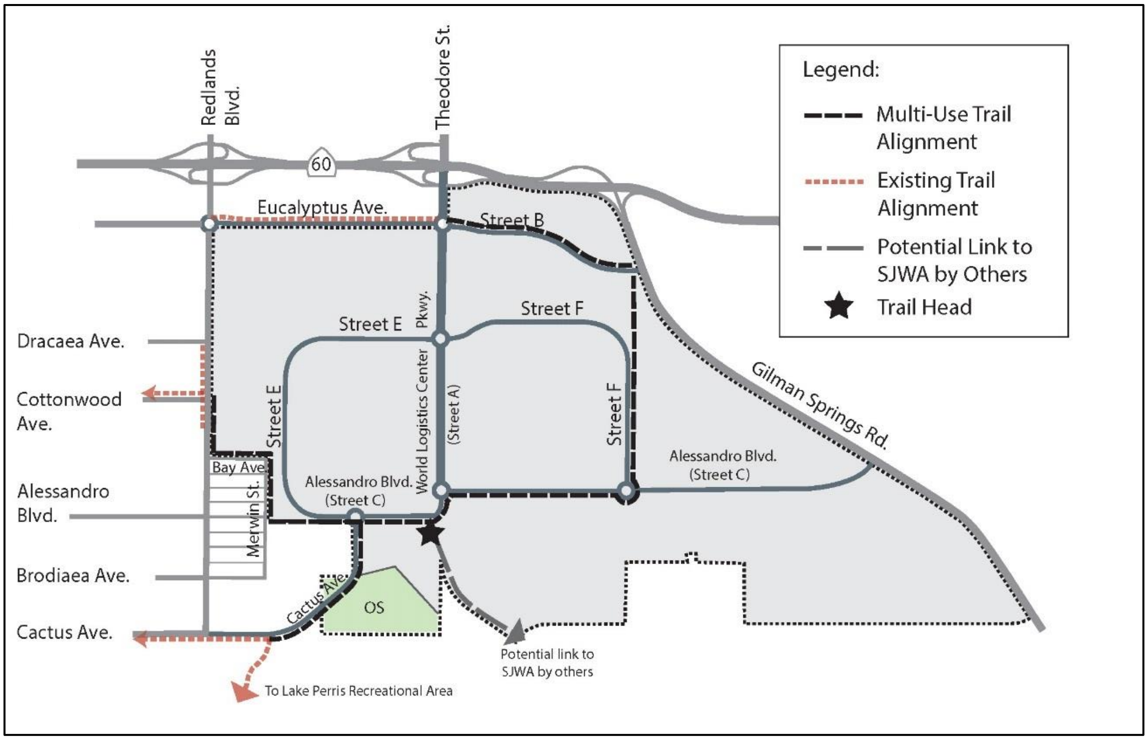

Figure 31: Proposed Multi-Use Trails

Phasing

The WLC would be developed over a number of years. For planning purposes it was assumed that Phase 1, to be completed by 2025, would contain approximately 22,946,000 square feet of logistics warehouse uses. This is approximately 57% of the total project building space. At that time, the road system would be partially built out (see Figure 15) with east-west through traffic served by Cactus Ave. Extension and Streets C and E, and north-south traffic served by World Logistics Center Parkway.

For Phase 2, full build-out of the project was assumed. An additional east-west through route would be provided when Eucalyptus Ave. (Street B) is connected with Redlands Blvd. to the west and Gilman Springs Rd. to the east.

C. PROJECT TRIP GENERATION

Chapter 2 of this report described the derivation of the trip generation rates used in the analysis. These rates are summarized in Table 21.

Table 21: Trip Generation Rates for Proposed and Existing Land Uses

Vehicle Class	Vehicle Class	AM Peak Hour		PM Peak Hour		ADT
		In	Out	In	Out	
High-Cube Logistics (per KSF)	Pass Veh	0.029	0.028	0.024	0.055	0.963
	Light Trucks	0.002	0.002	0.002	0.003	0.074
	Medium Trucks	0.001	0.002	0.002	0.003	0.097
	Heavy Trucks	0.007	0.009	0.005	0.006	0.266
	Total	0.039	0.041	0.034	0.066	1.400
Light Logistics (per KSF)	Pass Veh	0.105	0.031	0.041	0.111	1.397
	Light Trucks	0.007	0.002	0.003	0.007	0.090
	Medium Trucks	0.006	0.002	0.002	0.006	0.078
	Heavy Trucks	0.013	0.004	0.005	0.014	0.174
	Total	0.131	0.039	0.051	0.139	1.740
Utilities (per KSF)	Pass Veh	1.426	0.357	0.350	1.401	10.217
	Light Trucks	0.211	0.053	0.052	0.207	1.511
	Medium Trucks	0.048	0.012	0.012	0.047	0.341
	Heavy Trucks	0.163	0.041	0.040	0.161	1.171
	Total	1.848	0.462	0.454	1.816	13.240
Gas Station w Mart (Pumps)	Heavy Trucks	1.160	1.114	0.899	0.864	31.613
Fire Station (site)	Pass Veh	20.000	8.000	10.000	20.000	137.000
Convenience Market (KSF)	Pass Veh	13.209	13.209	10.580	10.165	321.873

Notes: 1) Trips for gas station and convenience market are net of pass-by and diverted trips
2) Trucks using the fueling stations are all non-diesel

Using these rates, the trips that would be generated by the WLC are shown in Table 22 and Table 23.

Table 22: Trips Generated by Proposed and Existing Land Uses

	Unit	Amount	AM Peak Hour			PM Peak Hour			ADT

D. PROJECT TRIP DISTRIBUTION

A survey of warehouses in the Inland Empire[39] found that 80% of the vehicles entering or leaving warehouse sites are passenger cars, nearly all of which are used for commute trips by employees of the warehouses. The travel pattern of the project-related auto traffic is discussed below, followed by a discussion of project-related truck traffic.

WLC Auto Traffic

As discussed previously, Moreno Valley currently has a severe jobs/housing imbalance that results in long westbound commutes for thousands of city residents every workday. The WLC would create approximately 20,000 local job opportunities[40]; a nearly fifty percent increase in the number of jobs in Moreno Valley. This would have several effects on commute patterns:

- Many current and future residents of Moreno Valley would have the opportunity to work locally with very short commute trips.
- Residents of neighboring cities who work at the WLC would have short commutes and, importantly, be able to access the site using the arterial road network. This is consistent with the policies of the Western Riverside Council of Governments and the Riverside County Transportation Commission to promote use of the arterial road network as an alternative to freeways. Tests with the RIVTAM model (see Figure 32) suggest that nearly half of auto traffic associated with the WLC would be on surface streets; i.e. not on freeways.
- Workers coming from more distant locations would, in most cases, be travelling on freeways in the off-peak direction; i.e. commuters traveling to the WLC from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to

---

[38] Light trucks are 2 axle trucks with six wheels, medium trucks are those with three axles, and heavy trucks are those with four or more axles. Pickup trucks with four wheels are included in the “auto” category.

[39] *Truck Trip Generation Study*, City of Fontana, August 2003.

[40] Based on a ratio of 0.5 employees per 1000 square feet of logistics. This ratio is taken from: *DTA Public Works Database; confirmed by “Employment Density Study,” SCAG (2001), and “Logistics Trends and Specific Industries,” NAIOP Research Foundation (March 2010).San Bernardino Planning Department.*

take advantage of the existing unused off-peak capacity of freeways, since the freeways were sized for flows in the peak direction.

- Assuming, as RIVTAM does, that WLC employees would work elsewhere if the WLC project were not implemented, then the availability of jobs at the east end of Moreno Valley would reduce the number of workers driving long commutes to distant jobsites to the west and southwest. Figure 33 shows that although the project would increase freeway auto traffic eastbound in the morning (where unused capacity is available), it would also decrease the traffic in the more congested westbound direction. In the evening the pattern would reverse, with the project relieving traffic in the congested eastbound direction (see Figure 34). Therefore, the WLC project would have a net beneficial impact on the regional freeway auto traffic. This is the effect sought in the policies of SCAG, WRCOG, and other regional governments and agencies that encourage better jobs/housing balances as a way to reduce peak directional flows on the regional freeway system.

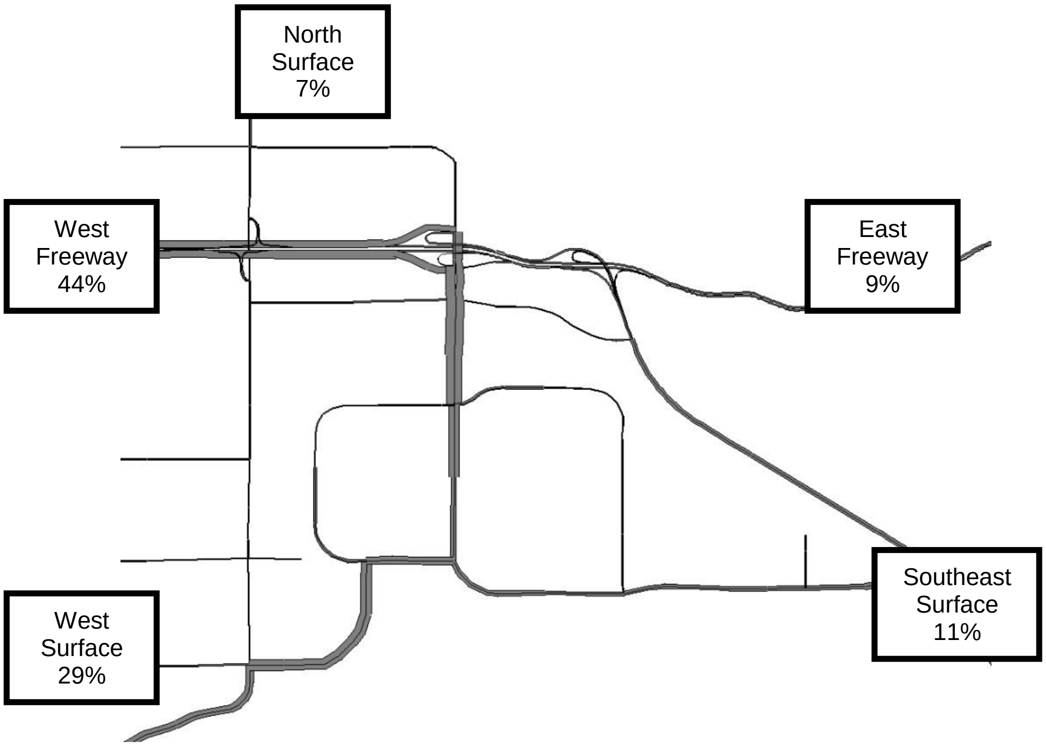

Figure 32: Daily Distribution of WLC Auto Trips

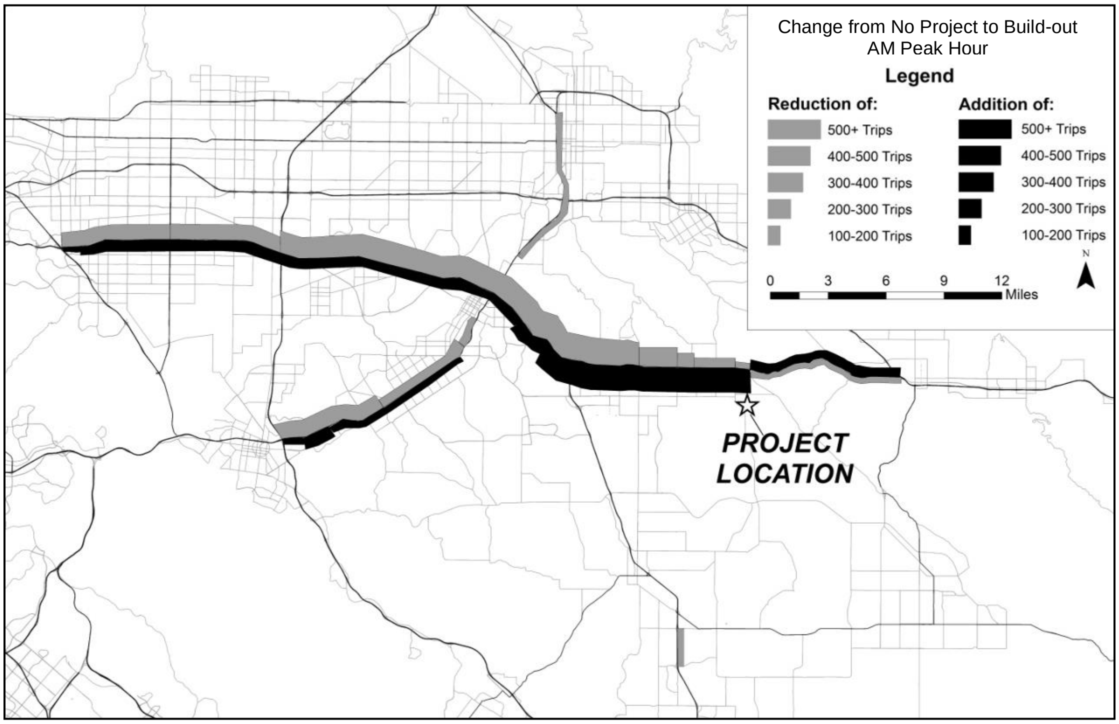

Figure 33: Effect of WLC on Freeway Car Traffic, AM Peak Hour

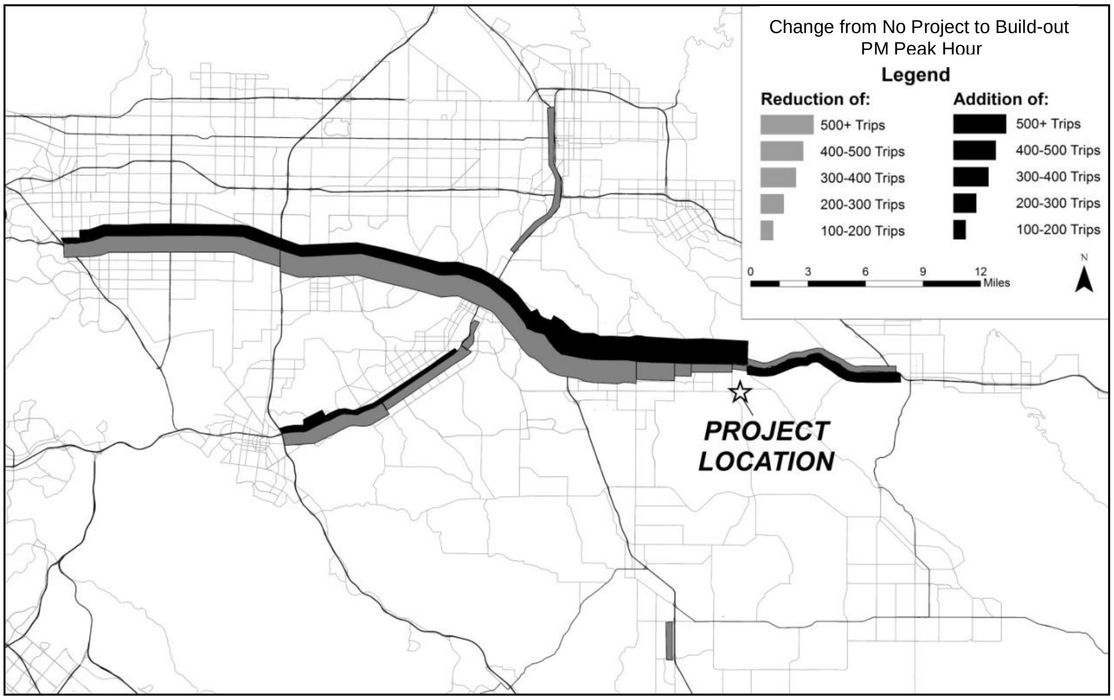

Figure 34: Effect of WLC on Freeway Car Traffic, PM Peak Hour

WLC Truck Traffic

The truck traffic associated with a typical logistics center has a much different time-of-day pattern than auto traffic. Figure 35 shows the combined traffic data for vehicles entering or leaving the 31 logistics centers in 2011 NAIOP trip generation study. As shown, besides being much larger, the auto traffic shows distinct peaks while truck traffic is spread much more evenly throughout the 24-hour period. The five hours with the highest truck traffic all occurred outside of the freeway peak periods.

Some readers of the previous TIA misunderstood Figure 35 to mean that the WLC traffic analysis did not cover the worst-case scenario. In fact, because the peak hour of trip generation for the WLC was assumed to occur simultaneous with the peak hour of background traffic, the assumptions in the WLC analysis are far more conservative (i.e. assume worse conditions) than the NAIOP survey would suggest is likely to occur (see Figure 36). In addition, the 2PM to 3PM hour was also studied with regards to possible impacts on pedestrians in the areas around schools, since most schools release students at that time of the day (see Chapter 12, Section B of this report).

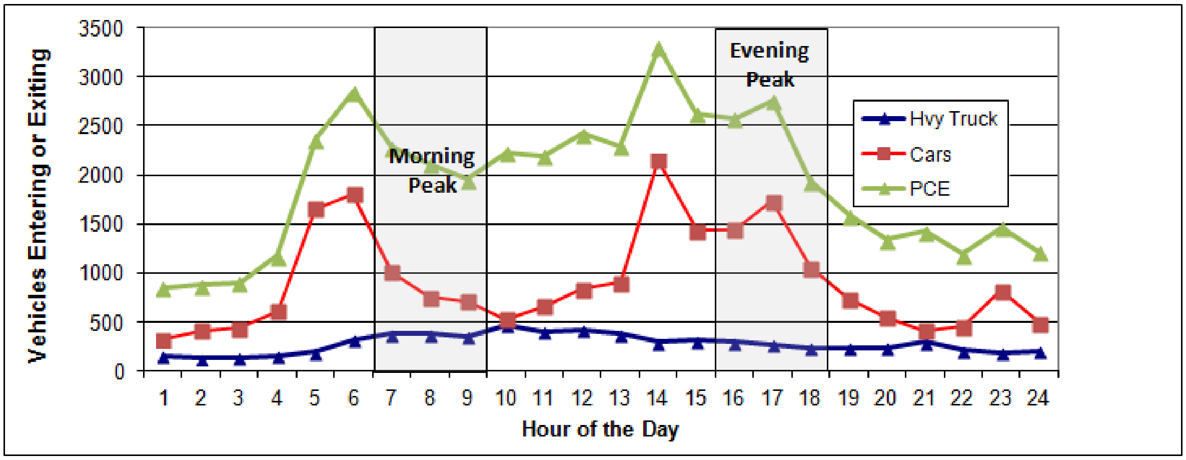

Figure 35: Time-of-Day Distribution of Traffic from Logistics Warehouses

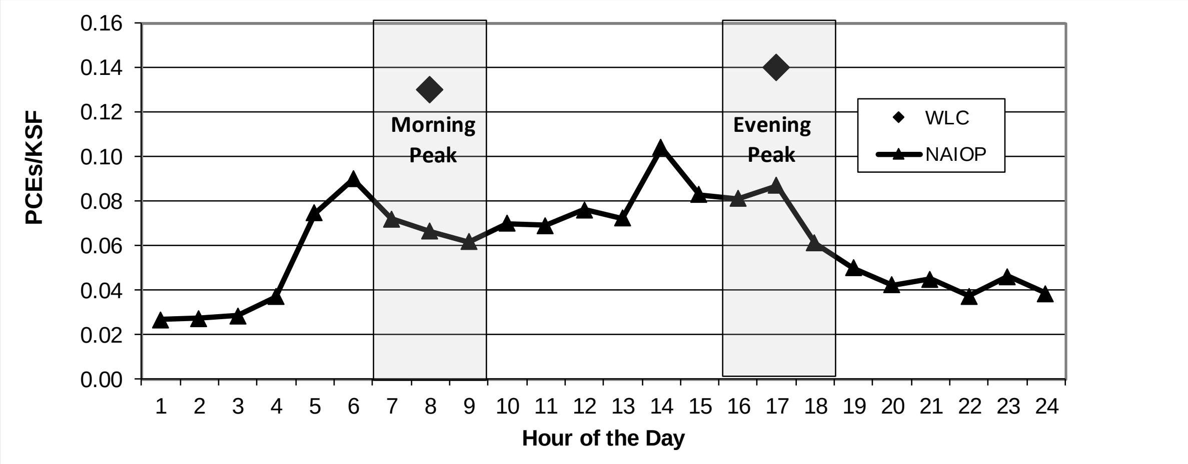

Figure 36: Time-of-Day Distribution, WLC Assumptions Compared to NAIOP

Since the internal trips, the port-related trips, and the majority of external trips (all but those on I-10) use routes west of the project site, it is anticipated that a large majority of the WLC truck traffic would be oriented to the west of the project, with a much smaller amount to and from the east. Also, due to truck routing restrictions, the majority of WLC truck traffic would use the freeway system to enter and leave the site. However, there may be some trips between the WLC and local businesses, for example trip chaining among warehouses to consolidate cargos, that may use surface streets such as Gilman Springs Rd. Tests with the RIVTAM model confirm this pattern (see Figure 37).

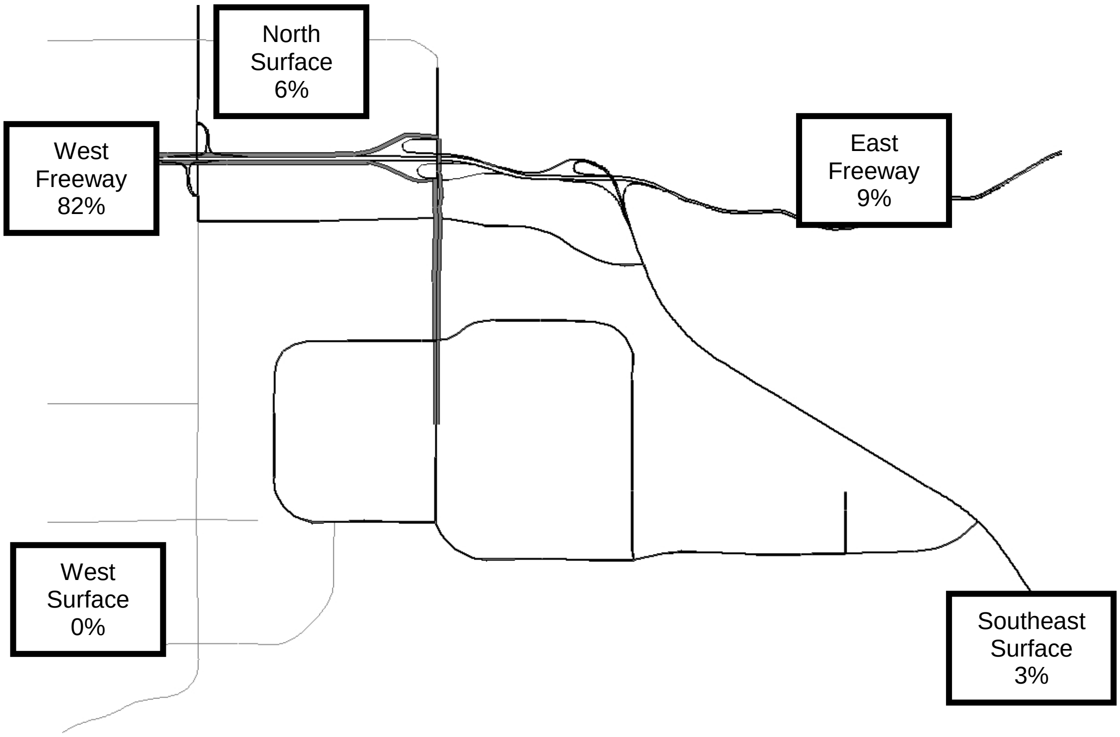

Figure 37: Daily Distribution of WLC Truck Trips

The percentage of WLC truck trips that would go to the port were estimated based on the assumptions described in Chapter 11 (see Table 86) for each study year. These percentages were then applied to the trip generation rates to find the number of WLC trucks going to and from the port in each analysis period. These are shown in Table 24. Tests with the SCAG traffic model showed that these trips would split approximately evenly between the two routes shown in Figure 48, so half of these trips were assigned to the SR-60 route and the other half assigned to the SR-91 route.

Table 24: WLC Truck Trips to and from the Port by Analysis Period

Scenario	AM Peak Hour		PM Peak Hour		Daily	
	In	Out	In	Out	In	Out
2018 Plus Build-out	7	8	5	7	130	130
2025 Plus Phase 1	6	7	5	6	111	111
2040 Plus Build-out	19	23	16	20	385	385

E. RAIL ALTERNATIVE

Several comments received on the previous TIA requested that the provision of rail service to the project site be studied as a potential means of reducing the number of trucks driving between the ports and the site, and therefore a reduction in the number of significant impacts caused by the project. This section describes why rail service is not considered a viable option for reducing the traffic impacts of the WLC. This conclusion is based on several factors, including the physical constraints to bringing rail service to the WLC site, the cost of cargo movement by rail relative to movement by truck, capacity constraints in the rail system that the WLC branch line would tie into, and the minimal effect that rail service would have even if all other factors could be overcome. These factors are discussed in turn below.

The Possible Alignments for Bringing Rail Service to the WLC Site

The WLC site is not currently served by rail. The rail lines nearest the site are the Union Pacific Yuma Line (single-track in this area), the Riverside County Transportation Commission's San Jacinto Branch Line (single-track, currently inactive), and the BNSF double-track line through the City of Riverside (see Figure 38).

As can be seen in Figure 38, there are four general alignment possibilities for a branch line to the WLC. Each has problems associated with it:

- Western Alignment – Alignments running from the BNSF line in Riverside to the WLC, an approximate distance of 15 miles, would have to run through built-up areas of the Cities of Riverside and Moreno Valley. The cost of acquiring right-of-way through these areas, and the impacts to the community (noise, traffic disruption, safety, division of the community, etc.) render such alignments unviable. Moreover, trains using the at-grade rail crossings in the City of Riverside already impose substantial delays on road traffic. In fact, in recent years the City of Riverside has sued the ports over the issue of traffic impacts from additional trains passing through their city. Adding more crossings and more trains would exacerbate this problem.
- Southern Alignment – It would be possible to avoid densely populated and built-out areas by connecting to the San Jacinto Branch Line south of March Air Reserve Base. However, the only way to avoid established communities would be to pass along the northern portion of the Lake Perris State Recreation Area. The alignment, approximately 10 miles in length, would be a major impact as it would require constructing and operating a rail line along the slopes of the Lake Perris State Recreation Area and potentially the San Jacinto Wildlife Area. There would also be traffic impacts at road crossings, potential grade issues, and grade separated crossings needed for drainage channels and I-215. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways (which will be discussed in a later section).
- Northern Alignment – The shortest alignment to an existing rail line is to the north in the vicinity of Redlands Blvd. and connecting to the UP Yuma line near the intersection of Redlands Blvd. and San Timoteo Canyon Rd., approximately five miles from the project site. This alignment would require extensive ROW acquisition, very serious grade issues that would increase the length of track needed[41], environmental impacts on the Badlands, and a grade separated crossing of SR-60. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways.
- Eastern Alignment – The final possibility would be to connect to the UP Yuma line along an alignment parallel to SR-60. This alignment would connect to the existing rail network near the Morongo Golf Club at Tukwet Canyon, approximately five miles to the east of the WLC site. The

---

[41] Although the grade passable by train depends on the load, generally tracks climb at less than three percent. For example, as the BNSF Cajon line traverses the Cajon Pass, the maximum uphill grade is 2.2 percent. Therefore, constructing a track through the Badlands, either near Redlands Blvd. or State Route 60, may require a longer more circuitous layout to avoid the grades. A longer track would require more right-of-way, result in a greater impact to the environmentally sensitive area, and be more costly to construct.

eastern alignment would be affected by the same drawbacks as the northern alignment, with the addition of the need to construct a bridge over San Timoteo Creek.

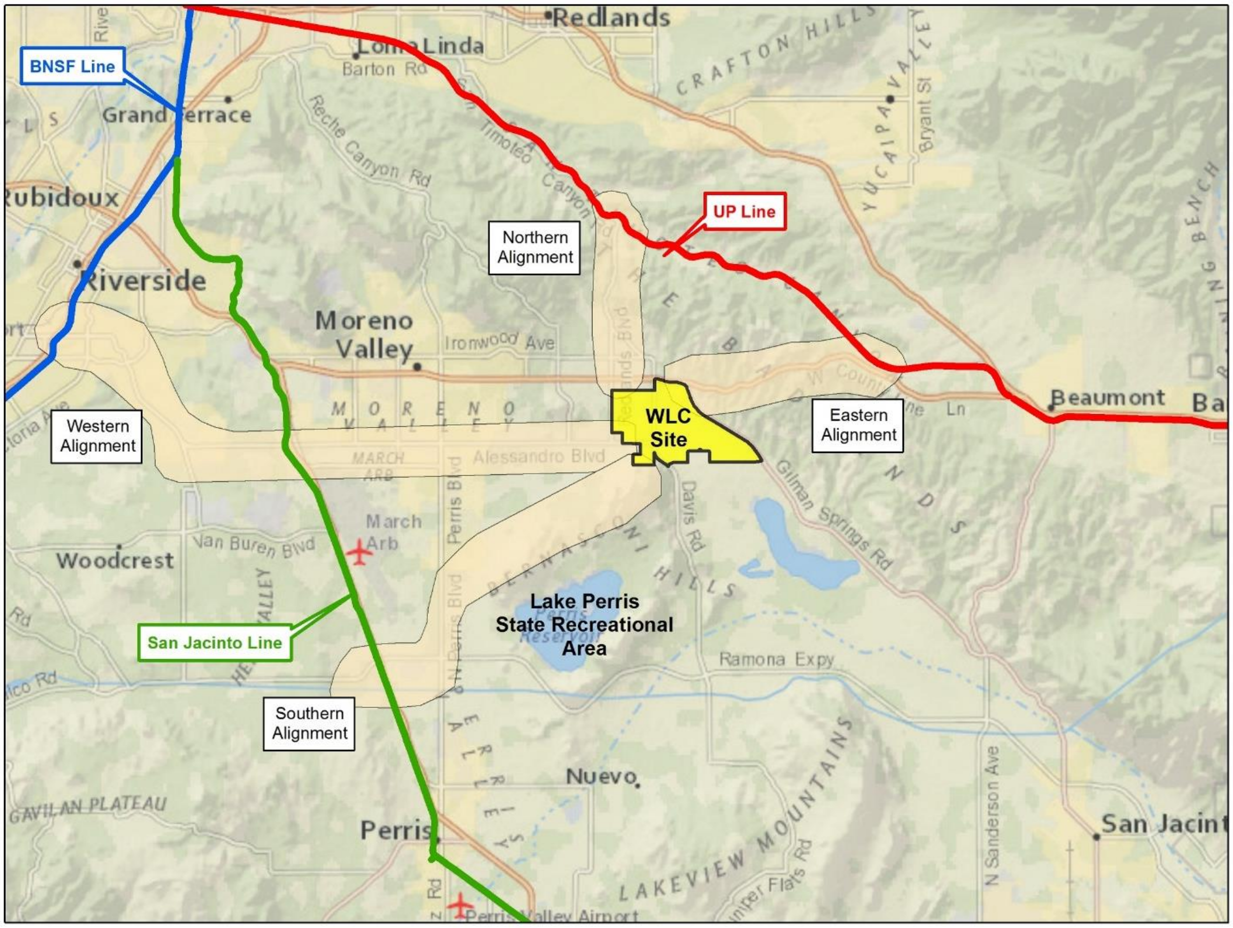

Figure 38: Conceptual Rail Alignments

As can be seen from the discussion above, providing rail service to the WLC along any of the possible alignments would in itself create serious environmental impacts.

Relative Costs of Truck and Rail Service

The loading and unloading of rail cargos require special equipment and handling and can only be performed at specialized places, which adds to the cost of shipping goods by rail. On the other hand, the actual movement of goods by rail is more energy-efficient and less expensive than movement by truck. This combination of relatively high fixed costs at each end of a trip with low variable costs for the distance traveled means rail can be a less expensive way to ship cargo than truck, but only if the shipping distance is sufficiently long.

The breakeven distance between rail and truck shipping has been the subject of several studies. The industry rule-of-thumb is that the rail becomes economically viable when cargos are shipped more than 500 miles. For example, the National Rail Plan, a nationwide guiding document from the U.S. Department of Transportation Federal Railroad Administration, has set the freight rail goal to, “Develop strategies to attract

50 percent of all shipments 500 miles or greater to intermodal rail."[42] In addition, the Plan highlights the importance that trucks have in conjunction with rail when moving freight as trucks, "excel in providing time-sensitive delivery services for high-value goods being transported over medium and short-haul distances."[43] A local example is the Ports of Long Beach/Los Angeles Rail Master Planning Study, which indicates that rail loaded with two levels of shipping containers, "traditionally competes well with trucks at distances greater than 500 miles.[44] Figure 39, from the San Pedro Bay Ports Rail Market Study, shows the breakeven point between truck and rail freight transport beginning east of Las Vegas and Phoenix, and north of the Bay Area. For shipments between the Ports of Los Angeles and Long Beach and the WLC, a distance of about 70 miles, shipping by rail would be far more expensive than by truck. So even if a rail line were built to the WLC, it would be uneconomical to use it for trips to and from the ports.

Capacity Constraints in the Rail System

If a rail line could be built to the WLC site and tenants could be induced to use it despite higher costs, this would only be helpful if the regional rail system had sufficient capacity to accommodate WLC freight without detriment to other users.

In fact, there are serious capacity constraints in the rail network in the Los Angeles basin. Among other things, rail operations for both BNSF and UP are already constrained by the capacity of the lines between the ports and western Riverside County. Two studies, completed in the early 2000s and using the year 2000 as the existing condition, found that many of the rail lines were already operating near capacity.[46] The studies evaluated 10 and 25 years of projected growth on the network and found that within 10 years (of the date of the study) the network would be overcapacity. Without capacity increasing improvements, 10 years of train traffic growth was forecast to increase delay more than six-fold. This did not include additional delays that would be caused by trains serving the WLC.

The Los Angeles-Inland Empire Railroad Main Line Advanced Planning Study from October 2002 found that the, "region's rail system is inadequate for forecast train traffic."[47] The study presented other findings that illustrate the near-capacity state of the rail network, for example, "…just 25 percent of the forecast 2010 traffic is sufficient to roughly double the average delay per train, to 67.6 minutes for BNSF freight and 54.4 minutes for UP freight." This occurs because small increases in train traffic result in disproportionate delays as the network nears capacity.

Several minor improvements to the rail network have been made since the 2002 study. However, accommodating estimated future demand in the year 2025 by providing capacity improvements alone would be costly; to meet future demand without rerouting would require capacity of some segments to be increased from two to four tracks. Therefore, an approach has been developed to revise train routing on the existing rail network and make limited capacity-increasing improvements. Even the limited improvements are estimated to cost over $2 billion.[48]

The fact that the rail system has limited capacity to accommodate additional traffic means that potential users have to be prioritized so that the capacity can be allocated efficiently. Highest priority would be for long-distance rail service direct from the ports. Short-distance cargo trips between the ports and the WLC would receive much lower priority than long-distance shipments because they would generate less revenue (unless a premium was charged). If regional passenger trains (e.g. Metrolink) share the tracks with freight trains, as is the case for some lines, then service to WLC would drop even further on the priority list.

Based on existing capacity of the rail network and projected growth, the studies indicated that the rail network would be overcapacity without further capital investments, which are beyond the scope of the WLC project.

Minimal Reduction in Traffic

Assuming that a rail line could be built to the WLC site and assuming that WLC freight could be accommodated by the rail network and that the costs for these things could be covered by subsidies or by increasing the prices on goods moved through the WLC, the question must be asked, "how much of a reduction in truck traffic impacts would be achieved?"

The answer is, "very little". As was discussed earlier, the economics of freight shipment make rail viable only for trips of 500 miles or more. As is described elsewhere in this report (Chapter 12, Section F), between 1% and 5% (depending on the year) of the truck trips beginning or ending in WLC go to the ports and these trips have no significant impact on freeway LOS for most of their length. So the effect of rail service on reducing truck impacts would be very small.

Conclusions About the Rail Alternative

This analysis of the rail alternative found that bringing rail service to the site would be very costly, result in serious environmental impacts, create major disruption to existing communities, and take many years to design, acquire right-of-way and construct. Even if a line were built, both economics and system constraints would deter its use for cargos between the WLC and the ports. Even if built and used, rail service would have very little effect on reducing the traffic impacts of the WLC. Based on these considerations rail service was not included in the design of the WLC.

5. EXISTING PLUS PHASE 1 SCENARIO

The analysis of the Existing Plus Phase 1 Scenario shows the effect of project-related traffic using the same land use and road network assumptions as the Existing scenario plus the build-out of Phase 1 (only) of the WLC and no changes occurred to the off-site land uses or roadway system.

A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 25 compares the average daily traffic (ADT) volumes for study roadway segments to Existing Conditions and to their threshold of significance under the City's General Plan policies. Under the Existing Plus Phase 1 Scenario, 3 segments would exceed the threshold of significance set by General Plan policy, namely:

- Gilman Springs Rd. between SR-60 and Alessandro Blvd. would exceed the threshold of significance under both Existing Conditions and under the Existing Plus Phase 1 Scenario. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Phase 1 Scenario.
- Gilman Springs Rd. from Alessandro Blvd. to Bridge St. would exceed the threshold of significance under both Existing Conditions and under the Existing Plus Phase 1 Scenario. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Phase 1 Scenario.
- Redlands Boulevard from Eucalyptus Avenue to the SR-60 eastbound ramps. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Phase 1 Scenario.

In each case adding lanes would bring the LOS above the target threshold set in the General Plan. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 40 shows the turning movement volumes under Existing Plus Phase 1 (see Figure 11 for the key map). Table 26 presents the LOS for the study intersections under the Existing Plus Phase 1 Scenario in the AM and PM peak hours. Detailed worksheets are presented in Appendix C.

Table 26 shows the LOS at study intersections under the Existing Plus Phase 1 Scenario. As shown in the table, there are 19 study intersections where the LOS would exceed the general plan target. In all of these locations the LOS would have been worse than the target for at least one peak hour (AM or PM) even in the No Project scenario. The intersections with poor LOS under the Existing Plus Phase 1 Scenario are:

Would Exceed Threshold of Significance Under Both the Existing Conditions and the Existing Plus Phase 1 Scenario

Table 27 identifies where impacts occur. As shown in the table, there are 15 study intersections where the project would have a significant impact[49]. The mitigation measures shown in Table 27 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that if they could be constructed they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

---

[49] For 4 of the 16 intersections where the LOS in the Plus Phase 1 scenario is below the target, the Project would nevertheless not have a significant impact because the average delay for the Plus Project scenario is less than in the No Project scenario. These are Intersections 65, 95, 107, and 115.

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means the cross-street is stop-controlled

"AWS" means all-way stop

When refering to lanes, "T" demotes a through lane

When refering to lanes, "L" demotes a left-turn lane

When refering to lanes, "R" demotes a right-turn lane

C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

Freeway Mainline Basic Sections LOS

Table 28 compares the LOS for freeway mainline sections for the Existing and the Existing Plus Phase 1 Scenarios. Details of the LOS calculations for freeways under the Existing Plus Phase 1 Scenario can be found in Appendix J. There are 33 locations where the LOS would be worse than the "D".

Table 29 identifies the 24 sections where the project would have a significant impact[50]. All of these sections are already deficient under Existing conditions. The Existing Plus Phase 1 scenario would have significant impacts at:

Northbound or Eastbound

- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-60 from Pierce St. to Magnolia Ave.
- SR-91 from Adams St. to Madison St.
- SR-91 from Central Ave. to 14th St.
- I-215 from Barton Rd. to Mt. Vernon Ave.
- I-215 from Auto Plaza Dr. to Mill St.

Southbound or Westbound

- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-91 from McKinley St. to Pierce St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Tyler St. to Van Buren Blvd.
- SR-91 from Van Buren Blvd. to Adams St.
- SR-91 from Madison St. to Arlington Ave.
- I-215 from Center St. to La Cadena Dr.
- I-215 from La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

Adding a mixed-flow lane would improve these 22 of these sections to better than LOS "E" in the Plus Phase 1 scenario and thus would reduce the impact of the WLC project to a less-than-significant level. In the two other sections with significant impacts, adding a mixed-flow lane would improve the LOS from "F" to "E". The mitigated LOS would be better than the LOS for the No Project scenario and so this measure would reduce the impact of the WLC project to a less-than-significant level. Mitigation measures that would be needed to reduce the impact of the project to a less-than-significant level are summarized in Table 29. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

---

[50] In some sections where the LOS in the Plus Phase 1 scenario is below the target, the Project would nevertheless not have a significant impact because the traffic density in the Plus Project scenario is less than in the No Project scenario.

Table 28: Existing Plus Phase 1 Freeway Mainline LOS

▨ Indicates that the LOS exceeds the target level

Freeway Weaving LOS

Table 30 compares the LOS for study weaving sections under the Existing and the Existing Plus Phase 1 Scenarios. Table 31 identifies five weaving section where the Project would have a significant impact, namely:

Northbound or Eastbound

- I-215 from SR-60 to Columbia Ave.
- I-215 from I-10 to Auto Plaza Dr./Orange Show Rd.

Southbound or Westbound

- SR-60 from University Ave. to Martin Luther King Blvd.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.

Table 31 identifies mitigation measures that would reduce the impact of the WLC project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Freeway Ramp LOS

Table 32 compares the freeway ramp level of service on SR-60 under the Existing and the Existing Plus Phase 1 Scenarios. Table 33 identifies the one ramp segment where the Project would have a significant impact, namely:

- SR-60 eastbound On-Ramp from Martin Luther King Blvd.

Table 33 shows the mitigation measures needed to reduce the impacts of the WLC to a less-than-significant level. The mitigation measure shown in Table 33 is what would be needed to reduce the impact of the project to a less-than-significant level. While this measure is feasible in the sense that if it could be constructed it would achieve the target LOS, this does not necessarily mean that it passes other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

6. EXISTING PLUS BUILD-OUT SCENARIO

The analysis of the Existing Plus Build-out Scenario shows the effects that project-related traffic would have on the local and regional road system if the WLC's land uses and internal road network were built-out in full in 2018 and no changes occurred to the off-site land uses or roadway system.

A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 34 compares the LOS for study roadway segments under the Existing Conditions and the Existing Plus Build-out Scenario. As shown, under Existing Plus Build-out Scenario 3segments exceed the target LOS set by General Plan policy, namely:

- Gilman Springs Rd. between SR-60 and Alessandro Blvd. exceeds the target LOS under both Existing Conditions and under the Existing Plus Build-out Scenario. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Build-out Scenario.
- Gilman Springs Rd. from Alessandro Blvd. to Bridge St. exceeds the threshold of significance under both Existing Conditions and under the Existing Plus Build-out Scenario. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Build-out Scenario.
- Redlands Boulevard from Eucalyptus Avenue to the SR-60 eastbound ramps. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Build-out Scenario.

In each case adding lanes would achieve the LOS target set in the General Plan. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

▨ Indicates LOS exceeds the target level

B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 41 shows the turning movement volumes under the Existing Plus Build-out Scenario (see Figure 11 for the key map).Table 35 presents the LOS for the study intersections under the Existing Plus Build-out Scenario in the AM and PM peak hours. Detailed worksheets are presented in Appendix D. As shown in the table, there are 25 study intersections where the LOS would exceed the general plan target. In 20 of these locations the LOS would have been worse than the target for at least one peak hour (AM or PM) even in the No Project scenario. The Project would cause the LOS to exceed the target in 2 locations that would otherwise have met the target in both peak hours, and in 3 cases the Project would case the LOS to exceed the target in both peak hours when it would otherwise have exceeded the target in only one of the peak hours (AM or PM). The intersections with poor LOS under the Existing Plus Buildout Scenario are:

Would Exceed Threshold of Significance Under Both the Existing Conditions and the Existing Plus Buildout Scenario

- IN-10 Redlands Blvd./Locust Ave. (AM, PM)
- IN-20 Oliver St./Alessandro Blvd. (AM)
- IN-23 Redlands Blvd/Alessandro Blvd (PM)
- IN-37 Moreno Beach Dr./SR-60 EB Ramps (PM)
- IN-65 Perris Blvd./Cactus Ave. (AM)
- IN-83 Martin Luther King Blvd/Canyon Crest Dr. (AM)
- IN-85 Martin Luther King Blvd/I-215 NB Ramps (AM, PM)
- IN-86 Central Ave/Chicago Ave (PM)
- IN-94 Arlington Ave./Victoria Ave. (AM)
- IN-95 Alessandro Blvd./Chicago Ave. (PM)
- IN-107 Evans Rd./Rider St. (AM)
- IN-114 Evans Rd./Orange Ave. (AM, PM)
- IN-115 Evans Rd./Nuevo Rd. (AM)
- IN-122 Bridge St./Ramona Expy. (AM, PM)
- IN-123 Gilman Springs Rd./Bridge St. (AM, PM)
- IN-124 SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (AM, PM)
- IN-125 SR-79 (Sanderson Ave) SB/Gilman Springs Rd. (AM, PM)
- IN-132 San Timoteo Canyon Rd./Alessandro Rd. (AM)
- IN-133 San Timoteo Canyon Rd./Live Oak Canyon Rd. (AM, PM)
- IN-134 Redlands Blvd./San Timoteo Canyon Rd. (AM, PM)

Would Exceed Threshold of Significance Under the Existing Plus Buildout Scenario (only)

- IN-18 Redlands Blvd/Eucalyptus Ave (PM)
- IN-36 Moreno Beach Drive & Ironwood Avenue (AM)
- IN-37 Moreno Beach Dr./SR-60 EB Ramps (AM)
- IN-124 SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (PM)
- IN-132 San Timoteo Canyon Rd./Alessandro Rd. (PM),

Table 36 identifies the 17 intersections where the Project has significant impacts[51] and the mitigation measures that would reduce the impacts to a less-than-significant level. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

---

[51] In some places, such as Intersection 23, where the LOS for the Existing Plus Buildout is worse than the target LOS but the Project does not have a significant impact. This is because the Project reduces delay through the intersection compared with the No-Project scenario.

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

When refering to lanes, "T" demotes a through lane

When refering to lanes, "L" demotes a left-turn lane

When refering to lanes, "R" demotes a right-turn lane

C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

Freeway Mainline Basic Sections LOS

Table 37 compares the LOS for freeway mainline sections for the Existing and Existing Plus Build-out scenarios. Details of the LOS calculations for freeways under the Existing Plus Build-out Scenario can be found in Appendix K. Table 38 identifies 24 sections where the project would have a significant impact. In 23 of the 24 cases these sections are already deficient under Existing conditions so the Project would be adding to an existing problem. The Project would have impacts at:

Northbound or Eastbound

- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-60 from Pierce St. to Magnolia Ave.
- SR-91 from Adams St. to Madison St.
- SR-91 from Central Ave. to 14th St.
- I-215 from Eucalyptus Ave. to SR-60
- I-215 from Auto Plaza Dr. to Mill St.

Southbound or Westbound

- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-91 from McKinley St. to Pierce St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Tyler St. to Van Buren Blvd.
- SR-91 from Van Buren Blvd. to Adams St.
- I-215 from Center St. to La Cadena Dr.
- I-215 from La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

Table 38 also identifies the mitigation measures needed to reduce the impact to a less-than-significant level. In each case adding a mixed-flow lane[52] would bring the LOS to “D” or better. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

---

[52] A “mixed-flow lane” is the most common type of freeway lane. The term is used to distinguish them from carpool lanes, truck lanes, etc.

▨ Indicates that the LOS exceeds the target level

Freeway Weaving LOS

Table 39 compares the LOS for the study weaving sections under the Existing and the Existing Plus Build-out Scenarios. As shown in Table 39 identifies five weaving section where the Project would have a significant impact, namely:

Northbound or Eastbound

- I-215 from Main St. to SR-91
- I-215 from I-10 to Auto Plaza Dr./Orange Show Rd.

Southbound or Westbound

- SR-60 from University Ave. to Martin Luther King Blvd.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.

Table 40 shows that in every case the addition of a mixed-flow lane would reduce the impact of the WLC project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Freeway Ramp LOS

Table 41 compares the freeway ramp level of service on SR-60 under the Existing and the Existing Plus Build-out Scenario.

Table 42 identifies the one ramp segment where the Project would have a significant impact, namely:

- SR-60 eastbound On-Ramp from Martin Luther King Blvd.

Table 42 shows the mitigation measure needed to reduce the impacts of the WLC to a less-than-significant level. While this measure is feasible in the sense that, if it could be constructed it would achieve the target LOS, this does not necessarily mean that it passes other tests of feasibility. The physical and financial feasibility of mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

7. 2025 NO-PROJECT SCENARIO

This chapter describes traffic conditions under the assumption that existing land uses plus other past, present, and reasonably foreseeable projects (both land development and roadway improvements) up to the year 2025 are implemented. Conditions on the WLC site were assumed to be unchanged from existing conditions. This scenario forms a basis of comparison for the 2025 Plus Phase 1 scenario that is discussed in the next chapter of this report.

A. 2025 NO-PROJECT TRAFFIC VOLUMES

The forecast turning movement volumes for this scenario are shown in Figure 42. Figure 11 is the key map for the Figure 42 sub-figures.

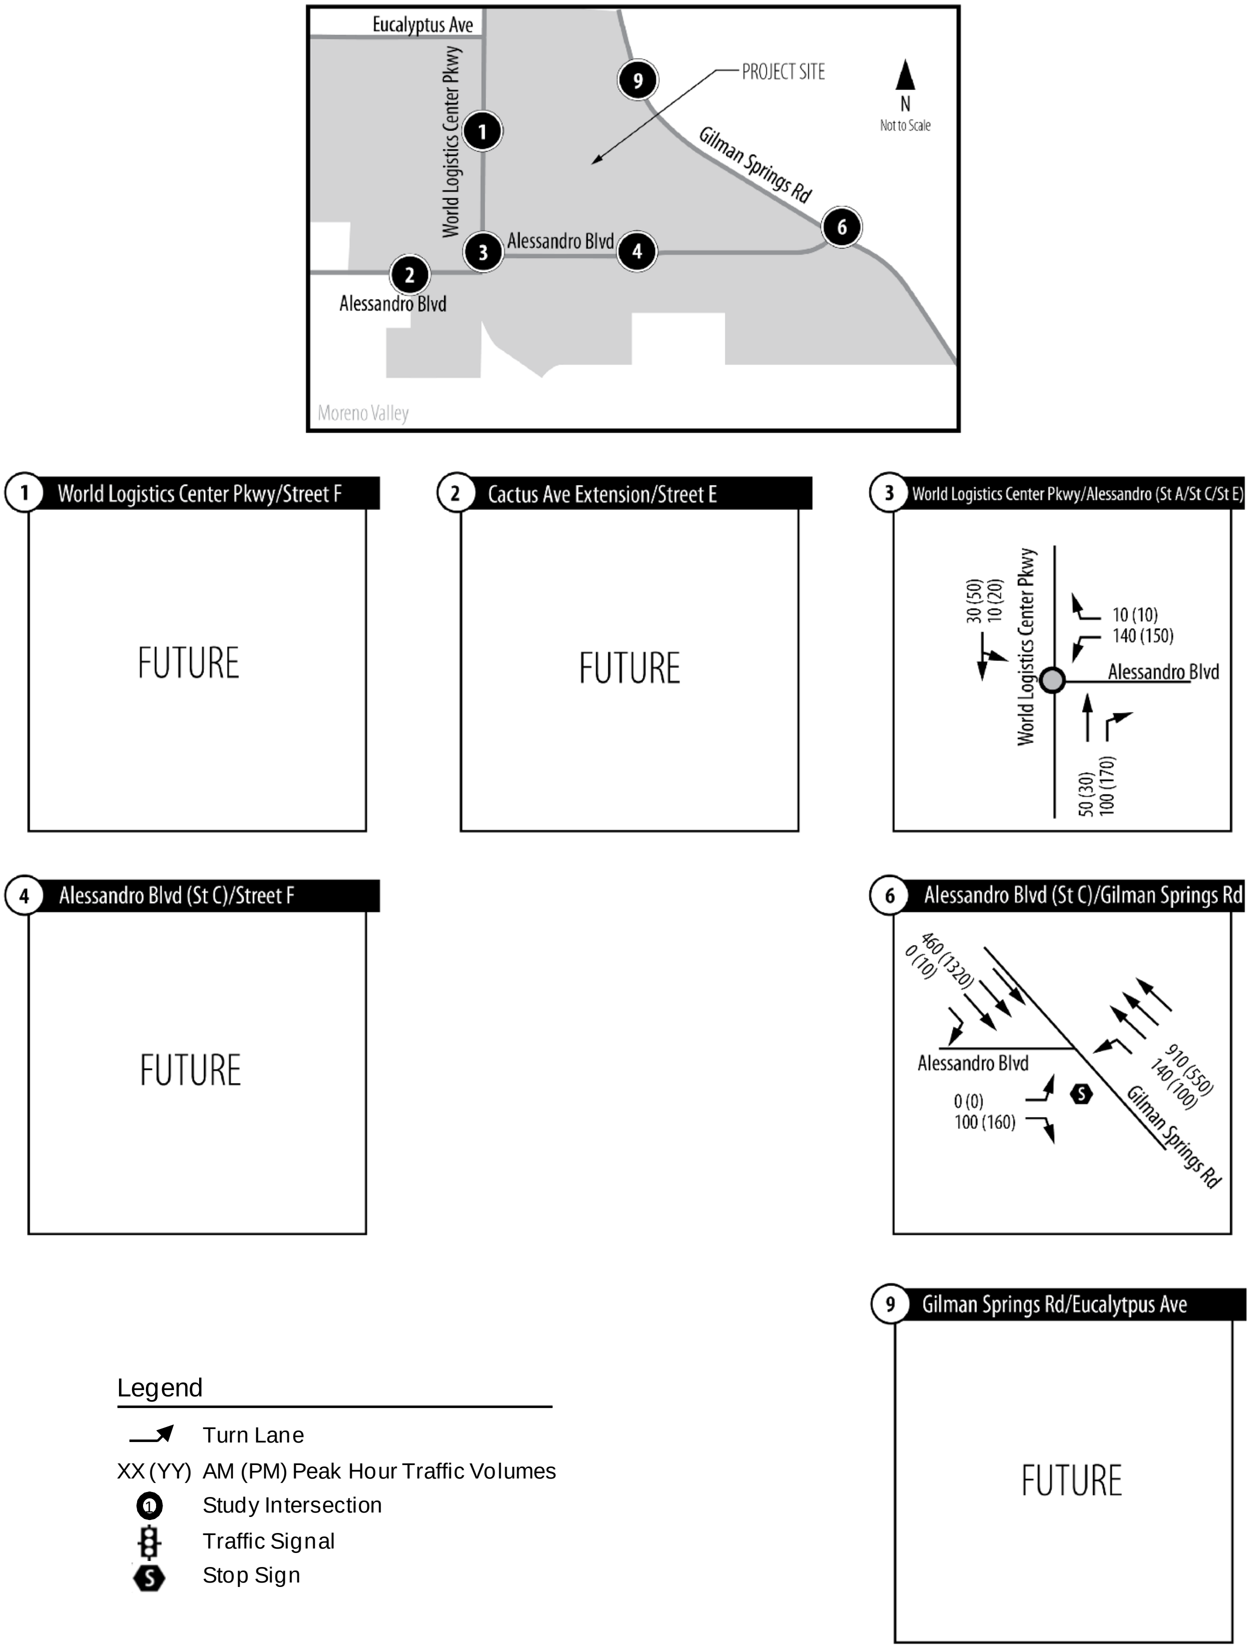

Figure 42: Turning Movement Volumes (PCE) under the 2025 No-Project Scenario

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

▨ Indicates LOS exceeds the target level

Intersection LOS

Table 44 presents the LOS for the study intersections under the 2025 No-Project Scenario in the AM and PM peak hours. Detailed worksheets are presented in Appendix E. The number of intersections that exceeded the LOS target in the AM peak hour, PM peak hour, or both, rose from 19 under Existing Conditions to 30 under the 2025 No-Project Scenario due to population and employment growth. The intersections that were forecast to exceed the LOS target were:

- IN-10 Redlands Blvd/Locust Ave (AM, PM)
- IN-20 Oliver St/Alessandro Blvd. (AM, PM)
- IN-23 Redlands Blvd./Alessandro Blvd. (AM, PM)
- IN-41 Lasselle St/Iris Ave (PM)
- IN-53 Lasselle St./Cactus Ave. (PM)
- IN-65 Perris Blvd./Cactus Ave. (AM, PM)
- IN-66 Alessandro Blvd./Sycamore Canyon Blvd. (AM)
- IN-75 Central Ave./Lochmoor Dr. (AM, PM)
- IN-76 Sycamore Canyon Blvd/Central Ave (AM, PM)
- IN-80 Alessandro Blvd./Mission Grove Pkwy. (AM, PM)
- IN-83 Martin Luther King Blvd./Canyon Crest Dr. (AM, PM)
- IN-85 Martin Luther King Blvd./I-215 NB Ramps (AM, PM)
- IN-86 Central Ave./Chicago Ave. (AM, PM)
- IN-88 Central Ave./Canyon Crest Dr. (PM)

- IN-94 Arlington Ave./Victoria Ave. (AM, PM)
- IN-95 Alessandro Blvd./Chicago Ave. (AM, PM)
- IN-96 Alessandro Blvd./Century Ave. (AM)
- IN-97 Alessandro Blvd./Via Vista Dr. (AM, PM)
- IN-98 Alessandro Blvd./Canyon Crest Dr. (AM, PM)
- IN-107 Evans Rd./Rider St. (AM)
- IN-114 Evans Rd./Orange Ave. (AM, PM)
- IN-123 Gilman Springs Rd./Bridge St. (AM, PM)

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

Freeway Mainline Basic Sections LOS

Table 45 presents the results of the LOS analysis for freeway mainline sections. The target LOS is currently exceeded in 40 mainline sections as follows:

North or Eastbound

- SR-60 Ramona Ave. to Central Ave. (AM, PM)
- SR-60 Central Ave. to Mountain Ave. (AM, PM)
- SR-60 Mountain Ave. to Euclid Ave. (AM, PM)
- SR-60 Euclid Ave. to Grove Ave. (AM, PM)
- SR-60 Grove Ave. to Vineyard Ave. (PM)
- SR-60 Vineyard Ave. to Archibald Ave. (PM)
- SR-60 Rubidoux Blvd. to Market St. (PM)
- SR-60 Market St. to Main St. (AM, PM)
- SR-60 Martin Luther King Blvd. to Central Ave. (AM, PM)
- SR-60 Pigeon Pass Rd. to Heacock St. (PM)
- SR-91 McKinley St. to Pierce St. (PM)
- SR-91 Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 Tyler St. to Van Buren Blvd. (PM)
- SR-91 Adams St. to Madison St. (AM, PM)
- SR-91 Central Ave. to 14th St. (AM, PM)
- I-215 Barton Rd. to Mt. Vernon Ave./Washington St. (AM, PM)
- I-215 Auto Plaza Dr. to Mill St. (PM)

Southbound or Westbound

- SR-60 Euclid Ave. to Grove Ave. (PM)
- SR-60 Grove Ave. to Vineyard Ave. (PM)
- SR-60 Vineyard Ave. to Archibald Ave. (AM, PM)
- SR-60 Valley Way to Rubidoux Blvd. (PM)
- SR-60 Rubidoux Blvd. to Market St. (PM)
- SR-60 Market St. to Main St. (AM)
- SR-60 Main St. to SR-91 (AM)
- SR-60 Martin Luther King Blvd. to Central Ave. (AM, PM)
- SR-60 Fair Isle Dr./Box Springs Rd. to I-215 (PM)
- SR-60 I-215 to Day St. (AM)
- SR-60 Pigeon Pass Rd. to Heacock St. (AM)
- SR-91 McKinley St. to Pierce St. (AM, PM)
- SR-91 Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 Magnolia Ave. to La Sierra Ave. (AM, PM)
- SR-91 La Sierra Ave. to Tyler St. (AM, PM)
- SR-91 Tyler St. to Van Buren Blvd. (PM)
- SR-91 Van Buren Blvd. to Adams St. (PM)
- SR-91 Adams St. to Madison St. (PM)
- SR-91 Madison St. to Arlington Ave. (AM, PM)
- I-215 Harley Knox Blvd. to Van Buren Blvd. (PM)
- I-215 Center St. to La Cadena Dr. (AM, PM)
- I-215 La Cadena Dr. to Barton Rd. (AM, PM)
- I-215 Barton Rd. to Mt. Vernon Ave. (PM)

▨ Indicates that the LOS exceeds the target level

Freeway Weaving LOS

Table 46 shows the weaving LOS under the 2025 No-Project Scenario. The target LOS is currently exceeded in 13 weave sections as follows:

North or Eastbound

- SR-60 from Main St. to SR-91 (AM, PM)
- SR-60 from SR-91 to Blaine St./3rd St. (PM)
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd. (PM)
- SR-60 from I-215 to Day St. (PM)
- SR-60 from Day St. to Pigeon Pass Rd./Frederick St. (PM)
- SR-91 from Magnolia Ave. to La Sierra Ave. (PM)
- I-215 from I-10 to Auto Plaza Dr./Orange Show Rd. (PM)

South or Westbound

- SR-60 from Haven Ave. to Archibald Ave. (PM)
- SR-60 from University Ave. to Martin Luther King Blvd. (AM, PM)
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd. (AM, PM)
- SR-91 from Arlington Ave. to Central Ave. (AM, PM)
- SR-91 from SR-60 to Mission Inn Ave./University Ave. (PM)
- I-215 from SR-60 to Columbia Ave. (AM, PM)

▨ Indicates that the LOS exceeds the target level

8. 2025 PLUS PHASE 1 SCENARIO

The analysis of the 2025 Plus Phase 1 Scenario shows the effect of project-related traffic if the first phase of the WLC project were built and no other changes from the 2025 No-Project scenario occurred to the roadway system or land uses.

A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 48compares the average daily traffic (ADT) volumes for study roadway segments for the 2025 No-Project Scenario and to their threshold of significance under the City's General Plan policies. The Project would have no impacts on roadway segments provided that the improvements in the RTP are implemented.

Table 48: 2025 Plus Phase 1 Road Segment Impacts and Mitigations

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

**** Due to the severing of Alessandro Blvd. and the diversion of traffic to other routes, there would be no need to widen this section beyond the current 2U configuration

▨ Indicates LOS exceeds the target level

B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 43 shows the turning movement volumes under the 2025 Plus Phase 1 Scenario (see Figure 11 for the key map). Table 49 presents the LOS for the study intersections under the 2025 Plus Phase 1 Scenario in the AM and PM peak hours. Detailed worksheets are presented in Appendix F. Conditions would be worse than the target LOS at 26 locations, 24 of which would have poor LOS even if the WLC were not built. These are:

Would Exceed Threshold of Significance Under Both the 2025 No-Project Scenario and the 2025 Plus Phase 1 Scenario

- IN-10 Redlands Blvd/Locust Ave. (AM, PM)
- IN-20 Oliver St/Alessandro Blvd. (AM, PM)
- IN-53 Lasselle St./Cactus Ave. (PM)
- IN-65 Perris Blvd./Cactus Ave. (AM)
- IN-66 Alessandro Blvd./Sycamore Canyon Blvd. (AM)
- IN-75 Central Ave./Lochmoor Dr. (AM)
- IN-76 Sycamore Canyon Blvd/Central Ave (PM)
- IN-80 Alessandro Blvd./Mission Grove Pkwy. (AM, PM)
- IN-83 Martin Luther King Blvd./Canyon Crest Dr. (AM)
- IN-85 Martin Luther King Blvd./I-215 NB Ramps (AM, PM)
- IN-86 Central Ave./Chicago Ave. (AM, PM)
- IN-88 Central Ave./Canyon Crest Dr. (PM)
- IN-94 Arlington Ave./Victoria Ave. (AM, PM)
- IN-95 Alessandro Blvd./Chicago Ave. (AM, PM)
- IN-98 Alessandro Blvd./Canyon Crest Dr. (PM)
- IN-107 Evans Rd./Rider St. (AM)
- IN-114 Evans Rd./Orange Ave. (AM)
- IN-123 Gilman Springs Rd./Bridge St. (AM, PM)
- IN-124 SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (AM, PM)
- IN-125 SR-79 (Sanderson Ave.) SB/Gilman Springs Rd. (AM, PM)
- IN-131 Reche Canyon Rd./Reche Vista Rd. (AM)
- IN-132 San Timoteo Canyon Rd./Alessandro Rd. (AM, PM)
- IN-133 San Timoteo Canyon Rd./Live Oak Canyon Rd. (AM, PM)
- IN-134 Redlands Blvd./San Timoteo Canyon Rd. (AM, PM)

Would exceed the target LOS under the 2025 Plus Phase 1 Scenario, but not under the 2025 No Project Scenario:

- IN-27 Redlands Blvd./Cactus Ave. (PM)
- IN-123 Gilman Springs Rd./Bridge St. (PM)

Table 50 identifies where impacts occur and mitigation measures that would reduce the impacts to a less-than-significant level. As shown in Table 50, there are 13 study intersections where the project would have a significant impact. The mitigation measures shown in Table 50 are those that would be needed to reduce the impact of the project to a less-than-significant level. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

When refering to lanes, "T" demotes a through lane

When refering to lanes, "L" demotes a left-turn lane

When refering to lanes, "R" demotes a right-turn lane

C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

Freeway Mainline Basic Sections LOS

Table 51 compares the LOS for freeway mainline sections for the 2025 No-Project and the 2025 Plus Phase 1 scenarios. Details of the LOS calculations for freeways under the 2025 Plus Build-out Scenario can be found in Appendix M. Table 52 identifies 34 sections where the project would have a significant impact. In 32 of the 34 cases these sections would be deficient in 2025 even under the No Project Scenario. The Project would have significant impacts at:

Northbound or Eastbound

- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Central Ave. to Mountain Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pierce St. to Magnolia Ave.
- SR-91 from Adams St. to Madison St.
- SR-91 from Central Ave. to 14th St.
- I-215 from Eucalyptus Ave. to SR-60
- I-215 from Barton Rd. to Mt. Vernon Ave.
- I-215 from Auto Plaza Dr. to Mill St.

Southbound or Westbound

- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-60 from I-15 to McKinley St.
- SR-91 from McKinley St. to Pierce St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Tyler St. to Van Buren Blvd.
- SR-91 from Van Buren Blvd. to Adams St.
- SR-91 from Adams St. to Madison St.
- SR-91 from Madison St. to Arlington Ave.
- I-215 from Center St. to La Cadena Dr.
- I-215 from La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

As shown in Table 52, adding a mixed-flow lane would improve these 30 of these sections to better than LOS "E" in the 2025 Plus Phase 1 scenario and thus would reduce the impact of the WLC project to a less-than-significant level. In the other 4 sections with significant impacts, adding a mixed-flow lane would improve the LOS from "F" to "E". The mitigated LOS would be better than the LOS for the 2025 No Project scenario and so this measure would reduce the impact of the WLC project to a less-than-significant level.

Table 51: 2025 Plus Phase 1 Freeway Mainline Level of Service

ID	Freeway	Segment	2025 No-Project Conditions						2025 Plus Phase 1 Conditions

▨ Indicates that the LOS exceeds the target level

Freeway Weaving LOS

Table 53 compares the LOS for study weaving sections under the 2025 No-Project and the 2025 Plus Phase 1 Scenario. Table 54 shows where the Project would have significant impacts. As shown in the table, there are 9 sections where the project would have a significant impact. All of these sections would be deficient under the 2025 No-Project Scenario; the Project's impact is that it would add to a problem that would occur in any case. The impacts would occur at:

Northbound or Eastbound

- SR-60 from Main St. to SR-91
- SR-60 from SR-91 to Blaine St./3rd St.
- SR-60 from I-215 to Day St.
- I-215 from SR-60 to Columbia Ave.
- I-215 from I-10 to Auto Plaza Dr./Orange Show Rd.

Southbound or Westbound

- SR-60 from Haven Ave. to Archibald Ave.
- SR-60 from University Ave. to Martin Luther King Blvd.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.

Table 54 identifies mitigation measures that would reduce the impact of the WLC project to a less-than-significant level. These mitigation measures may not all be feasible due physical and financial constraints, and may not be desirable as a matter of public policy. Chapter 11 analyses the mitigation measures in greater detail and discusses options for funding those that are feasible.

Freeway Ramp LOS

Table 55 compares the freeway ramp level of service on SR-60 under the 2025 No-Project and the 2025 Plus Phase 1 Scenarios. Table 56 identifies the one ramp segment where the Project would have a significant impact, namely:

- SR-60 eastbound On-Ramp from Martin Luther King Blvd.

Table 56 shows the mitigation measure needed to reduce the impacts of the WLC to a less-than-significant level. While this measure is feasible in the sense that, if it could be constructed, it would achieve the target LOS, this does not necessarily mean that it passes other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

9. 2040 NO-PROJECT SCENARIO

This chapter describes traffic conditions under the assumption that existing land uses plus other past, present, and reasonably foreseeable projects (both land development and roadway improvements) up to the year 2040 are implemented. Within the City of Moreno Valley full build-out of the General Plan was assumed, except for the project site which was assumed to be unchanged from existing conditions. This scenario forms a basis of comparison for the 2040 Plus Build-out scenario.

A. 2040 NO-PROJECT TRAFFIC VOLUMES

The forecast turning movement volumes for this scenario are shown in Figure 44. Figure 11 is the key map for the Figure 44 sub-figures.

B. 2040 NO-PROJECT LEVEL OF SERVICE

Roadway Segment Analysis

Table 57 shows the LOS for study roadway segments under the 2040 No-Project Scenario. In this scenario Gilman Springs Rd. and Redlands Blvd. are assumed to have been widened in accordance with General Plan policy to six and four lanes respectively. Under the 2040 No-Project Scenario Gilman Springs Road between Alessandro Boulevard and Bridge Street, and Alessandro Boulevard between Redlands Avenue and Merwin Street, would not meet the target LOS.

Table 57: LOS of Study Road Segments under the 2040 No-Project Scenario

Roadway		From	To	LOS Standard*	Roadway Section**	Daily Volume	LOS

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.
** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.
*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.
▨ Indicates LOS exceeds the target level

Intersection LOS

Table 58 presents the LOS for the study intersections under the 2040 No-Project Scenario in the AM and PM peak hours. Detailed worksheets are presented in Appendix G. The number of intersections that would exceed the target LOS rose from 19 under Existing Conditions to 30 under the 2025 No-Project Scenario to 72 under the 2040 No-Project Scenario due to population and employment growth. The intersections that would operate exceed the target LOS are:

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

Freeway Mainline Basic Sections LOS

Table 59 presents the results of the LOS analysis for freeway mainline sections. A total of 58 freeway mainline basic sections were forecast to exceed the target LOS of "D", up from 40 under the 2025 No-Project Scenario, and 34 under Existing No-Project conditions. The general worsening of conditions is due to the fact that freeway capacity is growing more slowly than population. The sections that would exceed the target LOS would be:

North or Eastbound

- SR-60 from Reservoir St. to Ramona Ave. (AM)
- SR-60 from Ramona Ave. to Central Ave. (AM)
- SR-60 from Mountain Ave. to Euclid Ave. (AM)
- SR-60 from Valley Way to Rubidoux Blvd. (AM)
- SR-60 from Rubidoux Blvd. to Market St. (AM)
- SR-60 from Market St. to Main St. (AM)
- SR-60 from Martin Luther King Blvd. to Central Ave. (AM, PM)
- SR-60 from Pigeon Pass Rd. to Heacock St. (PM)
- SR-60 from Heacock St. to Perris Blvd. (PM)
- SR-60 from Jack Rabbit Trail to Potrero Blvd. (PM)
- SR-91 from I-15 to McKinley St. (PM)
- SR-91 from McKinley St. to Pierce St. (AM, PM)
- SR-91 from Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 from La Sierra Ave. to Tyler St. (AM, PM)
- SR-91 from Tyler St. to Van Buren Blvd. (AM, PM)
- SR-91 from Adams St. to Madison St. (AM, PM)
- SR-91 from Madison St. to Arlington Ave. (AM)
- SR-91 from Central Ave. to 14th St. (AM, PM)
- I-215 from Alessandro Blvd. to Eucalyptus Ave. (PM)
- I-215 from Eucalyptus Ave. to SR-60 (PM)
- I-215 from Auto Plaza Dr. to Mill St. (PM)
- I-10 from Beaumont Ave. to Pennsylvania Ave. (PM)
- I-10 from Pennsylvania Ave. to Highland Springs Ave. (PM)
- I-10 from Highland Springs Ave to Sunset Ave. (PM)

Southbound or Westbound

- SR-60 from Grove Ave. to Vineyard Ave. (PM)
- SR-60 from Vineyard Ave. to Archibald Ave. (PM)
- SR-60 from Valley Way to Rubidoux Blvd. (PM)
- SR-60 from Rubidoux Blvd. to Market St. (PM)
- SR-60 from Market St. to Main St. (AM, PM)
- SR-60 from Main St. to SR-91 (AM)
- SR-60 from Martin Luther King Blvd. to Central Ave. (AM, PM)
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215 (AM, PM)
- SR-60 from I-215 to Day St. (AM, PM)
- SR-60 from Pigeon Pass Rd. to Heacock St. (AM)
- SR-60 from Heacock St. to Perris Blvd. (AM, PM)
- SR-60 from Moreno Beach Dr. to Redlands Blvd. (AM)
- SR-60 from Jack Rabbit Trail to Potrero Blvd. (AM)
- SR-91 from I-15 to McKinley St. (AM, PM)
- SR-91 from McKinley St. to Pierce St. (AM, PM)
- SR-91 from Pierce St. to Magnolia Ave. (AM, PM)
- SR-91 from Magnolia Ave. to La Sierra Ave. (AM, PM)
- SR-91 from La Sierra Ave. to Tyler St. (AM, PM)
- SR-91 from Tyler St. to Van Buren Blvd. (PM)
- SR-91 from Van Buren Blvd. to Adams St. (PM)
- SR-91 from Adams St. to Madison St. (PM)

- SR-91 from Madison St. to Arlington Ave. (AM, PM)
- I-215 from Alessandro Blvd. to Eucalyptus Ave. (AM, PM)
- I-215 from Center St. to La Cadena Dr. (AM, PM)
- I-215 from La Cadena Dr. to Barton Rd. (AM)
- I-215 from Barton Rd. to Mt. Vernon Ave. (AM)
- I-10 from SR-60 to Beaumont Ave. (AM)
- I-10 from Beaumont Ave. to Pennsylvania Ave. (AM)
- I-10 from Pennsylvania Ave. to Highland Springs Ave. (AM)
- I-10 from Highland Springs Ave. to Sunset Ave. (AM)
- I-10 from 22nd St. to 8th St. (AM)
- I-10 from 8th St. to Hargrave St. (AM)
- I-10 from Hargrave St. to Fields Rd. (AM)
- I-10 from Fields Rd. to Morongo Trail (AM)

▨ Indicates that the LOS exceeds the target level

Freeway Weaving LOS

Table 60 shows the weaving LOS under the 2040 No-Project Scenario. Ten north- or east-bound sections and nine south- or westbound sections would operate below LOS “D”. These sections are:

North or Eastbound

- SR-60 from Main St. to SR-91 (AM)
- SR-60 from SR-91 to Blaine St./3rd St. (AM, PM)
- SR-60 from Blaine St/3rd St. to University Ave. (AM, PM)
- SR-60 from University Ave. to Martin Luther King Blvd. (AM)
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd. (AM, PM)
- SR-60 from I-215 to Day St. (PM)
- SR-60 from Day St. to Pigeon Pass Rd./Frederick St. (PM)
- SR-91 from Magnolia Ave. to La Sierra Ave. (AM, PM)
- I-215 from SR-60 to Columbia Ave. (PM)
- I-215 from I-10 to Auto Plaza Dr./Orange Show Rd. (PM)
-

Southbound or Westbound

- SR-60 from Haven Ave. to Archibald Ave. (PM)
- SR-60 from SR-91 to Blaine St./3rd St. (PM)
- SR-60 from University Ave. to Martin Luther King Blvd. (AM, PM)
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd. (AM, PM)
- SR-60 from Day St. to Pigeon Pass Rd./Frederick St. (AM)
- SR-91 from Arlington Ave. to Central Ave. (AM, PM)
- SR-91 from SR-60 to Mission Inn Ave./University Ave. (AM, PM)
- I-215 from SR-60 to Columbia Ave. (AM, PM)
- I-10 from Haugen-Lehmann Way to SR-111 (PM)

▨ Indicates that the LOS exceeds the target level

Freeway Ramp LOS

Table 61 shows the level of service of study freeway ramps under the 2040 No-Project Scenario. Three ramps would exceed the target LOS of “D”. The ramps that would exceed LOS “D” under the 2040 No-Project Scenario would be:

- SR-60 eastbound on-ramp from Martin Luther King Boulevard (AM, PM)
- SR-60 westbound off-ramp to Central Avenue (AM, PM)
- SR-60 westbound off-ramp to Martin Luther King Boulevard (AM, PM)

Details of the LOS calculations for freeways under the 2040 No-Project Scenario can be found in Appendix N.

Table 61: 2040 No-Project Freeway Ramp Level of Service

▨ Indicates that the LOS exceeds the target level

10. 2040 PLUS BUILD-OUT SCENARIO

The analysis of the 2040 Plus Build-out Scenario shows the effect of project-related traffic if the WLC project were built-out in full and no other changes from the 2040 No-Project scenario occurred to the roadway system of land uses.

A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 62 compares the LOS for study roadway segments under the 2040 Plus Build-out Scenario to the 2040 No-Project Scenario and to the target LOS under the City's General Plan policies. Under the 2040 Plus Build-out Scenario traffic volumes on one segment would exceed the target LOS, namely:

- **Gilman Springs Rd. from Alessandro Blvd. to Bridge St.** would exceed the threshold of significance under the 2040 Plus Build-out Scenario. Widening the road from six lanes to eight lanes would allow it to achieve the target under the 2040 Plus Build-out Scenario. However, 6 lanes is the maximum planned for under the City of Moreno Valley General Plan and further widening may be undesirable from a public policy standpoint.

The feasibility of this mitigation measure and the means to fund it are discussed in greater depth in Chapter 11.

Table 62: 2040 Plus Build-out Road Segment Impacts and Mitigations

					2040 No-Project Conditions			2040 Plus Build-out					
Roadway		From	To	LOS Standard*	Roadway Section**	Daily Volume	LOS	Roadway Section**	Daily Volume	LOS	Project Impact Significant?	Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant	LOS After Mitigation

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

**** Due to the severing of Alessandro Blvd. and the diversion of traffic to other routes, there is no need to widen this section beyond the current 2U configuration

░ Indicates LOS exceeds the target level

B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 45 shows the turning movement volumes under the 2040 Plus Build-out Scenario (see Figure 11 for the key map). Table 63 presents the LOS for the study intersections under the 2040 Plus Build-out Scenario in the AM and PM peak hours. Detailed worksheets are presented in Appendix H. Seventy-two intersections would exceed the target LOS under the 2040 Plus Project Scenario. Of the 72 intersections, 67 would exceed the threshold of significance even if the WLC were not built (i.e. under the 2040 No-Project Scenario) and 5 more would exceed the threshold of significance with the addition of the project. These intersections are:

Would Exceed Threshold of Significance Under Both the 2040 No-Project Scenario and the 2040 Plus Build-out Scenario

Table 64 identifies where impacts occur and mitigation measures that would reduce the impacts to a less-than-significant level. As shown in Table 64 there are 30 study intersections where the project would have a significant impact. The mitigation measures shown in Table 64 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

When refering to lanes, "T" demotes a through lane

When refering to lanes, "L" demotes a left-turn lane

When refering to lanes, "R" demotes a right-turn lane

C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

Freeway Mainline Basic Sections

Table 65 compares the LOS for freeway mainline sections for the 2040 No-Project and the 2040 Plus Build-out scenarios. Details of the LOS calculations for freeways under the 2040 Plus Build-out Scenario can be found in Appendix O. Table 66 identifies the 42 basic freeway sections where the project has a significant impact and identifies measures that would reduce project impacts to a less-than-significant level. In 41 of the 42 segments there would be a deficiency in 2040 even under the No-Project Scenario. The Project would have significant impacts at:

North or Eastbound

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.
- SR-91 from McKinley St. to Pierce St.
- SR-60 from Pierce St. to Magnolia Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Tyler St. to Van Buren Blvd.
- SR-91 from Adams St. to Madison St.
- SR-91 from Central Ave. to 14th St.
- I-215 from Alessandro Blvd. to Eucalyptus Ave.
- I-215 from Eucalyptus Ave. to SR-60
- I-215 from Auto Plaza Dr. to Mill St.

Southbound or Westbound

- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.
- SR-60 from Moreno Beach Dr. to Redlands Blvd.
- SR-60 from I-15 to McKinley St.
- SR-91 from McKinley St. to Pierce St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- I-215 from Alessandro Blvd. to Eucalyptus Ave.
- I-215 from Center St. to La Cadena Dr.
- I-215 from La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.
- I-10 from Highland Springs Ave. to Sunset Ave.
- I-10 from 8th St. to Hargrave St.

- I-10 from Hargrave St. to Fields Rd.
- I-10 from Fields Rd. to Morongo Trail

The mitigation measures shown in Table 66 are those that would be needed to reduce the impact of the project to a less-than-significant level. In 37 of the cases adding a mixed-flow lane would achieve the target LOS. In the other 4 sections with significant impacts, adding a mixed-flow lane would vehicle density (on which LOS is based) to less than would occur in the 2025 No Project scenario, so this measure would reduce the impact of the WLC project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Table 65: 2040 Plus Build-out Freeway Mainline LOS

▨ Indicates that the LOS exceeds the target level

Freeway Weaving LOS

Table 67 compares the LOS for study weaving sections under the 2040 No-Project and the 2040 Plus Build-out Scenarios. Table 68 shows where significant impacts would occur. As shown in the table, there are 14 sections where the project would have a significant impact. In 13 of the 14 sections the LOS would be deficient under the 2025 No-Project Scenario; the Project's impact is that it would add to a problem that would occur even without the Project. The impacts would occur at:

North or Eastbound

- SR-60 from SR-71/Garey Ave. to Reservoir St.
- SR-60 from Main St. to SR-91
- SR-60 from SR-91 to Blaine St./3rd St.
- SR-60 from Blaine St/3rd St. to University Ave.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-60 from I-215 to Day St.
- SR-60 from Day St. to Pigeon Pass Rd./Frederick St.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- I-215 from SR-60 to Columbia Ave.
- I-215 from I-10 to Auto Plaza Dr./Orange Show Rd.

Southbound or Westbound

- SR-60 from Haven Ave. to Archibald Ave.
- SR-60 from Day St. to Pigeon Pass Rd./Frederick St.
- SR-91 from Arlington Ave. to Central Ave.
- I-215 from SR-60 to Columbia Ave

Table 68 identifies mitigation measures that would reduce the impact of the WLC project to a less-than-significant level. In 7 of the cases adding a mixed-flow lane would achieve the target LOS. In the other 7 sections with significant impacts, adding a mixed-flow lane would reduce vehicle density (on which LOS is based) to less than would occur in the 2040 No Project scenario, so this measure would reduce the impact of the WLC project to a less-than-significant level.

The mitigation measures shown in Table 68 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would mitigate the Project's impacts, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

▨ Indicates that the LOS exceeds the target level

Freeway Ramp LOS

Table 69 compares the freeway ramp level of service on SR-60 under the 2040 No-Project and the 2040 Plus Build-out Scenarios. Three ramps would operate at below LOS “D” under the 2040 Plus Build-out Scenario, and in each case the ramps would have operated at worse than “D” even without the Project (i.e. in the 2040 No Project Scenario). These locations are:

- SR-60 eastbound on-ramp from Martin Luther King Boulevard (AM, PM)
- SR-60 westbound off-ramp to Central Avenue (AM, PM)
- SR-60 westbound off-ramp to Martin Luther King Boulevard (AM, PM)

Table 70 shows where the Project would have a significant impact. As shown in the table, there is one ramp where the project would have a significant impact. The mitigation measure shown in Table 70 would reduce the impact of the project to a less-than-significant level. While that measure is feasible in the sense that if it was constructed then it would achieve the target LOS, this does not necessarily mean that it passes other tests of feasibility. The physical and financial feasibility of mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

11. MITIGATION MEASURES

The results of the traffic analysis indicate the proposed project would have some level of impact on the local and regional roadway system. The greatest impact by number of locations would occur under the 2040 Plus Build-out Scenario. This chapter discusses the mitigation measures that would be needed to reduce the impact of the project to a less-than-significant level. The discussion includes the fee programs relevant to the WLC, the methodology used to determine project impacts, and policy considerations regarding possible mitigations. The objective of each recommended measure is to allow the road or intersection to achieve the target level of service under the 2040 Plus Build-out Plus Mitigations Scenario or, where that is not feasible, to improve the level of service at the impacted locations to a level not worse than under the No-Project Scenario.

As set forth in greater detail below, in some circumstances mitigation is infeasible and so project impacts cannot be mitigated to less than significant levels. In such cases a statement of overriding considerations should be considered in accordance with City of Moreno Valley General Plan Policy 5.3.7 which reads:

> "*Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible*."

A. THE TUMF PROGRAM

In 1988 the voters of Riverside County approved Measure A, a half-cent sales tax to fund transportation projects. In 2002 voters approved a 20-year extension of Measure A, this time including a Transportation Uniform Mitigation Fee or TUMF. The rationale behind TUMF was that having a single uniform fee program to mitigate the cumulative regional impacts of new development on the area's arterial highway system would be more effective than having multiple, and potentially uncoordinated, fee programs with varying policies, fee amounts and project lists. Under the TUMF, developers of residential, industrial, and commercial properties pay a development fee to fund transportation projects that will be required as a result of the growth the projects create. The program is recognition by voters that residents and employees in all of western Riverside County's jurisdictions benefit from arterials located not just in their own city, but also in nearby cities as well.

The TUMF program is designed to provide a network of roads, bridges, interchanges and railroad grade separations, known as the Regional System of Highways and Arterials (RSHA), needed to accommodate future growth in the area through 2040. The RSHA was developed by the Public Works Directors of the WRCOG member jurisdictions. A "Nexus Study" was then prepared in accordance with the California Mitigation Fee Act, which requires that a reasonable relationship exist between the impact fee collected and the proposed improvements for which a fee is used. The study determined the proportion of the cost of the improvements that should be borne by different types of development based on the trip generating characteristics of each land use type. The Nexus Study was updated in 2016 and the RSHA was revised to reflect the most current transportation needs and costs for western Riverside County. The new RSHA network reflected several changes due to completed projects and recommendations from the WRCOG Public Works Committee (PWC) to better represent the transportation needs of western Riverside County.

TUMF is administered by the Western Riverside Council of Governments (WRCOG). As administrator, WRCOG receives all fees generated from the TUMF as collected by the local jurisdictions. TUMF funds are programmed by WRCOG's partner agencies, which are responsible for prioritizing projects and overseeing their development.

The TUMF program uses six categories of land uses; two residential and four non-residential. The two residential types are single-family residential and multi-family residential. Non-residential categories include industrial, retail, service commercial, and high-cube warehouse, with fees being assessed at different rates depending on the category. The high-cube warehouses in the WLC would fall into the "high-cube" category of non-residential development. Based on the current formula for calculating fees, if the WLC builds out as planned the developer would pay $34 million in TUMF fees.

TUMF fees are collected when a development reaches the building permit stage. TUMF revenues are allocated as follows[53]:

- 46.39 percent is allocated for regional improvements. These revenues are programmed by the RCTC pursuant to an agreement with WRCOG.
- 46.39 percent is allocated to the geographic zone from which the fees are collected. Project prioritization and programming are undertaken by the jurisdictions in each of the five zones.
- 1.64 percent is allocated for regional transit projects. WRCOG administers the funds on behalf of the Riverside Transit Agency which prioritizes and programs capital transit projects.
- 1.59 percent is allocated to the Multiple Species Habitat Conservation Plan (MSHCP)
- 4.00% is used for program administration.

Since its inception TUMF has collected more than $686 million in revenues, making it the largest multi-jurisdictional fee program in the nation. It has completed 85 projects[54] with several dozen more under development. The projects successfully funded by the program include a variety of road widening, intersection improvements, and freeway interchanges, including:

- Widening Pigeon Pass Rd. from 2 lanes to 4 lanes from Climbing Rose Dr. to Hidden Springs Dr.
- Widening the Ramona Expressway from 2 lanes to 6 lanes from I-215 to Evans Rd.
- Improvements to the Ironwood Ave./Moreno Beach Dr. Intersection
- Improvements to the Ironwood Ave./Nason St. intersection
- Adding a northbound lane to Lasselle St. from John F Kennedy Dr. to Alessandro Blvd.
- Widening Oleander Ave. from Perris Blvd to Indian Ave.
- The Van Buren Blvd./SR-91 Interchange project
- Widening State St. in Hemet from 2 to 4 lanes with a center turn lane
- Widening Sanderson Ave. from Menlo to Ramona Expressway

This track record of success is a key reason to believe that TUMF projects have a good probability of being implemented. Between now and 2040, when the program is scheduled for completion, the TUMF Program is forecasted to provide $2.9 billion towards a total of $3.7 billion in arterial road, bridge, intersection and interchange improvements in western Riverside County[55].

B. THE DIF PROGRAM

The City of Moreno Valley's Development Impact Fee (DIF) program is used to fund road and intersection improvements needed to accommodate new residential, commercial, and industrial development. The program collects fees from three categories of residential development (single-family, multi-family, and mobile homes) and five categories of commercial development (general commercial, regional commercial, general industrial, high-cube warehouse, and office) based on their respective trip generating characteristics. In many cases developers dedicate right-of-way and/or construct improvements that are part of the TUMF or DIF programs in lieu of paying the fees. These facilities are typically part of a project's direct frontage or are necessary to accommodate traffic needs in the immediate area of the project. DIF

---

[53] *Transportation Uniform Mitigation Fee Program, 2016 Annual Report*, WRCOG

[54] T*ransportation Uniform Mitigation Fee Program, 85 Projects and Counting* …, WRCOG, 2015

[55] *Transportation Uniform Mitigation Fee Nexus Study 2016 Update*, WSP for WRCOG. The TUMF program is one of several sources used to fund improvements.

fees on high-cube warehouses are currently set at $1.016 per square foot, which means that the WLC would more than $41 million in DIF fees if the project builds out and is required to pay DIF[56].

DIF funds are overseen by the City's Public Works Department. Department staff monitor traffic volumes and periodically develop a Capital Improvement Program (CIP) for use of the funds. The CIP is reviewed and approved by the city council. Examples of projects successfully completed using DIF funds include:

- Iris Ave. from Indian St. to Perris Blvd.
- Lasselle St./Bay Ave. traffic signal
- Lasselle St./Cottonwood Ave. traffic signal
- Cactus Ave. eastbound improvements from I-215 to Veterans Way

This track record of success is a key reason to believe that DIF projects have a good probability of being implemented. The DIF program supplements the TUMF program by funding elements of the City's General Plan Circulation Element not covered by TUMF, and in some projects by providing funds for additional capacity beyond what the TUMF project will provide. DIF and TUMF are routinely used in combination with other funding sources so that the inability of any single source to fund an entire project does not prevent the project from being implemented. Table 71 shows a sample of projects from Moreno Valley's Capital Improvement Program that used DIF and/or TUMF funds in combination with other funding sources.

Table 71: Projects Using DIF and TUMF in Combination with Other Funding Sources

Project	DIF Funds	TUMF Funds	Other Funds	Sources of Other Funds
Iron Avenue / Heacock Street to Perris Boulevard	$1,509,420	$72,413	$57,358	2005 Lease Revenue Bonds
Nason Street / Cactus Avenue Street Improvements	$9,272,000		$15,910,845	Measure "A"; State-Local Partnership Program; General Fund; General City C.P.; Successor Agency Tax Revenue; Redevelopment Agency Cap. Proj.; Eastern Municipal Water District; Riverside County Flood Control; 2007 Taxable Lease Revenue Bonds
SR-60 / Moreno Beach Drive South Side of Interchange (Phase 1)		$3,500,000	$6,110,735	Successor Agency; Redevelopment Agency
SR-60 / Nason Street Interchange	$740,000		$13,285,777	Measure "A"; Federal Demonstration Funds; Demo Toll Credit - Const.; Surface Transportation Program Local (construction); Surface Transportation Program Local Toll Credit - Const.
Heacock Street South Extension		$300,000	$564,172	Measure "A"
Emergency Vehicle Pre-emption at 117 Traffic Signals	$93,534		$840,000	Highway Safety Improvement Program
Nason Street / Riverside County Regional Medical Center Main Driveway Traffic Signal	$250,000		$50,000	Measure "A"
Transportation Management Center	$316,578		$214,646	Air Quality Management
Lasselle Street / John F. Kennedy Drive to Alessandro Boulevard		$2,757,886	$1,058,143	2005 Lease Revenue Bonds
Kitching Street / Alessandro Boulevard to Gentian Avenue	$11,903		$1,639,854	2005 Lease Revenue Bonds
Pigeon Pass Road Widening / Climbing Rose Drive to North City Limits	$462,239	$679,953	$22,664	Measure "A"
Total	$12,655,674	$7,310,252	$39,754,194	
Percentage of Total	21%	12%	67%	

The DIF program has been updated several times, most recently in October 2012, to reflect changes in priorities as development occurs in different parts of the city.

---

[56] Section 4.8 of the Development Agreement requires Highland Fairview to fully fund or construct all needed improvements within Moreno Valley in lieu of paying the traffic DIF. However, if the court sets aside the Development Agreement then Highland Fairview would pay into DIF.

C. METHODOLOGY FOR DETERMINING IMPACTS

The potential impacts of the project were classified as either direct impacts or cumulative impacts. A direct impact of the project is one that would occur if the proposed project was the only change from existing conditions. A cumulative impact is defined in the CEQA Guidelines, Section 15355 as, “an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts.” Both types of impacts can be either significant or less-than-significant depending on whether or not they result in traffic conditions that exceed the threshold of significance set by the agency that has jurisdiction over the road in question. For example, if a road was subject to a threshold of significance of LOS “D”, and the proposed project would by itself cause the LOS to change from “B” to “C”, then the direct impact would be less-than-significant. If the addition of other past, present, and reasonably foreseeable future projects would result in LOS “E”, then the cumulative impact of the project would be significant.

The methodology used to identify mitigation measures included:

1) Determining whether the LOS exceeded the target threshold in the Plus Build-out scenario.
2) If so, then determining whether the LOS under the Plus Build-out Scenario was better than the LOS under the No-Project Scenario. Some study intersections and freeway segments were found to exceed the threshold of significance under the Plus Build-out Scenario but the traffic density was better under the Plus Build-out Scenario than the No-Project Scenario. This would happen because detailed computer modeling shows that the project would cause some commuters to switch from the peak direction to the off-peak direction, thus reducing congestion at some locations (see Figure 33 and Figure 34). The project’s impacts were considered significant only when the Plus Build-out Scenario was worse than the No-Project Scenario.
3) If the project had a significant impact, capacity-increasing improvements were then added incrementally until the LOS was within the target threshold of significance.
4) For cumulative projects, determining whether the mitigations could be funded as part of an established fee program such as TUMF. If so, then Payment into the TUMF program could constitute mitigation of impacts to the TUMF facilities.
5) For improvements that would not be funded from an established fee program the project’s fair-share contribution was computed as the Project’s share of horizon-year traffic using the facility, computed in PCEs. This formula thus takes into account the effect of WLC at full build-out, including the effect of WLC-related trucks. Where there were significant impacts in both the AM and PM peak periods, the period with the higher share of project traffic was used to determine the fair-share contribution.

Potential mitigation measures were analyzed to determine whether they were feasible or not. Improvements were deemed to be infeasible if they would require the acquisition of existing homes or businesses, if they would result in excessive air, noise, or vibration impacts on existing homes, businesses, or sensitive natural environments, or would create safety impacts that could be considered less acceptable than a reduced traffic LOS. In cases where feasibility is uncertain, the recommended improvement was treated as feasible in order to produce a conservative estimate of project responsibilities (i.e. “conservative” in the sense that the project’s responsibilities would not be under-estimated).

In cases where a proposed modification to an existing intersection would result in the elimination of an existing bus stop or bicycle lane the proposed mitigation would include the replacement of the bicycle lane or bus stop even if not explicitly stated. This is also true of the replacement of existing curbs, gutters, sidewalks, lights, and other existing design features.

D. FORMAT FOR REPORTING IMPACTS

The remainder of the chapter is devoted to reporting project impacts and mitigation measures. The situation for each impacted facility is discussed in the text and the results are summarized in Table 72 through Table 77. These tables all follow a similar format which includes the following data fields (columns):

(A) This field identifies the location of the impact.

(B) This field identifies which agency has jurisdiction over the facility in question.

(C) This field shows the agency's target LOS for the facility in question.

(D) This field shows the LOS under Existing conditions. This is used to determine whether or not there is an existing deficiency.

(E) This field shows the LOS under the Existing Plus Build-out Scenario. This is used to determine whether or not the project has a significant impact.

(F) This field shows whether there is a significant impact. It is based on the thresholds of significance described in Chapter 2.

(G) This field describes what improvements would be required to achieve the target LOS under the Existing Plus Build-out Scenario.

(H) This field states whether the measure described in Column G is feasible or not. In some cases the needed improvements may not be feasible. For example, it may be infeasible to widen a road because doing so would cause serious negative impacts to an adjacent neighborhood.

(I) This field shows the LOS after all feasible mitigations have been implemented. If mitigation is infeasible then Column I will be the same as Column E.

(J) This field states whether the impact would still be significant after all feasible mitigation measures have been implemented. For those facilities under the jurisdiction of the City of Moreno Valley (see Column B) a "No" in Column J indicates that the impact will be mitigated to a less-than-significant level. For those facilities outside the jurisdiction of the City of Moreno Valley, Column J indicates what would happen if the jurisdiction that controls the facility implements the recommended feasible mitigations. However, because the City of Moreno Valley cannot guarantee that the other agency will implement the needed improvement the City cannot guarantee that the impact will be mitigated to a less-than-significant level.

(K) This field shows whether or not there is an existing deficiency. Generally speaking, under state law a developer is responsible for mitigating the impacts of their project but is not responsible for rectifying existing deficiencies that are the result of earlier projects. They need only pay a fair-share representing the portion of the improvements required to mitigate the impacts attributable to their own project.

(L) This field reports the action that the developers of the WLC will be required to take as a condition of approval.

E. PROJECT DIRECT IMPACTS

The direct impacts of the WLC project were determined by comparing the LOS of study facilities under the Existing and the Existing Plus Build-out Scenarios. The direct impacts of the project and their mitigation measures were as follows:

Road Section Direct Impacts

The project's direct impacts on road sections are summarized in Table 72. These impacts would be:

- **Gilman Springs Rd. from Alessandro Blvd. to Bridge St.** (S-16) is already deficient and needs to be widened to four lanes and will need to be widened to six lanes in the future. In accordance with General Plan Policy 5.5.7 the City will require the developer to widen Gilman Springs Rd. to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer will receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair-share contribution.

  However, because Gilman Springs Rd. is a Riverside County facility and is thus outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to four lanes between Alessandro Blvd. and Bridge St., or even preclude any widening at all. The project's impacts on Gilman Springs Rd. must therefore be considered significant and unavoidable. The City will work with Riverside County to find funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

- **Gilman Springs Rd. from SR-60 to Alessandro Blvd.** (S-17) is already deficient and needs to be widened to four lanes. In accordance with General Plan Policy 5.5.7 the City will require the developer to widen Gilman Springs Rd. to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer would receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair-share contribution.

  However, because Gilman Springs Rd. is a Riverside County facility and is thus outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on Gilman Springs Rd. must therefore be considered significant and unavoidable. The City will work with Riverside County to find funding for improvements that would provide an acceptable LOS on this road to the extent feasible

- **Redlands Boulevard between Eucalyptus Avenue and the SR-60 eastbound ramps** (S-18) is already deficient and needs to be widened to four lanes. This project is in the City's Capital Improvement Program with planned funding from the TUMF and DIF programs. Mitigation is for the developer to pay into the TUMF and to pay a fair-share contribution towards this improvement as a condition of approval.

Table 72: Project Direct Impacts on Road Sections

Study Roadway		From	To	Jurisdiction	LOS Standard*	Existing LOS	Existing Plus Build-out LOS	Does the Project have a Significant Impact?	Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant	Is the Mitigation Feasible?	LOS After Feasible Mitigations are Implemented	Impact Significant After Feasible Mitigations are Implemented?	Is There an Existing Deficiency?	Developer Action Required

Road Section Impacts that are Considered Significant and Unavoidable (because they are not under the control of the City of Moreno Valley)														
S-16	Gilman Springs Rd	Alessandro Blvd (Street C)	Bridge St	Riverside County	D	**F** ▨	**F** ▨	Yes	Widen to 4 lanes	No	**F** ▨	Yes	Yes	N/A**
S-17	Gilman Springs Rd	SR-60	Alessandro Blvd (Street C)	Riverside County	D	**F** ▨	**F** ▨	Yes	Widen to 4 lanes	No	**F** ▨	Yes	Yes	N/A**

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Not applicable because mitigation is infeasible

▨ Indicates LOS exceeds the target level

Intersection Direct Impacts

The project’s direct impacts on study intersections are summarized in Table 73. These impacts would be:

- **Redlands Blvd./Locust Ave. intersection** (IN-10) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing the intersection and adding an eastbound left-turn and westbound left-turn lanes would reduce project impacts to a less-than-significant level. Improvements to this intersection are already programmed in the RTP, so no action is required by the developer.
- **Redlands Blvd./Eucalyptus Avenue** (IN-18) would exceed the LOS threshold in the PM peak hour under the Existing Plus Build-out Scenario. Adding a westbound right-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Oliver St./Alessandro Blvd. intersection** (IN-20) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Adding a receiving lane for left turns from Oliver Street would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Moreno Beach Dr./Ironwood Ave.** (IN-36) would exceed the LOS threshold in the AM peak hour under the Existing Plus Build-out Scenario. Adding a northbound right-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Moreno Beach Dr./SR-60 EB Ramps intersection** (IN-37) already exceeds the LOS threshold in the PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Adding a southbound left-turn lane and changing the phasing to protected would reduce project impacts to a less-than-significant level. At time of publication, the needed improvements were already being made to the intersection.
- **Martin Luther King Blvd./Canyon Crest Dr.** (IN-83) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Changing a northbound through lane to a shared through-right-turn lane would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval if the City of Riverside has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project’s impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

Table 73: Direct Impacts on Intersections and Mitigation Measures

ID	Study Intersection	Jurisdiction	LOS Standard	Existing LOS		Existing Plus Buildout LOS		Does the Project have a Significant Impact?	Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant	Is the Mitigation Feasible? IN-124	SR-79(Sanderson Ave) NB/Gilman Springs Rd	Riverside County	C	**F**	**F**	**F**	**F**	Yes	Signalize.	Yes			No	Yes	Pay fair share (3.9%)
IN-125	SR-79(Sanderson Ave) SB/Gilman Springs Rd	Riverside County	C	**E**	**F**	**F**	**F**	Yes	Signalize.	Yes			No	Yes	Pay fair share (3.2%)
IN-132	San Timoteo Canyon Rd/Alessandro Rd	Redlands	D	**F**	C	**F**	**E**	Yes	Signalize.	Yes			No	Yes	Pay fair share (13.1%)
IN-133	San Timoteo Canyon Rd/Live Oak Canyon Rd	Riverside County	C	**F**	**D**	**F**	**F**	Yes	Signalize.	Yes			No	Yes	Pay fair share (11.5%)
IN-134	Redlands Blvd/San Timoteo Canyon Rd	Riverside County	C	**F**	**F**	**F**	**F**	Yes	Signalize. Add 1 EB Right Turn and 1 NB Left Turn.	Yes			No	Yes	Pay fair share (5.4%)

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

- **Martin Luther King Blvd./I-215 northbound ramps** (IN-85) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing the intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval if the City of Riverside has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Central Ave./Chicago Ave.** (IN-86) already exceeds the LOS threshold in the PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Changing a westbound through lane to a shared through-right-turn lane and changing a northbound through lane to a shared through-right-turn lane would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval if the City of Riverside has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Arlington Ave./Victoria Ave.** (IN-94) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Re-configuring the westbound approach to one left-turn lane, two through lanes, and one right-turn lane would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval if the City of Riverside has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Evans Rd./Orange Ave.** (IN-114) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing the intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Perris. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval if the City of Perris has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Bridge St./Ramona Expy.** (IN-122) already exceeds the LOS threshold in the AM and PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection would reduce project impacts to a less-than-significant level.

This intersection will be eliminated as part of planned improvements to the Ramona Expressway. Therefore no action is required by the developer.

- **Gilman Springs Rd./Bridge St.** (IN-123) already exceeds the LOS threshold in the AM and PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval if the Riverside County has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. intersection** (IN-124) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval if the Riverside County has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **SR-79 (Sanderson Ave.) SB/Gilman Springs Rd.** (IN-125) already exceeds the LOS threshold in the AM and PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval if the Riverside County has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **San Timoteo Canyon Rd./Alessandro Rd. intersection** (IN-132) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Redlands. The City will require the developer to pay for a fair share of this improvement as a condition of approval if the City of Redlands has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because this intersection is outside the jurisdiction of the

City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Redlands to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **San Timoteo Canyon Rd./Live Oak Canyon Rd. intersection** (IN-133) already exceeds the LOS threshold in the PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval if the Riverside County has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **Redlands Blvd./San Timoteo Canyon Rd. intersection** (IN-134) already exceeds the LOS threshold in the PM peak hour and traffic using the intersection would experience longer delays under the Existing Plus Build-out Scenario. Signalizing this intersection and adding an eastbound right turn and a northbound left turn lane would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval if the Riverside County has a fair share program in effect at the time of approval that would provide the remaining funds needed to construct the improvements. However, because intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

Freeway Direct Impacts

Unlike the surface streets, where intersection improvements are generally both feasible and desirable, the strategic situation for freeways in western Riverside County is such that major freeway improvements are becoming increasingly problematic over time. A key problem is that the rights-of way are essentially built out in many locations and cannot be expanded without severe impacts to existing communities (loss of homes and businesses, visual intrusion, increased noise and air quality impacts, etc.) and high costs to replace overcrossing structures. Moreover, there is a growing consensus that over-provision of freeway capacity facilitates long-distance commuting by car and leads to more auto-oriented residential development on the urban fringe, which in turn increases greenhouse gas emissions. This has resulted in a policy shift away from continued expansion of the freeway system, as reflected, for example, in Riverside County Transportation Commission's Ordinance No. 02-001 which reads in part,

> *"State Routes 91 and 60 and Interstate Routes 15 and 215 cannot cost effectively be widened enough to provide for the traffic expected as Riverside County continues to grow. In addition to the specific highway improvements listed in Section 1 above, congestion relief for these highways will require that new north–south and east-west transportation corridors will have to be developed to provide mobility within Riverside County and between Riverside County and its neighboring Orange and San Bernardino Counties."*

In other words, as a matter of policy, with the exception of spot improvements in some specific locations, the overall strategy to relieve congestion on SR-60 and SR-91 is to improve the capacity of surface streets that could serve as alternate routes to freeways. The policy to forego further widening of some sections of SR-60 and SR-91 is also noted in the Riverside County Congestion Management Program (CMP) which permits LOS "F" for some of the study freeway sections because those sections already operated at LOS

"F" when the CMP was established in 1991[57]. For these reasons some of the identified mitigation measures may not be pursued even if they are deemed feasible in an engineering sense. In such cases the project's payment into the TUMF and DIF programs and funding for the surface street improvements would constitute a type of mitigation because they help create viable alternative routes that would substitute for freeway travel for some trips. For the purposes of this report, however, the impacts were treated as significant and unavoidable.

The project's direct impacts on the regional freeway system are summarized in Table 74. The freeways studied in this report are state facilities outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvements of these freeways as a condition of approval. However, because the freeways are outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place either for collecting fees from WLC or for ensuring the availability of the non-project portion of the needed funds[58], the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable. These impacts would be:

Direct Impacts on Freeway Mainline Basic Sections

- **Eastbound SR-60 from Ramona Ave. to Central Ave.** (F-3) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2040 independent of the WLC project.
- **Eastbound SR-60 from Mountain Ave. to Euclid Ave.** (F-5) currently operates at an acceptable LOS in the AM peak hour but would exceed the LOS threshold under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2040 independent of the WLC project.
- **Eastbound SR-60 from Euclid Ave. to Grove Ave.** (F-6) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2040 independent of the WLC project.
- **Eastbound SR-60 from Martin Luther King Blvd. to Central Ave.** (F-24) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The Transportation Concept Report does not call for further widening of this section, which could only be accomplished by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.

---

[57] *2011 Riverside County Congestion Management Program*, Page 4-7.

[58] The City and Highland Fairview are providing funds for a study, currently underway, to determine the feasibility of establishing a freeway impact fee to mitigate the effects of truck traffic from new logistics warehouses in Riverside County.

Table 74: Direct Impacts on Freeways and Mitigations

	Study Facility	Juris-diction	LOS Standard	Determination of Impact					Mitigation Measures Required to Reduce Impact to Less-Than-Significant	Is Mitigation Feasible?	LOS After Feasible Mitigations are Implemented		Impact Significant After Feasible Mitigations are Implemented?	Is There an Existing Deficiency?	Developer Action Required

▨ Indicates LOS exceeds the target level

* Project is in the current RTP and is planned to be completed independent of the WLC project

** Not applicable because mitigation is infeasible

- **Eastbound SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.** (F-29) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Pierce St. to Magnolia Ave.** (F-41) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Adams St. to Madison St.** (F-46) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

  - **Eastbound SR-91 from Central Ave. to 14th St.** (F-49) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Northbound I-215 from Eucalyptus Ave. to SR-60** (F-95) currently operates at an acceptable LOS but would exceed the LOS threshold in the PM peak hour under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  I-215 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Northbound I-215 from Auto Plaza Dr. to Mill St.** (F-80) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

I-215 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Grove Ave. to Vineyard Ave.** (F-7) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2040 independent of the WLC project.

- **Westbound SR-60 from Vineyard Ave. to Archibald Ave.** (F-8) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2040 independent of the WLC project.

- **Westbound SR-60 from Fair Isle Dr./Box Springs Rd. to I-215** (F-26) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from I-215 to Day St.** (F-27) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Pigeon Pass Rd. to Heacock St.** (F-29) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from McKinley St. to Pierce St.** (F-40) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Pierce St. to Magnolia Ave.** (F-41) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Magnolia Ave. to La Sierra Ave.** (F-42) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from La Sierra Ave. to Tyler St.** (F-43) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Tyler St. to Van Buren Blvd.** (F-44) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Van Buren Blvd. to Adams St.** (F-45) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Southbound I-215 from Center St. to La Cadena Dr.** (F-75) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.
- **Southbound I-215 from La Cadena Dr. to Barton Rd.** (F-76) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

I-215 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Southbound I-215 from Barton Rd. to Mt. Vernon Ave.** (F-77) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  I-215 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

Direct Impacts on Freeway Weaving Sections

- **Eastbound SR-60 from Main St. to SR-91** (W-20) currently operates at an acceptable LOS in the AM peak hour but would exceed the LOS threshold under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.
- **Northbound I-215 from SR-60 to Columbia Ave.** (W-73) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Extending the auxiliary lane beyond the off-ramp would bring the LOS to within the target threshold.

  I-215 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.
- **Northbound I-215 from I-10 to Auto Plaza Dr./Orange Show Rd.** (W-79) currently operates at an acceptable LOS in the PM peak hour but would exceed the LOS threshold under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

I-215 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from University Ave. to Martin Luther King Blvd.** (W-23) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the AM peak hour LOS to within the target threshold and reduce the PM peak hour from "F" to "E".

SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.** (W-25) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Arlington Ave. to Central Ave.** (W-48) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

Direct Impacts on Freeway Ramps

- **Eastbound SR-60 on-ramp from Martin Luther King Blvd.** (R-1) already exceeds the LOS threshold in the AM and PM peak hours and traffic density would increase under the Existing Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The Transportation Concept Report does not call for further widening of this section, which could only be accomplished by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.

As individual projects within the WLC are processed the City will require that each project do a traffic impact assessment in accordance with City guidelines. These project-level assessments will determine the timing of each mitigation measure.

F. PROJECT CUMULATIVE IMPACTS

The cumulative impacts of the WLC project were determined by comparing the LOS of study facilities under the 2040 No-Project and 2040 Plus Build-out Scenarios[59]. The cumulative impacts of the project and their associated mitigation measures are described below. In cases where the facility had mitigation measures identified for direct impacts and requires additional improvements under cumulative scenarios, the improvements described below are the improvements required beyond those described in the previous section on direct impacts.

Cumulative Impacts on Road Sections

The project's cumulative impact on road sections is summarized in Table 75. This impact would be:

Gilman Springs Rd. from Alessandro Blvd. to Bridge St. (S-16) should be widened from two lanes to six lanes in the short term (see previous section on direct impacts) and may need to be further widened to eight lanes sometime in the 2025-to-2040 timeframe. Gilman Springs is a TUMF facility. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because Gilman Springs Rd. is a Riverside County facility and is thus outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to six lanes between Alessandro Blvd. and Bridge St., or even preclude any widening at all. The project's impacts on Gilman Springs Rd. must therefore be considered significant and unavoidable. The City will work with Riverside County and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

---

[59] As a reminder, both 2040 scenarios included in their land use assumptions the growth associated with the adopted SCS, the list of other past, present, and reasonably foreseeable projects, and buildout of the Moreno Valley General Plan. Sections Section 1.A. for details.

Table 75: Cumulative Impacts on Road Sections and Mitigations

Study Roadway		From	To	Jurisdiction	LOS Standard*	Existing LOS	Existing Plus Build-out LOS	Does the Project have a Significant Impact?	Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant	Is the Mitigation Feasible?	LOS After Feasible Mitigations are Implemented	Impact Significant After Feasible Mitigations are Implemented?	Is There an Existing Deficiency?	Developer Action Required
(A)				(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)
Road Section Impacts that are Considered Significant and Unavoidable (because they are not under the control of the City of Moreno Valley)														
S-16	Gilman Springs Rd	Alessandro Blvd (Street C)	Bridge Street	Riverside County	D	**F**	**F**	Yes	Widen to 8 lanes	No	**F**	Yes	Yes	N/A**

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Not applicable because mitigation is infeasible

▨ Indicates LOS exceeds the target level

Cumulative Impacts on Study Intersections

The WLC project's cumulative impacts on study intersections is summarized in Table 76, and described in detail below:

- **Theodore St./Ironwood Ave. intersection** (IN-12) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Signalizing the intersection would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.
- **Moreno Beach Dr./Cactus Ave. intersection** (IN-25) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Constructing a second eastbound left-turn lane and changing a northbound through lane to a shared through-right-turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.
- **Redlands Blvd./Cactus Ave. intersection** (IN-27) should be signalized and added eastbound and westbound left-turn lanes in the short term (see previous section on direct impacts) and may exceed the target LOS threshold at some point in the 2025-to-2040 period. Constructing a northbound left-turn lane and a southbound left turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Moreno Beach Dr./John Kennedy Dr.** (IN-28) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Changing the east/west directions from protected to split phase and converting a westbound through lane to a share through-left-turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Sunnymead Blvd./Perris Blvd.** (IN-32) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a westbound left turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.
- **Moreno Beach Dr./Locust Ave. intersection** (IN-35) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Signalizing the intersection and constructing a westbound left-turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.

Table 76: Cumulative Intersection Impacts and Mitigations

ID	Study Intersection	Jurisdiction	LOS Standard	2040 LOS		2040 Plus Buildout LOS		Does the Project have a Significant Impact?	Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant	Is the Mitigation Feasible? IN-107	Evans Rd/Rider St	Perris	C	**E**	**D**	**E**	C	Yes	Reconfigure SB approach to include 1 LT, 2 THs and 1 RT.	Yes			No	Yes	Pay TUMF
IN-130	W 6th St/Beaumont Ave	Beaumont	C	**E**	**F**	**E**	**F**	Yes	Reconfigure EB approach to 2 LTs, 2 THs and 1 RT. Reconfigure NB approach to 1 LT, 2 THs and 1 RT. change EB & WB lefts to protected.	**No**	**E**	**F**	**Yes**	No	Measure Not Feasible

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

▨ Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

- **Iris Ave./Perris Blvd. intersection** (IN-39) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Constructing a second westbound left-turn lane and a second southbound left-turn lane would reduce cumulative impacts to a less-than-significant level. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Lasselle St./Iris Ave. intersection** (IN-41) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a third westbound left-turn lane and an eastbound right-turn lane would reduce project impacts to a less-than-significant level. This improvement is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Nason St/Alessandro Blvd.** (IN-51) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a permissive overlap phase for the eastbound right turn, southbound right turn, and westbound right turn would reduce cumulative impacts to a less-than-significant level. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Kitching St./Cactus Ave.** (IN-52) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Changing the southbound right turn lane into a shared southbound through-right-turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.
- **Lasselle St./Cactus Ave.** (IN-53) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a westbound left turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Morrison St./Cactus Ave.** (IN-54) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a westbound right turn lane with overlap phasing would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.
- **Nason St./Cactus Ave.** (IN-55) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Changing the southbound shared through-right-turn lane into a right turn lane with overlap phasing would reduce cumulative impacts to a less-than-significant level. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Indian St./Cactus Ave.** (IN-64) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a northbound left turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.
- **Perris Blvd./Cactus Ave.** (IN-65) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding an eastbound right turn lane, a southbound left turn lane, and a northbound right turn overlap phase would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Elsworth St./Alessandro Blvd.** (IN-71) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding a northbound left turn lane would reduce cumulative impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards

this improvement as a condition of approval. This intersection is eligible for funds under the DIF program, which is expected to provide the remaining funds needed to implement the improvement.

- **Central Ave./Lochmoor Dr. intersection** (IN-75) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Converting the northbound approach to one left-turn lane and a shared left-right-turn lane and changing the eastbound approach to two through lanes and one right turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Alessandro Blvd./Mission Grove Pkwy. intersection** (IN-80) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Adding an eastbound left turn lane and a northbound through lane, and changing the westbound approach to have two left turn lanes, three through lanes, and one right turn lane3, and changing the southbound approach to one right turn, two through, and one left turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Central Ave./Canyon Crest Dr. intersection** (IN-88) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Changing the eastbound approach to one left turn, two through, and one right turn lane, changing the southbound approach to two left turn, two through, and one right turn lane, adding a westbound left-turn lane, and a northbound left-turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Horace St./Arlington Ave.** (IN-93) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Changing the eastbound approach to one left, two through, and one right turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Arlington Ave./Victoria Ave. intersection** (IN-94) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Changing the westbound approach to one left, two through, and one right turn lane, and adding an eastbound left turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Alessandro Blvd./Chicago Ave. intersection** (IN-95) is already built out to near the practical limit before grade separation is required (it has five lanes for each approach). Despite this it already operates at LOS "F" in the PM peak period. Reconfiguring the southbound approach to one left turn, three through, and one right turn would mitigation the Project's cumulative impact but still result in LOS "F" during peak hours. There are established residential communities on each corner that would be impacted by such a widening or by grade separation. These mitigation measures are thus likely to be infeasible, and the project impact at this location is therefore considered to be a significant and unavoidable.

- **Ramona Expwy./Indian St. intersection** (IN-101) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Constructing one eastbound right-turn lane, a second northbound left-turn lane, and one northbound right-turn lane, and modifying the traffic signal to provide overlap phasing for all right-turn movements would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Perris. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Evans Rd./Rider St. intersection** (IN-107) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Reconfiguring the southbound approach to have one left turn, two through, and one right turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Perris. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **W. 6th St./Beaumont Ave. intersection** (IN-130) will exceed the target LOS threshold at some point in the 2025-to-2040 period. Reconfiguring the eastbound approach to two left, two through, and one right turn, and reconfiguring the northbound approach to one left, two through and one right turn, and making the eastbound and westbound left turns protected movements would reduce cumulative impacts to a less-than-significant level.

There are established commercial buildings on the corners on the northern part of the intersection that would be impacted by such a widening. These mitigation measures are thus infeasible, and the project impact at this location is therefore considered to be significant and unavoidable.

Cumulative Freeway Impacts

The WLC's cumulative impacts on the freeways system are summarized in Table 77, and described in detail below:

Cumulative Impacts on Mainline Basic Sections

- **Eastbound SR-60 from Reservoir St. to Ramona Ave.** (F-2) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  The state freeway system is owned and operated by Caltrans and is thus outside the jurisdiction of the City of Moreno Valley. The City will work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements. However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC

Table 77: Cumulative Freeway Impacts and Mitigations

Study Facility		Juris-diction	LOS Standard	Determination of Impact					Mitigation Measures Required to Reduce Impact to Less-Than-Significant	Is Mitigation Feasible? W-73	SB I-215 SR-60 to Columbia Ave	Caltrans	D	**F**	**F**	**F**	**F**	Yes	Add one mixed flow lane.	Yes	**F**	**F**	No*	Yes	Pay fair share (0.1%)

▨ Indicates LOS exceeds the target level

* Although the target LOS is not met, conditions with the project and the mitigation measure would be better than No-Project conditions

** This is in addition to the lane that will be added under the current RTP

*** Not applicable because mitigation is infeasible impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, this and all other freeway impacts must be considered as significant and unavoidable.

- **Eastbound SR-60 from Valley Way to Rubidoux Blvd.** (F-17) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Rubidoux Blvd. to Market St.** (F-18) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Market St. to Main St.** (F-19) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Heacock St. to Perris Blvd.** (F-30) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from McKinley St. to Pierce St.** (F-40) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from La Sierra Ave. to Tyler St.** (F-43) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Tyler St. to Van Buren Blvd.** (F-44) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Northbound I-215 from Eucalyptus Ave. to SR-60** (F-95) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-215 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Valley Way to Rubidoux Blvd.** (F-17) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Rubidoux Blvd. to Market St.** (F-18) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Market St. to Main St.** (F-19) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Martin Luther King Blvd. to Central Ave.** (F-24) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Heacock St. to Perris Blvd.** (F-30) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus

Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Moreno Beach Dr. to Redlands Blvd.** (F-33) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of an HOV lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from I-15 to McKinley St.** (F-39) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Southbound I-215 from Alessandro Blvd. to Eucalyptus Ave.** (F-94) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-215 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Highland Springs Ave. to Sunset Ave.** (F-55) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from 8th St. to Hargrave St.** (F-58) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Hargrave St. to Fields Rd.** (F-59) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Fields Rd. to Morongo Trail** (F-60) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

Cumulative Impacts on Weaving Sections

- **Eastbound SR-60 from SR-71/Garey Ave. to Reservoir St.** (W-1) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from SR-91 to Blaine St.** (W-21) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Eastbound SR-60 from Blaine St. to University Ave.** (W-22) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Eastbound SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.** (W-25) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from I-215 to Day St.** (W-27) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Day St. to Pigeon Pass Rd./Fredrick St.** (W-28) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Magnolia Ave. to Sierra Ave.** (W-42) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Northbound I-215 from SR-60 to Columbia Ave.** (W-73) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-215 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Haven Ave. to Archibald Ave.** (W-9) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Day St. to Pigeon Pass Rd./Fredrick St.** (W-28) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of an HOV lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Southbound I-215 from SR-60 to Columbia Ave.** (W-73) will exceed the target LOS threshold at some point in the 2025-to-2040 period and traffic density would increase under the 2040 Plus Build-out Scenario. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-215 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

G. RECOMMENDED MITIGATION MEASURES

Based on the analysis described above following Mitigation Measures are recommended:

- MM Trans-1: A traffic impact analysis ("TIA"), conforming to the guidelines for TIAs adopted by the City shall be submitted in conjunction with each Plot Plan application within the WLCSP. Prior to the approval of the Plot Plan, the City shall review the TIA to determine if any of the traffic improvements listed in Table 72, Table 73, Table 75, or Table 76 of the TIA prepared for the Program EIR are required to be completed prior to the issuance of a certificate of occupancy for each building. If the City determines that any of the improvements within Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated into insignificance, then the completion of construction of the improvements prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. Construction of improvements within the City shall be subject to reimbursement agreement for those costs that exceed the fair share contribution determined for the specific Plot Plan application. If the City determines that any of the improvements outside Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated to a less than significant level, then the payment of any necessary fair share contribution as prescribed in MM Trans-6 prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. If the City determines that the traffic impacts which will result from the construction or operation of a building will be significantly more adverse than those shown in the program EIR, further environmental review shall be conducted prior to the approval of the Plot Plan pursuant to Public Resources Code § 21166 and CEQA Guidelines § 15162 to determine what additional mitigation measures, if any, will be required in order to maintain the appropriate levels of service.
- MM Trans-2: As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require the dedication of appropriate right-of-way, where feasible, consistent with the Subdivision Map Act for frontage street improvements contained within the World Logistics Center Specific Plan Circulation Map, as shown in Figure 22. Required dedications shall be made prior to the issuance of occupancy permits for the requested development Figure 15.
- MM Trans-3: As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require the Applicant to construct or to fully fund the transportation measures identified in the development's TIA (see MM Trans-1) as needed to mitigate the transportation impacts of the Plot Plan development. The payment or construction shall be made prior to the issuance of occupancy permits for the requested development. This condition shall apply only to mitigation measures where mechanism has been established to collect funds from the Project and any other funds needed to complete the improvements.
- MM Trans-4: As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the requisite Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Chapter 3.44. Required TUMF payments shall be made prior to the issuance of occupancy permits for the requested development.
- MM Trans-5: In order to ensure that all of the Project's traffic impacts are mitigated to the greatest extent feasible, the Applicant shall contribute its fair share of the cost of the needed traffic improvements that are not within the City as identified in the Traffic Impact Analysis, *i.e.,* under the jurisdiction of other cities, the County of Riverside or Caltrans, pursuant to MM Trans-6. As used in this mitigation measure, the Applicant's "fair share" has been determined in compliance with the requirements of the Fee Mitigation Act, Government Code § 66000 *et seq.*, and, pursuant to § 66001(g), does not require that the Applicant be responsible for making up for any existing deficiencies.

- MM Trans-6: The Applicant shall pay a portion of the fair share of the cost of traffic improvements identified in the Transportation Impact Analysis for those significantly impacted road segments and intersections for each warehouse building within the World Logistics Center if the impacted jurisdiction has established a fair share contribution program prior to the approval of a building-specific plot plan. The City shall determine whether a fair share program exists in the impacted jurisdiction and, if one does exist, require that the appropriate fees are paid by the Applicant, consistent with the requirements below, prior to the issuance of a certificate of occupancy for the building in question. If no fair share program exists or if the existing programs are not consistent with the requirements below, then no payment of fees shall be required. The impacts are to be determined on a road segment or intersection basis. Nothing in this condition requires the payment of a traffic impact fee imposed by another jurisdiction which covers improvement to facilities where the Project does not have a significant impact. Fair-share contributions will be determined on a building-by-building basis as a share of the impact of the Project as a whole (for each segment or intersection where the WLC project as a whole has a significant impact identified in the programmatic EIR) as determined by the Traffic Impact Analysis and will be due as each certificate of occupancy is issued. The fair share payments for the significantly impacted road segments and intersections identified in the program EIR will be required even though the impact resulting from a specific building does not, by itself, cause a significant impact.

  For example, the intersection of Martin Luther King Blvd. and the I-215 northbound ramps (Intersection 85) in the City of Riverside was identified as a place where the WLC contributes to an existing deficiency, and where the fair share contribution of the WLC project as a whole was computed to be 0.6%. If the City of Riverside establishes a fair share contribution program consistent with this MM Trans-6 to improve that intersection, then when a certificate of occupancy is to be issued for a 2-million sq.ft. high-cube warehouse in the WLC (approximately 5% of the entire WLC project) the amount of the fair share payment due from the Applicant to the City of Riverside would be computed as follows:

Amount Due	=	Total cost of Improvement	*	Total WLC fair Share (0.6%) as determined by TIA	*	% attributable to the building that is subject to the certificate of occupancy (5%)

  A similar calculation would be done for each subsequent building, with payments for each due at the time of issuance of the certificate of occupancy. As a result, while each building individually would not produce a significant impact, and therefore would not be required to pay any mitigation fees if considered by itself, the total amount of the payments for all of the buildings would be equal to the fair share payment for the entire WLC to the extent that the responsible jurisdiction has chosen to adopt a fair share contribution funding program consistent with MM Trans-6.

- MM Trans-7: City shall work directly with WRCOG to request that TUMF funding priorities be shifted to align with the needs of the City, including improvements identified in this TIA. Toward this end, City shall meet regularly with WRCOG.

Level of Significance after Mitigation

The mitigation measures described above can be usefully grouped into four categories based on who is responsible for the facility, which is the primary determinant of the level of significance after mitigation. The four categories are as follows:

> On-Site Improvements – These are changes to the road system within the WLC project site that are being undertaken as part of the WLC project. The developer shall be responsible for constructing the improvements described in the section “*Proposed Road Network*” in Chapter 4 above in accordance with City standards for roadway construction and the roadway cross-sections in the proposed Specific Plan. Completion of these improvements shall constitute the developer’s mitigation of the project’s on-site impacts. When these improvements are completed the project’s impacts on the roadway system within the WLC project site will be mitigated to a **less-than-significant** level.

Off-Site Improvements for Non-TUMF Roads Under the Jurisdiction of the City of Moreno Valley - These are improvements to public streets in Moreno Valley that are outside the area covered by the proposed WLC Specific Plan Amendment. The developer shall be responsible for paying its fair share contribution which the City shall use to implement the mitigation measures identified in Table 72, Table 73, Table 75, and Table 76 pertaining to facilities under the City's jurisdiction. These payments shall constitute the developer's mitigation of project impacts on this category of roads. When these improvements are completed the project's impacts on the City roadway system will be mitigated to a **less-than-significant** level.

Off-Site Improvements to TUMF Facilities – These are improvements to roads that are part of the TUMF Regional System of Highways and Arterials, some of which are under the jurisdiction of Moreno Valley and others are located in other jurisdictions. The developer shall be responsible for paying the TUMF fees in effect at the time of approval. These payments shall constitute the developer's mitigation of project impacts to this category of roads.

The City shall implement the mitigation measures identified in Table 72, Table 73, Table 75, and Table 76 pertaining to TUMF facilities under the City's jurisdiction. When these improvements are completed the project's impacts on the roadway system within the WLC project site will be mitigated to a **less-than-significant** level.

The City shall work with the other member agencies of WRCOG to program TUMF funds to implement the mitigation measures identified in Table 72, Table 73, Table 75 and Table 76 pertaining to TUMF facilities outside the jurisdiction of the City of Moreno Valley. To the extent that TUMF fees provided by the developer are used to implement the recommended improvements the project's impacts would be less-than-significant. However, because the City does not have direct control over TUMF funding the City cannot ensure that the identified improvements would be made. Thus at this point the project's impacts on these facilities must be considered **significant and unavoidable**.

Off-Site Improvements to Roads Outside the Jurisdiction of the City and Not Part of the TUMF Program – This category includes all of the recommended mitigation measures that are under the jurisdiction of Riverside County, Caltrans, and other municipalities and that are not included in the TUMF Regional System of Highways and Arterials.

At this time the City does not have cooperative agreements with neighboring jurisdictions that would serve as a mechanism for collecting and distributing developer funds to cover the cost of cross-jurisdictions mitigation measures, other than the TUMF program. The City shall therefore work with the Cities of Beaumont, Perris, Redlands and Riverside, and with Riverside County, to collect funds from the developer and to implement the mitigations measures identified in Table 72, Table 73, Table 75, and Table 76 that are in these jurisdictions. To the extent that the City is able to establish such a funding mechanism (as described in MM Trans-6) and the other jurisdiction constructs the recommended improvement the project's impacts would be less-than-significant. However, because the City cannot guarantee that such a mechanism will be established and does not have direct control over facilities outside of its jurisdiction the City cannot ensure that the identified improvements would be made. Thus at this point the project's impacts on these facilities must be considered **significant and unavoidable**.

Similarly, the City has not entered into an agreement with Caltrans for the collection of developer payments for improvements to the state highway system other than freeway interchange improvements funded through the TUMF program. Nor has Caltrans established a program to collect fair-share contributions to freeway improvements such as those identified in Table 74 and Table 77. Instead, Caltrans has traditionally relied on other means to fund freeway improvements; means involving multiple stages of review and input from other agencies, with priorities and constraints applied at each stage, that preclude a direct connection between developer-provided fair-share funds and specific highway improvements.

Decisions on funding for improvements to the state highway system are made by four bodies, namely[60]:

> Legislature: Establishes overall policies, including determining funding sources and distribution, and spending priorities through state statutes such as Revenue and Taxation Code, Streets and Highways Code, and Government Code. The Legislature appropriates funds through the annual budget for transportation projects and has authority to designate transportation projects statutorily.
>
> California Transportation Commission (CTC): The nine-member CTC, appointed by the Governor, reviews and adopts the state transportation programs and approves projects nominated by Caltrans and regional agencies for funding. The CTC recommends policy and funding priorities to the Legislature and is also responsible for project delivery oversight.
>
> California Department of Transportation (Caltrans): Caltrans owns, operates and maintains the state highway system. Caltrans plans, designs, and nominates interregional capital improvement projects on the state highway system and also manages the intercity rail operation.
>
> Metropolitan Planning Organizations (MPOs) and Regional Transportation Planning Agencies (RTPAs): MPOs and RTPAs are responsible for planning, coordinating and administering funds for regional transportation systems. In California, 17 MPOs and 48 RTPAs develop 20-year Regional Transportation Plans (RTPs) as well as 5-year Regional Transportation Improvement Program (RTIP), which identify projects for the regional portion of the State Transportation Improvement Program (STIP). SCAG is the MPO for Riverside County.

Most funds for improvements to the state highway system come through the State Highway Account (SHA), which receives funding from a variety of sources including:

- motor vehicle fuel taxes, part of which goes into the Highway Users Tax Account, a portion of which goes to the SHA and the rest goes to cities and counties according to a statutory formula.
- The fuel tax swap, enacted in 2011 (Fuel Tax Swap Fix), reenacted the provisions of the Fuel Tax Swap of 2010 addressing issues raised by the passage of Propositions 22 and 26. The Fuel Tax Swap eliminated the state sales tax on gasoline and instead imposed an additional excise tax on gasoline of 17.3¢ (July 2010). The increase in the excise tax would generate revenues equivalent to what would have been collected from the state sales tax on gasoline. These revenues are intended for new road construction (STIP), highway maintenance and operations (SHOPP), and local roadways.
- the federal fuel tax, which goes into the Highway Trust fund for use on the portions of the system that are designated ad federal aid highways

In addition local sales tax measures, such as Measure A in Riverside County, and the proceeds of Proposition 1B provide funding for improvements to certain portions of the state highway system.

The key feature of this system pertaining to the recommended freeway mitigation measures is that this system is outside the control of the City of Moreno Valley. The City shall work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements (as described in MM Trans-6). However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, the project's impacts on the state highway system must be considered **significant and unavoidable**.

---

[60] This information came from *Transportation Funding in California*, Caltrans Economic Analysis Branch, 2011, page 2.

12. OTHER ISSUES

At the request of the City of Moreno Valley and to facilitate a more complete understanding of transportation issues related to the WLC, the following additional issues were studied.

A. TRAFFIC SIGNAL WARRANT ANALYSIS

Traffic signal warrants are criteria used to determine whether a traffic signal might be justified at a particular location. The warrants represent minimum criteria for justifiability; in other words, meeting a warrant by itself does not necessarily mean that a signal should be installed. The City of Moreno Valley's TIA Guidelines mandate that study intersections that are not currently signalized be analyzed to determine whether the *California Manual of Uniform Traffic Control Devices*' (California MUTCD) peak-hour warrant is met for existing intersections or whether the California MUCTD daily warrant is met for future intersections. Table 78 through Table 80 show this analysis for the No-Project and Plus Build-out Scenarios for the existing, 2025, and 2040 study years. Detailed signal warrant analyses can be found in Appendix P.

Table 78: Signal Warrant Analysis for Existing Conditions

In 2025 there would be five intersections that would meet the signal warrant with the WLC project. In all five cases they would meet the warrant even without the project. These are:

- IN-85 Martin Luther King Blvd./SR-60 NB Ramp
- IN-114 Evans Rd./Orange Ave.
- IN-124 Gilman Springs Rd./SR-79 NB Ramps
- IN-132 San Timoteo Canyon Rd./Alessandro Rd.
- IN-133 Live Oak Canyon/San Timoteo Canyon Rd.

In 2040 there would be eight intersections that would meet the signal warrant with the WLC project. In all eight cases they would meet the warrant even without the project. These are:

- IN-12 Ironwood Ave./Theodore St.
- IN-27 Evans Rd./Orange Ave.
- IN-35 Locust Ave./Moreno Beach Dr.
- IN-85 Martin Luther King Blvd./SR-60 NB Ramp
- IN-123 Bridge St./Gilman Springs Rd.
- IN-125 Gilman Springs Rd./SR-79 SB Ramps
- IN-132 San Timoteo Canyon Rd./Alessandro Rd.
- IN-133 Live Oak Canyon/San Timoteo Canyon Rd.

B. TRAFFIC NEAR SCHOOLS

Several comments were received in the previous DEIR regarding possible traffic safety issues related to traffic going to or from the WLC passing near schools.

In one case the commenter mistakenly believed that WLC trucks would be using Alessandro Blvd. to access SR-60 and I-215. In fact, trucks will be prohibited from using Cactus Ave. Extension and trucks are already prohibited from using Redlands Blvd. south of Eucalyptus Ave., which means that they will not be using Alessandro Blvd. to get to and from the WLC. Figure 46 shows the designated trucks routes in and around Moreno Valley[61], while Figure 47 shows the main routes expected to be taken by WLC trucks. With the

---

[61] Note that Riverside County does not identify truck routes. The City of Riverside's code does not identify a positive list of where trucks are allowed, but does have a negative list of where trucks are prohibited based on weight.

exception of Perris Blvd., which will be used by a small volume of WLC trucks[62], none of the routes go near schools.

It was assumed that other comments regarding “streets adjacent and near schools” were safety related due to the fact that there may be a higher amount of pedestrian activity near schools. Therefore, the safety impact of Project-related auto trips along streets adjacent to and near schools was evaluated by reviewing the existing pedestrian facilities and collecting pedestrian counts at the intersections along Project truck trip distribution routes.

The intersections reviewed exhibit the characteristics of typical suburban arterial roadways with common pedestrian accommodations, such as crosswalks, curb ramps, push buttons, pedestrian walk/don’t walk signals, etc. All pedestrian crossings at the signalized intersections are protected; a protected crossing occurs where traffic that conflicts with the pedestrian movement is required to stop. Crosswalks near a school are striped in yellow, consistent with guidance from the *California Manual on Traffic Control Devices* (page 1282). In most cases, sidewalks exist along roadways and lead to the striped, protected crosswalks at the intersections.

Key intersections along the truck trip distribution routes were reviewed during a site visit and found to provide adequate pedestrian amenities with protected crossings, crosswalks, curb ramps, and pedestrian signals, consistent with other signalized intersections in the City. Therefore, the location of an intersection on a Project truck trip distribution route is not expected to cause unsafe pedestrian facilities.

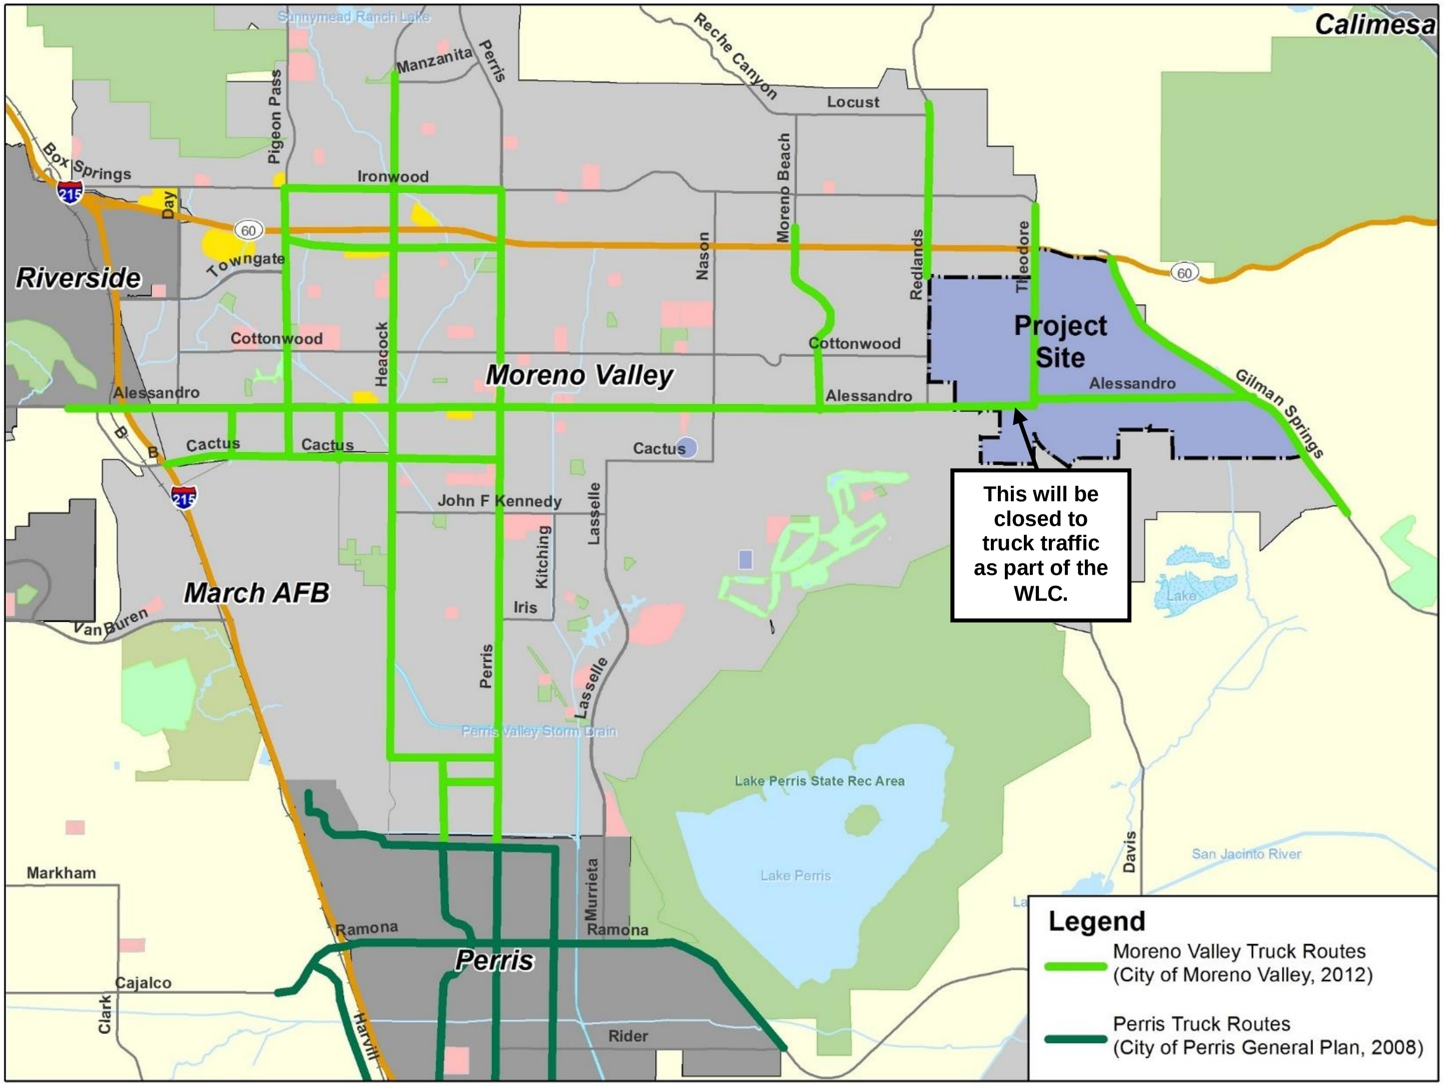
Pedestrian counts were collected at 25 study intersections along the Project truck trip distribution routes to determine if unusually high pedestrian volumes were being experienced at intersections. Table 81 shows that many of the intersections along the routes have fewer than 30 pedestrian crossings per hour between the hours of 2:00 to 4:00 PM (the peak of school children crossing activity). Table 81 also shows the net change in traffic, in PCEs, that would occur with the Project in the 2040 Plus Full Buildout scenario[63]. Only two locations were identified where noteworthy pedestrian activity (50 or more pedestrians per hour) may encounter a noteworthy increase (50 or more peak-hour trips) in traffic. These would occur at the Iris Ave./Laselle St and Alessandro Blvd./Perris Blvd. intersections. These intersections were specifically reviewed to ensure that pedestrian accommodations were provided. Protected, marked crosswalks exist at all of these intersections and pedestrian amenities are consistent with other, standard signalized intersections in the City.

Based on this analysis the conclusion was reached that the WLC project poses no special traffic safety risk to children near schools, and that appropriate safety measures have already been taken to minimize traffic risks in the vicinity of the schools near the project.

---

[62] 22 medium and heavy trucks in the AM peak hour and 25 in the PM peak hour.

[63] Note that traffic at some intersections would decrease as a result of the Project. In most cases this would be due to the severing of Alessandro Boulevard west of Merwin Street. In other cases this is due to the general re-distribution of traffic as a result of adding a major employment center at the east end of Moreno Valley.



This will be closed to truck traffic as part of the WLC.

C. SAFETY AND OPERATIONAL CONSIDERATIONS

The City's guidelines mandate that the TIA cover the following safety and operational issues:

- Turn Lanes: The improvements needed for study intersections were described in detail in the preceding chapters.
- Intersections Needing Future Sight Distance Studies: The City's established sight distance standard will be applied at all street intersections in connection with all plot plan and subdivision applications.
- Parking Restrictions: Each plot plan application will be reviewed to ensure that off-street parking will be provided at each building in compliance with the Moreno Valley Municipal Code. A limited

---

[64] Peak hour car volumes are shown as a worse-case. Actual traffic volumes in the 2:00 to 3:00 PM period are forecast to be lower. Peak hour pedestrian crossings are shown as the one peak hour within the 2:00 to 4:00 PM period.

amount of short-term on-street parking for trucks will be provided in selected areas of the WLC. Overnight or extended parking would be prohibited.

- Measures to Reduce Cut-Through Traffic in Adjacent Residential Neighborhoods: The design of the WLC incorporates several features that limit the project's impacts on adjacent residential areas. Eastbound Alessandro Blvd. will end at Merwin St. to prevent traffic from passing through the neighborhood directly west of the project. Cactus Ave. Extension would be for cars and light trucks only. The intersection of Cactus Ave. Extension and Street E would include signage and, if deemed necessary by the City, a design feature, such as a median island, height-restricting gateway, or reduced curb return, which would preclude trucks from turning onto Cactus Ave.

- Potential Impacts to Adjacent Schools, Parks, and/or Trails: There are no schools or parks within or adjacent to the WLC. The WLC Specific Plan provides for the continuation of a public multi-use trail from Redlands Blvd. through the WLC linking to the Lake Perris State Recreation Area and the San Jacinto Wildlife Area.

- Queue Lengths and Impacts to Adjacent Intersections and/or Driveways: As individual buildings are developed, a traffic study will be performed including a queue length analysis to ensure there is not spill back affecting nearby intersections.

- Emergency Access: Every plot plan will be conditioned to provide all emergency access required by federal, state, and local regulations. Emergency vehicles that currently pass through the site using either World Logistics Center Parkway or Alessandro Blvd. would continue to have those routes available to them, upgraded to arterial standards. The Alessandro route would reach Redlands Blvd. at Cactus Ave. instead of at Alessandro. The change would not lengthen the route between Gilman Springs Rd. and the Riverside Community Regional Medical Center on Cactus Ave. or the route to and from the Kaiser Moreno Valley Community Hospital on Iris Ave. The extension of Eucalyptus Ave. through the WLC would provide an upgraded [65] route to the project site from the nearest existing fire station (the Moreno Beach fire station). Moreover, the WLC would include a fire station on site.

D. TRANSIT, PEDESTRIAN, AND BICYCLE FACILITIES

There is currently no transit service in the project area. The WLC would be designed to accommodate bus access on all project streets. Bus turn-outs and shelters would be provided at all active bus stops. It is expected that transit service would be provided once the project reaches a transit-supportable level of operations.

The WLC pedestrian and bicycle facilities were described previously in Chapter 4 (see Figure 30, Figure 31, etc.).

E. CONSTRUCTION TRAFFIC IMPACTS

A project phasing plan was developed to estimate the level of construction activity occurring during any given year during build-out of the project. Based on this plan, the expected level of truck activity related to construction of the project is shown in Table 82.

---

[65] There is currently a gated connection available to emergency vehicles only between Eucalyptus Avenue and Redlands Blvd.

F. TRUCK TRIPS TO PORT

Several comments received on the Draft EIR indicated confusion regarding the volume of truck traffic between the WLC and the Ports of Los Angeles and Long Beach. In general, the DEIR commenters seemed to believe that the truck traffic between the WLC and the ports will be much higher than will actually occur. This section responds to these comments by 1) describing the current share of port-related use of warehouse space, 2) estimating the truck traffic between the WLC and the ports using three different methods, 3) estimating the growth in WLC truck traffic to the port over time, and 4) determining whether WLC trucks would impose significant impacts on the freeways to the ports beyond those identified in previous chapters.

Current Share of Port-Related Warehouse Space

The DEIR commenters referred to SCAG's study entitled *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities*[66]. This study states that 13% of the occupied warehouse space in the SCAG region in 2009 was port-related. This indicates that while the ports are important sources of demand for warehouse space, the great majority of warehouse space serves other demands. In a large regional economy such as southern California this other demand amounted to 578 million square feet in 2009, and is growing over time.

The SCAG study also shows wide differentiation in the markets served. As can be seen in Table 83[67], Riverside County serves only a small percentage of port-related demand while playing a much more

---

[66] *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities (Task Report 5)*, SCAG, June 2010

[67] Ibid

important role in serving non-port demand. This differentiation reflects the tendency of warehouse tenants whose operations rely on the ports to self-select locations close to the port.

Table 83: Share of Port and Non-Port Demand by County

County	Share of Port Demand for Warehouse Space	Share of Non-Port Demand for Warehouse Space
Los Angeles	61%	21%
Orange	7%	7%
Ventura	1%	3%
San Bernardino	19%	34%
Riverside	12%	34%
Imperial	0%	1%
Total	100%	100%

The information provided in the report indicates that only 5% of the warehouse space in Riverside County serves port-related demand (See Table 85), which suggests that the volume of truck traffic between the ports and warehouses in Riverside County, including those in WLC, will be relatively small.

The study also reached two conclusions regarding the regional supply of warehouse space, taken from the report's Executive Summary (pages ES-1 and ES-2):

- "*According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet.*
- *During the year 2035, there will be a projected shortfall of space of about 228 million square feet, unless other land not currently zoned for warehousing becomes available.*"

In other words, according to SCAG study cited by the commenters, even if all of the land currently zoned for warehouse space were developed, there would still be a massive shortfall of warehouse space by 2035 unless projects like the WLC are approved and built.

Estimating Truck Trips between WLC and the Ports

In order to ensure that a reasonable worst case scenario was used for the impact analysis, the number of truck trips between the WLC and the ports was forecast using three different methods, all based on data provided by regional planning agencies, with the highest of the three forecasts used for the analysis. The three methods were as follows:

Method 1: RIVTAM Model

The first method for estimating truck trips to the port was to use the RIVTAM model. As described in Chapter 2, RIVTAM is the standard traffic forecasting tool used by agencies in Riverside County to analyze the regional effects of proposed projects. Like most other traffic models, RIVTAM assigns trips to destinations using a gravity model where the number of trips between each origin-destination pair increases in proportion to the number of trips generated at each end, but decreases in proportion to the distance between the origin and destination. The effect of distance on the likelihood of travel between origin-destination pairs is determined by the trip length distribution which in turn is based on survey data.

The WLC's proposed land uses were input into the RIVTAM model as described in Chapter 2, the model was run, and the outputs were checked to find how many truck trips were assigned between the port TAZs and the WLC. Using the RIVTAM model to estimate truck trips yields **82 truck trips per day between the ports and the WLC** if the WLC were built today (i.e. the Existing Plus Full Build-Out scenario).

Method 2: Based on Port Truck Study

The best information currently available on truck trips from the ports comes from the Ports of Los Angeles and Long Beach Year 2010 Marine Terminal Gate Surveys[68]. These surveys found that 1.5% of truck trips entering the ports came from Riverside County, and 1.7% of trucks leaving the ports went to Riverside County. These finding are consistent with an earlier study[69] that found 1% of truck trips entering the ports came from Riverside County and 2% of truck trips leaving the ports went to Riverside County (the numbers are rounded in the study). Applying the percentages from the 2010 survey to the approximately 54,700 truck trips per day generated by the ports[70] yields a total of approximately 875 trucks per day between the ports and Riverside County.

If we make the conservative assumption that every one of these 875 truck trips goes to a warehouse rather than to a factory, store, or some other destination, and divide these trips among the 136 million square feet of occupied warehouse space in Riverside County, we find an average of 6.5 truck trips to or from the ports per million square feet of warehouse space per day. Applying this rate to the 40.6 million square feet of warehouse space proposed for the WLC yields **261 truck trips per day between the ports and the WLC** if the WLC were built today (the Existing Plus Full Build-Out scenario).

Method 3: Based on Truck Flows from Riverside County

The best information currently available on regional truck traffic patterns comes from SCAG's Goods Movement Study[71] that was done in preparation for the 2016 RTP/SCS. Table 84 shows SCAG's estimated truck flows between Riverside County and other locations.

Table 84: Location of Other End of Trip, for Truck Trips Beginning or Ending in Riverside County

Type of Truck Trip	Riverside County	
	Truck Trips	% of Truck Trips
Other Places in SCAG Region	89,910	94.5%
Places Outside SCAG Region	4,231	4.4%
Intermodal	197	0.2%
Port-Related (Including secondary trips)	787	0.8%
Total	95,125	100.0%

Applying the ports' 0.8% share of Riverside County truck trips applies to WLC's 15,138 medium and heavy truck trips per day yields **125 truck trips per day between the ports and the WLC** if the WLC were built today (the Existing Plus Full Build-Out scenario).

This analysis shows that a reasonable estimate of truck traffic between WLC and the ports would be in the range of 82-to-261 truck trips per day. The higher figure of 261 truck trips per day was used as a reasonable worst-case scenario.

Growth in Truck Trips to the Port

Some comments suggested that the analysis should consider the possibility that the share of warehouse space in the Inland Empire, and by extension the WLC, may grow over time. This section addresses those comments.

As discussed previously (see Table 84) currently only 0.8% of the truck trips in Riverside County are to or from the ports. In the future, port-related uses are anticipated to require a greater share of warehouse space. Table 85 shows the expected growth in port-related cargo's share of warehouse space by county. For Riverside County, SCAG estimates that the percentage of warehouse space devoted to port uses would more than double between 2018 and 2035, from 6.6% to 16.3%.

Table 85: Percentage of Warehouse Space that is Port-Related[72]

Year	Los Angeles	Orange	Riverside	San Bernardino	Ventura	Imperial	Total
2018	30.6%	11.9%	6.6%	8.2%	4.3%	0.0%	17.9%
2025	29.1%	17.5%	9.8%	22.3%	5.8%	0.0%	21.1%
2035	28.3%	28.5%	16.3%	21.8%	7.6%	0.0%	22.5%

Note that the percentage of warehouse space devoted to port-related cargo will always be larger than the percentage of trucks going to and from the port. That is because the cargo that has come from the port to the warehouse then leaves the warehouse in trucks going to non-port destinations. There may also be inbound truck trips to warehouses from places other than the ports, delivering shipments of packaging material and other items which might be combined with port-related cargo, thus further reducing the proportion of trucks that come from the ports.

The estimated percentage of WLC trucks going to the ports is summarized in Table 86. The percentage of WLC going to the port (1.72%) was estimated from 261 truck trips per day to the port compared to 15,138 medium and heavy truck trips per day to and from the WLC. For later years the percentage of WLC trucks going to the port was based on the growth trends in port-related warehouse space.

Table 86: Percentage of WLC Trucks to or from the Port

Year	% of Warehouse Space Used for Port-Related Cargo	% of WLC Truck Trips Going to and from the Ports
2018	6.6%	1.72%
2025	9.8%	2.54%
2035	16.3%	4.24%
2040	19.6%	5.09%

These percentages were then applied to the trip generation rates to obtain the number of WLC trucks to and from the port for each analysis period. These are shown in Table 87.

---

Table 87: Medium & Heavy Truck Trips between WLC and the Ports by Analysis Period

Scenario		AM Peak Hour		PM Peak Hour		Daily	
		In	Out	In	Out	In	Out
2018 Plus Full Build-Out	Total WLC Med & Hvy Trucks	379	450	319	383	7,569	7,569
	Percent to or from Ports	1.72%	1.72%	1.72%	1.72%	1.72%	1.72%
	WLC Med & Hvy Trucks to Port	7	8	5	7	130	130
2025 Plus Phase 1	Total WLC Med & Hvy Trucks	223	261	186	223	4,374	4,374
	Percent to or from Ports	2.54%	2.54%	2.54%	2.54%	2.54%	2.54%
	WLC Med & Hvy Trucks to Port	6	7	5	6	111	111
2040 Plus Full Build-Out	Total WLC Med & Hvy Trucks	379	450	319	383	7,569	7,569
	Percent to or from Ports	5.09%	5.09%	5.09%	5.09%	5.09%	5.09%
	WLC Med & Hvy Trucks to Port	19	23	16	20	385	385

Tests with the SCAG traffic model showed that these trips would split approximately evenly between the two routes shown in Figure 48 and thus, half of these trips were assigned to the SR-60 route and half to the SR-91 route.

Determination of Whether Impacts are Significant

The potential for traffic impacts along the SR-60 and SR-91 corridors was assessed by manually adding the forecasts for WLC trucks to and from the port to the No-Project scenario from the SCAG model. Because the ports and the freeways leading to them are in Los Angeles County, the threshold of significance for the analysis was taken from the Los Angeles County Congestion Management Program (CMP)[73]. The CMP states that a significant impact would be deemed to occur if the project increased demand on a highway by at least 2% causing LOS "F" or, if the highway facility already operates at LOS "F", then a significant impact would be deemed to occur if the project increases traffic demand by 2% or more of capacity.

Table 88 through Table 99[74] show the results of this analysis for each section of the SR-60 and SR-91 corridors and in each direction, for both the AM and PM peak periods, for three of the four Plus Build-out scenarios studied in other sections of the report[75]. As shown in the tables the addition of the WLC traffic, which ranges from 0.03% to 0.51% of non-project traffic, would not cause a significant impact on any segment of these freeways.

---

[73] Note that Caltrans has not established thresholds of significance for freeway impacts, and neither have the CMPs for Orange, San Bernardino, or Riverside Counties.

[74] The determination of whether the 2% threshold was reached was done in Passenger Car Equivalents. Please see Chapter 2 Section A for an explanation of the PCE factors used.

[75] For freeway traffic the Existing Plus Phase 1 (Only) scenario is identical to the Existing Plus Full Build-Out scenario but with much less warehouse space and so fewer freeway truck trips. If the Existing Plus Full Build-Out scenario does not generate any significant impacts then the Existing Plus Phase 1 (only) would necessarily not generate any significant impacts, either.

G. GENERAL PLAN CONFORMITY

The City General Plan has established a set of goals, policies, and objectives for the Circulation Element. Table 100 shows how the WLC project conforms to these goals, policies, and objectives with the implementation of the proposed Specific Plan and General Plan amendments. In Table 100 WLCSP refers to the World Logistics Center Specific Plan while WLC is the World Logistics Center business entity for the project's development that ensures implementation of mitigations.

Table 100: Conformity to General Plan (as Amended)

Goals, Policies, and Objectives Goal, Policy, or Objective as Stated in the General Plan		**Consistent?**	**Explanation**
9.5 Circulation Element Goals, Objectives. Policies and Programs			
9.5.1 Circulation Element Goals			
Goal 5.1	Develop a safe, efficient, environmentally and financially sound, integrated vehicular circulation system consistent with the City General Plan Circulation Element Map, Figure 9-1, which provides access to development and supports mobility requirements of the system's users.	Yes	The WLC Specific Plan (WLCSP) meets the intent of the General Plan Circulation Element Map based on land use and design criteria. The WLCSP provides planned cross sections that satisfy minimum City requirements and serve the unique needs of logistics development.
Goal 5.2	Maintain safe and adequate pedestrian, bicycle, and public transportation systems to provide alternatives to single occupant vehicular travel and to support planned land uses.	Yes	The WLCSP supports this goal of the General Plan Circulation Element based on land use and design criteria. All on-site roads would include design features to facilitate the use of alternative transportation modes including but not limited to bus, bicycle, pedestrian, etc.
9.5.2 Circulation Element Objectives and Policies			
Objective 5.1	***Create a safe, efficient and neighborhood- friendly street system.***	Yes	The WLCSP supports this objective in that the specific plan is designed to reduce vehicle and pedestrian conflicts near residential neighborhoods by prohibiting truck access to nearby residential areas.
Policy 5.1.1	Plan access and circulation of each development project to accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles.	Yes	The planned street network features multiple routes to most buildings and would have two major east-west connectors called for in the General Plan. This would facilitate the passage of emergency and service vehicles. On-site roads would be provided with sidewalks and bicycle lanes. All of the WLC logistics buildings would be provided with bicycle racks.
Policy 5.1.2	Plan the circulation system to reduce conflicts between vehicular, pedestrian and bicycle traffic.	Yes	The project features modern roundabouts at key locations, which are proven to be effective in reducing the frequency and severity of traffic accidents. Pedestrian ways are not curb-adjacent, and streets are designed to accommodate bikeways.
Policy 5.1.3	Require adequate off-street parking for all developments.	Yes	Off-street parking would be provided for all WLC buildings in accordance with City of Moreno Valley standards.

Policy 5.1.4	Driveway placement shall be designed for safety and to enhance circulation wherever possible.	Yes	Driveway design and placement would not be less than City code or engineering standards. Specific proposals will be reviewed with the plot plans.
Policy 5.1.5	Incorporate Americans with Disabilities Act (ADA) and Title 24 requirements in roadway improvements as appropriate.	Yes	ADA compliant paths of travel would be required with all building permits.
Policy 5.1.6	Design new developments to provide opportunity for access and circulation to future adjacent developments.	Yes	The WLCSP is bounded by SR-60 to the north, Gilman Springs Rd. to the east, and permanent open space to the south. There is a small amount of developable land west of the project that would benefit from the construction of Cactus Ave. Extension.
Objective 5.2	***Implement access management policies.***	Yes	The WLCSP supports this objective by prohibiting truck movements on Cactus Ave. Extension. All developments subject to plot plans including detailed access management conditions.
Policy 5.2.1	Locate residential units with access from local streets. Minimize direct residential access from collectors. Prohibit direct single-family driveway access on arterials and higher classification roadways.	NA	The project has no residential component. Existing non-conforming uses would continue to have driveway access as long as the use continues.
Policy 5.2.2	Feed short local streets into collectors.	NA	The project has no local streets. All on-site streets are classified as arterials or collectors and meet City standards.
Policy 5.2.3	Encourage the incorporation of traffic calming design into local and collector streets to promote safe vehicle speeds.	Yes	The project has no residential component that would need traffic calming. There are three roundabouts to ensure that vehicle movement is fluid and to reduce pedestrian and vehicle conflicts.
Policy 5.2.4	Design new subdivisions to minimize the disruptive impact of motor vehicles on local streets. Long, broad and linear streets should be avoided. Residential streets should be no wider than 40 feet, and should have an uninterrupted length of less than one half mile. Curvilinear streets and cul-de-sacs are preferred. Streets within the subdivision should be designed to facilitate access to residences and to discourage through traffic.	NA	The project has no residential component and so design features intended to enhance the quality of life for residents of the street are not applicable to the WLCSP.

Objective 5.3	***Maintain Level of Service (LOS) "C" on roadway links, wherever possible, and LOS "D" in the vicinity of SR 60 and high employment centers. Figure 9-2 depicts the LOS standards that are applicable to all segments of the General Plan Circulation Element Map.***	Yes	All WLC streets would be designed to function at LOS D or better.
Policy 5.3.1	Obtain right-of-way and construct roadways in accordance with the designations shown on the General Plan Circulation Element Map and the City street improvement standards.	Yes	The project would obtain right-of-way and construct roadways in accordance with the General Plan Circulation Element Map as revised.
Policy 5.3.2	Wherever feasible, promote the development of roadways in accordance with the City standard roadway cross-sections, as shown in Figure 9-3. Cross-sections range from two-lane undivided roadways to 8-lane divided facilities.	Yes	The project would develop roadways in accordance with City standard cross-sections.
Policy 5.3.3	Create new roadway classifications to accommodate future traffic demand, including; Divided Major Arterial – Reduced Cross-Section, and Divided Arterial – 6-lane. These cross-sections are shown on Figure 9-3.	Yes	The project would develop roadways in accordance with City standard cross-sections.
Policy 5.3.4	For planning purposes, utilize LOS standards shown on Table 5 –1 to determine recommended roadway widths.	Yes	The City LOS standards were used to develop the General Plan Amendment.
Policy 5.3.5	Ensure that new development pays a fair share of costs to provide local and regional transportation improvements and to mitigate cumulative traffic impacts. For this purpose, require new developments to participate in Transportation Uniform Mitigation Fee Program (TUMF), the Development Impact Fee Program (DIF) and any other applicable transportation fee programs and benefit assessment districts.	Yes	By the terms of the Development Agreement the WLC will make fair-share contributions rather than pay into DIF.

Policy 5.3.6	Where new developments would increase traffic flows beyond the LOS C (or LOS D, where applicable), require appropriate and feasible mitigation measures as a condition of approval. Such measures may include extra right-of-way and improvements to accommodate left-turn and right-turn lanes at intersections, or other improvements.	Yes	The project applicant would pay fair-share contributions towards improvements needed to mitigate the project's traffic impacts where applicable.
Policy 5.3.7	Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible.	Yes	Moreno Valley's jobs/housing ratio is currently very imbalanced, with too few jobs for the number of employable residents. By creating a large number of jobs in a housing-rich area, The WLCSP would reduce the need for long-distance out-commuting. The WLC has the potential to support reverse commute conditions reducing westbound commute impacts on SR-60. Also, the project helps fill the expected deficit in warehousing capacity that SCAG has identified as a drag on the regional economy (see *Logistics & Distribution: An Answer to Regional Upward Social Mobility*, SCAG June 2004).
Policy 5.3.8	Pursue arterial improvements that link and/or cross the State route 60 (SR-60) Freeway, including an additional over-crossing at Graham St.	Yes	The project would participate in the TUMF program which funds interchange improvements.
Policy 5.3.9	Address additional widenings at arterials providing access to SR-60 at Day St., Frederick St./Pigeon Pass Rd. and Perris Blvd.	Yes	The project would fund its fair share of improvements to these roads through its contributions to TUMF and its fair-share contributions to non-TUMF locations where the Project has significant impacts.
Objective 5.4	***Maximize efficiency of the regional circulation system through close coordination with state and regional agencies and implementation of regional transportation policies.***	Yes	WLC would pay all applicable TUMF fees and would participate in other multi-jurisdictional funding programs as established.
Policy 5.4.1	Coordinate with Caltrans and the Riverside County Transportation Commission (RCTC) to identify and protect ultimate rights-of-way, including those for freeways, regional arterial projects, transit, bikeways and interchange expansion.	Yes	Project-specific Plot Plans and subdivisions would provide for the ultimate rights of way or regional facilities.

Policy 5.4.2	Coordinate with Caltrans and RCTC regarding the integration of Intelligent Transportation Systems (ITS) consistent with the principles and recommendations of the Inland Empire Regional ITS Architecture Project.	NA	This policy concerns system-wide improvements that are not associated with individual development projects.
Policy 5.4.3	Work with property owners, in cooperation with RCTC, to reserve rights-of-way for potential Community and Environmental Transportation Acceptability Process (CETAP) corridors through site design, dedication, and land acquisition, as appropriate.	NA	The project site is not on any of the four corridors being studied: Winchester to Temecula, Hemet to the Corona/Lake Elsinore area, west Moreno Valley to San Bernardino County, and Riverside County to Orange County.
Policy 5.4.4	The City Council will commit to establishing ongoing relationships with all agencies that play a role in the development of the City’s transportation system. Council members who are appointed to these agencies as City representatives shall seek out leadership roles to maximize their effectiveness on behalf of the City. Council will strive to maintain continuity in their appointments of representatives.	NA	This policy concerns relationships that are not associated with individual development projects.
Policy 5.4.5	Work with RCTC, WRCOG, and the TUMF Central Zone Committee to facilitate the expeditious construction of TUMF Network projects, especially projects that directly benefit Moreno Valley.	Yes	The WLC would participate in the TUMF program.
Policy 5.4.6	Cooperatively participate with SCAG, RCTC, and WRCOG in the planning for a transportation system that anticipates regional needs for the safe and efficient movement of goods and people.	NA	This policy is not directly related to the WLC project.
Policy 5.4.7	Utilizing a combination of regional, state and federal funds, development impact fees, and other locally generated funds, provide needed improvements along SR 60 and the associated interchanges, including interchange and grade separation improvements.	Yes	With implementation of a cooperative program, the WLC would participate in a fair-share funding program for improvements to SR-60, if such a program is established among all contributing jurisdictions.

Policy 5.4.8	Reserve rights-of-way to accomplish future improvements as specified in the Caltrans District 8 Route Concept Fact Sheet for SR-60. Specifically, SR-60 shall be built to six general purpose lanes and two High Occupancy Vehicle (HOV) lanes through Moreno Valley. Additional auxiliary lanes may be required between interchanges. The need for auxiliary lanes will be determined from future studies.	Yes	The City would work with Caltrans to define and protect the ultimate right-of-way for SR-60 and its interchange at Theodore St.
Policy 5.4.9	Lobby the State Legislature to keep triple trailer trucks off highways in developed areas of California.	NA	This policy is not directly related to the WLC project.
Objective 5.5	***Maximize efficiency of the local circulation system by using appropriate policies and standards to design, locate and size roadways.***	Yes	The WLCSP supports this objective by requiring right of way standards that accommodates automobile and truck traffic that the project requires. Street cross sections meet or exceed minimum City standards.
Policy 5.5.1	Space Collectors between higher classification roadways within development areas at appropriate one-quarter mile intervals.	Yes	The WLCSP supports this policy. The spacing of roadways for collectors is at appropriate intervals to reflect the size and scale of the WLC buildings.
Policy 5.5.2	Provide dedicated left-turn lanes at all major intersections on minor arterials and higher classification roadways.	Yes, Partially	The most critical intersections within the project site would use modern roundabout rather than conventional intersections. These conform to the intent of the policy which is to minimize conflicts between left-turning traffic and through traffic. Subsequent subdivision applications will provide dedicated left-turn lanes in public streets as required by the City.
Policy 5.5.3	Prohibit points of access from conflicting with other existing or planned access points. Require points of access to roadways to be separated sufficiently to maintain capacity, efficiency, and safety of the traffic flow.	Yes	Plot plans and subdivisions would be reviewed to analyze all points of access on a project by project basis. The WLC features a relatively small number of very large buildings. There would therefore be fewer access points needed than for the same square footage of conventional low-rise commercial buildings. The driveways to WLC would be located away from intersections at distances not be less than required by City code or engineering standards.

Policy 5.5.4	Wherever possible, minimize the frequency of access points along streets by the consolidation of access points between adjacent properties on all circulation element streets, excluding collectors.	Yes	The WLC features a relatively small number of very large buildings. There would be fewer access points needed than for the same square footage of conventional low-rise business parks. Plot plans and subdivisions would be reviewed to analyze all points of access on a project by project basis.
Policy 5.5.5	Design streets and intersections in accordance with the Moreno Valley Municipal Code.	Yes	Project streets and intersections would be built to comply with City standards. The cross-sections would be designed to accommodate the type of traffic associated with high-cube logistics.
Policy 5.5.6	Consider the overall safety, efficiency and capacity of street designs as more important than the location of on-street parking.	Yes	On-street parking would be prohibited except at selected locations within the project subject to city approval. Safety, efficiency, and the capacity of the street would be key factors in selecting the location of on-street parking areas.
Policy 5.5.7	For developments fronting both sides of a street, require that streets be constructed to full width. Where new developments front only one side of a street, require that streets be constructed to half width plus an additional 12-foot lane for opposing traffic, whenever possible. Additional width may be needed for medians or left and/or right turn lanes.	Yes	The applicant would comply with this policy.
Policy 5.5.8	Whenever possible, require private and public land developments to provide on-site and off-site improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation system. The City may require developers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.	Yes	A traffic impact study has been conducted for the project. Improvements needed to mitigate project impacts have been identified. The project would pay TUMF that would cover its share of many improvements, and would pay its fair share towards the cost of implementing the remaining (non-TUMF) improvements.
Policy 5.5.9	Design curves and grades to permit safe movement of vehicular traffic per applicable Caltrans and Moreno Valley standards.	Yes	All WLC roadways would be designed to meet or exceed City standards.

Policy 5.5.10	Provide adequate sight distances for safe vehicular movement at all intersections and driveways.	Yes	Plot plans and subdivisions would be reviewed to ensure compliance with City standards. Driveways would provide sight distances per City code and engineering standards.
Policy 5.5.11	Implement National Pollutant Discharge Elimination System (NPDES) Best Management Practices (BMPs) relating to construction of roadways to control runoff contamination from affecting water resources.	Yes	The WLCSP would design streets to comply with NPDES BMPs for street run-off.
Objective 5.6	***Support development of a ground access system to March Inland Port in accordance with its development plan as a major cargo airport.***	NA	The WLC is not related to the March Inland Cargo Port project.
Policy 5.6.1	Ensure that City arterials that provide access to and from March Inland Port are properly designed to accommodate projected traffic volumes, including truck traffic.	NA	The WLC is not involved in the development of the March Inland Cargo Port.
Policy 5.6.2	Ensure that traffic routes to March Inland Port are planned to minimize impacts to City residential communities.	NA	The WLC is not involved in the development of the March Inland Cargo Port.
Objective 5.7	***Design roads to meet the needs of the residents of the community without detracting from the "rural" atmosphere in designated portions of Moreno Valley. (Designated "rural" areas include those encompassed by the Residential Agriculture 2, Residential 1, Rural Residential and Hillside Residential zoning districts. "Urban" areas encompass all other zoning districts.)***	NA	The WLC project has no rural residential component.
Policy 5.7.1	Pursue development of modified sidewalk standards for local and collector roads within low density areas to reflect the rural character of those areas.	NA	The WLC would not be a low density residential area.

Policy 5.7.2	Provide sidewalks on arterials in designated low density areas that provide access to schools and bus stops.	NA	There is no residential component in this project.
Objective 5.8	***Encourage development of an efficient public transportation system for the entire community.***	Yes	All WLC streets would accommodate bus traffic, bus turnouts, and shelters.
Policy 5.8.1	Support the development of high-speed transit linkages, or express routes, that would benefit the citizens and employers of Moreno Valley.	Yes	All WLC streets would accommodate bus traffic, bus turnouts, and shelters.
Policy 5.8.2	Support the efforts of the March Joint Powers Authority in its pursuit of a Transit Center	NA	This policy is not directly related to the WLC.
Policy 5.8.3	Encourage public transportation opportunities that address the particular needs of transit dependent individuals in the City such as senior citizens, the disabled and low -income residents.	Yes	The WLC would be designed to accommodate transit. The City would work with Riverside Transit Agency to develop routes serving WLC when development on the site has reached transit-supportive levels.
Policy 5.8.4	Ensure that all new developments make adequate provision for bus stops and turnout areas for both public transit and school bus service.	Yes	WLC would provide bus turn-outs and shelters at all active bus stops.
Policy 5.8.5	Continue on-going coordination with transit authorities toward the expansion of transit facilities into newly developed areas.	Yes	The WLC would be designed to accommodate transit and would work with transit operators to establish routes once the WLC has reached a transit-supportive level of development.

Objective 5.9	***Support and encourage development of safe, efficient and aesthetic pedestrian facilities.***	Yes	The WLCSP establishes right of way standards and street sections appropriate for an employment center. The Specific Plan requires pedestrian ways (sidewalks) along both sides of all streets in the WLC. Project provides multi-use trails throughout.
Policy 5.9.1	Encourage walking as an alternative to single occupancy vehicle travel, and help ensure the safety of the pedestrian as follows:	Yes	The WLC encourages walking to work by providing jobs within walking distance of many homes in Moreno Valley.
	(a) All new developments shall provide sidewalks in conformance with the City's streets cross-section standards, and applicable policies for designated urban and rural areas.	Yes	All streets in the WLC would conform to GP cross-sections, as amended including the provision of sidewalks on all streets.
	(b) The City shall actively pursue funding for the infill of sidewalks in developed areas. The highest priority shall be to provide sidewalks on designated school routes.	NA	The WLC is not an infill area.
Policy 5.9.2	Walkways shall be designed to minimize conflicts between vehicles and pedestrians.	Yes	All streets and sidewalks in the WLC would meet minimum city standards
Policy 5.9.3	Where appropriate, provide amenities such as, but not limited to, enhanced paving, seating, and landscaping to enhance the pedestrian experience.	Yes	The WLC provides and supports pedestrian facilities along street right of ways as designed. California-friendly and drought-tolerant landscaping would be incorporated into the plan to create a pleasing environment.
Policy 5.9.4	Require the provision of convenient and safe pedestrian access to buildings from the public sidewalk.	Yes	Pedestrian considerations are incorporated into the appropriate streetscapes and rely on individual building site planning efforts as established in the development standards and design guidelines. All plot plans would provide such access.

Objective 5.10	***Encourage bicycling as an alternative to single occupant vehicle travel for the purpose of reducing fuel consumption, traffic congestion, and air pollution. The Moreno Bikeway Plan is shown in Figure 9-4.***	Yes	All WLC streets would provide class II bikeways. The WLCSP provides continued trail use on the west side of Redlands Blvd. towards Alessandro Blvd. The WLCSP establishes right of way standards conducive to the economic center and to support heavy truck use. Pedestrian considerations are incorporated into the appropriate streetscapes and rely on individual building site planning efforts as established in the development standards and design guidelines.
Policy 5.10.1	Bikeways shall link residential neighborhood areas with parks, employment centers, civic and commercial areas, and schools.	Yes	All streets within the WLC will include class II bikeways. They will link to bikeways to the west to provide paths between residential areas outside WLC and employment centers within the WLC site.
Policy 5.10.2	Integrate bikeways, consistent with the Bikeway Plan, with the circulation system and maintain Class II and III bikeways as part of the City's street system.	Yes	The WLCSP provides continued trail use on the west side of Redlands Blvd. towards Alessandro Blvd. Class II bikeways are provided on all streets in the WLC.
Policy 5.10.3	Support bicycle safety programs, and active enforcement of laws relating to the safe operation of bicycles on City streets.	NA	This is a system-wide policy not associated with any specific development proposal.
Policy 5.10.4	Link local bikeways with existing and planned regional bikeways.	Yes	All streets within the WLC will include class II bikeways. They would link to bikeways to the west to provide paths between residential areas outside WLC and employment centers in WLC.
Objective 5.11	***Eliminate obstructions that impede safe movement of vehicles, bicyclists, and pedestrians.***	Yes	The WLC would provide a comprehensively planned network of roads, bikeways, pedestrian ways and trails to facilitate, efficient, safe travel for vehicles, cyclists, and pedestrians. Roadways would be designed with 8-ft shoulders with no parking, allowing unobstructed Class II bikeways.

Policy 5.11.1	Landscaping adjacent to City streets, sidewalks and bikeways shall be designed, installed and maintained so as not to physically or visually impede public use of these facilities.	Yes	WLC landscape design standards would provide a safe environment for motorists, pedestrians, and cyclists that would not impede visibility or access to facilities. Landscape areas adjacent to streets would be maintained by a Property Owner Association
	(a) The removal or relocation of mature trees, street trees and landscaping may be necessary to construct safe pedestrian, bicycle and street facilities.	NA	Existing vegetation may be removed to provide adequate pedestrian, bicycle, and street facilities.
	(b) New landscaping, especially street trees shall be planted in such a manner to avoid overhang into streets, obstruction of traffic control devices or sight distances, or creation of other safety hazards.	Yes	The WLCSP would establish right of way standards and street design that allow for safe sight distances.
Policy 5.11.2	Driveways shall be designed to avoid conflicts with pedestrian and bicycle travel.	Yes	Project-specific Plot Plans and subdivisions would be reviewed and approved by the City to ensure the safe design of streets, bikeways, and pedestrian ways.
Objective 5.12	***Promote efficient circulation planning for all school sites that will maximize pedestrian safety, and minimize traffic congestion and neighborhood impacts.***	NA	There are no schools in the WLC.
Policy 5.12.1	Coordinate with school districts to identify suggested pedestrian routes within existing and new subdivisions for school children to walk to and from schools and/or bus stops.	NA	There are no schools in the WLC.

H. VEHICLE MILES OF TRAVEL

An analysis was performed of the effect that the WLC would have on regional vehicle miles of travel (VMT). This analysis was done primarily to provide data needed for the air quality analysis. Readers may be aware that, as a result of Senate Bill 743 (Steinberg, 2013), CEQA analysis of traffic impacts is likely to change at some point in the future from LOS-based to VMT-based. This change will not take effect before January 1st 2020 at the earliest, so the LOS approach that is the primary focus of the current study is in accordance with current state law. The VMT analysis is therefore included in this traffic study for informational purposes only.

The VMT analysis was performed by using the RIVTAM model to forecast the difference in regional VMT for different vehicle classes. This is consistent with long-standing practice in regional air quality conformity analyses and is a method recommended by the Governor's Office of Policy and Research (OPR) in their April 2018 *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA*:

> *"Assessing Change in Total VMT*
>
> *A third method, estimating the change in total VMT with and without the project, can evaluate whether a project is likely to divert existing trips, and what the effect of those diversions will be on total VMT. This method answers the question, "What is the net effect of the project on area VMT?" As an illustration, assessing the total change in VMT for a grocery store built in a food desert that diverts trips from more distant stores could reveal a net VMT reduction. The analysis should address the full area over which the project affects travel behavior, even if the effect on travel behavior crosses political boundaries."*

The effects of the WLC on daily regional VMT can be seen in Table 101, which uses the Existing Plus Buildout scenario as an example. The table distinguishes between trips that have an origin or destination in the WLC, called "WLC Trips" in the table, and trips that have neither an origin nor a destination in the WLC, called "Non-Project Trips". The sections of the table are as follows:

- Columns A, B, and C (the columns with tan-colored headers) show existing conditions in the region, as represented in the RIVTAM model. Since the WLC does not yet exist, all trips are non-project trips.
- Columns D through I represent what conditions would be like with the addition of the WLC. Columns G and H show the vehicle trips and VMT for the WLC, and Column I uses those to compute the average trip length for WLC trips (see the columns with green-colored headers). The WLC tend to be longer than the regional average, as is generally true of land uses in Riverside County.
- The addition of the WLC would not just add WLC trips (Columns G through I), it would also affect non-project trips. For example, because of the WLC, some people that would have driven to jobs somewhere else would instead drive to work at the WLC, thereby converting a non-project trip into a WLC trip (this is an example of what the OPR guidelines quoted above calls a "diverted" trip). Similarly, the VMT for their drive to some other job site is changed from non-project VMT to WLC VMT. Columns D through F (the columns with yellow-colored headers) show RIVTAM's forecast of non-project vehicle trips and VMT in the Existing Plus Full Build-Out scenario.
- Columns N through P (the columns with pink-colored headers) compute the change in regional vehicle trips as a result of the WLC. Column N shows that there would be a reduction in non-project trips that would partially (see Column P) offset the new project-related trips. Note that there is a net increase in trips as a result of the WLC. This is because not every WLC trip would be a replacement for a trip that would otherwise have occurred; it depends on the trip purpose. Specifically, work trips, which are based on the number of households in the region[76], are held constant while trips between employment places increase or decrease based on the expansion or contraction of different sectors of the economy. The net growth in vehicle trips shown in Column O of the table can be thought of as the result of additional economic activity created by the WLC. For a logistics center, most of the increase will be truck trips. However, there will be some additional car trips; perhaps driving to and from meetings at WLC or lunch trips taken by WLC employees. Column O shows 4,317 additional car trip-ends (entering and leaving counted separately), or 2,158 cars trips (the way people usually think of them) as a result of the WLC. That works out to about 1 non-commute car trip for every 9 of the 20,000 workers expected at the WLC, which is a reasonable number.
- Columns J though M (the columns with the blue-colored headers) compute the change in regional VMT as a result of the WLC. Of particular interest for the air quality analysis is the fact that every heavy-duty truck trip generated by the WLC results in a net increase of 35 miles of heavy truck travel, even though the average trip length is 47 miles. This is because a portion of the heavy truck trips that are forecast to go to the WLC would have taken place even without the project; they would just have gone to some other place.

---

[76] The land use data in the Sustainable Communities Strategy is based on birth, deaths, and migration. It includes the growth-inducing effects of new employment, including the WLC.

	Existing Conditions Scenario			Existing Plus Full Build-Out Scenario						Changes as a Result of WLC						
	Non-Project Trips			Non-Project Trips			WLC Project Trips			Changes in VMT				Changes in Vehicle Trips

Trips in Riverside County tend to be longer than the regional average

The net effect of the WLC is like a 35-mile trip
per heavy truck entering or leaving the WLC site ...

... even though the average trip length for
WLC heavy trucks is somewhat longer.

Table 101: Effect of WLC on Regional VMT, Existing Plus Buildout Scenario

Table 102 disaggregates the effects on the Project between freeway and non-freeway VMT. Several things are worth noting:

- As can be seen in the table, for the 2018 and 2025 scenarios the largest increase in VMT is for heavy-duty trucks. That is because heavy-duty trucks have the longest average trip lengths of any vehicle class and longer-distance trips tend to use freeways rather than surface streets.
- For the 2018 and 2025 scenarios, the Project reduces cars' VMT on freeways but increases cars' VMT on arterial roads. This would be due to some people switching from driving long distances on freeways to get to jobs in L.A. and Orange Counties and instead driving shorter distances on arterial roads to jobs in the WLC.
- The 2040 Plus Buildout scenario assumes, based on the SCS and Moreno Valley's General Plan, the development of other employment centers in Moreno Valley and the surrounding communities. The WLC would therefore need to draw workers from farther afield, which would increase the freeway VMT for Project-related cars.

	2018					2025			2040		
	Existing	Existing Plus Phase 1		Existing Plus Buildout		2025 No Project	2025 Plus Phase 1		2040 No Project	2040 Plus Buildout
